

TPS22996H-Q1 5.5V, 4A, 13mΩ On-Resistance Dual-Channel Automotive Load Switch

1 Features

- Integrated dual-channel load switch
- Input voltage range: 0.6V to V_{BIAS}
- V_{BIAS} voltage range: 2.5V to 5.5V
- ON-Resistance
 - $R_{ON} = 13m\Omega$ (typical) at $V_{IN} = 0.6V$ to 5V, $V_{BIAS} = 5V$
- 4A⁽¹⁾ maximum continuous switch current per channel
- Quiescent current:
 - 18μA (typical, both channels) at $V_{IN} = V_{BIAS} = 5V$
 - 13μA (typical, single channel) at $V_{IN} = V_{BIAS} = 5V$
- Humidity resistant:
 - Device keeps functionality (ON, OFF, protection), but timing specification is affected under the following conditions:
 - 100kΩ short to GND
 - 100kΩ short to power
- Control input threshold enables use of 1.2V, 1.8V, 2.5V, and 3.3V logic
- Configurable rise time
- Thermal shutdown
- Quick output discharge (QOD)

(1) For the pre-production units, only 3A of max continuous current per channel is supported. The full released version will support 4A max continuous current per channel.

2 Applications

- Infotainment
- Cluster
- ADAS

3 Description

TPS22996H-Q1 is a dual-channel load switch with controlled turnon. The device contains two N-channel MOSFETs that can operate over an input voltage range of 0.6V to 5.5V, and can support a maximum continuous current of 4A per channel. Each switch is independently controlled by an on and off input (ON1 and ON2), which can interface directly with low-voltage control signals. The device is capable of thermal shutdown when the junction temperature is above the threshold, turning the switch off. The switch turns on again when the junction temperature stabilizes to a safe range. The device also offers an integrated 230Ω on-chip load resistor for quick output discharge when the switch is turned off.

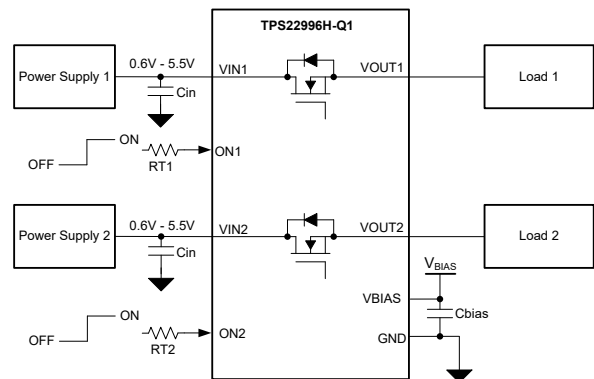

The pins of the TPS22996H-Q1 are resistant to high humidity conditions, meaning that the device is able to function with a 100kΩ short from any pin to GND or power.

The TPS22996H-Q1 is available in a small, space-saving 2.1mm × 1.2mm 8-DYC package. The device is characterized for operation over the free-air temperature range of -40°C to 125°C.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
TPS22996H	DYC (SOT, 8)	2.1mm × 1.2mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
 (2) The package size (length × width) is a nominal value and includes pins, where applicable.

4 Pin Configuration and Functions

Figure 4-1. DYC Package, 8-Pin SOT (Top View)

Table 4-1. Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	ON1	Input	Active-high switch 1 control input. Connect series resistor to set Slew Rate. Do not leave floating. See Section 7.3.7 for more information.
2	VIN1	Input	Switch 1 input. Recommended voltage range for these pins for optimal R_{ON} performance is 0.6V to V_{BIAS} . Place an optional decoupling capacitor between these pins and GND to reduce V_{IN1} dip during turnon of the channel. See Section 8.2 for more information.
3	VIN2	Input	Switch 2 input. Recommended voltage range for these pins for optimal R_{ON} performance is 0.6V to V_{BIAS} . Place an optional decoupling capacitor between these pins and GND to reduce V_{IN2} dip during turnon of the channel. See Section 8.2 for more information.
4	ON2	Input	Active-high switch 2 control input. Connect series resistor to set slew rate. Do not leave floating. See Section 7.3.7 for more information.
5	GND	—	Device ground.
6	VOUT2	Output	Switch 2 output.
7	VOUT1	Output	Switch 1 output.
8	VBIAS	Input	Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2.5V to 5.5V. See Section 8.1 .

