

LP2951-Q1 Automotive, Adjustable Micropower Voltage Regulator With Shutdown

1 Features

- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: -40°C to $+125^{\circ}\text{C}$, T_A
 - Temperature grade 1: -40°C to $+125^{\circ}\text{C}$, T_J
- Wide input voltage range
 - V_{IN} range (new chip): 2V to 30V
- Wide output voltage range V_{OUT}
 - Fixed option: 3.3V, 5.0V
 - Adjustable option: 1.2V to 29V
- Output current: Up to 100mA
- V_{OUT} accuracy:
 - $\pm 2\%$ over line, load, and temperature for legacy chip
 - $\pm 1\%$ over line, load, and temperature for new chip
- Quiescent current I_Q (new chip): 50 μA (typical)
- Low dropout: 340mV (typical) for new chip
- Output current limiting and thermal shutdown
- Open-drain error output
- Stable over a wide range of ceramic output capacitor values:
 - C_L range: 1 μF to 100 μF (new chip)
 - ESR range: 0 Ω to 2 Ω (new chip)
- Package options:
 - D (8-pin SOIC)
 - DRG (8-pin WSON)

- [HEV/EV battery-management systems \(BMS\)](#)
- [HEV/EV inverters and motor controls](#)
- [HEV/EV onboard chargers \(OBC\) and wireless chargers](#)
- [HEV/EV DC/DC converters](#)

Dropout Voltage vs Temperature (New Chip)

3 Description

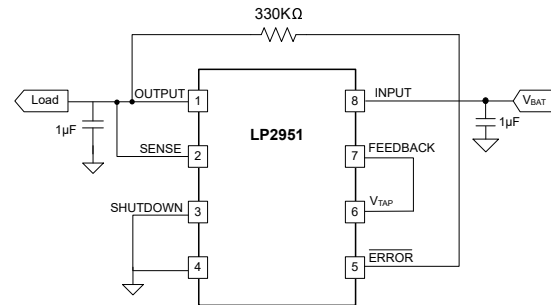

The LP2951-Q1 is a wide input low-dropout regulator (LDO) supporting an input voltage range from 2V to 30V and can supply up to 100mA of load current. The LP2951-Q1 is able to output either a fixed or adjustable output from the same device. By tying the OUTPUT and SENSE pins together, and the FEEDBACK and V_{TAP} pins together, the LP2951-Q1 gives 3.3V or 5V fixed output voltages. Alternatively, leave the SENSE and V_{TAP} pins open and connect FEEDBACK to an external resistor divider. This configuration allows the output to be set to any value between 1.2V to 29V.

The LP2951-Q1 has a $\overline{\text{ERROR}}$ output that monitors the voltage at the feedback pin to indicate the status of the output voltage. The SHUTDOWN input and $\overline{\text{ERROR}}$ output are used for sequencing multiple power supplies in the system.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
LP2951-33-Q1	DRG (WSON, 8)	3mm × 3mm
LP2951-50-Q1		
LP2951-50-Q1	D (SOIC, 8)	4.9mm × 6mm

- (1) For more information, see the [Section 10](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

Figure 4-2. DRG Package, 8-Pin WSON With Exposed Thermal Pad (Top View)

Table 4-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
$\overline{\text{ERROR}}$	5	O	Active-low, open-drain error output. Goes low when V_{OUT} drops by 6% of the nominal value.
FEEDBACK	7	I	Determines the output voltage. Connect to V_{TAP} (with OUTPUT tied to SENSE) for fixed output option, or connect to a resistor divider for adjustable output option.
GND	4	—	Ground
INPUT	8	I	Input supply pin. Use a capacitor with a value of 1 μF or larger from this pin to ground is recommended. See the Input and Output Capacitor Requirements section for more information.
OUTPUT	1	O	A capacitor is required from OUTPUT to GND for stability. For best transient response, use the nominal recommended value or larger ceramic capacitor from OUTPUT to GND ⁽²⁾ . Place the output capacitor as close to the device output as possible. See the Input and Output Capacitor Requirements section for more details.
SENSE	2	I	Senses the output voltage. Connect to OUTPUT (with FEEDBACK tied to V_{TAP}) for fixed output option only. If using the device as adjustable output, this pin must be left floating.
SHUTDOWN	3	I	Active-high input. A high signal disables the device; a low signal enables the device.
V_{TAP}	6	O	Connect to FEEDBACK for fixed output option. If using the device as adjustable output, this pin must be left floating.

