

# LMV3xx-N/-Q1 Single, Dual, and Quad General Purpose, Low-Voltage, Rail-to-Rail Output Operational Amplifiers

## 1 Features

- For  $V^+ = 5\text{ V}$  and  $V^- = 0\text{ V}$ , unless otherwise specified
- LMV321-N, LMV358-N, and LMV324-N are available in automotive AEC-Q100 grade 1 and grade 3 versions
- Ensured 2.7-V and 5-V performance
- No crossover distortion
- Industrial temperature range  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$
- Gain-bandwidth product 1 MHz
- Low supply current
- LMV321-N 130  $\mu\text{A}$
- LMV358-N 210  $\mu\text{A}$
- LMV324-N 410  $\mu\text{A}$
- Rail-to-rail output swing at 10 k $\Omega$   $V^+ - 10\text{ mV}$  and  $V^- + 65\text{ mV}$
- $V_{\text{CM}}$  range  $-0.2\text{ V}$  to  $V^+ - 0.8\text{ V}$

## 2 Applications

- [Active filters](#)
- General purpose low voltage applications
- [General purpose portable devices](#)

## 3 Description

The LMV358-N and LMV324-N are low-voltage (2.7 V to 5.5 V) versions of the dual and quad commodity op amps LM358 and LM324 (5 V to 30 V). The LMV321-N is the single channel version. The LMV321-N, LMV358-N, and LMV324-N are the most cost-effective solutions for applications where low-voltage operation, space efficiency, and low price are important. They offer specifications that meet or exceed the familiar LM358 and LM324. The LMV321-N, LMV358-N, and LMV324-N have rail-to-rail output swing capability and the input common-mode voltage range includes ground. They all exhibit excellent speed to power ratio, achieving 1 MHz of bandwidth and 1-V/ $\mu\text{s}$  slew rate with low supply current.

### Device Information

PART NUMBER <sup>(1)</sup>	PACKAGE	BODY SIZE (NOM)
LMV321-N	SOT-23 (5)	2.90 mm × 1.60 mm
	SC70 (5)	2.00 mm × 1.25 mm
LMV321-N-Q1	SOT-23 (5)	2.90 mm × 1.60 mm
LMV324-N	SOIC (14)	8.65 mm × 3.91 mm
	TSSOP (14)	5.00 mm × 4.40 mm
LMV324-N-Q1	SOIC (14)	8.65 mm × 3.91 mm
	TSSOP (14)	5.00 mm × 4.40 mm
LMV358-N	SOIC (8)	4.90 mm × 3.91 mm
	VSSOP (8)	3.00 mm × 3.00 mm
LMV358-N-Q1	SOIC (8)	4.90 mm × 3.91 mm
	VSSOP (8)	3.00 mm × 3.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision J (October 2014) to Revision K (August 2020)</b>	<b>Page</b>
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Added application links to <i>Applications</i> section.....	1
• Added Thermal Information table for commercial LMV3xx-N and information is updated.....	6
• Added Thermal Information table for automotive LMV3xx-N-Q1.....	6
• Changed I <sub>o</sub> , output short circuit current for LMV3xx-N in 5V DC Electrical Characteristics section.....	7
• Added open-loop output impedance vs frequency figure for LMV3xx-N in <i>Typical Characteristics</i> section.....	9
• Added output voltage vs output current figure for LMV3xx-N in <i>Typical Characteristics</i> section.....	9

---

<b>Changes from Revision I (February 2013) to Revision J (October 2014)</b>	<b>Page</b>
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1

<b>Changes from Revision H (February 2013) to Revision I (February 2013)</b>	<b>Page</b>
• Changed layout of National Semiconductor Data Sheet to TI format.....	33

## 5 Description (Continued)

The LMV321-N is available in the space saving 5-Pin SC70, which is approximately half the size of the 5-Pin SOT23. The small package saves space on PC boards and enables the design of small portable electronic devices. It also allows the designer to place the device closer to the signal source to reduce noise pickup and increase signal integrity.

The chips are built with Texas Instruments's advanced submicron silicon-gate BiCMOS process. The LMV321-N/LMV358-N/LMV324-N have bipolar input and output stages for improved noise performance and higher output current drive.

### Pin Functions

NAME	PIN			TYPE <sup>(1)</sup>	DESCRIPTION
	LMV321-N, LMV321-N-Q1, LMV321-N-Q3 DVB, DCK	LMV358-N, LMV358-N-Q1, LMV358-N-Q3 D, DGK	LMV324-N, LMV324-N-Q1, LMV324-N-Q3 D, PW		
+IN	1	—	—	I	Noninverting input
IN A+	—	3	3	I	Noninverting input, channel A
IN B+	—	5	5	I	Noninverting input, channel B
IN C+	—	—	10	I	Noninverting input, channel C
IN D+	—	—	12	I	Noninverting input, channel D
–IN	3	—	—	I	Inverting input
IN A–	—	2	2	I	Inverting input, channel A
IN B–	—	6	6	I	Inverting input, channel B
IN C–	—	—	9	I	Inverting input, channel C
IN D–	—	—	13	I	Inverting input, channel D
OUTPUT	4	—	—	O	Output
OUT A	—	1	1	O	Output, channel A
OUT B	—	7	7	O	Output, channel B
OUT C	—	—	8	O	Output, channel C
OUT D	—	—	14	O	Output, channel D
V+	5	8	4	P	Positive (highest) power supply
V–	2	4	11	P	Negative (lowest) power supply

(1) Signal Types: I = Input, O = Output, I/O = Input or Output, P = Power.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

See (1) (9).

