

## DS90LV028A 3V、LVDSデュアルCMOS差動入力ライン・レシーバ

### 1 特長

- 400Mbps (200MHz)を超えるスイッチング速度
- 差動スキュー: 50ps (標準値)
- チャネル間スキュー: 0.1ns (標準値)
- 最大伝搬遅延: 2.5ns
- 3.3V電源の設計
- フロースルーのピン配置
- パワーダウン時高インピーダンスのLVDS入力
- 低消費電力の設計(3.3V静的で18mW)
- 既存の5V LVDSネットワークと相互運用可能
- 小振幅(標準値350mV)差動信号レベルを許容
- 開放、短絡、終端の入力フェイルセーフに対応
- ANSI/TIA/EIA-644規格に準拠
- 工業用温度範囲: -40°C~85°C
- SOICおよび省スペースのWSOパッケージで供給

### 2 アプリケーション

- 多機能プリンタ
- LVDS-LVCMOS間の変換
- ビル・オートメーションとファクトリ・オートメーション
- グリッド・インフラストラクチャ

### 3 概要

DS90LV028AはデュアルCMOS差動ライン・レシーバで、超低消費電力、低ノイズ、高いデータ速度を必要とするアプリケーション用に設計されています。このデバイスは、低電圧差動信号(LVDS)テクノロジーを活用し、400Mbps (200MHz)を超えるデータ速度をサポートするように設計されています。

DS90LV028Aは低電圧(標準値350mV)の差動入力信号を受信し、3V CMOS出力レベルへ変換します。また、レシーバは開放、短絡、終端(100Ω)の入力フェイルセーフもサポートします。すべてのフェイルセーフ条件において、レシーバの出力はHIGHになります。DS90LV028Aにはフロースルー設計が採用されているため、PCBレイアウトが容易です。

DS90LV028Aと、対になるLVDSライン・ドライバは、消費電力の大きいPECL/ECLデバイスの代替として、高速のポイント・ツー・ポイント・インターフェイス・アプリケーションに使用できます。

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	5	—	Ground pin
R <sub>IN</sub> +	2, 3	I	Noninverting receiver input pin
R <sub>IN</sub> -	1, 4	I	Inverting receiver input pin
R <sub>OUT</sub>	6, 7	O	Receiver output pin
V <sub>CC</sub>	8	—	Power supply pin, 3.3 V ±0.3 V

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage, $V_{CC}$		-0.3	4	V
Input voltage, $R_{IN+}$ , $R_{IN-}$		-0.3	3.9	V
Output voltage, $R_{OUT}$		-0.3	$V_{CC} + 0.3$	V
Maximum package power dissipation at 25°C	D package	1025		mW
	Derate D package	8.2 mW/°C above 25°C		°C
	NGN package	3.3		W
	Derate NGN package	25.6 mW/°C above 25°C		°C
Lead temperature range, soldering (4 s)		260		°C
Junction temperature, $T_J$		150		°C
Storage temperature, $T_{stg}$		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±7000	V
	Machine model (MM) <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) EIAJ, 0 Ω, 200 pF

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{CC}$ Supply voltage	Receiver input voltage	3	3.3	3.6	V
		GND		3	V
$T_A$ Operating free-air temperature		-40	25	85	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DS90LV028A		UNIT
		D (SOIC)	NGN (WSON)	
		8 PINS	8 PINS	
$R_{\theta JA}$ Junction-to-ambient thermal resistance		—	35.9	°C/W
	Low-K thermal resistance	212	—

