

# TUSB1042I USB Type-C™ 10Gbps 2:1 リニア・リドライバ・スイッチ

## 1 特長

- USB Type-C™ 2:1 のリドライバ・スイッチ
- USB 3.1 Gen 1/Gen 2 で最大 10Gbps
- 超低消費電力アーキテクチャ
- 最大 14dB のイコライゼーション付きのリニア・リドライバ
- 自動的な LFPS ディエンファシス制御により USB 3.1 の認定要件に合致
- GPIO または I<sup>2</sup>C により構成可能
- Intel 独自の USB Type-C 上での DCI 能力により、クローズド・シャーシ・デバッグが可能
- ホットプラグ対応
- 工業用温度範囲: -40°C~85°C
- 4mm x 6mm、0.4mm ピッチの WQFN パッケージ

## 2 アプリケーション

- タブレット
- ノートブック PC
- デスクトップ PC
- ドッキング・ステーション

## 3 概要

TUSB1042I は、USB 3.1 で最高 10Gbps のデータ・レートをサポートする、リドライビング・スイッチです。TUSB1042I には、いくつかのレベルの受信リニア・イコライゼーションがあり、ケーブルおよびボード配線での損失によるシンボル間干渉 (ISI) を補償できます。このデバイスは単一の 3.3V 電源で動作し、工業用温度範囲に対応しています。

## 4 改訂履歴

### Revision C (August 2018) から Revision D に変更 Page

- Added following to pin 11 description: If I2C\_EN = “F”, then this pin must be set to “F” or “0”. 4

### Revision B (April 2018) から Revision C に変更 Page

- Added Note 1 To pins 29 and 32 in the *Pin Functions* table. 3

### Revision A (October 2017) から Revision B に変更 Page

- Changed the appearance of the pinout image in the *Pin Configuration and Function* section 3
- Changed the USB3.1 Control/Status Registers reset value From: 00000000 To: 00000100 23
- Changed the Reset value of bit 3:2 From: 00 To: 01 in [表 12](#) 23

### 2017年8月発行のものから更新 Page

- Changed the Human-body model (HBM) value From: ±6000 To: ±5000 in the *ESD Ratings*. 5

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply Voltage Range <sup>(2)</sup> , $V_{CC}$		-0.3	4	V
Voltage Range at any input or output pin	Differential voltage between positive and negative inputs		±2.5	V
	Voltage at differential inputs	-0.5	$V_{CC} + 0.5$	V
	CMOS Inputs	-0.5	$V_{CC} + 0.5$	V
Maximum junction temperature, $T_J$			125	°C
Storage temperature, $T_{stg}$		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the GND terminals.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±5000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

## 8 Detailed Description

### 8.1 Overview

The TUSB1042I is a USB Type-C re-driving switch supporting data rates up to 10 Gbps. This device utilizes 5<sup>th</sup> generation USB re-driver technology.

The TUSB1042I provides several levels of receive equalization to compensate for inter-symbol interference (ISI) due to cable and board trace loss when USB 3.1 Gen1/Gen2 signals travel across a PCB or cable. This device requires a 3.3-V power supply. It comes in the industrial temperature range.

For a host or device application the TUSB1042I enables the system to pass both transmitter compliance and receiver jitter tolerance tests for USB 3.1 Gen1/Gen2. The re-driver recovers incoming data by applying equalization that compensates for channel loss, and drives out signals with a high differential voltage. Each channel has a receiver equalizer with selectable gain settings. The equalization should be set based on the amount of insertion loss before or after the TUSB1042I receivers. Independent equalization control for each channel can be set using EQ[1:0] and SSEQ[1:0] pins.

The TUSB1042I advanced state machine makes it transparent to hosts and devices. After power up, the TUSB1042I periodically performs receiver detection on the TX pairs. If it detects a USB 3.1 Gen1/Gen2 receiver, the RX termination is enabled, and the TUSB1042I is ready to re-drive.

The device ultra-low-power architecture operates at a 3.3-V power supply and achieves enhanced performance. The automatic LFPS de-emphasis control further enables the system to be USB3.1 compliant.

## 8.3 Feature Description

### 8.3.1 USB 3.1

The TUSB1042I supports USB 3.1 Gen1/Gen2 data rates up to 10 Gbps. The TUSB1042I supports all the USB defined power states (U0, U1, U2, and U3). Because the TUSB1042I is a linear redriver, it can't decode USB3.1 physical layer traffic. The TUSB1042I monitors the actual physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the USB power state of the USB 3.1 interface.

The TUSB1042I features an intelligent low frequency periodic signaling (LFPS) detector. The LFPS detector automatically senses the low frequency signals and disables receiver equalization functionality. When not receiving LFPS, the TUSB1042I will enable receiver equalization based on the EQ[1:0] and SSEQ[1:0] pins or values programmed into EQ1\_SEL, EQ2\_SEL, and SSEQ\_SEL registers.