	MIN	MAX	UNIT
Differential Input Voltage	±Supply Voltage		V
Input Voltage	-0.3	+Supply Voltage	V
Supply Voltage ( $V^+ - V^-$ )	5.5		V
Output Short Circuit to $V^+$	(2)		
Output Short Circuit to $V^-$	(3)		
Soldering Information: Infrared or Convection (30 sec)	260		°C
Junction Temperature <sup>(4)</sup>	150		°C
Storage temperature $T_{stg}$	-65	150	°C

### 7.2 ESD Ratings - Commercial

		VALUE	UNIT
LMV358-N, and LMV324-N in all packages			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Machine model	±100	
LMV321-N in all packages			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±900	V
	Machine model	±100	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 7.3 ESD Ratings - Automotive

		VALUE	UNIT
LMV358-N-Q1, LMV324-N-Q1, LMV358-N-Q3 and LMV324-N-Q3 in all packages			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V
	Machine model	±100	
LM321-N-Q1 and LM321-N-Q3 in all packages			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±900	V
	Machine model	±100	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.4 Recommended Operating Conditions

	MIN	MAX	UNIT
Supply Voltage	2.7	5.5	V
Temperature Range <sup>(4)</sup> : LMV321-N, LMV358-N, LMV324-N	-40	125	°C
Temperature Range <sup>(4)</sup> : LMV321-N-Q1, LMV358-N-Q1, LMV324-N-Q1	-40	125	°C
Temperature Range <sup>(4)</sup> : LMV321-N-Q3, LMV358-N-Q3, LMV324-N-Q3	-40	85	°C

## 7.5 Thermal Information - Commercial

## 7.7 2.7-V DC Electrical Characteristics

Unless otherwise specified, all limits specified for T<sub>J</sub> = 25°C, V<sup>+</sup> = 2.7 V, V<sup>-</sup> = 0 V, V<sub>CM</sub> = 1.0 V, V<sub>O</sub> = V<sup>+</sup>/2 and R<sub>L</sub> > 1 MΩ.

		TEST CONDITIONS	MIN <sup>(6)</sup>	TYP <sup>(5)</sup>	MAX <sup>(6)</sup>	UNIT
V <sub>OS</sub>	Input Offset Voltage			1.7	7	mV
TCV <sub>OS</sub>	Input Offset Voltage Average Drift			5		μV/°C
I <sub>B</sub>	Input Bias Current			11	250	nA
I <sub>OS</sub>	Input Offset Current			5	50	nA
CMRR	Common Mode Rejection Ratio	0 V ≤ V <sub>CM</sub> ≤ 1.7 V	50	63		dB
PSRR	Power Supply Rejection Ratio	2.7 V ≤ V <sup>+</sup> ≤ 5 V V <sub>O</sub> = 1V	50	60		dB
V <sub>CM</sub>	Input Common-Mode Voltage Range	For CMRR ≥ 50 dB	0	-0.2		V
				1.9	1.7	V
V <sub>O</sub>	Output Swing	R <sub>L</sub> = 10 kΩ to 1.35 V	V <sup>+</sup> -100	V <sup>+</sup> -10		mV
				60	180	mV
I <sub>S</sub>	Supply Current	Single		80	170	μA
		Dual Both amplifiers		140	340	μA
		Quad All four amplifiers		260	680	μA

## 7.8 2.7-V AC Electrical Characteristics

Unless otherwise specified, all limits specified for T<sub>J</sub> = 25°C, V<sup>+</sup> = 2.7 V, V<sup>-</sup> = 0 V, V<sub>CM</sub> = 1.0 V, V<sub>O</sub> = V<sup>+</sup>/2 and R<sub>L</sub> > 1 MΩ.

		TEST CONDITIONS	MIN <sup>(6)</sup>	TYP <sup>(5)</sup>	MAX <sup>(6)</sup>	UNIT
GBWP	Gain-Bandwidth Product	C <sub>L</sub> = 200 pF		1		MHz
Φ <sub>m</sub>	Phase Margin			60		Deg
G <sub>m</sub>	Gain Margin			10		dB
e <sub>n</sub>	Input-Referred Voltage Noise	f = 1 kHz		46		$\frac{nV}{\sqrt{Hz}}$
i <sub>n</sub>	Input-Referred Current Noise	f = 1 kHz		0.17		$\frac{pA}{\sqrt{Hz}}$

## 7.9 5-V DC Electrical Characteristics

Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 5\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{\text{CM}} = 2.0\text{ V}$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

