SLUS191D – FEBRUARY 1997 – REVISED JULY 2017

UCx52xA Regulating Pulse Width Modulators

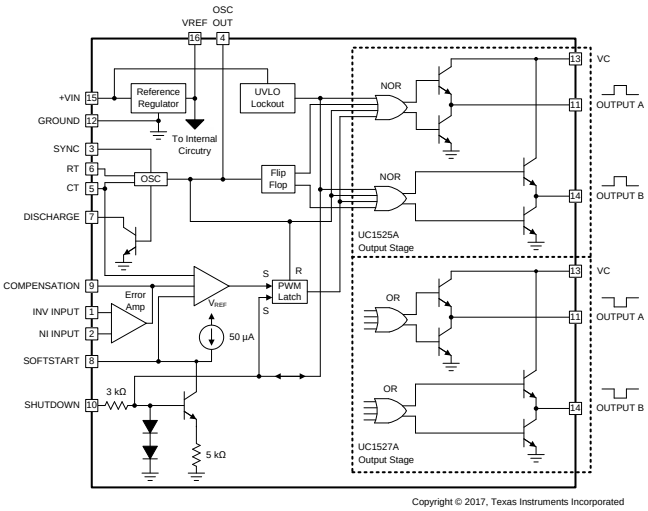
1 Features

- 8-V to 35-V Operation
- 5.1-V Reference Trimmed to 1%
- 100-Hz to 500-kHz Oscillator Range
- Separate Oscillator Sync Terminal
- Adjustable Dead-Time Control
- Internal Soft Start
- Pulse-by-Pulse Shutdown
- Input Undervoltage Lockout With Hysteresis
- Latching PWM to Prevent Multiple Pulses
- Dual Source and Sink Output Drivers

2 Applications

- Off-Line and DC/DC Power Supplies
- Converters Using Voltage Mode
- Single-Ended or Two-Switch Topology Designs
- Solar Inverters
- Welding Inverters
- Motor Control
- Battery Chargers

Block Diagram



3 Description

The UC1525A/1527A series of pulse width modulator integrated circuits are designed to offer improved performance and lowered external parts count when used in designing all types of switching power supplies. The on-chip 5.1-V reference is trimmed to 1% and the input common-mode range of the error amplifier includes the reference voltage, eliminating external resistors. A sync input to the oscillator allows multiple units to be slaved or a single unit to be synchronized to an external system clock. A single resistor between C_T and the discharge terminals provides a wide range of dead-time adjustment. These devices also feature built-in soft-start circuitry with only an external timing capacitor required. A shutdown terminal controls both the soft-start circuitry and the output stages, providing instantaneous turn off through the PWM latch with pulsed shutdown, as well as soft-start recycle with longer shutdown commands.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
UCx52xA	LCCC (20)	8.89 mm × 8.89 mm
	CDIP (16)	19.56 mm × 6.67 mm
	SOIC (16)	10.30 mm × 7.50 mm
	PDIP (16)	19.30 mm × 6.35 mm
	PLCC (20)	8.96 mm × 8.96 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

4 Revision History

Changes from Revision C (January 2008) to Revision D **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1
- Added *Thermal Information* table ... 5
- Changed $R_{\theta JA}$ values in the *Thermal Information table: from 80-120 to N/A for J; from 90 to 47.6 for N; from 45-90 to 72.6 for DW; from 43-75 to 55.8 for FN; and from 70-80 to N/A for FK* ... 5
- Changed $R_{\theta JC}$ values in the *Thermal Information* table: from 28 to 37.4 (top) and 10.1 (bottom) for J; from 45 to 37.3 (top) for N; from 25 to 34 (top) for DW; from 34 to 33.7 (top) for FN; and from 20 to 32.9 (top) to 3.5 (bottom) for FK ... 5