(1) I = Input, O = Output.

(2) The nominal output capacitance must be greater than 1 μF . Throughout this document, the nominal derating on these capacitors is assumed to be 50%. Verify that the effective capacitance at the pin is greater than 1 μF .

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{IN}	Continuous input voltage (Legacy chip)	-0.3	30	V
	Continuous input voltage (New chip)	-0.3	42	
V _{OUT}	Output voltage	-0.3	39	
V _{SHDN}	SHUTDOWN input voltage (Legacy chip)	-1.5	30	
	SHUTDOWN input voltage (New chip)	-0.3	42	
V _{ERROR}	ERROR comparator output voltage (Legacy chip) ⁽²⁾	-1.5	30	
	ERROR comparator output voltage (New chip) ⁽²⁾	-0.3	39	
V _{FDBK}	FEEDBACK input voltage (Legacy chip) ^{(2) (3)}	-1.5	30	
	FEEDBACK input voltage (New chip) ^{(2) (3)}	-0.3	5	
V _{TAP}	Internal resistor divider (fixed voltage option only) (New Chip)	-0.3	5	
V _{SENSE}	Output voltage sense (fixed voltage option only) (New Chip)	-0.3	5	
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Can exceed input supply voltage.
- (3) If load is returned to a negative power supply, the output must be diode clamped to GND.

5.2 ESD Ratings

			VALUE (Legacy Chip)	VALUE (New Chip)	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	±3000	V	
		Charged-device model (CDM), per AEC V Q100-011	All pins	±1000		±1000
		Charged-device model (CDM), per AEC V Q100-011	Corner pins	±1000		±1000

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	2.0		30	V
V _{EN}	Enable voltage	0		30	
V _{OUT}	Output voltage	1.2		30	
I _L	Output current	0		100	mA
C _L	Output capacitor ⁽¹⁾	1	2.2	100	μF
C _L ESR	Output capacitor ESR (Legacy chip)	30m		5	Ω
	Output capacitor ESR (New chip)	0		2	
C _{IN}	Input capacitor		1		μF
C _{FF}	Feed-forward capacitor (optional ⁽²⁾ , for adjustable device only)		10		pF
I _{FB_DIVIDER}	Feedback divider current ⁽²⁾ (adjustable device only)	12			μA
T _J	Junction temperature	–40		125	°C

(1) Effective output capacitance of 0.5μF minimum required for stability.

(2) C_{FF} required for stability if the feedback divider current < 12μA. Feedback divider current = V_{OUT} / (R₁ + R₂). See the *Feed-Forward Capacitor (C_{FF})* section for details.

5.4 Thermal Information

THERMAL METRIC ^{(1) (2)}		Legacy Chip		New Chip		UNIT
		D	DRG	D	DRG	
		8 PINS	8 PINS	8 PINS	8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	121.6	55.7	123	48.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	69.8	66.5	67.8	60.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	61.9	30.2	70.7	22.4	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	22.2	1.1	18.0	1.7	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	69.8	30.4	69.8	22.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	10	n/a	3.3	°C/W

(1) The thermal data is based on the JEDEC standard high K profile, JESD 51-7. Two-signal, two-plane, four-layer board with 2-oz. copper. The copper pad is soldered to the thermal land pattern. Also, correct attachment procedure must be incorporated.

(2) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

5.5 Electrical Characteristics (Both Legacy and New Chip)

V_{IN} = V_{OUT} (nominal) + 1V, I_L = 100μA, C_L = 1μF (for new chip) and C_L = 2.2μF (for legacy chip),

FEEDBACK tied to V_{TAP}, OUTPUT tied to SENSE, V_{SHUTDOWN} ≤ 0.7V

		New chip	25°C	4	6	
			–40°C to 125°C		7.5	

- Output or reference voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.
- Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specification for thermal regulation.

- (3) Thermal regulation is defined as the change in output voltage at a time (T) after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 50-mA load pulse at $V_{IN} = 30V$, $V_{OUT} = 5V$ (1.25W pulse) for $t = 10ms$.
- (4) Comparator thresholds are expressed in terms of a voltage differential equal to the nominal reference voltage (measured at $V_{IN} - V_{OUT} = 1V$) minus FEEDBACK terminal voltage. To express these thresholds in terms of output voltage change, multiply by the error amplifier gain = $V_{OUT}/V_{REF} = (R1 + R2)/R2$. For example, at a programmed output voltage of 5V, the ERROR output is specified to go low when the output drops by $95mV \times 5V/1.2V = 395mV$. Thresholds remain constant as a percentage of V_{OUT} (as V_{OUT} is varied), with the low-output warning occurring at 6% below nominal (typ) and 7.7%(max).