		TEST CONDITIONS	MIN <sup>(6)</sup>	TYP <sup>(5)</sup>	MAX <sup>(6)</sup>	UNIT
$V_{\text{OS}}$	Input Offset Voltage			1.7	7	mV
		Over Temperature			9	
$\text{TCV}_{\text{OS}}$	Input Offset Voltage Average Drift			5		$\mu\text{V}/^\circ\text{C}$
$I_{\text{B}}$	Input Bias Current			15	250	nA
		Over Temperature			500	
$I_{\text{OS}}$	Input Offset Current			5	50	nA
		Over Temperature			150	
CMRR	Common Mode Rejection Ratio	$0\text{ V} \leq V_{\text{CM}} \leq 4\text{ V}$	50	65		dB
PSRR	Power Supply Rejection Ratio	$2.7\text{ V} \leq V^+ \leq 5\text{ V}$ $V_O = 1\text{ V}$ , $V_{\text{CM}} = 1\text{ V}$	50	60		dB
$V_{\text{CM}}$	Input Common-Mode Voltage Range	For CMRR $\geq 50\text{ dB}$	0	-0.2		V
				4.2	4	V
$A_{\text{V}}$	Large Signal Voltage Gain <sup>(7)</sup>	$R_L = 2\text{ k}\Omega$	15	100		V/mV
		$R_L = 2\text{ k}\Omega$ , Over Temperature	10			
$V_O$	Output Swing	$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$	$V^+ - 300$	$V^+ - 40$		mV
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$ , Over Temperature	$V^+ - 400$			
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$		120	300	
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$ , Over Temperature			400	
		$R_L = 10\text{ k}\Omega$ to $2.5\text{ V}$	$V^+ - 100$	$V^+ - 10$		
		$R_L = 10\text{ k}\Omega$ to $2.5\text{ V}$ , Over Temperature	$V^+ - 200$			
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$		65	180	
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$ , $125^\circ\text{C}$			280	
$I_{\text{O}}$	Output Short Circuit Current	Sourcing, $V_O = 0\text{ V}$ , LMV3xx-N	5	40		mA
		Sinking, $V_O = 5\text{ V}$ , LMV3xx-N	10	40		
		Sourcing, $V_O = 0\text{ V}$	5	60		
		Sinking, $V_O = 5\text{ V}$	10	160		
$I_{\text{S}}$	Supply Current	Single		130	250	$\mu\text{A}$
		Single, Over Temperature			350	
		Dual (both amps)		210	440	
		Dual (both amps), Over Temperature			615	
		Quad (all four amps)		410	830	
		Quad (all four amps), Over Temperature			1160	

## 7.10 5-V AC Electrical Characteristics

Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 5\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{\text{CM}} = 2.0\text{ V}$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

		TEST CONDITIONS	MIN <sup>(6)</sup>	TYP <sup>(5)</sup>	MAX <sup>(6)</sup>	UNIT
SR	Slew Rate	<sup>(8)</sup>		1		V/ $\mu\text{s}$
GBWP	Gain-Bandwidth Product	$C_L = 200\text{ pF}$		1		MHz
$\Phi_m$	Phase Margin			60		Deg
$G_m$	Gain Margin			10		dB
$e_n$	Input-Referred Voltage Noise	$f = 1\text{ kHz}$		39		$\frac{\text{nV}}{\sqrt{\text{Hz}}}$
$i_n$	Input-Referred Current Noise	$f = 1\text{ kHz}$		0.21		$\frac{\text{pA}}{\sqrt{\text{Hz}}}$

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. [Section 7.4](#) indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) Shorting output to  $V^+$  will adversely affect reliability.
- (3) Shorting output to  $V^-$  will adversely affect reliability.
- (4) The maximum power dissipation is a function of  $T_{J(\text{MAX})}$ ,  $R_{\theta\text{JA}}$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(\text{MAX})} - T_A) / R_{\theta\text{JA}}$ . All numbers apply for packages soldered directly onto a PC Board.
- (5) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (6) All limits are ensured by testing or statistical analysis.
- (7)  $R_L$  is connected to  $V^-$ . The output voltage is  $0.5\text{ V} \leq V_O \leq 4.5\text{ V}$ .
- (8) Connected as voltage follower with 3-V step input. Number specified is the slower of the positive and negative slew rates.
- (9) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office / Distributors for availability and specifications.

## 7.11 Typical Characteristics

## 8 Detailed Description

### 8.1 Overview

The LMV358-N/LMV324-N are low voltage (2.7 V to 5.5 V) versions of the dual and quad commodity op amps LM358/LM324 (5 V to 30 V). The LMV321-N is the single channel version. The LMV321-N/LMV358-N/LMV324-N are the most cost effective solutions for applications where low voltage operation, space efficiency, and low price are important. They offer specifications that meet or exceed the familiar LM358/LM324. The LMV321-N/LMV358-N/LMV324-N have rail-to-rail output swing capability and the input common-mode voltage range includes ground. They all exhibit excellent speed to power ratio, achieving 1 MHz of bandwidth and 1-V/ $\mu$ s slew rate with low supply current.

#### 8.1.1 Benefits of the LMV321-N/LMV358-N/LMV324-N

##### 8.1.1.1 Size

The small footprints of the LMV321-N/LMV358-N/LMV324-N packages save space on printed circuit boards, and enable the design of smaller electronic products, such as cellular phones, pagers, or other portable systems. The low profile of the LMV321-N/LMV358-N/LMV324-N make them possible to use in PCMCIA type III cards.