Pin Functions

PIN			I/O	DESCRIPTION
NAME	CDIP, PDIP	PLCC, LCCC		
INV Input	1	2	I	Inverting input to the error amplifier
NI Input	2	3	I	Noninverting input to the error amplifier
SYNC	3	4	I	Oscillator sync terminal
OSC Output	4	5	O	Oscillator frequency output
C_T	5	7	I	Timing capacitor connection pin for oscillator frequency programming. The timing capacitor should be connected to the device ground using minimal trace length.
R_T	6	8	I	Timing resistor connection pin for oscillator frequency programming
Discharge	7	9	I	A single resistor between C_T and the discharge terminals provides dead-time adjustment
Soft Start	8	10	I	Soft-start input pin.
Compensation	9	12	O	Output of the error amplifier for compensation
Shutdown	10	13	I	Pull this pin high to shut down PWM output
Output A	11	14	O	output A of the on-chip drive stage
Ground	12	15	—	Ground return pin
V_C	13	17	—	Power supply pin for the output stage. This pin should be bypassed with a 0.1-µF monolithic ceramic low ESL capacitor with minimal trace lengths.
Output B	14	18	O	Output B of the on-chip drive stage.
$+V_{IN}$	15	19	—	Input voltage
V_{REF}	16	20	O	5.1-V reference. For stability, the reference should be bypassed with a 0.1-µF monolithic ceramic low ESL capacitor and minimal trace length to the ground plane.
NC	—	1, 6, 11, 16	—	No internal connection

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
$+V_{IN}$	Supply voltage		40	V
V_C	Collector supply voltage		40	V
	Logic inputs	–0.3	5.5	V
	Analog inputs	–0.3	$+V_{IN}$	V
	Output current, source or sink		500	mA
	Reference output current		50	mA
	Oscillator charging current		5	mA
	Power dissipation at T_A = +25°C(2)		1000	mW
	Power dissipation at T_C = +25°C(2)		2000	mW
	Operating junction temperature	–55	150	°C
	Lead temperature (soldering, 10 seconds)		300	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	3000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
$+V_{IN}$	Input voltage		8	35	V
V_C	Collector supply voltage		4.5	35	V
	Sink/source load current (steady state)		0	100	mA
	Sink/source load current (peak)		0	400	mA
	Reference load current		0	20	mA
	Oscillator frequency range		100	400	Hz
	Oscillator timing resistor		2	150	kΩ
	Oscillator timing capacitor		0.001	0.01	µF
	Dead time resistor range		0	500	Ω
	Operating ambient temperature	UC1525A, UC1527A	–55	125	°C
		UC2525A, UC2527A	–25	85	
		UC3525A, UC3527A	0	70	

6.4 Thermal Information

THERMAL METRIC[1]		UCx52xA					UNIT
		FK (LCCC)	J (CDIP)	DW (SOIC)	N (PDIP)	FN (PLCC)

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT
REFERENCE						
Output voltage	T_J = 25°C	UC152xA, UC252xA	5.05	5.1	5.15	V
		UC352xA	5	5.1	5.2	
Line regulation	V_{IN} = 8 V to 35 V			10	20	mV
Load regulation	I_L = 0 mA to 20 mA			20	50	mV
Temperature stability[1]	Over operating			20	50	mV
Total output variation[1]	Line, load, and temperature	UC152xA, UC252xA	5		5.2	V
		UC352xA	4.95		5.25	
Shorter circuit current	V_{REF} = 0, T_J = 25°C			80	100	mA
Output noise Voltage[1]	10 Hz ≤ 10 kHz, T_J = 25°C			40	200	µVrms
Long-term stability[1]	T_J = 125°C			20	50	mV
OSCILLATOR SECTION[2]						
Initial accuracy[1][2]	T_J = 25°C			2%	6%	
Voltage stability[1][2]	V_{IN} = 8 V to 35 V	UC152xA, UC252xA		0.3%	1%	
		UC352xA		1%	2%	
Temperature stability[1]	Over operating			3%	6%	
Minimum frequency	R_T = 200 kΩ, C_T = 0.1 mF				120	Hz
Maximum frequency	R_T = 2 kΩ, C_T = 470 pF		400			kHz
Current mirror	I_{RT} = 2 mA		1.7	2	2.2	mA
Clock amplitude[1][2]			3	3.5		V
Clock width[1][2]	T_J = 25°C		0.3	0.5	1	µs
Syncronization threshold[1][2]			1.2	2	2.8	V
Sync input current	Sync voltage = 3.5 V			1	2.5	mA
ERROR AMPLIFIER SECTION (V_{CM} = 5.1 V)						
Input offset voltage	UC152xA, UC252xA			0.5	5	mV
	UC352xA			2	10	

