

bq27541 to bq27541-v200 Change List

Samuel Wong

PMP - BMS Handheld

ABSTRACT

This document describes the design changes from the bq27541 (firmware version 1.12) to bq27541-v200 (firmware version 2.00). For ordering information and data sheet, see the Texas Instruments Web site at <http://www.power.ti.com>.

Change Details

This firmware release fixes the known bugs in the bq27541 with firmware v1.12 and upgrades it to bq27541-v200 with firmware v2.00. It also added new features and Impedance Track™ enhancements to improve performance. The latest ordering information and data sheet are available on the TI web site. The latest version of the evaluation software is required to be able to use the new commands and read/write to all the new data flash configuration locations.

ID	bq27541-v200	bq27541	Comment
1	New life-time data logging feature. See the data sheet for new data flash added.	No life-time data logging feature	New feature
2	Configurable ADC Ground Select between Vss and SRP. This feature addresses board level layout issues and provides configurability. Default is set to Vss	ADC reference is hardwired to SRP.	New feature
3	New 8-byte serial number in data flash. See the data sheet Section 5 for details	No serial number feature	New feature
4	Voltage at charge termination now saved and is used in DOD at EOC calculation.	Voltage at charge termination is not saved	New feature
5	Add OCVTaken flag. Flag is cleared at entry to relax and set at first OCV in relax.	No OCVTaken flag to indicate OCV measurements	New feature.
6	Add new data commands: a) Internal_Temp() b) StateOfHealth() c) PassedCharge() d) DOD0() e) PackConfig() See data sheet for command details.	These commands are unavailable.	New features
7	Add new data flash parameter DF Config Version and Control() subcommand DF_VERSION to report value. This feature enables customer to track data flash versions.	No DF_VERSION subcommand and DF Config Version data flash.	New feature
8	SE Pin state is based on HIBERNATE mode. New Pack Configuration register bit SE_EN is added to enable function. See data sheet for system shutdown enable operations.	SE Pin function cannot be disabled	New feature.
9	Temperature Compensation to improve reference voltage drift with temperature to improve voltage measurement accuracy	No temperature compensation for voltage drift.	Measurement enhancement
10	New data flash parameters for Ra computation: a) Ra Filter, b) Ra Max Delta c) Max Res Factor d) Min Res Factor New Pack Configuration Register bit ResFactorStep (bit 6) to enable or disable of Ra steps up/down to max/min Res Factor before disabling Ra updates. This feature eliminates unexpected fluctuation in the updated Ra values to avoid data corruption due to extreme data	No Ra filtering function. Ra value can change abruptly.	Impedance Track™ enhancement

Impedance Track is a trademark of Texas Instruments.

ID	bq27541-v200	bq27541	Comment
11	New data flash filtering parameters to limit Avg I/P Last Run to DesignCapacity/Max Sim Rate and DesignCapacity/Min Sim Rate : a) Max Sim Rate b) Min Sim Rate	No Sim Rate configuration to limit Avg I/P simulation.	Impedance Track™ enhancement
12	New data flash filtering parameter DeltaV Max Delta to limit change of DeltaV.	Delta V value change is not limited.	Impedance Track™ enhancement
13	New data flash filtering parameter Qmax Max Delta % to limit change of Qmax during update as a percentage to Design Capacity.	Qmax change is not limited.	Impedance Track™ enhancement
14	Allow extrapolation of Ra of next grid on exit of discharge if the terminated voltage is reached.	No extrapolation of Ra allowed unless grid point is reached	Impedance Track™ enhancement
15	Qstart/RM/FCC are updated under the following additional conditions: a) Start of charge b) Temperature change > DODatEOC Delta T c) Charge termination d) At rest during each 1-hr DOD0 update interval	Qstart/RM/FCC is not updated during these conditions.	Impedance Track™ enhancement
16	When overdischarged below termination voltage, internal True Remaining Capacity continues to count negative and RM remains 0. RM remains 0 until internal True Remaining Capacity is charged to positive value. When overcharged above FCC, internal True Remaining Capacity continues to count and RM remains equal to FCC. RM starts to count down when internal True Remaining Capacity becomes less than FCC. This feature improves remaining capacity calculation.	When overdischarged, RM starts to count up immediately when charging begins. This causes overestimation of capacity. When overcharged, RM starts to count down immediately when discharge begins. This causes underestimation of capacity.	Impedance Track™ enhancement
17	Use two exponent Rb tables for enhanced cold temperature modeling to improve cold temperature accuracy	Single Rb exponent is used for full temperature range.	Impedance Track™ enhancement
18	Improve IR Compensation to simulate OCV under load up to C/5	C/20 is the maximum OCV under load allowed for IR compensation	Impedance Track™ enhancement
19	New data flash parameters T rise and T Time Constant for thermal Modeling. Thermal modeling is used to model for self-heating.	No thermal modeling	Impedance Track™ enhancement
20	New Transient modeling to model loading change.	No transient modeling	Impedance Track™ enhancement
21	Fix HW_VER Command to show correct hardware "B4"	HW_VER command shows "00"	Bug fix
22	CHG_INH and XCHG bits are set based on temperature settings in data flash only.	CHG_INH and XCHG bits are set based on temperature settings in data flash and FC flag is set	Bug fix
23	PREV_MAC command limits command to < 0x0020	PREV_MAC command limits command to < 0x000b	Bug fix
24	Do not update Qmax if RUP_DIS bit set	Qmax is updated regardless of RUP_DIS bit	Bug fix
25	When loading requirement is not met during discharge grid point, previous resistance data is preserved for the skipped point.	When loading requirement is not met during discharge grid point, resistance is interpolated for the skipped point.	Bug fix
26	On an exit from discharge in which min DoD has been passed, only allow the extrapolation of R values for the grid points during a learning cycle.	Extrapolation is allowed on any cycle.	Bug fix
27	Add a check to force SOC to 0 if RM and FCC are ≤ 0.	SOC is 100 when RM & FCC are ≤ 0.	Bug fix
28	Enable use of secure memory key for authentication by setting data flash key to all zeros.	Secure memory key cannot be enabled.	Bug fix
29	AtRateTTE reports 65535 when AtRate is set to 0.	AtRateTTE reports are incorrect when AtRate is set to 0.	Bug fix

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