5.6 Timing Requirements (New Chip only)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PGDH}	PG delay time rising, time from 92% V_{OUT} to 20% of PG ⁽¹⁾		40		μs
t_{PGDL}	PG delay time falling, time from 90% V_{OUT} to 80% of PG ⁽¹⁾		10		μs

- (1) Output Overdrive = 10%.

6 Detailed Description

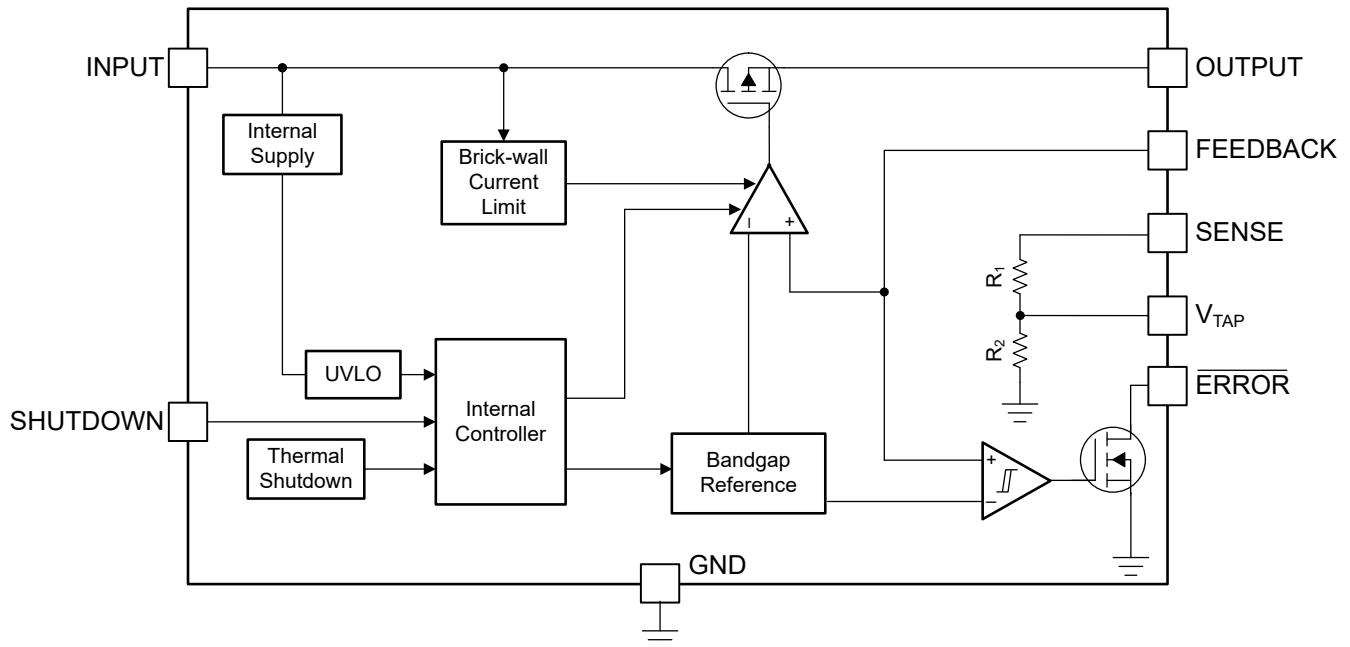

6.1 Overview

The LP2951-Q1 is low-dropout voltage regulator that accommodates a wide input supply voltage range up to 30V. The 8-pin LP2951-Q1 outputs either a fixed or adjustable output from the same device. By tying the OUTPUT and SENSE pins together, and the FEEDBACK and V_{TAP} pins together, the LP2951-Q1 outputs a fixed 5V or 3.3V (depending on the version). Alternatively, by leaving the SENSE and V_{TAP} pins unconnected and connecting FEEDBACK to an external resistor divider, the output can be set to any value between 1.2V to 30V.