(1) These parameters, although ensured over the recommended operating conditions, are not 100% tested in production.
(2) Tested at f_{OSC} = 40 kHz (R_T = 3.6 kΩ, C_T = 0.01 mF, R_D = 0. Approximate oscillator frequency is defined by

$$f = \frac{1}{C_T\left(0.7R_T + 3R_D\right)}.$$

Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Input bias current			1	10	µA
Input offset current				1	
DC open loop gain	$R_L \geq 10\ M\Omega$	60	75		dB
Gain-bandwidth product(1)	A_V = 0 dB, T_J = 25°C	1	2		MHz
DC transconductance(1)(3)	T_J = 25°C, 30 kΩ ≤ R_L ≤ 1 MΩ	1.1	1.5		mS
Low-level output voltage			0.2	0.5	V
High-level output voltage		3.8	5.6		
Common mode rejection	V_{CM} = 1.5 V to 5.2 V	60	75		dB
Supply voltage rejection	V_{IN} = 8 V to 35 V	50	60		
PWM COMPARATOR					
Minimum duty-cycle				0%	
Maximum duty-cycle		45%	49%		
Input threshold(4)	Zero duty-cycle	0.7	0.9		V
	Maximum duty-cycle		3.3	3.6	
Input bias current(4)			0.05	1	µA
SHUTDOWN					
Soft-start current	V_{SD} = 0 V, V_{SS} = 0 V	25	50	80	µA
Soft-start low level	V_{SD} = 2.5 V		0.4	0.7	V
Shutdown threshold	To outputs, V_{SS} = 5.1 V, T_J = 25°C	0.6	0.8	1	
Shutdown input current	V_{SD} = 2.5 V		0.4	1	mA
Shutdown Delay(5)	V_{SD} = 2.5 V, T_J = 25°C		0.2	0.5	µS
OUTPUT DRIVERS (EACH OUTPUT) (V_C = 20 V)					
Low-level output voltage	I_{SINK} = 20 mA		0.2	0.4	V
	I_{SINK} = 100 mA		1	2	
High-level output voltage	I_{SOURCE} = 20 mA	18	19		V
	I_{SOURCE} = 100 mA	17	18		
Undervoltage lockout	V_{COMP} and V_{SS} = High	6	7	8	V
V_C OFF current(6)	V_C = 35 V			200	µA
Rise time(5)	C_L = 1 nF, T_J = 25°C		100	600	ns
Fall time(5)	C_L = 1 nF, T_J = 25°C		50	300	
TOTAL STANDBY CURRENT					
Supply current	V_{IN} = 35 V		14	20	mA

(3) DC transconductance (g_M) relates to DC open-loop voltage gain (A_V) according to the following equation: A_V = gMRL where R_L is the resistance from pin 9 to ground. The minimum g_M specification is used to calculate minimum A_V when the error amplifier output is loaded.
(4) Tested at f_{OSC} = 40 kHz (R_T = 3.6 kΩ, C_T = 0.01 mF, R_D = 0 Ω.
(5) These parameters, although ensured over the recommended operating conditions, are not 100% tested in production.
(6) Collector off-state quiescent current measured at pin 13 with outputs low for UC1525A and high for UC1527A.