##### 8.1.1.2 Signal Integrity

Signals can pick up noise between the signal source and the amplifier. By using a physically smaller amplifier package, the LMV321-N/LMV358-N/LMV324-N can be placed closer to the signal source, reducing noise pickup and increasing signal integrity.

##### 8.1.1.3 Simplified Board Layout

These products help you to avoid using long PC traces in your PC board layout. This means that no additional components, such as capacitors and resistors, are needed to filter out the unwanted signals due to the interference between the long PC traces.

##### 8.1.1.4 Low Supply Current

These devices will help you to maximize battery life. They are ideal for battery powered systems.

##### 8.1.1.5 Low Supply Voltage

Texas Instruments provides ensured performance at 2.7 V and 5 V. These specifications ensure operation throughout the battery lifetime.

##### 8.1.1.6 Rail-to-Rail Output

Rail-to-rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating on low supply voltages.

##### 8.1.1.7 Input Includes Ground

Allows direct sensing near GND in single supply operation.

Protection should be provided to prevent the input voltages from going negative more than  $-0.3$  V (at 25°C). An input clamp diode with a resistor to the IC input terminal can be used.

##### 8.1.1.8 Ease of Use and Crossover Distortion

The LMV321-N/LMV358-N/LMV324-N offer specifications similar to the familiar LM324-N. In addition, the new LMV321-N/LMV358-N/LMV324-N effectively eliminate the output crossover distortion. The scope photos in [Figure 8-1](#) and [Figure 8-2](#) compare the output swing of the LMV324-N and the LM324-N in a voltage follower configuration, with  $V_S = \pm 2.5$  V and  $R_L (= 2$  k $\Omega)$  connected to GND. It is apparent that the crossover distortion has been eliminated in the new LMV324-N.

## 8.3 Feature Description

### 8.3.1 Capacitive Load Tolerance

The LMV321-N/LMV358-N/LMV324-N can directly drive 200 pF in unity-gain without oscillation. The unity-gain follower is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers. The combination of the amplifier's output impedance and the capacitive load induces phase lag. This results in either an underdamped pulse response or oscillation. To drive a heavier capacitive load, the circuit in [Figure 8-3](#) can be used.

Figure 8-3. Indirectly Driving a Capacitive Load Using Resistive Isolation

In [Figure 8-3](#), the isolation resistor  $R_{ISO}$  and the load capacitor  $C_L$  form a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of  $R_{ISO}$ . The bigger the  $R_{ISO}$  resistor value, the more stable  $V_{OUT}$  will be. [Figure 8-4](#) is an output waveform of [Figure 8-3](#) using 620  $\Omega$  for  $R_{ISO}$  and 510 pF for  $C_L$ .

**Figure 8-4. Pulse Response of the LMV324 Circuit in Figure 8-3**

The circuit in Figure 8-5 is an improvement to the one in Figure 8-3 because it provides DC accuracy as well as AC stability. If there were a load resistor in Figure 8-3, the output would be voltage divided by  $R_{ISO}$  and the load resistor. Instead, in Figure 8-5,  $R_F$  provides the DC accuracy by using feed-forward techniques to connect  $V_{IN}$  to  $R_L$ . Caution is needed in choosing the value of  $R_F$  due to the input bias current of the LMV321-N/LMV358-N/LMV324-N.  $C_F$  and  $R_{ISO}$  serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop. Increased capacitive drive is possible by increasing the value of  $C_F$ . This in turn will slow down the pulse response.

**Figure 8-5. Indirectly Driving A Capacitive Load With DC Accuracy**

### 8.3.2 Input Bias Current Cancellation

The LMV321-N/LMV358-N/LMV324-N family has a bipolar input stage. The typical input bias current of LMV321-N/LMV358-N/LMV324-N is 15 nA with 5V supply. Thus a 100 kΩ input resistor will cause 1.5 mV of error voltage. By balancing the resistor values at both inverting and non-inverting inputs, the error caused by the amplifier's input bias current will be reduced. The circuit in Figure 8-6 shows how to cancel the error caused by input bias current.

**Figure 8-6. Cancelling the Error Caused by Input Bias Current**

## 8.4 Device Functional Modes

The LMV321-N/LMV321-N-Q1/LMV358-N/LMV358-N-Q1/LMV324-N/LMV324-N-Q1 are powered on when the supply is connected. They can be operated as a single supply or a dual supply operational amplifier depending on the application.

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LMV32x-N family of amplifiers is specified for operation from 2.7 V to 5 V ( $\pm 1.35$  V to  $\pm 2.5$  V). Many of the specifications apply from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . They provide ground-sensing inputs as well as rail-to-rail output swing. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the *Typical Characteristics* section.

### 9.2 Typical Applications

#### 9.2.1 Simple Low-Pass Active Filter

A simple active low-pass filter is shown in [Figure 9-1](#).

Figure 9-1. Simple Low-Pass Active Filter

##### 9.2.1.1 Design Requirements

The simple single pole active lowpass filter shown in [Figure 9-1](#) will pass low frequencies and attenuate frequencies above corner frequency ( $f_c$ ) at a roll-off rate of 20 dB/Decade.