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{IN1,2}	Input voltage	−0.3	6	V
V _{OUT1,2}	Output voltage	−0.3	6	V
V _{ON1,2}	ON pin voltage	−0.3	6	V
V _{BIAS}	Bias voltage	−0.3	6	V
I _{MAX}	Maximum continuous current per channel		4 ⁽²⁾	A
I _{MAX,PLS}	Maximum pulsed current switch per channel, pulse < 300μs, 3% duty cycle		5.5	A
T _J	Junction temperature		150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For the pre-production units, only 3A of max continuous current per channel is supported. The full released version will support 4A maximum continuous current per channel.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, VIN1,VIN2,VOUT1,VOUT2 pins ⁽²⁾	±500	
		Charged device model (CDM), per JEDEC specification JESD22-C101, ON1,ON2,VBIAS ⁽²⁾	±750	V

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN1,2}	Input voltage	0.6		V _{BIAS}	V
V _{BIAS}	Bias voltage	2.5		5.5	V
V _{ON1,2}	ON pin voltage	0		5.5	V
V _{OUT1,2}	Output voltage	0		V _{IN}	V
V _{IH}	High-level input voltage, ON	1.2		5.5	V
V _{IL}	Low-level input voltage, ON	0		0.5	V
T _A	Ambient temperature	−40		125	°C

6 Parameter Measurement Information

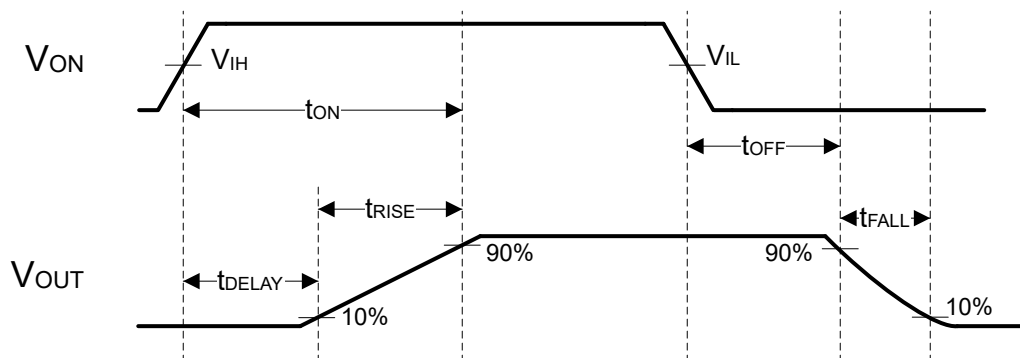

Figure 6-1. t_{ON} and t_{OFF} Waveforms

7 Detailed Description

7.1 Overview

The TPS22996H-Q1 is a 5.5V, dual-channel, 13m Ω (typical) R_{ON} load switch in a 8-pin DYC package. Each channel can support a maximum continuous current of 4A and is controlled by an on and off GPIO-compatible input. To reduce the voltage drop in high current rails, the device implements N-channel MOSFETs. Note that the ON pins must be connected and cannot be left floating. The device has a configurable slew rate for applications that require specific rise-time, which controls the inrush current. By controlling the inrush current, power supply sag can be reduced during turnon. Furthermore, the slew rate is proportional to the series resistor used on the ONx pin. See [Section 7.3.7](#) to determine the correct resistor value for a desired rise time.

The internal circuitry is powered by the V_{BIAS} pin, which supports voltages from 2.5V to 5.5V. This circuitry includes the charge pump, QOD, and control logic. When a voltage is applied to V_{BIAS} , and the ON_{1,2} pins transition to a low state, the QOD functionality is activated. This connects V_{OUT1} and V_{OUT2} to ground through the on-chip resistor. The typical pulldown resistance (R_{PD}) is 230 Ω .

During the off state, the device prevents downstream circuits from pulling high standby current from the supply. The integrated control logic, driver, power supply, and output discharge FET eliminates the need for any external components, reducing solution size and bill of materials (BOM) count.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 ON and OFF Control

The ON pins control the state of the switch. Asserting ON high enables the switch. ON is active high with a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2V or higher GPIO voltage. This pin cannot be left floating and must be tied either high or low for proper functionality.