The LP2951-Q1 has an error flag output (\overline{ERROR}) that monitors the voltage at the feedback pin to indicate the status of the output voltage. The SHUTDOWN input and \overline{ERROR} output are used for sequencing multiple power supplies in the system.

The LP2951-Q1 is stable with small ceramic output capacitors, allowing for a small overall solution size. The LP2951-Q1 has an output tolerance of 1% across line, load, and temperature variation (new chip) and is capable of delivering 100mA of continuous load current. This device includes integrated thermal shutdown, current limit, and undervoltage lockout (UVLO) features. This device delivers excellent line and load transient performance. The operating ambient temperature range of the device is -40°C to 125°C .

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Output Enable

The SHUTDOWN pin for the device is an active-high pin. The output voltage is enabled when the SHUTDOWN pin voltage is less than the low-level input voltage of the SHUTDOWN pin. The output voltage is disabled when the SHUTDOWN pin voltage is greater than the high-level input voltage of the SHUTDOWN pin. If independent control of the output voltage is not needed, connect the SHUTDOWN pin to the GND of the device.

6.3.2 Dropout Voltage

Dropout voltage (V_{DO}) is defined as $V_{IN} - V_{OUT}$ at the rated output current (I_{RATED}), where the pass transistor is fully on. V_{IN} is the input voltage, V_{OUT} is the output voltage, and I_{RATED} is the maximum I_L listed in the [Recommended Operating Conditions](#) table. At this operating point, the pass transistor is driven fully on. Dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage where the output voltage is expected to stay in regulation. If the input voltage falls to less than the nominal output regulation, then the output voltage falls as well.

For a CMOS regulator, the dropout voltage is determined by the drain-source, on-state resistance ($R_{DS(ON)}$) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. The following equation calculates the $R_{DS(ON)}$ of the device.

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}} \quad (1)$$

6.3.3 Current Limit

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a brick-wall scheme. In a high-load current fault, the brick-wall scheme limits the output current to the current limit (I_{CL}). I_{CL} is listed in the [Electrical Characteristics](#) table.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brick-wall current limit, the pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{CL}]$. If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application note](#).

Figure 6-1 shows a diagram of the current limit.

Figure 6-1. Current Limit

6.3.4 Undervoltage Lockout (UVLO)

The device has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the [Electrical Characteristics](#) table.

6.3.5 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature (T_J) of the pass transistor rises to $T_{SD(\text{shutdown})}$ (typical). Thermal shutdown hysteresis verifies that the device resets (turns on) when the temperature falls to $T_{SD(\text{reset})}$ (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device cycles on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start up is potentially high from large $V_{IN} - V_{OUT}$ voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start-up completes.

For reliable operation, limit the junction temperature to the maximum listed in the [Recommended Operating Conditions](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

6.4 Device Functional Modes

6.4.1 Shutdown Mode

This device can be placed in shutdown mode with a logic high at the SHUTDOWN pin. Return the logic level low to restore operation or tie SHUTDOWN to ground if the feature is not being used.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The LP2951-Q1 is used as a low-dropout regulator with a wide range of input voltages.

7.1.1 Reverse Current

Excessive reverse current potentially damages this device. Reverse current flows through the intrinsic body diode of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current occurs are outlined in this section, all of which potentially exceed the absolute maximum rating of $V_{OUT} \leq V_{IN} + 0.3V$.

- If the device has a large C_{OUT} and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

If reverse current flow is expected in the application, use external protection to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated.

Figure 7-1 shows one approach for protecting the device.

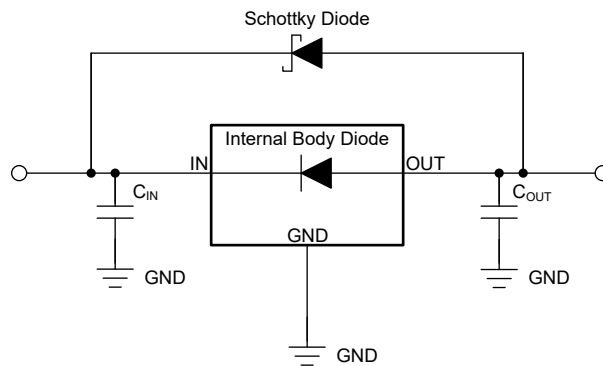

Figure 7-1. Example Circuit for Reverse Current Protection Using a Schottky Diode

7.1.2 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is more than 0.5Ω . Use a higher value capacitor if large, fast rise-time load or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic device performance is improved by using an output capacitor. Use an output capacitor within the range specified in the [Recommended Operating Conditions](#) table for stability.

