

- 1.6 to 2.7 Gigabits Per Second (Gbps) Serializer/Deserializer
- Hot-Plug Protection
- High-Performance 80-Pin BGA Microstar Junior™ Package (GQE)
- 2.5-V Power Supply for Low Power Operation
- Programmable Preemphasis Levels on Serial Output
- Interfaces to Backplane, Copper Cables, or Optical Converters
- On-Chip 8-bit/10-bit Encoding/Decoding, Comma Detect
- On-Chip PLL Provides Clock Synthesis From Low-Speed Reference
- Receiver Differential Input Thresholds 200 mV Minimum
- Low Power: < 500 mW
- 3 V Tolerance on Parallel Data Input Signals
- 16-Bit Parallel TTL Compatible Data Interface
- Ideal for High-Speed Backplane Interconnect and Point-to-Point Data Link
- Industrial Temperature Range (–40°C to 85°C RCP Package Only)
- Loss of Signal (LOS) Detection
- Integrated 50-Ω Termination Resistors on RX

description

The TLK2711 is a member of the *WizardLink* transceiver family of multigigabit transceivers, intended for use in ultrahigh-speed bidirectional point-to-point data transmission systems. The TLK2711 supports an effective serial interface speed of 1.6 Gbps to 2.7 Gbps, providing up to 2.16 Gbps of data bandwidth.

The primary application of this chip is to provide very high-speed I/O data channels for point-to-point baseband data transmission over controlled impedance media of approximately 50 Ω. The transmission media can be printed-circuit board, copper cables, or fiber-optic cable. The maximum rate and distance of data transfer is dependent upon the attenuation characteristics of the media and the noise coupling to the environment.

This device can also be used to replace parallel data transmission architectures by providing a reduction in the number of traces, connector terminals, and transmit/receive terminals. Parallel data loaded into the transmitter is delivered to the receiver over a serial channel, which can be a coaxial copper cable, a controlled impedance backplane, or an optical link. It is then reconstructed into its original parallel format. It offers significant power and cost savings over parallel solutions, as well as scalability for higher data rates in the future.

The TLK2711 performs data conversion parallel-to-serial and serial-to-parallel. The clock extraction functions as a physical layer interface device. The serial transceiver interface operates at a maximum speed of 2.7 Gbps. The transmitter latches 16-bit parallel data at a rate based on the supplied reference clock (TXCLK). The 16-bit parallel data is internally encoded into 20 bits using an 8-bit/10-bit (8b/10b) encoding format. The resulting 20-bit word is then transmitted differentially at 20 times the reference clock (TXCLK) rate. The receiver section performs the serial-to-parallel conversion on the input data, synchronizing the resulting 20-bit wide parallel data to the recovered clock (RXCLK). It then decodes the 20-bit wide data using the 8-bit/10-bit decoding format resulting in 16 bits of parallel data at the receive data terminals (RXD0-15). The outcome is an effective data payload of 2 Gbps to 2.5 Gbps (16 bits data x the frequency).

The TLK2711 is provided in two packages options: a 80-pin ball grid array MicroStar Junior package and a 64-pin VQFP (RCP) package.

The TLK2711 provides an internal loopback capability for self-test purposes. Serial data from the serializer is passed directly to the deserializer, providing the protocol device with a functional self-check of the physical interface.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

TLK2711

1.6 TO 2.7 GBPS TRANSCEIVER

SLLS501 – SEPTEMBER 2001

description (continued)

The TLK2711 has a loss of signal (LOS) detection circuit for conditions where the incoming signal no longer has a sufficient voltage amplitude to keep the clock recovery circuit in lock.

The TLK2711 allows users to implement redundant ports by connecting receive data bus terminals from two TLK2711 devices together. Asserting the LCKREFN to a low state will cause the receive data bus terminals, RXD[0:15], RXCLK, RKLSB, and RKMSB to go to a high-impedance state. This places the device in a transmit-only mode since the receiver is not tracking the data.

The TLK2711 uses a 2.5-V supply. The I/O section is 3 V compatible. With the 2.5-V supply the chipset is very power efficient, consuming less than 450 mW typically. The TLK2711 is characterized for operation from -40°C to 85°C (RCP only).