7.3.2 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor needs to be placed between VIN and GND. A 1µF ceramic capacitor, C_{IN} ,

placed close to the pins is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current application. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

7.3.3 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, a C_{IN} greater than C_L is highly recommended. A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from V_{OUT} to V_{IN} . A C_{IN} to C_L ratio of 10 to 1 is recommended for minimizing V_{IN} dip caused by inrush currents during startup, however a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) could cause slightly more V_{IN} dip upon turnon due to inrush currents. This can be mitigated by increasing the capacitance on the CT pin for a longer rise time (see [Section 7.3.7](#)).

7.3.4 Quick Output Discharge

When the switch is disabled, an internal discharge resistance is connected between V_{OUT} and GND to remove the remaining charge from the output. This resistance prevents the output from floating while the switch is disabled. For best results, it is recommended that the device gets disabled before V_{BIAS} falls below the minimum recommended voltage.

7.3.5 Humidity Resistance

TPS22996H-Q1 is designed to be resistant to humidity, which is replicated by 100k Ω short between any pin to either GND or power. Under such humidity conditions, our device is able to function correctly with ON, OFF and thermal shutdown. However, the timing parameter will be affected by the short condition, and will deviate from the typical value listed in the Electrical Characteristic table (see [Section 5.5](#)).

7.3.6 Thermal Shutdown

Thermal shutdown protects the part from internally or externally generated excessive temperatures. When the device temperature exceeds T_{SD} , the switch is turned off. The switch automatically turns on again if the temperature of the die drops $T_{SD,HYS}$ below the T_{SD} threshold.

7.3.7 Adjustable Rise Time

TPS22996H-Q1 integrates a unique architecture for adjusting the rise time. The device senses the current flowing into the ON1 and ON2 (I_{ON}) pins and utilizes the information to set the rise time. This allows the user to adjust the rise time by connecting a series resistance that is determined by the ON pin voltage. Refer to [Table 7-1](#) for reference on setting the resistor.

Table 7-1. Typical Rise Time ($V_{BIAS} = 5V$)

I_{ON}	$V_{IN} = 0.6V$	$V_{IN} = 1.8V$	$V_{IN} = 2.5V$	$V_{IN} = 3.3V$	$V_{IN} = 5V$
20 μA	764 μs	1380 μs	1700 μs	1955 μs	2350 μs
100 μA	203 μs	343 μs	426 μs	500 μs	626 μs
250 μA	85 μs	148 μs	180 μs	208 μs	265 μs

Table 7-2. Typical Rise Time ($V_{BIAS} = 3.3V$)

I_{ON}	$V_{IN} = 0.6V$	$V_{IN} = 1.8V$	$V_{IN} = 2.5V$	$V_{IN} = 3.3V$
20 μA	738 μs	1420 μs	1735 μs	2040 μs
100 μA	191 μs	360 μs	437 μs	512 μs
250 μA	88 μs	239 μs	170 μs	204 μs

The following equation can be used to estimate the series resistance required to meet the desired rise time.

$$R_{TX} = 1000 \times (V_{ONx_GPIO} - 1.2V) / I_{ONx} - R_i \quad (1)$$

where:

- R_{TX} = Channel \times series resistance in $k\Omega$.
- R_i = Internal ON pin resistance $k\Omega$.
- V_{ONx_GPIO} = Channel \times GPIO voltage connected to ONx pin in V.
- I_{ONx} = Current flowing into the ONx pin in μA .