##### 9.2.1.2 Detailed Design Procedure

The values of  $R_1$ ,  $R_2$ ,  $R_3$ , and  $C_1$  are selected using the formulas in [Figure 9-2](#). The low-frequency gain ( $\omega \rightarrow 0$ ) is defined by  $-R_3/R_1$ . This allows low-frequency gains other than unity to be obtained. The filter has a  $-20$  dB/decade roll-off after its corner frequency  $f_c$ .  $R_2$  should be chosen equal to the parallel combination of  $R_1$  and  $R_3$  to minimize errors due to bias current. The frequency response of the filter is shown in [Figure 9-3](#).

$$A_L = -\frac{R_3}{R_1}$$

$$f_c = \frac{1}{2\pi R_3 C_1}$$

$$R_2 = R_1 \parallel R_3$$

Figure 9-2. Simple Low-Pass Active Filter Equations

### 9.2.1.3 Application Curves

**Figure 9-3. Frequency Response of Simple Low-Pass Active Filter**

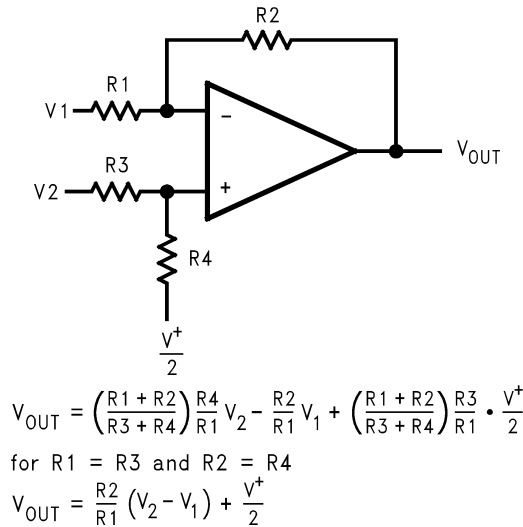

Note that the single-op-amp active filters are used in the applications that require low quality factor,  $Q (\leq 10)$ , low frequency ( $\leq 5$  kHz), and low gain ( $\leq 10$ ), or a small value for the product of gain times  $Q (\leq 100)$ . The op amp should have an open loop voltage gain at the highest frequency of interest at least 50 times larger than the gain of the filter at this frequency. In addition, the selected op amp should have a slew rate that meets the following requirement:

$$\text{Slew Rate} \geq 0.5 \times (\omega_H V_{OPP}) \times 10^{-6} \text{ V}/\mu\text{sec} \quad (1)$$

where  $\omega_H$  is the highest frequency of interest, and  $V_{OPP}$  is the output peak-to-peak voltage.

### 9.2.2 Difference Amplifier

The difference amplifier allows the subtraction of two voltages or, as a special case, the cancellation of a signal common to two inputs. It is useful as a computational amplifier, in making a differential to single-ended conversion or in rejecting a common mode signal.

**Figure 9-4. Difference Amplifier**

### 9.2.3 Instrumentation Circuits

The input impedance of the previous difference amplifier is set by the resistors  $R_1$ ,  $R_2$ ,  $R_3$ , and  $R_4$ . To eliminate the problems of low input impedance, one way is to use a voltage follower ahead of each input as shown in the following two instrumentation amplifiers.

#### 9.2.3.1 Three-Op-Amp Instrumentation Amplifier

The quad LMV324 can be used to build a three-op-amp instrumentation amplifier as shown in [Figure 9-5](#).

Figure 9-5. Three-Op-Amp Instrumentation Amplifier

The first stage of this instrumentation amplifier is a differential-input, differential-output amplifier, with two voltage followers. These two voltage followers assure that the input impedance is over 100 MΩ. The gain of this instrumentation amplifier is set by the ratio of  $R_2/R_1$ .  $R_3$  should equal  $R_1$ , and  $R_4$  should equal  $R_2$ . Matching of  $R_3$  to  $R_1$ , and  $R_4$  to  $R_2$  affects the CMRR. For good CMRR over temperature, low drift resistors should be used. Making  $R_4$  slightly smaller than  $R_2$  and adding a trim pot equal to twice the difference between  $R_2$  and  $R_4$  will allow the CMRR to be adjusted for optimum performance.

### 9.2.3.2 Two-Op-Amp Instrumentation Amplifier

A two-op-amp instrumentation amplifier can also be used to make a high-input-impedance DC differential amplifier (Figure 9-6). As in the three-op-amp circuit, this instrumentation amplifier requires precise resistor matching for good CMRR.  $R_4$  should equal  $R_1$ , and  $R_3$  should equal  $R_2$ .

$$V_o = \left(1 + \frac{R_4}{R_3}\right)(V_2 - V_1), \text{ where } R_1 = R_4 \text{ and } R_2 = R_3$$

$$\text{As shown: } V_o = 2(V_2 - V_1)$$

Figure 9-6. Two-Op-Amp Instrumentation Amplifier

### 9.2.3.3 Single-Supply Inverting Amplifier

There may be cases where the input signal going into the amplifier is negative. Because the amplifier is operating in single supply voltage, a voltage divider using  $R_3$  and  $R_4$  is implemented to bias the amplifier so the input signal is within the input common-mode voltage range of the amplifier. The capacitor  $C_1$  is placed between the inverting input and resistor  $R_1$  to block the DC signal going into the AC signal source,  $V_{IN}$ . The values of  $R_1$  and  $C_1$  affect the cutoff frequency,  $f_c = 1 / 2\pi R_1 C_1$ .