## 6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(2)</sup>	MAX	UNIT	
V <sub>TH</sub>	Differential input high threshold	V <sub>CM</sub> = 1.2 V, 0 V, 3 V, R <sub>IN+</sub> , R <sub>IN-</sub> pins <sup>(3)</sup>			100	mV	
V <sub>TL</sub>	Differential input low threshold	V <sub>CM</sub> = 1.2 V, 0 V, 3 V, R <sub>IN+</sub> , R <sub>IN-</sub> pins <sup>(3)</sup>	-100			mV	
I <sub>IN</sub>	Input current	V <sub>CC</sub> = 3.6 V or 0 V, R <sub>IN+</sub> , R <sub>IN-</sub> pins					
			V <sub>IN</sub> = 2.8 V	-10	±1	10	μA
			V <sub>IN</sub> = 0 V	-10	±1	10	
	V <sub>CC</sub> = 0 V, V <sub>IN</sub> = 3.6 V, R <sub>IN+</sub> , R <sub>IN-</sub> pins						
V <sub>OH</sub>	Output high voltage	I <sub>OH</sub> = -0.4 mA, V <sub>ID</sub> = 200 mV, R <sub>OUT</sub> pin	2.7	3.1		V	
		I <sub>OH</sub> = -0.4 mA, inputs terminated, R <sub>OUT</sub> pin	2.7	3.1			
		I <sub>OH</sub> = -0.4 mA, inputs shorted, R <sub>OUT</sub> pin	2.7	3.1			
V <sub>OL</sub>	Output low voltage	I <sub>OL</sub> = 2 mA, V <sub>ID</sub> = -200 mV, R <sub>OUT</sub> pin		0.3	0.5	V	
I <sub>OS</sub>	Output short-circuit current	V <sub>OUT</sub> = 0 V, R <sub>OUT</sub> pin <sup>(4)</sup>	-15	-50	-100	mA	
V <sub>CL</sub>	Input clamp voltage	I <sub>CL</sub> = -18 mA, R <sub>OUT</sub> pin	-1.5	-0.8		V	
I <sub>CC</sub>	No load supply current	V <sub>CC</sub> pin, inputs open		5.4	9	mA	

- (1) Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified (such as V<sub>ID</sub>).
- (2) All typicals are given for: V<sub>CC</sub> = 3.3 V and T<sub>A</sub> = 25°C.
- (3) V<sub>CC</sub> is always higher than R<sub>IN+</sub> and R<sub>IN-</sub> voltage. R<sub>IN+</sub> and R<sub>IN-</sub> are allowed to have voltage range -0.05 V to 3.05 V. V<sub>ID</sub> is not allowed to be greater than 100 mV when V<sub>CM</sub> = 0 V or 3 V.
- (4) Output short circuit current (I<sub>OS</sub>) is specified as magnitude only, minus sign indicates direction only. Only one output must be shorted at a time, do not exceed maximum junction temperature specification.

## 6.6 Switching Characteristics

V<sub>CC</sub> = 3.3 V ±10%, and T<sub>A</sub> = -40°C to 85°C (unless otherwise noted)<sup>(1)(2)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>PHLD</sub>	Differential propagation delay high to low	C <sub>L</sub> = 15 pF	1	1.6	2.5	ns
t <sub>PLHD</sub>	Differential propagation delay low to high	V <sub>ID</sub> = 200 mV	1	1.7	2.5	ns
t <sub>SKD1</sub>	Differential pulse skew  t <sub>PHLD</sub> - t <sub>PLHD</sub>   <sup>(3)</sup>	See <a href="#">Figure 18</a> and <a href="#">Figure 19</a>	0	50	400	ps
t <sub>SKD2</sub>	Differential channel-to-channel skew-same device <sup>(4)</sup>		0	0.1	0.5	ns
t <sub>SKD3</sub>	Differential part to part skew <sup>(5)</sup>		0		1	ns
t <sub>SKD4</sub>	Differential part to part skew <sup>(6)</sup>		0		1.5	ns
t <sub>TLH</sub>	Rise Time			325	800	ps
t <sub>THL</sub>	Fall Time			225	800	ps
f <sub>MAX</sub>	Maximum operating frequency <sup>(7)</sup>		200	250		MHz

- (1) C<sub>L</sub> includes probe and jig capacitance.
- (2) Generator waveform for all tests unless otherwise specified: f = 1 MHz, Z<sub>O</sub> = 50 Ω, t<sub>r</sub> and t<sub>f</sub> (0% to 100%) ≤ 3 ns for R<sub>IN-</sub>.
- (3) t<sub>SKD1</sub> is the magnitude difference in differential propagation delay time between the positive-going-edge and the negative-going-edge of the same channel.
- (4) t<sub>SKD2</sub> is the differential channel-to-channel skew of any event on the same device. This specification applies to devices having multiple receivers within the integrated circuit.
- (5) t<sub>SKD3</sub>, part to part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices at the same V<sub>CC</sub> and within 5°C of each other within the operating temperature range.
- (6) t<sub>SKD4</sub>, part to part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over the recommended operating temperature and voltage ranges, and across process distribution. t<sub>SKD4</sub> is defined as |Maximum - Minimum| differential propagation delay.
- (7) f<sub>MAX</sub> generator input conditions: t<sub>r</sub> = t<sub>f</sub> < 1 ns (0% to 100%), 50% duty cycle, differential (1.05V to 1.35 peak to peak). Output criteria: 60%/40% duty cycle, V<sub>OL</sub> (max 0.4V), V<sub>OH</sub> (min 2.7V), load = 15 pF (stray plus probes).