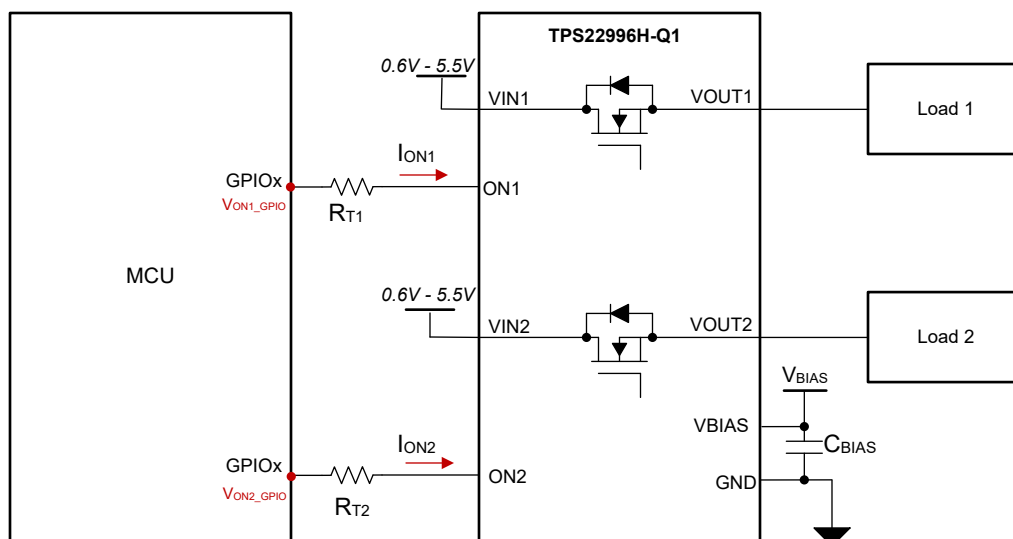

Figure 7-1. TPS22996H-Q1 Adjustable Rise Time Configuration

7.4 Device Functional Modes

Table 7-3 lists the TPS22996H-Q1 functions.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

This section highlights some of the design considerations for implementing the device in various applications.

8.2 Typical Application

This application demonstrates how the TPS22996H-Q1 can be used to limit the inrush current when powering on downstream modules.

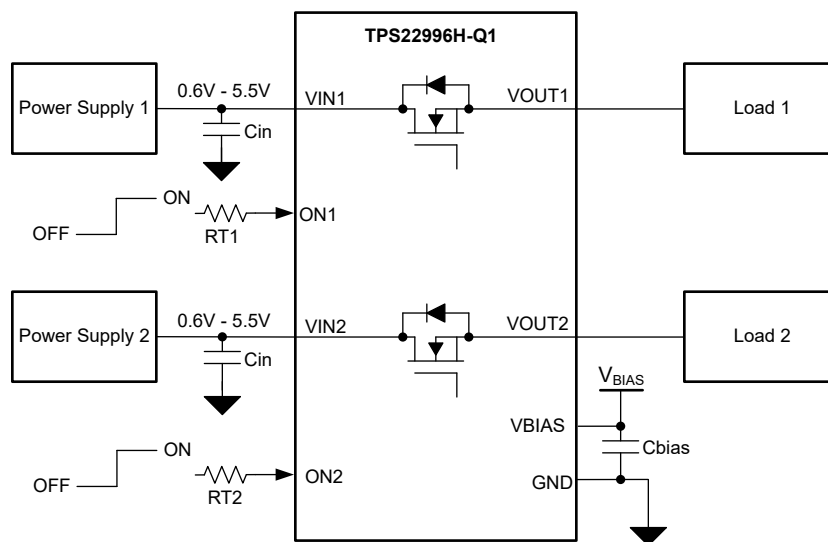

Figure 8-1. Typical Application Circuit

Table 8-1. Component Descriptions

DESIGN PARAMETER	TYPICAL VALUES	DESCRIPTION
C _{IN}	1μF	Filtering voltage transients
C _{OUT}	100nF	Filtering voltage transients
C _{BIAS}	0.1μF	Filtering voltage transients
RT1, RT2	10kΩ	Series resistor for rise time control

8.2.1 Design Requirements

Table 8-2 shows the TPS22996H-Q1 design parameters.

Table 8-2. Design Parameters

DESIGN PARAMETER	VALUE
V_{BIAS}	5V
V_{IN}	5V
Rise Time	1000 μ s

8.2.2 Detailed Design Procedure

The design in this example is trying to achieve 1000µs rise time for power sequencing, with both V_{BIAS} and V_{IN} to be 5V. From [Table 7-1](#), the I_{ON} needs to be between 20µA and 100µA. To find the I_{ON} needed to achieve 1000µs rise time, linear interpolation can be used to estimate as below:

$$T_R = (T_{R2} - T_{R1}) / (I_{ON2} - I_{ON1}) * (I_{ON} - I_{ON1}) + T_{R1} \quad (2)$$

where:

- T_R is the desired T_R , which is 1000µs
- I_{ON} is the desired I_{ON}
- T_{R1} is the first T_R used for linear interpolation, which is 2350µs
- T_{R2} is the second T_R used for linear interpolation, which is 626µs
- I_{ON1} is the first I_{ON} used for linear interpolation, which is 20µA
- I_{ON2} is the second I_{ON} used for linear interpolation, which is 100µA

I_{ON} is calculated to be 82.6µA. To find the R_T value, plug in the parameters in [Equation 1](#).

$$R_T = 1000 \times (5V - 1.2V) / 82.6\mu A - 12.5k\Omega = 33.5k\Omega$$

By using the standard resistor value closest to 33.5kΩ, the typical rise time can be calculated for the actual resistor value used on board.