7.1.3 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the linear regulator when in-circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The [Thermal Information](#) table lists the primary thermal metrics, which are the junction-to-top characterization parameter (ψ_{JT}) and junction-to-board characterization parameter (ψ_{JB}). These parameters provide two methods for calculating the junction temperature (T_J), as described in the following equations. Use the junction-to-top characterization parameter (ψ_{JT}) with the temperature at the center-top of device package (T_T) to calculate the junction temperature. Use the junction-to-board characterization parameter (ψ_{JB}) with the PCB surface temperature 1mm from the device package (T_B) to calculate the junction temperature.

$$T_J = T_T + \psi_{JT} \times P_D \quad (2)$$

where:

- P_D is the dissipated power
- T_T is the temperature at the center-top of the device package

$$T_J = T_B + \psi_{JB} \times P_D \quad (3)$$

where:

- T_B is the PCB surface temperature measured 1mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use the metrics, see the [Semiconductor and IC Package Thermal Metrics application note](#).

7.1.4 Power Dissipation (P_D)

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. The following equation calculates power dissipation (P_D).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

Note

Power dissipation is minimized, and therefore greater efficiency is achieved, by correct selection of the system voltage rails. For the lowest power dissipation use the minimum input voltage required for correct output regulation.

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. Make sure this pad area contains an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

The maximum power dissipation determines the maximum allowable ambient temperature (T_A) for the device. According to the following equation, power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (5)$$

Thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the [Thermal Information](#) table is determined by the JEDEC standard PCB and copper-spreading area. This thermal resistance is used as a relative measure of package thermal performance.

7.2 Typical Application

Figure 7-2. 12-V to 5-V Converter

7.2.1 Design Requirements

7.2.1.1 Recommended Capacitor Types

7.2.1.1.1 Recommended Capacitors (Legacy Chip)

Most tantalum or aluminum electrolytics are used at the input. Film-type capacitors also work but at higher cost. Ceramic capacitors are available for use at the output, but the low ESR (as low as $5\text{m}\Omega$ to $10\text{m}\Omega$) potentially causes the output to not meet the minimum ESR requirement. If a ceramic capacitor is used, add a series resistor between 0.1Ω to 2Ω to meet the minimum ESR requirement.

Ceramic capacitors can be used, but because of the low ESR (as low as $5\text{m}\Omega$ to $10\text{m}\Omega$), these capacitors can possibly not meet the minimum ESR requirement previously discussed. If a ceramic capacitor is used, a series resistor between 0.1Ω to 2Ω must be added to meet the minimum ESR requirement. In addition, ceramic capacitors have one glaring disadvantage that must be taken into account — a poor temperature coefficient, where the capacitance can vary significantly with temperature. For instance, a large-value ceramic capacitor ($\geq 2.2\mu\text{F}$) can lose more than half of the capacitance as temperature rises from 25°C to 85°C . Thus, a $2.2\mu\text{F}$ capacitor at 25°C drops well below the minimum C_L required for stability as ambient temperature rises. For this reason, select an output capacitor that maintains the minimum $2.2\mu\text{F}$ required for stability for the entire operating temperature range.

7.2.1.1.1.1 ESR Range (Legacy Chip)

The regulator control loop relies on the ESR of the output capacitor to provide a zero to add sufficient phase margin to provide unconditional regulator stability. This condition requires the closed-loop gain to intersect the open-loop response in a region where the open-loop gain rolls off at 20dB/decade. This roll off makes sure that the phase is always less than 180° (phase margin greater than 0°) at unity gain. Thus, a minimum-maximum range for the ESR must be observed.

The upper limit of this ESR range is established by the fact that an ESR that is too high can result in the zero occurring too soon, causing the gain to roll off too slowly. This effect, in turn, allows a third pole to appear before unity gain and introduces enough phase shift to cause instability. This phase shift typically limits the maximum ESR to approximately 5Ω.

Conversely, the lower limit of the ESR range is tied to the fact that an ESR that is too low shifts the zero too far out, past unity gain, which allows the gain to roll off at 40dB/decade at unity gain, resulting in a phase shift of greater than 180°. Typically, limit the minimum ESR to approximately 20mΩ to 30mΩ.