## 8 Detailed Description

### 8.1 Overview

LVDS drivers and receivers are intended to be primarily used in an uncomplicated point-to-point configuration as is shown in [Figure 20](#). This configuration provides a clean signaling environment for the fast edge rates of the drivers. The receiver is connected to the driver through a balanced media which may be a standard twisted pair cable, a parallel pair cable, or simply PCB traces. Typically, the characteristic impedance of the media is in the range of 100  $\Omega$ . A termination resistor of 100  $\Omega$  (selected to match the media), and is placed as close to the receiver input pins as possible. The termination resistor converts the driver output (current mode) into a voltage that is detected by the receiver. Other configurations are possible such as a multi-receiver configuration, but the effects of a mid-stream connector(s), cable stub(s), and other impedance discontinuities as well as ground shifting, noise margin limits, and total termination loading must be considered.

### 8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 8.3 Feature Description

The DS90LV028A differential line receiver is capable of detecting signals as low as 100 mV, over a  $\pm 1$ -V common mode range centered around 1.2 V. This is related to the driver offset voltage which is typically 1.2 V. The driven signal is centered around this voltage and may shift  $\pm 1$  V around this center point. The  $\pm 1$ -V shifting may be the result of a ground potential difference between the driver's ground reference and the receiver's ground reference, the common mode effects of coupled noise, or a combination of the two. The AC parameters of both receiver input pins are optimized for a recommended operating input voltage range of 0 V to 2.4 V (measured from each pin to ground). The device operates for receiver input voltages up to  $V_{CC}$ , but exceeding  $V_{CC}$  turns on the ESD protection circuitry which clamps the bus voltages.

## Feature Description (continued)

### 8.3.1 Fail-Safe Feature

The LVDS receiver is a high gain, high speed device that amplifies a small differential signal (20 mV) to CMOS logic levels. Due to the high gain and tight threshold of the receiver, take care to prevent noise from appearing as a valid signal.

The internal fail-safe circuitry of the receiver is designed to source or sink a small amount of current, providing fail-safe protection (a stable known state of HIGH output voltage) for floating, terminated or shorted receiver inputs.

1. **Open Input Pins:** The DS90LV028A is a dual receiver device, and if an application requires only 1 receiver, the unused channel inputs must be left OPEN. Do not tie unused receiver inputs to ground or any other voltages. The input is biased by internal high value pull up and pull down resistors to set the output to a HIGH state. This internal circuitry ensures a HIGH, stable output state for open inputs.
2. **Terminated Input:** If the driver is disconnected (cable unplugged), or if the driver is in a power-off condition, the receiver output is again in a HIGH state, even with the end of cable 100Ω termination resistor across the input pins. The unplugged cable can become a floating antenna which can pick up noise. If the cable picks up more than 10 mV of differential noise, the receiver may see the noise as a valid signal and switch. To insure that any noise is seen as common mode and not differential, a balanced interconnect must be used. Twisted pair cable offers better balance than flat ribbon cable.
3. **Shorted Inputs:** If a fault condition occurs that shorts the receiver inputs together, thus resulting in a 0 V differential input voltage, the receiver output remains in a HIGH state. Shorted input fail-safe is not supported across the common mode range of the device (GND to 2.4 V). It is only supported with inputs shorted and no external common mode voltage applied.

External lower value pull up and pull down resistors (for a stronger bias) may be used to boost fail-safe in the presence of higher noise levels. The pull up and pull down resistors must be in the 5-kΩ to 15-kΩ range to minimize loading and waveform distortion to the driver. The common mode bias point must be set to approximately 1.2 V (less than 1.75 V) to be compatible with the internal circuitry. Refer to [AN-1194 Failsafe Biasing of LVDS Interfaces](#) (SNLA051) for more information.