The TLK2711 is designed to be hot-plug capable. An on-chip power-on reset circuit holds the RXCLK low and goes to high impedance on the parallel side output signal terminals as well as TXP and TXN during power up.

block diagram

Figure 1. TLK2711 Block Diagram

Terminal Functions

TERMINAL			I/O	DESCRIPTION
NAME	NO.			
	GQE	RCP		
ENABLE	A5	24	I [†]	Device enable. When this terminal is held low, the device is placed in power-down mode. Only the signal detect circuit on the serial receive pair is active. When asserted high while the device is in power-down mode, the transceiver goes into power-on reset before beginning normal operation.
GND	A1, J1, D3, E3, F3, G3, C4, D4, E4, F4, G4, A9, J9	5, 13, 18, 28, 33, 43		Digital logic ground. Provides a ground for the logic circuits and digital I/O buffers.
GNDA	H4, H6	52, 58, 61		Analog ground. GNDA provides a ground reference for the high-speed analog circuits, RX and TX.
LCKREFN	B5	25	I [†]	Lock to reference. When LCKREFN is low, the receiver clock is frequency locked to TXCLK. This places the device in a transmit only mode since the receiver is not tracking the data. When LCKREFN is asserted low, the receive data bus terminals, RXD[0:15], RXCLK and RKLSB, RKMSB are in a high-impedance state. When LCKREFN is deasserted high, the receiver is locked to the received data stream.
LOOPEN	B6	21	I [‡]	Loop enable. When LOOPEN is active high, the internal loop-back path is activated. The transmitted serial data is directly routed internally to the inputs of the receiver. This provides a self-test capability in conjunction with the protocol device. The TXP and TXN outputs are held in a high-impedance state during the loop-back test. LOOPEN is held low during standard operational state with external serial outputs and inputs active.
PRE	J5	56	I [‡]	Preemphasis control. Selects the amount of preemphasis to be added to the high speed serial output drivers. Left low or unconnected, 5% preemphasis is added. Pulled high, 20% preemphasis is added.
PRBSEN	A4	26	I [‡]	PRBS test enable. When asserted high results of pseudo random bit stream (PRBS) tests can be monitored on the RKLSB terminal. A high on RKLSB indicates that valid PRBS is being received.
RKLSB	A3	29	O	K-Code indicator/PRBS test results. When RKLSB is asserted high, an 8-bit/10-bit K code was received and is indicated by data bits RXD0–RXD7. When RKLSB is asserted low an 8-bit/10-bit D code is received and is presented on data bits RXD0–RXD7. When PRBSEN is asserted high this pin is used to indicate status of the PRBS test results (high = pass).
RKMSB	B3	30	O	K-code indicator. When RKMSB is asserted high an 8-bit/10-bit K code was received and is indicated by data bits RXD8 –RXD15. When RKMSB is asserted low an 8-bit/10-bit D code was received and is presented on data bits RXD8 – RXD15. If the differential signal on RXN and RXP drops below 200 mV, then RXD [0:15], RKLSB, and RKMSB are all asserted high.
RXCLK RX_CLK	E2	41	O	Recovered clock. Output clock that is synchronized to RXD [0..9], RKLSB, and RKMSB. RXCLK is the recovered serial data rate clock divided by 20. RXCLK is held low during power-on reset.

detailed description

transmit interface

The transmitter portion registers valid incoming 16-bit wide data (TXD[0:15]) on the rising edge of the TXCLK. The data is then 8-bit/10-bit encoded, serialized, and transmitted sequentially over the differential high-speed I/O channel. The clock multiplier multiplies the reference clock (TXCLK) by a factor of 10 times, creating a bit clock. This internal bit clock is fed to the parallel-to-serial shift register which transmits data on both the rising and falling edges of the bit clock, providing a serial data rate that is 20 times the reference clock. Data is transmitted LSB (TXD0) first.

transmit data bus

The transmit bus interface accepts 16-bit single-ended TTL parallel data at the TXD[0:15] terminals. Data and K-code control is valid on the rising edge of the TXCLK. The TXCLK is used as the word clock. The data, K-code, and clock signals must be properly aligned as shown in Figure 2. Detailed timing information can be found in the electrical characteristics table.