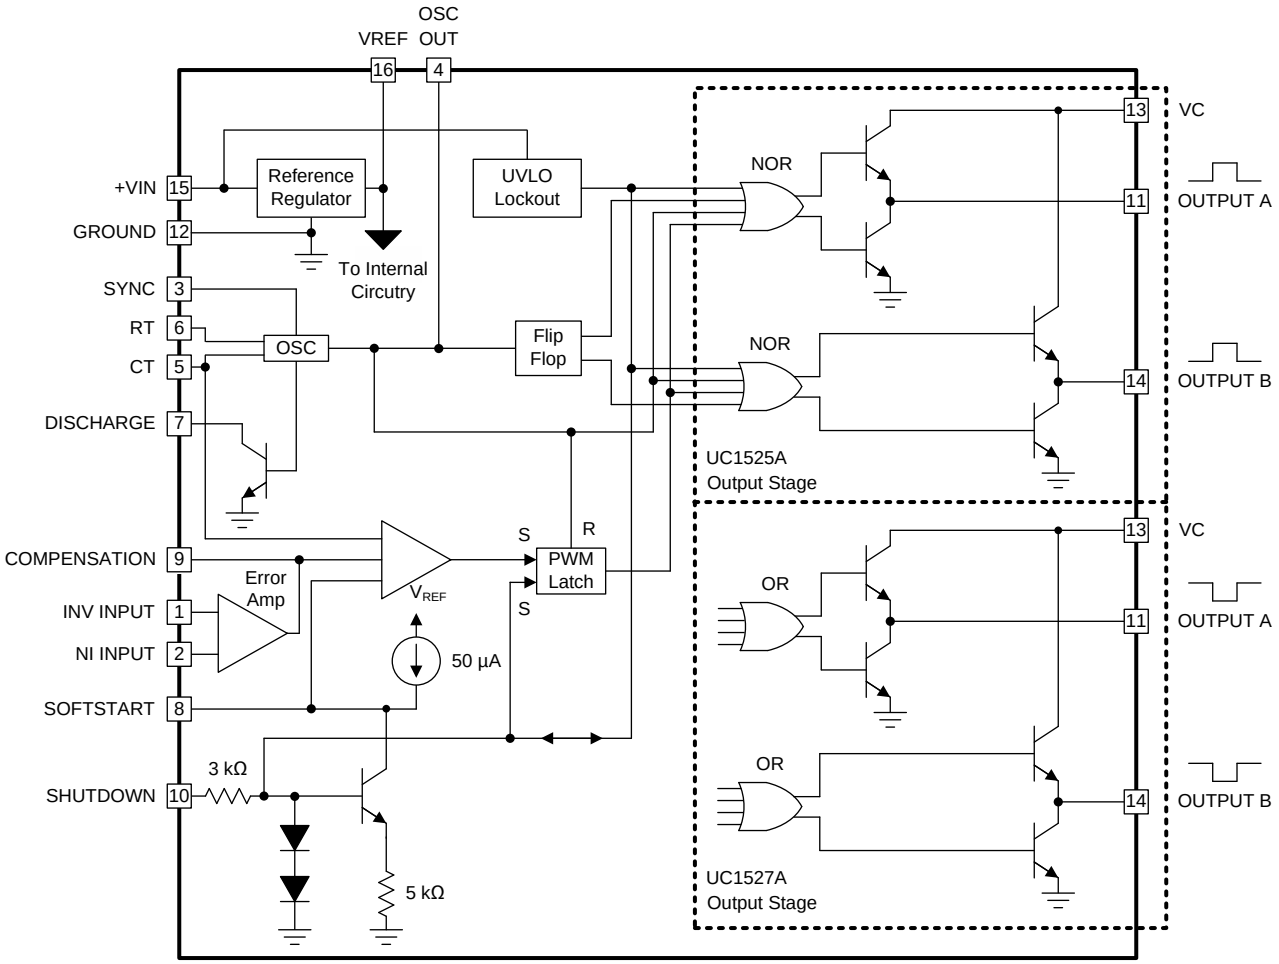
7 Detailed Description

7.1 Overview

The UCx52xA series of pulse width modulator integrated circuits are designed to offer improved performance and lowered external parts count when used in designing all types of switching power supplies. The on-chip 5.1-V reference is trimmed to 1% and the input common-mode range of the error amplifier includes the reference voltage, eliminating external resistors. A sync input to the oscillator allows multiple units to be slaved or a single unit to be synchronized to an external system clock. A single resistor between CT and the discharge terminals provides a wide range of dead-time adjustment. These devices also feature built-in soft-start circuitry with only an external timing capacitor required. A shutdown terminal controls both the soft-start circuitry and the output stages, providing instantaneous turn off through the PWM latch with pulsed shutdown, as well as soft-start recycle with longer shutdown commands.