As a result, the output signal is centered around mid-supply (if the voltage divider provides  $V^+ / 2$  at the non-inverting input). The output can swing to both rails, maximizing the signal-to-noise ratio in a low voltage system.

Figure 9-7. Single-Supply Inverting Amplifier

### 9.2.4 Sallen-Key 2nd-Order Active Low-Pass Filter

The Sallen-Key 2nd-order active low-pass filter is illustrated in Figure 9-8. The DC gain of the filter is expressed as:

$$A_{LP} = \frac{R_3}{R_4} + 1 \quad (2)$$

The transfer function is:

$$\frac{V_{OUT}}{V_{IN}}(S) = \frac{\frac{1}{C_1 C_2 R_1 R_2} A_{LP}}{S^2 + S \left( \frac{1}{C_1 R_1} + \frac{1}{C_1 R_2} + \frac{1}{C_2 R_2} - \frac{A_{LP}}{C_2 R_2} \right) + \frac{1}{C_1 C_2 R_1 R_2}} \quad (3)$$

Figure 9-8. Sallen-Key 2nd-Order Active Low-Pass Filter

### 9.2.4.1 Detailed Design Procedure

The following paragraphs explain how to select values for  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $C_1$ , and  $C_2$  for given filter requirements, such as  $A_{LP}$ ,  $Q$ , and  $f_c$ .

The standard form for a 2nd-order low pass filter is:

$$\frac{V_{OUT}}{V_{IN}}(S) = \frac{A_{LP} \omega_c^2}{S^2 + \left(\frac{\omega_c}{Q}\right)S + \omega_c^2} \quad (4)$$

where

$Q$ : Pole Quality Factor

$\omega_c$ : Corner Frequency

A comparison between [Equation 3](#) and [Equation 4](#) yields:

$$\omega_c^2 = \frac{1}{C_1 C_2 R_1 R_2} \quad (5)$$

$$\frac{\omega_c}{Q} = \frac{1}{C_1 R_1} + \frac{1}{C_1 R_2} + \frac{1}{C_2 R_2} - \frac{A_{LP}}{C_2 R_2} \quad (6)$$

To reduce the required calculations in filter design, it is convenient to introduce normalization into the components and design parameters. To normalize, let  $\omega_c = \omega_n = 1$  rad/s, and  $C_1 = C_2 = C_n = 1$ F, and substitute these values into [Equation 5](#) and [Equation 6](#). From [Equation 5](#), we obtain:

$$R_1 = \frac{1}{R_2} \quad (7)$$

From [Equation 6](#), we obtain:

$$R_2 = \frac{1 \pm \sqrt{1 - 4Q^2(2 - A_{LP})}}{2Q} \quad (8)$$

For minimum DC offset,  $V^+ = V^-$ , the resistor values at both inverting and non-inverting inputs should be equal, which means:

$$R_1 + R_2 = \frac{R_3 R_4}{R_3 + R_4} \quad (9)$$

From [Equation 2](#) and [Equation 9](#), we obtain:

$$R_3 = (R_1 + R_2)A_{LP} \quad (10)$$

$$R_4 = \left(\frac{A_{LP}}{A_{LP} - 1}\right)(R_1 + R_2) \quad (11)$$

The values of  $C_1$  and  $C_2$  are normally close to or equal to:

$$C = \frac{10}{f_c} \mu\text{F} \quad (12)$$

As a design example:

Require:  $A_{LP} = 2$ ,  $Q = 1$ ,  $f_c = 1$  kHz

Start by selecting  $C_1$  and  $C_2$ . Choose a standard value that is close to:

$$C = \frac{10}{f_c} \mu\text{F} \quad (13)$$

$$C_1 = C_2 = \frac{10}{1 \times 10^3} \mu\text{F} = 0.01 \mu\text{F} \quad (14)$$

From [Equation 7](#), [Equation 8](#), [Equation 10](#), and [Equation 11](#),

$$R_1 = 1 \Omega \quad (15)$$

$$R_2 = 1 \Omega \quad (16)$$

$$R_3 = 4 \Omega \quad (17)$$

$$R_4 = 4 \Omega \quad (18)$$

The above resistor values are normalized values with  $\omega_n = 1$  rad/s and  $C_1 = C_2 = C_n = 1$ F. To scale the normalized cutoff frequency and resistances to the real values, two scaling factors are introduced, frequency scaling factor ( $k_f$ ) and impedance scaling factor ( $k_m$ ).

$$k_f = \frac{\omega_c}{\omega_n} = \frac{2\pi \times 1 \times 10^3}{1} = 2\pi \times 10^3$$

$$k_m k_f = \frac{C_n}{C_1}$$

$$k_m = 1.59 \times 10^4 \quad (19)$$

Scaled values:

$$R_2 = R_1 = 15.9 \text{ k}\Omega \quad (20)$$

$$R_3 = R_4 = 63.6 \text{ k}\Omega \quad (21)$$

$$C_1 = C_2 = 0.01 \mu\text{F} \quad (22)$$

An adjustment to the scaling may be made in order to have realistic values for resistors and capacitors. The actual value used for each component is shown in the circuit.

