

## How to Transfer bq27541 Into Hibernate Mode

Steven Yao

BMS Handheld

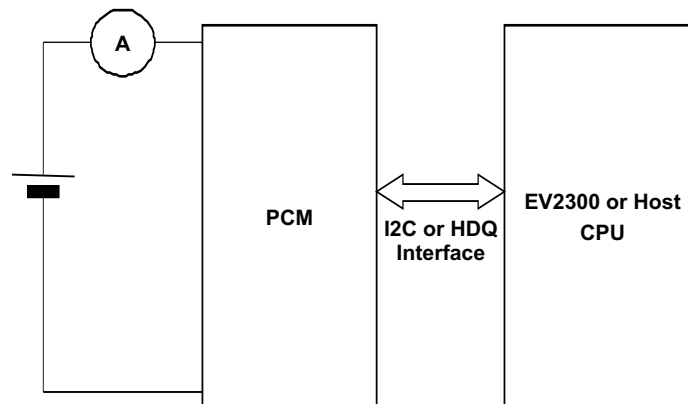

### ABSTRACT

This document presents a checklist and a discussion on how to transfer reliably the bq27541 into Hibernate mode.

The bq27541 has four power modes – Normal , Sleep , Full Sleep, and Hibernate. Hibernate mode is the lowest power consumption mode. In this mode, the device only draws about 6  $\mu\text{A}$  from the cell. Due to such a low power consumption rate, many customers pay special attention to this mode and want to enable it in real applications. Thus, battery manufacturers need to provide test reports that manifest the power modes transition.

Many customers have reported that they failed to see the device entering the Hibernate mode according to the conditions specified in the data sheet. This document provides some reference guidelines to ensure the successful transition to this low power mode.

The connecting diagram for the consumption current test is illustrated in [Figure 1](#).

**Figure 1. Consumption Current Test**

To enter Hibernate mode, the gauge has to be transferred to Sleep mode and Full Sleep mode. The conditions for entering Sleep mode and Full Sleep mode are straightforward, and the conditions for entering the Hibernate mode are:  $V_{\text{cell}} < \text{Hibernate Voltage}$  or the Host sets the Control Status [HIBERNATE] bit to 1, the Cell is relaxed, and Average Current  $<$  Hibernate Current.

The conditions like [HIBERNATE] = 1, Average Current  $<$  Hibernate Current are Clear, but  $V_{\text{cell}}$  relax not only refers to the cell voltage stability, but also implies that the gauge has to be enabled for the IT algorithm because the OCV measurements are taken after the IT is enabled. The test operator must ensure that the input voltage of PCM is stable for these requirements. To enter the Hibernate mode, the following requirements must apply.

1. The current meter connected in series between the power supply and the PCM must have very low impedance, like 2  $\Omega$  to 3  $\Omega$  . Because the device still wakes up periodically while in the Sleep mode, the consumption current can reach 130  $\mu\text{A}$  during those wake-up times. Thus, a 7- $\Omega$  impedance on the current meter can cause a voltage drop of approximately 1 mV. For the gauge to confirm that the cell is in the relax mode, the measured voltage by bq27541 cannot vary over 1 mV within approximately 1000 s; the impedance of the current meter therefore must be very low.

2. The [HIBERNATE] bit in the control status bit must be set before entering the Full Sleep mode.
3. No load is applied to the PCM output, i.e., the current measured by gas gauge must be 0.
4. The device has to be in IT Enable mode so that the OCV voltage can be taken periodically. If the IT is not enabled, the gas gauge does not take the OCV
5. When the device enters Full Sleep mode, which is followed by Hibernate mode, do not unplug the HDQ connector (but you must stop scanning if you are using EVSW). Otherwise, the device may be mistakenly activated to Sleep mode.
6. The time needed to await the device to enter the Hibernate mode is about 8 to 10 minutes
7. A cell serves as a better power supply to the PCM than does a dc power supply. This is because with many dc power supplies, even the ripple of the output can be over 1 mV.

The preceding list can be used as a checklist for reliably entering the Hibernate mode. The described test is performed using the bq27541 VC2.0 firmware F/W.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