### 8.3.2 Cables and Connectors

When choosing cable and connectors for LVDS it is important to remember:

Use controlled impedance media. The cables and connectors you use must have a matched differential impedance of about 100 Ω. They must not introduce major impedance discontinuities.

Balanced cables (for example, twisted pair) are usually better than unbalanced cables (ribbon cable, simple coax) for noise reduction and signal quality. Balanced cables tend to generate less EMI due to field canceling effects and also tend to pick up electromagnetic radiation a common mode (not differential mode) noise which is rejected by the receiver.

For cable distances < 0.5 M, most cables can be made to work effectively. For distances 0.5 M ≤ d ≤ 10 M, CAT 3 (category 3) twisted pair cable works well, is readily available, and relatively inexpensive.

## 8.4 Device Functional Modes

[Table 1](#) lists the functional modes of the DS90LV028A.

**Table 1. Truth Table**

INPUTS	OUTPUT
$[R_{IN+}] - [R_{IN-}]$	$R_{OUT}$
$V_{ID} \geq 0.1 \text{ V}$	H
$V_{ID} \leq -0.1 \text{ V}$	L
Full fail-safe OPEN/SHORT or Terminated	H

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The DS90LV028A has a flow-through pinout that allows for easy PCB layout. The LVDS signals on one side of the device easily allows for matching electrical lengths of the differential pair trace lines between the driver and the receiver as well as allowing the trace lines to be close together to couple noise as common mode. Noise isolation is achieved with the LVDS signals on one side of the device and the TTL signals on the other side.

### 9.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

**Figure 20. Point-to-Point Application**

#### 9.2.1 Design Requirements

When using LVDS devices, it is important to remember to specify controlled impedance PCB traces, cable assemblies, and connectors. All components of the transmission media must have a matched differential impedance of about 100 Ω. They must not introduce major impedance discontinuities.

Balanced cables (for example, twisted pair) are usually better than unbalanced cables (ribbon cable) for noise reduction and signal quality. Balanced cables tend to generate less EMI due to field canceling effects and also tend to pick up electromagnetic radiation as common mode (not differential mode) noise which is rejected by the LVDS receiver.

For cable distances  $< 0.5$  M, most cables can be made to work effectively. For distances  $0.5 \text{ M} \leq d \leq 10 \text{ M}$ , CAT5 (Category 5) twisted pair cable works well, is readily available, and relatively inexpensive.

#### 9.2.2 Detailed Design Procedure

##### 9.2.2.1 Probing LVDS Transmission Lines

Always use high impedance ( $>100 \text{ k}\Omega$ ), low capacitance ( $<2 \text{ pF}$ ) scope probes with a wide bandwidth (1 GHz) scope. Improper probing gives deceiving results.

##### 9.2.2.2 Threshold

The LVDS Standard (ANSI/TIA/EIA-644) specifies a maximum threshold of  $\pm 100 \text{ mV}$  for the LVDS receiver. The DS90LV028A supports an enhanced threshold region of  $-100 \text{ mV}$  to  $0 \text{ V}$ . This is useful for fail-safe biasing. The threshold region is shown in the Voltage Transfer Curve (VTC) in [Figure 21](#). The typical DS90LV028A LVDS receiver switches at about  $-35 \text{ mV}$ .

### NOTE

With  $V_{ID} = 0 \text{ V}$ , the output is in a HIGH state. With an external fail-safe bias of  $25 \text{ mV}$  applied, the typical differential noise margin is now the difference from the switch point to the bias point.

**Typical Application (continued)**

In the following example, this would be 60 mV of Differential Noise Margin (25 mV – (-35 mV)). With the enhanced threshold region of -100 mV to 0 V, this small external fail-safe biasing of 25 mV (with respect to 0 V) gives a DNM of a comfortable 60 mV. With the standard threshold region of ±100 mV, the external fail-safe biasing would require 25 mV with respect to 100 mV or 125 mV, giving a DNM of 160 mV which is stronger fail-safe biasing than is necessary for the DS90LV028A. If more differential noise margin (DNM) is required, then a stronger fail-safe bias point can be set by changing resistor values.