7.2.1.1.1.2 Recommended Capacitors (New Chip)

The new chip requires an output capacitor of at least 1μF for stability and an equivalent series resistance (ESR) between 0Ω and 2Ω. Without the output capacitor, the regulator oscillates. For best transient performance, use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and ESR over temperature. When choosing a capacitor for a specific application, be mindful of the DC bias characteristics for the capacitor. Higher output voltages cause a significant derating of the capacitor. For best performance, the maximum recommended output capacitor is 100μF. An input capacitor is not required for stability. However, good analog practice is to connect a capacitor (500nF or higher) between the GND and IN pins. Some input supplies have a high impedance, thus placing the input capacitor on the input supply helps reduce input impedance. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. If the input supply has a high impedance over a large range of frequencies, use several input capacitors in parallel to lower the impedance over frequency. Use a higher-value capacitor if large, fast rise-time load transients are anticipated, or if the device is located several inches from the input power source.

7.2.2 Detailed Design Procedure

7.2.2.1 Feedback Resistor Selection

V_{OUT} is set by the external feedback resistors R_1 and R_2 , according to the following equation:

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R_1}{R_2}\right) \quad (6)$$

To ignore the FB pin current error term in the V_{OUT} equation, set the feedback divider current to 100 times the FB pin current listed in the [Section 5.5](#) table. This setting provides the maximum feedback divider series resistance, as shown in the following equation:

$$R_1 + R_2 \leq \frac{V_{OUT}}{(I_{FB} \times 100)} \quad (7)$$

7.2.2.2 Feedforward Capacitor

Connect a feedforward capacitor (C_{FF}) between the OUT pin and the FB pin. C_{FF} improves transient, noise, and PSRR performance. A higher capacitance C_{FF} is possible; however, the start-up time increases. For a detailed description of C_{FF} tradeoffs, see the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator application note](#).

As shown in [Figure 7-3](#), poor layout practices and using long traces at the FB pin results in the formation of a parasitic capacitor (C_{FB}).

Figure 7-3. Formation of Parasitic Capacitor at the FB Pin

C_{FB} , along with the feedback resistors R_1 and R_2 potentially result in the formation of an uncompensated pole in the transfer function of the loop gain. A C_{FB} value as small as 6pF potentially causes the parasitic pole frequency, given by [Equation 8](#), to fall within the bandwidth of the LDO and result in instability.

$$f_P = \frac{1}{(2 \times \pi \times C_{FB} \times (R_1 \parallel R_2))} \quad (8)$$

Adding a feedforward capacitor (C_{FF}), as shown in [Figure 7-4](#), creates a zero in the loop gain transfer function that compensates for the parasitic pole created by C_{FB} . [Equation 9](#) and [Equation 10](#) calculate the pole and zero frequencies.

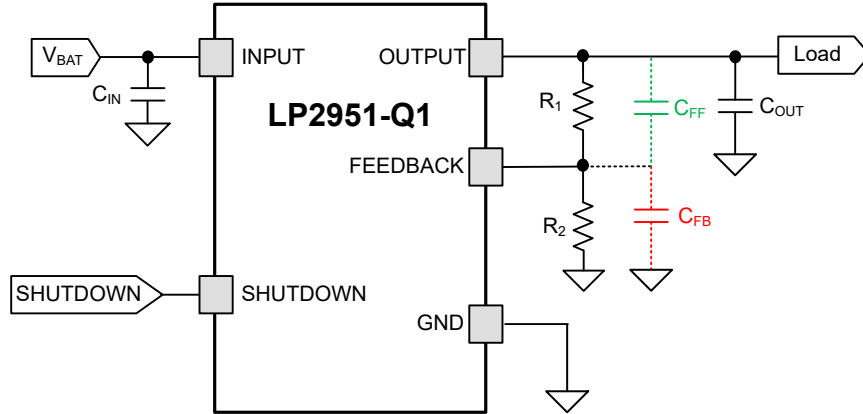

Figure 7-4. Feedforward Capacitor Compensates the Effects of the Parasitic Capacitor

$$f_p = \frac{1}{(2 \times \pi \times (R_1 \parallel R_2) \times (C_{FF} + C_{FB}))} \quad (9)$$