### 8.3.2 4-level Inputs

The TUSB1042I has (I2C\_EN, EQ[1:0], and SSEQ[1:0]) 4-level inputs pins that are used to control the equalization gain and place TUSB1042I into different modes of operation. These 4-level inputs utilize a resistor divider to help set the 4 valid levels and provide a wider range of control settings. There is an internal 30 kΩ pull-up and a 94 kΩ pull-down. These resistors, together with the external resistor connection combine to achieve the desired voltage level.

**表 1. 4-Level Control Pin Settings**

LEVEL	SETTINGS
0	Option 1: Tie 1 KΩ 5% to GND. Option 2: Tie directly to GND.
R	Tie 20 KΩ 5% to GND.
F	Float (leave pin open)
1	Option 1: Tie 1 KΩ 5% to V <sub>CC</sub> . Option 2: Tie directly to V <sub>CC</sub> .

#### 注

All four-level inputs are latched on rising edge of internal reset. After  $t_{cfg\_hd}$ , the internal pull-up and pull-down resistors will be isolated in order to save power.

### 8.3.3 Receiver Linear Equalization

The purpose of receiver equalization is to compensate for channel insertion loss and inter-symbol interference in the system before the input or after the output of the TUSB1042I. The receiver overcomes these losses by attenuating the low frequency components of the signals with respect to the high frequency components. The proper gain setting should be selected to match the channel insertion loss. Two 4-level input pins enable up to 16 possible equalization settings. USB3.1 upstream path and USB3.1 downstream path each have their own two 4-level inputs. The TUSB1042I also provides the flexibility of adjusting settings through I<sup>2</sup>C registers.

## 8.4 Device Functional Modes

### 8.4.1 Device Configuration in GPIO Mode

The TUSB1042I is in GPIO configuration when I2C\_EN = “0”. The TUSB1042I supports USB 3.1 operation. The TEST1 pin needs to be pulled down to GND. CTL0 pins enables or disables USB 3.1 operation as detailed in [表 2](#).

After power-up ( $V_{CC}$  from 0 V to 3.3 V), the TUSB1042I defaults to USB3.1 mode. The USB PD controller upon detecting no device attached to Type-C port or USB3.1 operation not required by attached device must take TUSB1042I out of USB3.1 mode by transitioning the CTL0 pin from L to H and back to L.

**表 2. GPIO Configuration Control**

### 8.4.2 Device Configuration In I<sup>2</sup>C Mode

The TUSB1042I is in I<sup>2</sup>C mode when I2C\_EN is not equal to “0”. The same configurations defined in GPIO mode are also available in I<sup>2</sup>C mode. The TUSB1042I USB3.1 configuration is controlled based on [表 4](#).

### 8.4.3 Linear EQ Configuration

Each of the TUSB1042I receiver lanes has individual controls for receiver equalization. The receiver equalization gain value can be controlled either through I<sup>2</sup>C registers or through GPIOs. 表 5 details the gain value for each available combination when TUSB1042I is in GPIO mode. These same options are also available in I<sup>2</sup>C mode by updating registers EQ1\_SEL, EQ2\_SEL, and SSEQ\_SEL.

### 8.4.4 USB3.1 Modes

The TUSB1042I monitors the physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the state of the USB3.1 interface. Depending on the state of the USB 3.1 interface, the TUSB1042I can be in one of four primary modes of operation when USB 3.1 is enabled (CTL0 = H or CTLSEL0 = 1b1): Disconnect, U2/U3, U1, and U0.

The Disconnect mode is the state in which TUSB1042I has not detected far-end termination on both upstream facing port (UFP) or downstream facing port (DFP). The disconnect mode is the lowest power mode of each of the four modes. The TUSB1042I remains in this mode until far-end receiver termination has been detected on both UFP and DFP. The TUSB1042I immediately exits this mode and enter U0 once far-end termination is detected.

Once in U0 mode, the TUSB1042I will redrive all traffic received on UFP and DFP. U0 is the highest power mode of all USB3.1 modes. The TUSB1042I remains in U0 mode until electrical idle occurs on both UFP and DFP. Upon detecting electrical idle, the TUSB1042I immediately transitions to U1.

The U1 mode is the intermediate mode between U0 mode and U2/U3 mode. In U1 mode, the TUSB1042I UFP and DFP receiver termination remains enabled. The UFP and DFP transmitter DC common mode is maintained. The power consumption in U1 is similar to power consumption of U0.

Next to the disconnect mode, the U2/U3 mode is next lowest power state. While in this mode, the TUSB1042I periodically performs far-end receiver detection. Anytime the far-end receiver termination is not detected on either UFP or DFP, the TUSB1042I leaves the U2/U3 mode and transitions to the Disconnect mode. It also monitors for a valid LFPS. Upon detection of a valid LFPS, the TUSB1042I immediately transitions to the U0 mode. In U2/U3 mode, the TUSB1042I receiver terminations remain enabled but the TX DC common mode voltage is not maintained.

## 8.5 Programming

For further programmability, the TUSB1042I can be controlled using I<sup>2</sup>C. The SCL and SDA pins are used for I<sup>2</sup>C clock and I<sup>2</sup>C data respectively.