**Figure 21. VTC of the DS90LV028A**

**9.2.3 Application Curve**

**Figure 22. Power Supply Current vs Frequency**

## 10 Power Supply Recommendations

Bypass capacitors must be used on power pins. TI recommends using high-frequency, ceramic, 0.1- $\mu$ F and 0.01- $\mu$ F capacitors in parallel at the power supply pin with the smallest value capacitor closest to the device supply pin. Additional scattered capacitors over the printed-circuit board improves decoupling. Multiple vias must be used to connect the decoupling capacitors to the power planes. A 10- $\mu$ F, 35-V (or greater) solid tantalum capacitor must be connected at the power entry point on the printed-circuit board between the supply and ground.

## 11 Layout

### 11.1 Layout Guidelines

Use at least 4 PCB board layers (top to bottom): LVDS signals, ground, power, and TTL signals.

Isolate TTL signals from LVDS signals, otherwise the TTL signals may couple onto the LVDS lines. Best practice places TTL and LVDS on different layers which are isolated by a power or ground plane(s).

Keep drivers and receivers as close to the (LVDS port side) connectors as possible.

For PC board considerations for the WSON package, please refer to [AN-1187, Leadless Leadframe Package \(SNOA401\)](#). It is important to note that to optimize signal integrity (minimize jitter and noise coupling), the WSON thermal land pad, which is a metal (normally copper) rectangular region placed under the package as seen in [Figure 23](#), must be attached to ground and match the dimensions of the exposed pad on the PCB (1:1 ratio).

#### 11.1.1 Differential Traces

Use controlled impedance traces which match the differential impedance of your transmission medium (that is, cable) and termination resistor. Run the differential pair trace lines as close together as possible as soon as they leave the IC (stubs must be <10 mm long). This helps eliminate reflections and ensure noise is coupled as common mode. In fact, we have seen that differential signals which are 1mm apart radiate far less noise than traces 3 mm apart because magnetic field cancellation is much better with the closer traces. In addition, noise induced on the differential lines is much more likely to appear as common mode which is rejected by the receiver.

Match electrical lengths between traces to reduce skew. Skew between the signals of a pair means a phase difference between signals which destroys the magnetic field cancellation benefits of differential signals and the EMI result. The velocity of propagation,  $v = c/E$ , where  $c$  (the speed of light) = 0.2997 mm/ps or 0.0118 in/ps. Do not rely solely on the autoroute function for differential traces. Carefully review dimensions to match differential impedance and provide isolation for the differential lines. Minimize the number of vias and other discontinuities on the line.

Avoid 90° turns (these cause impedance discontinuities). Use arcs or 45° bevels.

Within a pair of traces, the distance between the two traces must be minimized to maintain common mode rejection of the receivers. On the printed-circuit board, this distance must remain constant to avoid discontinuities in differential impedance. Minor violations at connection points are allowable.

#### 11.1.2 Termination

Use a termination resistor which best matches the differential impedance or your transmission line. The resistor must be between 90  $\Omega$  and 130  $\Omega$ . Remember that the current mode outputs require the termination resistor to generate the differential voltage. LVDS does not work correctly without resistor termination. Typically, connecting a single resistor across the pair at the receiver end will suffice.

Surface mount 1% to 2% resistors are the best. PCB stubs, component lead, and the distance from the termination to the receiver inputs must be minimized. The distance between the termination resistor and the receiver must be <10 mm (12 mm maximum).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 12.4 商標

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

#### 12.5 静電気放電に関する注意事項

これらのデバイスは、限定的なESD (静電破壊) 保護機能を内蔵しています。保存時または取り扱い時は、MOSゲートに対する静電破壊を防止するために、リード線同士をショートさせておくか、デバイスを導電フォームに入れる必要があります。

#### 12.6 Glossary

**SLYZ022** — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。これらの情報は、指定のデバイスに対して提供されている最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DS90LV028ATLD/NOPB	ACTIVE	WSON	NGN	8	1000	RoHS & Green	SN	Level-3-260C-168 HR	-40 to 85	LV028AT	<a href="#">Samples</a>
DS90LV028ATM	LIFEBUY	SOIC	D	8	95	Non-RoHS & Green	Call TI	Level-1-235C-UNLIM	-40 to 85	90LV028ATM

DS90LV028ATMX/NOPB	ACTIVE	SOIC	D	8	2500	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 85	90LV028ATM	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF DS90LV028A :**

4214794/A 11/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