$$f_z = \frac{1}{(2 \times \pi \times C_{FF} \times R_1)} \quad (10)$$

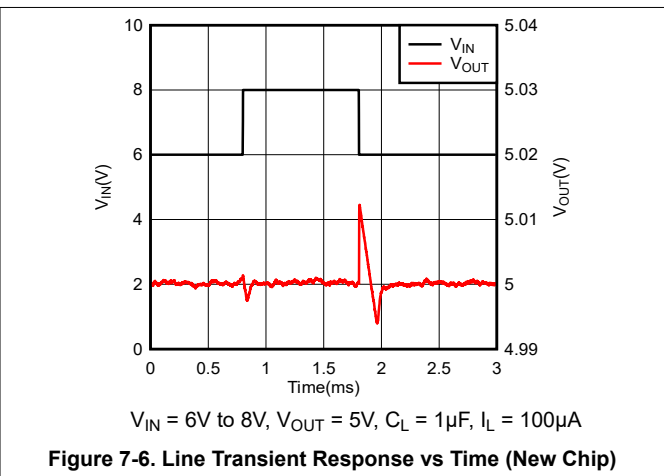

The C_{FF} value that makes f_p equal to f_z , and results in a pole-zero cancellation, depends on the values of C_{FB} and the feedback resistors used in the application. Alternatively, if the feedforward capacitor is selected so that $C_{FF} \gg C_{FB}$, then the pole and zero frequencies given by Equation 9 and Equation 10 are related as:

$$\frac{f_p}{f_z} \cong \left(1 + \frac{R_1}{R_2}\right) = \frac{V_{OUT}}{V_{FB}} \quad (11)$$

In most applications, particularly where a 3.3V or 5V V_{OUT} is generated, this ratio is not very large. Thus, implying that the frequencies are located close to each other and therefore the parasitic pole is compensated. Even for large V_{OUT} values, where this ratio is as large as 20, a C_{FF} value in the range $100\text{pF} \leq C_{FF} \leq 10\text{nF}$ typically helps prevent instability caused by the parasitic capacitance on the feedback node.

7.2.3 Application Curves

at $V_{IN} = V_{OUT} (\text{nominal}) + 1\text{V}$, $I_L = 100\mu\text{A}$, $C_L = 1\mu\text{F}$ (for new chip) and $C_L = 2.2\mu\text{F}$ (for legacy chip) FEEDBACK tied to V_{TAP} , OUTPUT tied to SENSE, $V_{SHUTDOWN} \geq 0.7\text{V}$ (unless otherwise noted)

7.2.3 Application Curves (continued)

at $V_{IN} = V_{OUT} \text{ (nominal)} + 1V$, $I_L = 100\mu A$, $C_L = 1\mu F$ (for new chip) and $C_L = 2.2\mu F$ (for legacy chip) FEEDBACK tied to V_{TAP} , OUTPUT tied to SENSE, $V_{SHUTDOWN} \geq 0.7V$ (unless otherwise noted)

$V_{IN} = 6V$, $V_{OUT} = 5V$, $C_L = 10\mu F$, $I_L = 1mA$

Figure 7-13. Enable Transient Response vs Time (New Chip)

7.3 Power Supply Recommendations

Limit maximum input voltage to 30 V for proper operation. Place input and output capacitors as close to the device as possible to take advantage of the high-frequency, noise-filtering properties.

7.4 Layout

7.4.1 Layout Guidelines

Make sure that traces on the input and outputs of the device are wide enough to handle the desired currents. For this device, the output trace must be larger to accommodate the larger available current.

Place input and output capacitors as close to the device as possible to take advantage of the high-frequency, noise-filtering properties.

7.4.2 Layout Example

Figure 7-14. Layout Example (D Package)

8 Device and Documentation Support

8.1 Device Support

8.1.1 Development Support

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation. The [LP2951EVM](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

8.1.2 Device Nomenclature

Table 8-1. Device Nomenclature

PRODUCT ⁽¹⁾	V _{out}
LP2951xxQyyyzQ1	<p>xx is the nominal output voltage (for example, 50 = 5.0V, 33 = 3.3V). Q indicates that this device is a grade-1 device in accordance with the AEC-Q100 standard. yyy is the package designator. z is the package quantity. Q1 indicates that this device is an automotive grade (AEC-Q100) device. This device is able to output either a fixed or adjustable output from the same device. Devices ship with either the legacy chip (CSO: SHE) or the new chip (CSO: RFB). The reel packaging label provides the CSO information to distinguish which chip is being used. Device performance for new and legacy chips is denoted throughout the document.</p>
LP2951xxQyyyzM3Q1	<p>xx is the nominal output voltage (for example, 50 = 5.0V, 33 = 3.3V). Q indicates that this device is a grade-1 device in accordance with the AEC-Q100 standard. yyy is the package designator. z is the package quantity. M3 indicates that this device only ships with the new chip. Q1 indicates that this device is an automotive grade (AEC-Q100) device. This device is able to output either a fixed or adjustable output from the same device.</p>