Figure 2. Transmit Timing Waveform

transmission latency

The data transmission latency of the TLK2711 is defined as the delay from the initial 16-bit word load to the serial transmission of bit 0. The transmit latency is fixed once the link is established. However, due to silicon process variations and implementation variables such as supply voltage and temperature, the exact delay varies slightly. The minimum transmit latency $t_d(\text{Tx latency})$ is 34 bit times; the maximum is 38 bit times. Figure 3 illustrates the timing relationship between the transmit data bus, the TXCLK, and the serial transmit terminals.

TLK2711

1.6 TO 2.7 GBPS TRANSCEIVER

SLLS501 – SEPTEMBER 2001

detailed description (continued)

Figure 3. Transmitter Latency

8-bit/10-bit encoder

All true serial interfaces require a method of encoding to insure minimum transition density so that the receiving PLL has a minimal number of transitions to stay locked on. The encoding scheme maintains the signal dc balance by keeping the number of ones and zeros the same. This provides good transition density for clock recovery and improves error checking. The TLK2711 uses the 8-bit/10-bit encoding algorithm that is used by fibre channel and gigabit ethernet. This is transparent to the user, as the TLK2711 internally encodes and decodes the data such that the user reads and writes actual 16-bit data.

The 8-bit/10-bit encoder converts 8-bit wide data to a 10-bit wide encoded data character to improve its transmission characteristics. Since the TLK2711 is a 16-bit wide interface, the data is split into two 8-bit wide bytes for encoding. Each byte is fed into a separate encoder. The encoding is dependent upon two additional input signals, the TKMSB and TKLSB.

Table 1. Transmit Data Controls

TKLSB	TKMSB	16 BIT PARALLEL INPUT
0	0	Valid data on TXD(0-7), Valid data TXD(8-15)
0	1	Valid data on TXD(0-7), K code on TXD(8-15)
1	0	K code on TXD(0-7), Valid data on TXD(8-15)
1	1	K code on TXD(0-7), K code on TXD(8-15)

PRBS generator

The TLK2711 has a built-in 2^7-1 PRBS (pseudorandom bit stream) function. When the PRBSEN terminal is forced high, the PRBS test is enabled. A PRBS is generated and fed into the 10-bit parallel-to-serial converter input register. Data from the normal input source is ignored during the PRBS mode. The PRBS pattern is then fed through the transmit circuitry as if it were normal data and sent out to the transmitter. The output can be sent to a BERT (bit error rate tester), the receiver of another TLK2711, or looped back to the receive input. Since the PRBS is not really random but a predetermined sequence of ones and zeroes, the data can be captured and checked for errors by a BERT.

parallel-to-serial

The parallel-to-serial shift register takes in the 20-bit wide data word multiplexed from the two parallel 8-bit/10-bit encoders and converts it to a serial stream. The shift register is clocked on both the rising and falling edge of the internally generated bit clock, which is 10 times the TXCLK input frequency. The LSB (TXD0) is transmitted first.

detailed description (continued)

high-speed data output

The high-speed data output driver consists of a voltage mode logic (VML) differential pair optimized for a 50-Ω impedance environment. The magnitude of the differential pair signal swing is compatible with pseudo emitter coupled logic (PECL) levels when ac-coupled. The line can be directly-coupled or ac-coupled. Refer to Figure 11 and Figure 12 for termination details. The outputs also provide preemphasis to compensate for ac loss when driving a cable or PCB backplane trace over a long distance (see Figure 4). The level of preemphasis is controlled by PRE as shown in Table 2 .