The following procedure should be followed to write to TUSB1042I I<sup>2</sup>C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB1042I 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB1042I acknowledges the address cycle.
3. The master presents the sub-address (I<sup>2</sup>C register within TUSB1042I) to be written, consisting of one byte of data, MSB-first.
4. The TUSB1042I acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I<sup>2</sup>C register.
6. The TUSB1042I acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB1042I.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure should be followed to read the TUSB1042I I<sup>2</sup>C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the TUSB1042I 7-bit address and a one-value “W/R” bit to indicate a read cycle.
2. The TUSB1042I acknowledges the address cycle.
3. The TUSB1042I transmit the contents of the memory registers MSB-first starting at register 00h or last read sub-address+1. If a write to the T I<sup>2</sup>C register occurred prior to the read, then the TUSB1042I shall start at the sub-address specified in the write.
4. The TUSB1042I shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I<sup>2</sup>C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the TUSB1042I transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure should be followed for setting a starting sub-address for I<sup>2</sup>C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB1042I 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB1042I acknowledges the address cycle.
3. The master presents the sub-address (I<sup>2</sup>C register within TUSB1042I) to be written, consisting of one byte of data, MSB-first.

4. The TUSB1042I acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

---

**注**

If no sub-addressing is included for the read procedure, and reads start at register offset 00h and continue byte by byte through the registers until the I<sup>2</sup>C master terminates the read operation. If a I<sup>2</sup>C address write occurred prior to the read, then the reads start at the sub-address specified by the address write.

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TUSB1042I is a linear redriver switch designed specifically to compensate for intersymbol interference (ISI) jitter caused by signal attenuation through a passive medium like PCB traces and cables. Because the TUSB1042I has one upstream facing USB 3.1 Gen1/Gen2 input, and two downstream facing USB 3.1 Gen1/Gen2 inputs, it can be optimized to correct ISI on all those three inputs through 16 different equalization choices. Placing the TUSB1042I between a USB3.1 Host and a USB3.1 Type-C receptacle can correct signal integrity issues resulting in a more robust system.

☒ 19. TUSB1042I in a Host Application

## Typical Application (continued)

### 9.2.1 Design Requirements

For this design example, use the parameters shown in 表 13.

表 13. Design Parameters

PARAMETER	VALUE
A to B PCB trace length, $X_{AB}$	12 inches
E to F PCB trace length, $X_{EF}$	2 inches
PCB trace width	4 mils
AC-coupling capacitor (75 nF to 265 nF)	100 nF
VCC supply (3 V to 3.6 V)	3.3 V
I2C Mode or GPIO Mode	I2C Mode. (I2C_EN pin != "0")
1.8V or 3.3V I2C Interface	3.3V I2C. Pull-up the I2C_EN pin to 3.3V with a 1K ohm resistor.

### 9.2.2 Detailed Design Procedure

A typical usage of the TUSB1042I device is shown in 图 20. The device can be controlled either through its GPIO pins or through its I<sup>2</sup>C interface. In the example shown below, a Type-C PD controller is used to configure the device through the I<sup>2</sup>C interface. When configured for I2C mode, pins 29 (DCI\_DAT) and 32 (DCI\_CLK) can be used for the DCI interface. In I2C mode, the equalization settings for each receiver can be independently controlled through I2C registers. For this reason, all of the equalization pins (EQ[1:0] and SSEQ[1:0]) can be left unconnected. If these pins are left unconnected, the TUSB1042I 7-bit I2C slave address will be 0x12 because both A1 and SSEQ0/A0 will be at pin level "F". If a different I2C slave address is desired, A1 and SSEQ0/A0 pins should be set to a level which produces the desired I2C slave address.

10 Power Supply Recommendations

The TUSB1042I is designed to operate with a 3.3-V power supply. Levels above those listed in the [Absolute Maximum Ratings](#) table should not be used. If using a higher voltage system power supply, a voltage regulator can be used to step down to 3.3 V. Decoupling capacitors should be used to reduce noise and improve power supply integrity. A 0.1-μF capacitor should be used on each power pin.

## 11 Layout

### 11.1 Layout Guidelines

1. RXP/N and TXP/N pairs should be routed with controlled 90-Ω differential impedance ( $\pm 15\%$ ).
2. Keep away from other high speed signals.
3. Intra-pair routing should be kept to within 2 mils.
4. Length matching should be near the location of mismatch.
5. Each pair should be separated at least by 3 times the signal trace width.
6. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be  $\geq 135$  degrees. This will minimize any length mismatch causes by the bends and therefore minimize the impact bends have on EMI.
7. Route all differential pairs on the same of layer.
8. The number of vias should be kept to a minimum. It is recommended to keep the vias count to 2 or less.
9. Keep traces on layers adjacent to ground plane.
10. Do not route differential pairs over any plane split.
11. Adding Test points will cause impedance discontinuity, and therefore, negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