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (April 2024) to Revision H (November 2024)		Page
• Changed entire document to align with current family format.....		1
• Added M3 devices to document.....		1
• Added legacy and new chip nomenclature throughout document.....		1
• Updated the numbering format for tables, figures, and cross-references throughout the document		1
• Added new chip curves to the <i>Typical Characteristics</i> section.....		10
• Added <i>Output Enable</i> section.....		20
• Added <i>Dropout Voltage</i> section.....		20
• Changed <i>Current Limit</i> section.....		20
• Added <i>Undervoltage Lockout (UVLO)</i> section.....		21
• Added <i>Thermal Shutdown</i> section.....		21
• Added <i>Reverse Current</i> section.....		22
• Added <i>Input and Output Capacitor Requirements</i> section.....		22
• Added <i>Estimating Junction Temperature</i> section.....		23
• Added <i>Power Dissipation (P_D)</i> section.....		23
• Added <i>Recommended Capacitor Types</i> section.....		24
• Added <i>Feedback Resistor Selection</i> section.....		26
• Added <i>Feedforward Capacitor</i> section.....		26
• Added <i>Device Support and Documentation Support</i> sections.....		31

Changes from Revision F (August 2023) to Revision G (April 2024)		Page
• Added correct temperature grade 1 range to AEC-Q100 <i>Features</i> bullet.....		1
• Changed LP2591-50-Q1 to LP2951-50-Q1 in <i>Package Information</i> table and D package pinout drawing.....		1

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

D0008A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.

EXAMPLE BOARD LAYOUT

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
 EXPOSED METAL SHOWN
 SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DRG (S-PWSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

4205379/C 12/10

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. SON (Small Outline No-Lead) package configuration.
 - △ The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. JEDEC MO-229 package registration pending.

4218885/A 03/2020

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

DRG0008A

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:20X

SOLDER MASK DETAILS

4218885/A 03/2020

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

DRG0008A

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

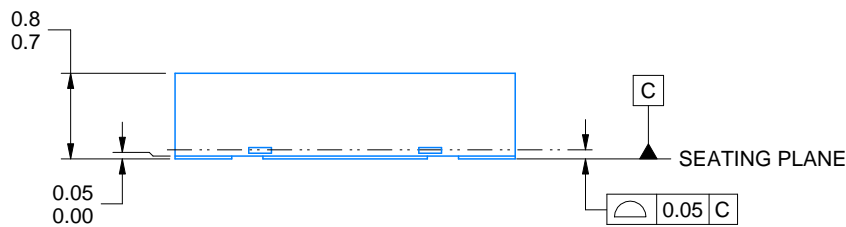

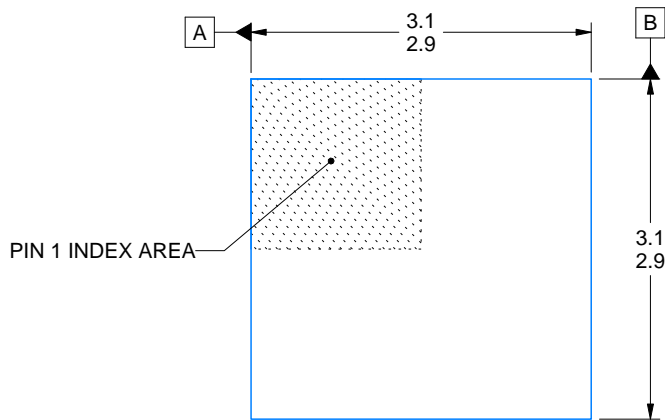

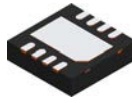

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
84% PRINTED SOLDER COVERAGE BY AREA
SCALE:25X

4218885/A 03/2020

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

DIMENSION A	
OPTION 01	(0.1)
OPTION 02	(0.2)

4218886/A 01/2020

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