Figure 4. Output Voltage Under Preemphasis (|VTXP–VTXN|)

Table 2. Programmable Preemphasis

PRE	PREEMPHASIS LEVEL(%) VOD(P), VOD(D) [†]
0	5%
1	20%

[†] VOD(p) : Voltage swing when there is a transition in the data stream
VOD(d): Voltage swing when there is no transition in the data stream.

receive interface

The receiver portion of the TLK2711 accepts 8-bit/10-bit encoded differential serial data. The interpolator and clock recovery circuit locks to the data stream and extract the bit rate clock. This recovered clock is used to retime the input data stream. The serial data is then aligned to two separate 10-bit word boundaries, 8-bit/10-bit decoded and output on a 16-bit wide parallel bus synchronized to the extracted receive clock. The data is received LSB (RXD0) first.

receive data bus

The receive bus interface drives 16-bit wide single-ended TTL parallel data at the RXD[0:15] terminals. Data is valid on the rising edge of the RXCLK. The RXCLK is used as the recovered word clock. The data, RKLSB, RKMSB, and clock signals are aligned as shown in Figure 5. Detailed timing information can be found in the switching characteristics table.

Figure 5. Receive Timing Waveform

TLK2711

1.6 TO 2.7 GBPS TRANSCEIVER

SLLS501 – SEPTEMBER 2001

detailed description (continued)

data reception latency

The serial-to-parallel data receive latency is the time from when the first bit arrives at the receiver until it is output in the aligned parallel word. The receive latency is fixed once the link is established. However, due to silicon process variations and implementation variables such as supply voltage and temperature, the exact delay varies slightly. The minimum receive latency $t_d(\text{Rx latency})$ is 76 bit times; the maximum is 107 bit times. Figure 6 illustrates the timing relationship between the serial receive terminals, the recovered word clock (RXCLK), and the receive data bus.

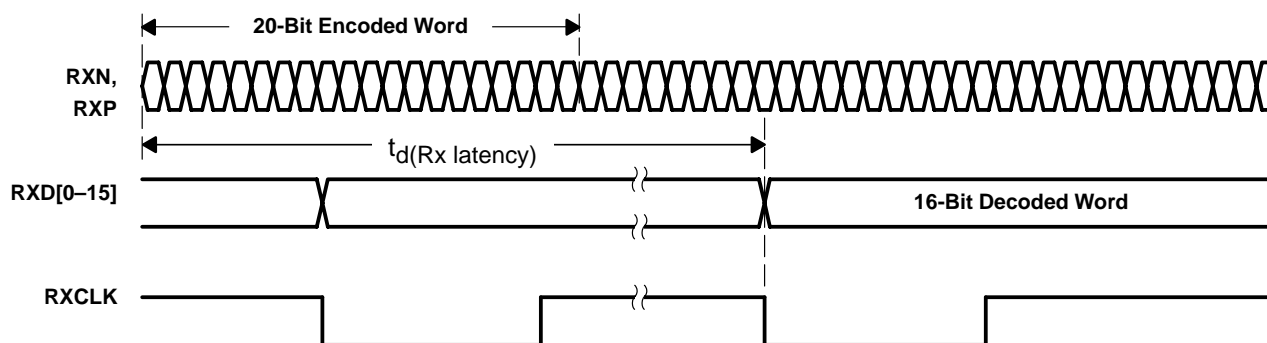

Figure 6. Receiver Latency

serial-to-parallel

Serial data is received on the RXP and RXN terminals. The interpolator and clock recovery circuit locks to the data stream if the clock to be recovered is within 200 PPM of the internally generated bit rate clock. The recovered clock is used to retiming the input data stream. The serial data is then clocked into the serial-to-parallel shift registers. The 10-bit wide parallel data is then multiplexed and fed into two separate 8-bit/10-bit decoders where the data is then synchronized to the incoming data stream word boundary by detection of the comma 8-bit/10-bit synchronization pattern.