### 9.2.5 2nd-Order High Pass Filter

A 2nd-order high pass filter can be built by simply interchanging those frequency selective components ( $R_1$ ,  $R_2$ ,  $C_1$ ,  $C_2$ ) in the Sallen-Key 2nd-order active low pass filter. As shown in [Figure 9-9](#), resistors become capacitors, and capacitors become resistors. The resulted high pass filter has the same corner frequency and the same maximum gain as the previous 2nd-order low pass filter if the same components are chosen.

Figure 9-9. Sallen-Key 2nd-Order Active High-Pass Filter

### 9.2.6 State Variable Filter

A state variable filter requires three op amps. One convenient way to build state variable filters is with a quad op amp, such as the LMV324 (Figure 9-10).

This circuit can simultaneously represent a low-pass filter, high-pass filter, and bandpass filter at three different outputs. The equations for these functions are listed below. It is also called "Bi-Quad" active filter as it can produce a transfer function which is quadratic in both numerator and denominator.

Figure 9-10. State Variable Active Filter

$$V_{LP} = \left( \frac{2R_3}{R_2 + R_3} \right) \frac{\frac{1}{R^2 C^2}}{S^2 + \frac{1}{\left( \frac{R_2 + R_3}{2R_2} \right) RC} S + \frac{1}{R^2 C^2}} V_{IN}$$

$$V_{HP} = \left( \frac{2R_3}{R_2 + R_3} \right) \frac{S^2}{S^2 + \frac{1}{\left( \frac{R_2 + R_3}{2R_2} \right) RC} S + \frac{1}{R^2 C^2}} V_{IN}$$

$$V_{BP} = \left( \frac{2R_3}{R_2 + R_3} \right) \frac{\left( \frac{1}{RC} \right) S}{S^2 + \frac{1}{\left( \frac{R_2 + R_3}{2R_2} \right) RC} S + \frac{1}{R^2 C^2}} V_{IN} \tag{23}$$

where for all three filters,

$$Q = \frac{R_2 + R_3}{2R_2} \tag{24}$$

$$\omega_0 = \frac{1}{RC} \quad (\text{resonant frequency}) \tag{25}$$

### 9.2.6.1 Detailed Design Procedure

Assume the system design requires a bandpass filter with  $f_0 = 1$  kHz and  $Q = 50$ . What needs to be calculated are capacitor and resistor values.

First choose convenient values for  $C_1$ ,  $R_1$ , and  $R_2$ :

$$C_1 = 1200 \text{ pF} \tag{26}$$

$$2R_2 = R_1 = 30 \text{ k}\Omega \tag{27}$$

Then from [Equation 24](#),

$$\begin{aligned} R_3 &= R_2(2Q-1) \\ R_3 &= 15 \text{ k}\Omega \times (2 \times 50 - 1) \\ &= 1.5 \text{ M}\Omega \end{aligned} \tag{28}$$

From [Equation 25](#),

$$\begin{aligned} R &= \frac{1}{\omega_0 C_1} \\ R &= \frac{1}{(2\pi \times 10^3)(1.2 \times 10^{-9})} \\ &= 132.7 \text{ k}\Omega \end{aligned} \tag{29}$$

From the above calculated values, the midband gain is  $H_0 = R_3 / R_2 = 100$  (40 dB). The nearest 5% standard values have been added to [Figure 9-10](#).

### 9.2.7 Pulse Generators and Oscillators

A pulse generator is shown in [Figure 9-11](#). Two diodes have been used to separate the charge and discharge paths to capacitor C.

**Figure 9-11. Pulse Generator**

When the output voltage  $V_O$  is first at its high,  $V_{OH}$ , the capacitor C is charged toward  $V_{OH}$  through  $R_2$ . The voltage across C rises exponentially with a time constant  $\tau = R_2C$ , and this voltage is applied to the inverting input of the op amp. Meanwhile, the voltage at the non-inverting input is set at the positive threshold voltage ( $V_{TH+}$ ) of the generator. The capacitor voltage continually increases until it reaches  $V_{TH+}$ , at which point the output of the generator will switch to its low,  $V_{OL}$  which 0 V is in this case. The voltage at the non-inverting input is switched to the negative threshold voltage ( $V_{TH-}$ ) of the generator. The capacitor then starts to discharge toward  $V_{OL}$  exponentially through  $R_1$ , with a time constant  $\tau = R_1C$ . When the capacitor voltage reaches  $V_{TH-}$ , the output of the pulse generator switches to  $V_{OH}$ . The capacitor starts to charge, and the cycle repeats itself.

**Figure 9-12. Waveforms of the Circuit in Figure 9-11**

As shown in the waveforms in Figure 9-12, the pulse width ( $T_1$ ) is set by  $R_2$ ,  $C$  and  $V_{OH}$ , and the time between pulses ( $T_2$ ) is set by  $R_1$ ,  $C$  and  $V_{OL}$ . This pulse generator can be made to have different frequencies and pulse width by selecting different capacitor value and resistor values.