These functions are also controlled by an undervoltage lockout which keeps the outputs off and the soft-start capacitor discharged for subnormal input voltages. This lockout circuitry includes approximately 500 mV of hysteresis for jitter-free operation. Another feature of these PWM circuits is a latch following the comparator. Once a PWM pulse has been terminated for any reason, the outputs will remain off for the duration of the period. The latch is reset with each clock pulse. The output stages are totem-pole designs capable of sourcing or sinking in excess of 200 mA. The UC1525A output stage features NOR logic, giving a LOW output for an OFF state. The UC1527A uses OR logic, which results in a HIGH output level when OFF.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Adjustable Dead-Time Control

A single resistor between CT and the discharge terminals provides a wide range of dead-time adjustment.

7.3.2 Soft Start

Soft start is achieved by connecting the soft-start pin to ground through a capacitor, charged by the 50-µA current source. See Functional Block Diagram.

7.3.3 Input Undervoltage Lockout With Hysteresis

The undervoltage lockout keeps the outputs off and the soft-start capacitor discharged for subnormal input voltages. This lockout circuitry includes approximately 500 mV of hysteresis for jitter-free operation.

7.3.4 Shutdown and Pulse-by-Pulse Current Limiting

See *Shutdown Options (See Functional Block Diagram)*.

7.4 Device Functional Modes

This device has no functional modes.

7.4.1 Shutdown Options (See *Functional Block Diagram*)

Since both the compensation and soft-start terminals have current source pullups, either can readily accept a pull-down signal which only has to sink a maximum of 100 A to turn off the outputs. This is subject to the added requirement of discharging whatever external capacitance may be attached to these pins.

An alternate approach is the use of the shutdown circuitry of the shutdown pin which has been improved to enhance the available shutdown options. Activating this circuit by applying a positive signal on the shutdown pin performs two functions; the PWM latch is immediately set providing the fastest turn-off signal to the outputs; and a 150-A current sink begins to discharge the external soft-start capacitor. If the shutdown command is short, the PWM signal is terminated without significant discharge of the soft-start capacitor, thus, allowing, for example, a convenient implementation of pulse-by-pulse current limiting. Holding the shutdown pin high for a longer duration, however, will ultimately discharge this external capacitor, recycling slow turnon upon release.

The shutdown pin should not be left floating as noise pickup could conceivably interrupt normal operation. All transitions of the voltage on the shutdown pin should be within the time frame of one clock cycle and not repeated at a frequency higher than 10 clock cycles.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The UC1525A/1527A series of pulse width modulator integrated circuits are designed to offer improved performance and lowered external parts count when used in designing all types of switching power supplies. The UC1525A output stage features NOR logic, giving a LOW output for an OFF state. The UC1527A utilizes OR logic which results in a HIGH output level when OFF.

8.2 Typical Application

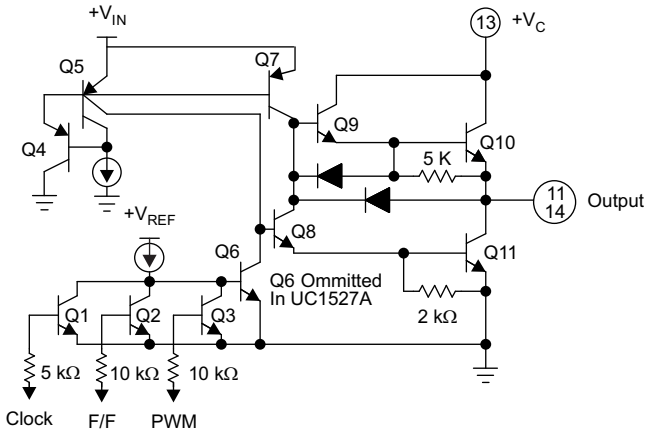

Figure 9. UC1525A Output Circuit (1/2 circuit shown)

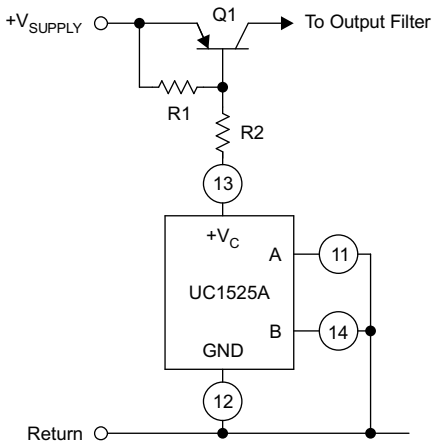

Figure 10. Grounded Driver Outputs For Single-Ended Supplies

Typical Application (continued)

For single-ended supplies, the driver outputs are grounded. The V_C terminal is switched to ground by the totem-pole source transistors on alternate oscillator cycles.