comma detect and 8-bit/10-bit decoding

The TLK2711 has two parallel 8-bit/10-bit decode circuits. Each 8-bit/10-bit decoder converts 10 bit encoded data (half of the 20-bit received word) back into 8 bits. The comma detect circuit is designed to provide for byte synchronization to an 8-bit/10-bit transmission code. When parallel data is clocked into a parallel to serial converter, the byte boundary that was associated with the parallel data is now lost in the serialization of the data. When the serial data is received and converted to parallel format again, a method is needed to recognize the byte boundary. Generally this is accomplished through the use of a synchronization pattern. This is generally a unique pattern of 1's and 0's that either cannot occur as part of valid data or is a pattern that repeats at defined intervals. The 8-bit/10-bit encoding contains a character called the comma (b0011111 or b1100000), which is used by the comma detect circuit on the TLK2711 to align the received serial data back to its original byte boundary. The decoder detects the comma, generating a synchronization signal aligning the data to their 10-bit boundaries for decoding; the comma is mapped into the LSB. The decoder then converts the data back into 8-bit data. The output from the two decoders is latched into the 16-bit register synchronized to the recovered parallel data clock (RXCLK) and output valid on the rising edge of the RXCLK.

NOTE:

The TLK2711 only achieves byte alignment on the 0011111 comma.

comma detect and 8-bit/10-bit decoding (continued)

Decoding provides two additional status signals, RKLSB and RKMSB. When RKLSB is asserted, an 8-bit/10-bit K code was received and the specific K code is presented on the data bits RXD0–RXD7; otherwise, an 8-bit/10-bit D code was received. When RKMSB is asserted, an 8-bit/10-bit K code was received and the specific K-code is presented on data bits RXD8–RXD15; otherwise, an 8-bit/10-bit D code was received (see Table 3). The valid K codes the TLK2711 decodes are provided in Table 4. An error detected on either byte, including K codes not in Table 4, causes that byte only to indicate a K0.0 code on the RK×SB and associated data pins, where K0.0 is known to be an invalid 8-bit/10-bit code. A loss of input signal causes a K31.7 code to be presented on both bytes, where K31.7 is also known to be an invalid 8-bit/10-bit code.

Table 3. Receive Status Signals

RKLSB	RKMSB	DECODED 20 BIT OUTPUT
0	0	Valid data on RXD(0–7), Valid data RXD(8–15)
0	1	Valid data on RXD(0–7), K code on RXD(8–15)
1	0	K code on RXD(0–7), Valid data on RXD(8–15)
1	1	K code on RXD(0–7), K code on RXD(8–15)

Table 4. Valid K Characters

K CHARACTER	RECEIVE DATA BUS (RXD[7–0]) OR (RXD[15–8])
K28.0	000 11100
K28.1†	001 11100

K23.7	111 10111
K27.7	111 11011
K29.7	111 11101
K30.7	111 11110

† Should only be present on RXD[7–0] when in running disparity < 0.

power down mode

When the ENABLE pin is pulled low, the TLK2711 goes into power-down mode. In the power-down mode, the serial transmit pins (TXN), the receive data bus pins (RXD[0:15]), and RKLSB goes into a high-impedance state. In the power-down condition, the signal detection circuit draws less than 15 mW. When the TLK2711 is in the power-down mode, the clock signal on the TXCLK terminal must be provided.

loss of signal detection

The TLK2711 has a loss of signal detection circuit for conditions where the incoming signal no longer has a sufficient voltage level to keep the clock recovery circuit in lock. The signal detection circuit is intended to be an indication of gross signal error conditions, such as a detached cable or no signal being transmitted, and not an indication of signal coding health. The TLK2711 reports this condition by asserting RKLSB, RKMSB and RXD[0:15] terminals to a high state. As long as the differential signal is above 200 mV in differential magnitude, the LOS circuit does not signal an error condition.

PRBS verification

The TLK2711 also has a built-in BERT function in the receiver side that is enabled by the PRBSEN. It can check for errors and report the errors by forcing the RKLSB terminal low.