Figure 9-13 shows another pulse generator, with separate charge and discharge paths. The capacitor is charged through  $R_1$  and is discharged through  $R_2$ .

**Figure 9-13. Pulse Generator**

Figure 9-14 is a squarewave generator with the same path for charging and discharging the capacitor.

**Figure 9-14. Squarewave Generator**

### 9.2.8 Current Source and Sink

The LMV321-N/LMV358-N/LMV324-N can be used in feedback loops which regulate the current in external PNP transistors to provide current sources or in external NPN transistors to provide current sinks.

#### 9.2.8.1 Fixed Current Source

A multiple fixed current source is shown in Figure 9-15. A voltage ( $V_{REF} = 2\text{ V}$ ) is established across resistor  $R_3$  by the voltage divider ( $R_3$  and  $R_4$ ). Negative feedback is used to cause the voltage drop across  $R_1$  to be equal to  $V_{REF}$ . This controls the emitter current of transistor  $Q_1$  and if we neglect the base current of  $Q_1$  and  $Q_2$ , essentially this same current is available out of the collector of  $Q_1$ .

Large input resistors can be used to reduce current loss and a Darlington connection can be used to reduce errors due to the  $\beta$  of  $Q_1$ .

The resistor,  $R_2$ , can be used to scale the collector current of  $Q_2$  either above or below the 1 mA reference value.

**Figure 9-15. Fixed Current Source**

### 9.2.8.2 High Compliance Current Sink

A current sink circuit is shown in [Figure 9-16](#). The circuit requires only one resistor ( $R_E$ ) and supplies an output current which is directly proportional to this resistor value.

Figure 9-16. High Compliance Current Sink

### 9.2.9 Power Amplifier

A power amplifier is illustrated in [Figure 9-17](#). This circuit can provide a higher output current because a transistor follower is added to the output of the op amp.

**Figure 9-17. Power Amplifier**

### 9.2.10 LED Driver

The LMV321-N/LMV358-N/LMV324-N can be used to drive an LED as shown in [Figure 9-18](#).

**Figure 9-18. LED Driver**

### 9.2.11 Comparator With Hysteresis

The LMV321-N/LMV358-N/LMV324-N can be used as a low power comparator. [Figure 9-19](#) shows a comparator with hysteresis. The hysteresis is determined by the ratio of the two resistors.

$$V_{TH+} = V_{REF} / (1 + R_1 / R_2) + V_{OH} / (1 + R_2 / R_1) \quad (30)$$

$$V_{TH-} = V_{REF} / (1 + R_1 / R_2) + V_{OL} / (1 + R_2 / R_1) \quad (31)$$

$$V_H = (V_{OH} - V_{OL}) / (1 + R_2 / R_1) \quad (32)$$

where

$V_{TH+}$ : Positive Threshold Voltage

$V_{TH-}$ : Negative Threshold Voltage

$V_{OH}$ : Output Voltage at High

$V_{OL}$ : Output Voltage at Low

$V_H$ : Hysteresis Voltage

Since LMV321-N/LMV358-N/LMV324-N have rail-to-rail output, the  $(V_{OH}-V_{OL})$  is equal to  $V_S$ , which is the supply voltage.

$$V_H = V_S / (1 + R_2 / R_1) \quad (33)$$

The differential voltage at the input of the op amp should not exceed the specified absolute maximum ratings. For real comparators that are much faster, we recommend you use Texas Instruments' LMV331/LMV93/LMV339, which are single, dual and quad general purpose comparators for low voltage operation.

Figure 9-19. Comparator With Hysteresis

## 10 Power Supply Recommendations

The LMV3xx-N is specified for operation from 2.7 V to 5.5 V; many specifications apply from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Typical Characteristics](#) section.

Place 0.1- $\mu\text{F}$  bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high impedance power supplies. For more detailed information on bypass capacitor placement, refer to the [Layout Guidelines](#) section.

## 11 Layout

### 11.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1- $\mu\text{F}$  ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from  $V+$  to ground is applicable for single supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep them separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping  $R_F$  and  $R_G$  close to the inverting input minimizes parasitic capacitance, as shown in the [Layout Example](#) section.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

## 11.2 Layout Example

**Figure 11-1. Operational Amplifier Board Layout for Noninverting Configuration**

### 12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
 All other trademarks are the property of their respective owners.

### 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. (1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF LMV321-N, LMV321-N-Q1, LMV324-N, LMV324-N-Q1, LMV358-N, LMV358-N-Q1 :**

● Catalog : [LMV321-N](#), [LMV324-N](#), [LMV358-N](#)

● Automotive : [LMV321-N-Q1](#), [LMV324-N-Q1](#), [LMV358-N-Q1](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214839/J 02/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214839/J 02/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4040047-5/M 06/11

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - $\triangle C$  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
  - $\triangle D$  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
  - E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4211284-2/G 08/15

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D0008A

# PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

### NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed  $.006$  [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.

# EXAMPLE BOARD LAYOUT

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE  
 EXPOSED METAL SHOWN  
 SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE  
BASED ON .005 INCH [0.125 MM] THICK STENCIL  
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