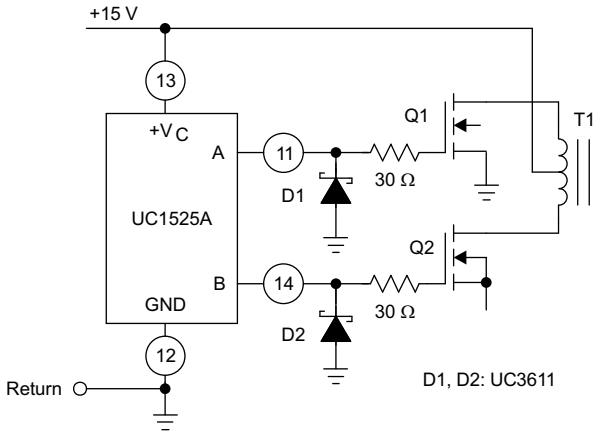

Figure 11. Output Drivers With Low Source Impedance

The low source impedance of the output drivers provides rapid charging of power FET input capacitance while minimizing external components.

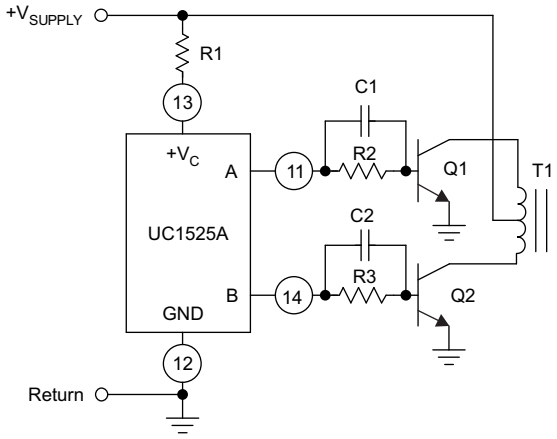

Figure 12. Conventional Push-Pull Bipolar Design

In conventional push-pull bipolar designs, forward base drive is controlled by R1–R3. Rapid turn-off times for the power devices are achieved with speed-up capacitors C1 and C2.

8.2.2 Design Requirements

This example illustrates the design process and component selection for a push-pull DC-DC converter utilizing the UC1525A. The converter regulates a 30-V input to a 5-V output with 10-A maximum load.

Table 1. Design Parameters

PARAMETER		MIN	TYP	MAX	UNIT
V_{IN}	Input voltage range	25	30	35	V
V_{OUT}	Output voltage		5		V
i_{OUT}	Output current	1		10	A
f_O	Oscillator frequency		100		kHz
f_S	Switching frequency		50		kHz

8.2.3 Detailed Design Procedure

8.2.3.1 Timing Resistor and Capacitor Selection

Generally, higher switching frequency gives smaller size but have higher switching loss. Operation at 100 kHz was selected in this example as a reasonable compromise between size and efficiency. The value of R_T = 10 kΩ, C_T = 1.37 nF and R_D = 100 Ω were chosen for 100-kHz oscillator frequency based on equation:

$$f = \frac{1}{C_T(0.7\,R_T + 3\,R_D)} \tag{1}$$

8.2.3.2 Turns Ratio Selection

The maximum primary-to-secondary turns ratio N_{MAX} can be determined by the target output voltage, minimum input voltage, and the estimated maximum duty cycle. D_{LIM} = 0.35 was selected for this example. N_{MAX} can be calculated using Equation 1.

$$N_{MAX} = \frac{2 \times D_{LIM} \times V_{IN(min)}}{V_{OUT} + V_F} = \frac{2 \times 0.35 \times 25\,V}{5\,V + 0.3\,V} = 3.3 \tag{2}$$

Rounding N_{MAX} down to the next lowest integer results in a turns ratio of N = 3.