TLK2711

1.6 TO 2.7 GBPS TRANSCEIVER

SLLS501 – SEPTEMBER 2001

detailed description (continued)

reference clock input

The reference clock (TXCLK) is an external input clock that synchronizes the transmitter interface. The reference clock is then multiplied in frequency 10 times to produce the internal serialization bit clock. The internal serialization bit clock is frequency-locked to the reference clock and used to clock out the serial transmit data on both its rising and falling edges, providing a serial data rate that is 20 times the reference clock.

operating frequency range

The TLK2711 can operate at a serial data rate from 1.6 Gbps to 2.7 Gbps. To achieve these serial rates, TXCLK must be within 80 MHz to 135 MHz. The TXCLK must be within ± 100 PPM of the desired parallel data rate clock.

testability

The TLK2711 has a comprehensive suite of built-in self-tests. The loopback function provides for at-speed testing of the transmit/receive portions of the circuitry. The enable terminal allows for all circuitry to be disabled so that a quiescent current test can be performed. The PRBS function allows for BIST (built-in self-test).

loopback testing

The transceiver can provide a self-test function by enabling (LOOPEN) the internal loop-back path. Enabling this terminal causes serial-transmitted data to be routed internally to the receiver. The parallel data output can be compared to the parallel input data for functional verification. (The external differential output is held in a high-impedance state during the loopback testing.)

built-in self-test (BIST)

The TLK2711 has a BIST function. By combining PRBS with loopback, an effective self-test of all the circuitry running at full speed can be realized. The successful completion of the BIST is reported on the RKLSB terminal.

power-on reset

Upon application of minimum valid power, the TLK2711 generates a power-on reset. During the power-on reset the RXD[0..15], RKLSB, and RKMSB signal terminals go to a high-impedance state. The RXCLK is held low. The length of the power-on reset cycle is dependent upon the TXCLK frequency, but is less than 1 ms.

NOTE 1: All voltage values, except differential I/O bus voltages, are stated with respect to network ground.

DISSIPATION RATING TABLE‡

PACKAGE	θ_{JA} (°C/W)	θ_{JC} (°C/W)	$T_A = 25^\circ\text{C}$ POWER RATING
GQE	37.8	4.56	3.3 W

‡ This data was taken using 2 oz trace and copper pad that is soldered directly to a JEDEC standard 4 layer 3 in × 3 in PCB.

DISSIPATION RATING TABLE

PACKAGE	$T_A \leq 25^\circ\text{C}$ POWER RATING	DERATING FACTOR‡ ABOVE $T_A = 25^\circ\text{C}$	$T_A = 70^\circ\text{C}$ POWER RATING
RCP64§	5.25 W	46.58 mW/°C	2.89 W
RCP64¶	3.17 W	23.70 mW/°C	1.74 W
RCP64#	2.01 W	13.19 mW/°C	1.11 W

‡ This is the inverse of the traditional junction-to-ambient thermal resistance ($R_{\theta JA}$).

§ 2 oz. Trace and copper pad with solder.

¶ 2 oz. Trace and copper pad without solder.

Standard JEDEC High-K board.

For more information, refer to TI application note *PowerPAD™ Thermally Enhanced package*, TI literature number SLMA002.

electrical characteristics over recommended operating conditions

PARAMETER	TEST CONDITIONS	MIN NOM MAX			UNIT
Supply voltage, V_{DD}		2.3	2.5	2.7	V
Supply current, I_{CC}	Frequency = 1.6 Gbps, PRBS pattern	105			mA
	Frequency = 2.7 Gbps, PRBS pattern	156			
Power dissipation, P_D	Frequency = 1.6 Gbps, PRBS pattern	262			mW
	Frequency = 2.7 Gbps, PRBS pattern	390			mW
	Frequency = 2.7 Gbps, worst case pattern	550			mW
Shutdown current	Enable = 0, V_{DDA} , V_{DD} terminals, $V_{DD} = \text{MAX}$	3			mA
PLL startup lock time	V_{DD} , $V_{DDC} = 2.3$ V	0.1	0.4		ms
Data acquisition time		1024			Bits
Operating free-air temperature, T_A		–40	85		°C

|| Worst case pattern is a pattern that creates a maximum transition density on the serial transceiver.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLK2711JRGQE	OBSOLETE	BGA MICROSTAR JUNIOR	GQE	80		TBD	Call TI	Call TI	0 to 70		
TLK2711JRZQE	LIFEBUY	BGA MICROSTAR JUNIOR	ZQE	80		TBD	Call TI	Call TI	0 to 70		

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