8.3 Power Supply Recommendations

The device is designed to operate from a V_{BIAS} range of 2.5V to 5.5V and a V_{IN} range of 0.6V to V_{BIAS} .

8.4 Layout

8.4.1 Layout Guidelines

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal operation. Using wide traces for V_{IN} , V_{OUT} , and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

8.4.2 Layout Example

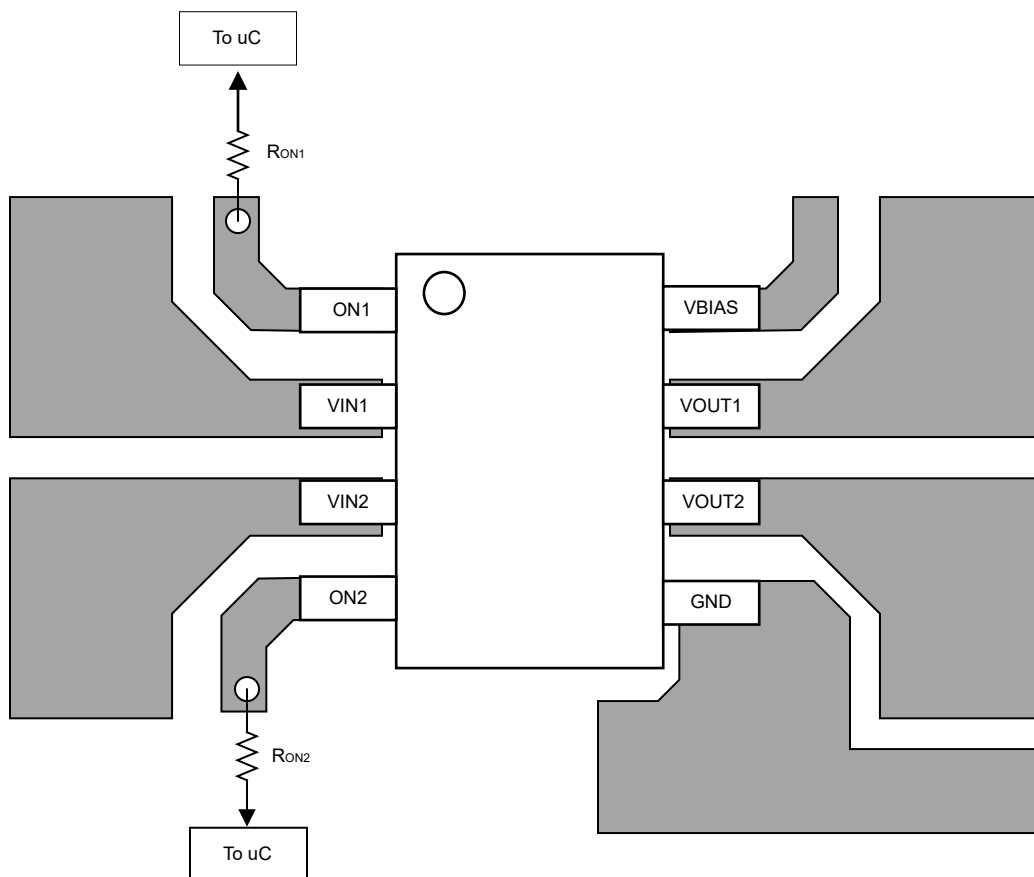

Figure 8-2. TPS22996H Layout Example

8.4.3 Power Dissipation

The maximum IC junction temperature must be restricted to 150°C under normal operating conditions. To calculate the maximum allowable power dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use [Equation 3](#).

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{\theta_{JA}} \quad (3)$$

where

- $P_{D(max)}$ is the maximum allowable power dissipation.
- $T_{J(max)}$ is the maximum allowable junction temperature (150°C for the TPS22996H).

- T_A is the ambient temperature of the device.
- θ_{JA} is the junction to air thermal impedance. See [Section 5.4](#). This parameter is highly dependent upon board layout.

9 Device and Documentation Support

9.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.5 Glossary

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4224486/E 12/2021

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, interlead flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC Registration MO-293, Variation UDAD