8.2.3.3 Inductor Selection

The maximum inductor ripple current occurs at the maximum input voltage. Typically, 20% to 40% of the full load current ripple is a good compromise between core loss and copper loss of the inductor. Higher ripple current allows for a smaller inductor size, but places more burden on the output capacitor to smooth the ripple voltage on the output. In this example, a ripple current of 25% of 10 A was chosen. The inductor value can be calculated as:

$$L_O = \frac{V_{OUT} + V_F}{\Delta I_L \times f_{SW}} \times \left(\frac{1}{2} - \frac{N \times (V_{OUT} + V_F)}{2 \times V_{IN(max)}}\right) = 11.57\,\mu H \tag{3}$$

8.2.3.4 Rectification Diode Selection

A rectification diode should always possess low-forward voltage drop. When used in high-frequency switching applications, the diode must also possess a short recovery time. Schottky diodes meet both requirements and are therefore strongly recommended in push-pull converter designs.

8.2.3.5 VC Capacitor Selection

The primary purpose of the VC capacitor is to supply the peak transient currents of the drivers as well as provide stability for the VC regulator. These peak currents can be several amperes. The recommended value of VC capacitor should be no smaller than 0.1 μF, and should be a good quality, low ESR, ceramic capacitor. VC capacitor should be placed as close as possible to the VC pin to minimize potentially damaging voltage transients caused by trace inductance.

8.2.3.6 Output Capacitor Selection

The output capacitors smooth the output voltage ripple caused by inductor ripple current and provide a source of charge during load transient conditions.

8.2.3.7 Input Capacitor Selection

The input supply voltage typically has high source impedance at the switching frequency. Good quality input capacitors are necessary to limit the ripple voltage at the VIN pin while supplying most of the switch current during the on-time. The input capacitor should be selected for RMS current rating and minimum ripple voltage.

8.2.4 Application Curves

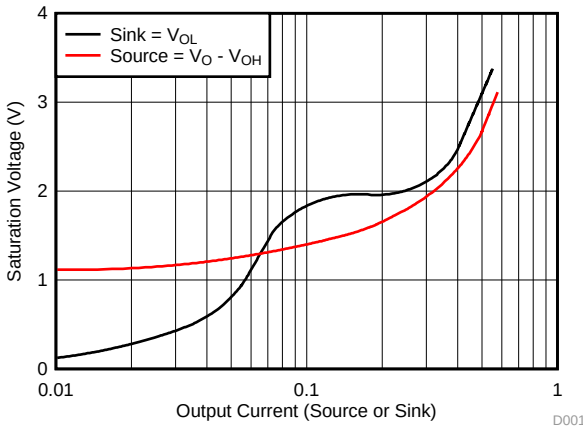

Figure 13. UC1525A Output Saturation Characteristics

9 Power Supply Recommendations

The voltage range for V_{IN} is 8 V to 35 V.

The voltage range for V_C is 4.5 V to 35 V. Choose a voltage level which is suitable for the power switch, for example, 12 V for MOSFET.

10 Layout

10.1 Layout Guidelines

High-speed circuits demand careful attention to layout and component placement. To assure proper performance of the UC1525A follow these rules:

- Use a ground plane
- Damp or clamp parasitic inductive kick energy from the gate of driven MOSFETs. Do not allow the output pins to ring below ground. A series gate resistor or a shunt 1-A Schottky diode at the output pin will serve this purpose.
- Bypass V_{IN}, V_C, and V_{REF}. Use 0.1-µF monolithic ceramic capacitors with low equivalent series inductance. Allow less than 1 cm of total lead length for each capacitor between the bypassed pin and the ground plane.
- Treat the timing capacitor, C_T, like a bypass capacitor.

10.2 Layout Example

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

OTHER QUALIFIED VERSIONS OF UC1525A, UC1527A, UC2525A, UC2525AM, UC3525A, UC3525AM, UC3527A :
