

TLV9051/TLV9052/TLV9054 5MHz 15V/ μ s 高压摆率 RRIO 运算放大器

1 特性

- 高压摆率：15V/ μ s
- 低静态电流：330 μ A
- 轨至轨输入和输出
- 低输入失调电压： ± 0.33 mV
- 单位增益带宽：5MHz
- 低宽带噪声：15nV/ $\sqrt{\text{Hz}}$
- 低输入偏置电流：2pA
- 单位增益稳定
- 内置 RFI 和 EMI 滤波器
- 适用于低成本应用的可扩展 CMOS 运算放大器系列
- 可在电源电压低至 1.8V 的情况下运行
- 工作温度范围：-40°C 至 125°C

2 应用

- HVAC：暖通空调
- 光电二极管放大器
- 用于实现直流电机控制的电流分流监控
- 白色家电（冰箱、洗衣机等）
- 传感器信号调节
- 有源滤波器
- 低侧电流检测

3 说明

TLV9051、TLV9052 和 TLV9054 器件分别为单通道、双通道和四通道的运算放大器。这些器件可在 1.8V 至 6.0V 的低电压下运行。输入和输出可以在非常高的压摆率下轨到轨运行。这些器件非常适合需要低工作电压、高压摆率和低静态电流的成本受限应用。TLV905x 系列的容性负载驱动器具有 150pF 的电容，而电阻式开环输出阻抗使其能够在更高的容性负载下更轻松地实现稳定。

$$\frac{V_{\text{OUT}}}{V_{\text{IN}}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1 C_1}\right)$$

单极低通滤波器

TLV905xS 器件具有关断模式，允许放大器切换至典型电流消耗低于 1 μ A 的待机模式。

TLV905x 系列易于使用，因为它具有稳定的单位增益，集成了 RFI 和 EMI 滤波器，且不会在过驱动情况下出现相位反转。

器件信息

器件型号 ⁽¹⁾	通道数	封装 ⁽²⁾	封装尺寸 ⁽⁴⁾
TLV9051	单通道	DBV (SOT-23, 5)	2.9mm × 2.8mm
		DCK (SC70, 5)	2mm × 2.1mm
		DRL (SOT553, 5) ⁽³⁾	1.6mm × 1.6mm
		DPW (X2SON, 5)	0.8mm × 0.8mm
TLV9051S	单通道, 关断	DBV (SOT-23, 6)	2.9mm × 2.8mm
TLV9052	双通道	D (SOIC, 8)	4.9mm × 6mm
		PW (TSSOP, 8)	3mm × 6.4mm
		DGK (VSSOP, 8)	3mm × 4.9mm
		DDF (SOT-23, 8)	2.9mm × 2.8mm
		DSG (WSON, 8)	2mm × 2mm
TLV9052S	双通道, 关断	DGS (VSSOP, 10)	3mm × 4.9mm
		RUG (X2QFN, 10)	1.5mm × 2mm
TLV9054	四通道	D (SOIC, 14)	8.65mm × 6mm
		PW (TSSOP, 14)	5mm × 6.4mm
		RUC (WQFN, 14)	2mm × 2mm
		RTE (WQFN, 16)	3mm × 3mm
TLV9054S	四通道, 关断	RTE (WQFN, 16)	3mm × 3mm

- (1) 请参阅 [器件比较](#)
- (2) 有关更多信息，请参阅 [节 11](#)
- (3) 封装仅为预发布状态。
- (4) 封装尺寸（长 × 宽）为标称值，并包括引脚（如适用）。

V+	2	—	Positive (high) supply

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT	
Supply voltage			7	V	
Signal input pins	Voltage ⁽²⁾	Common-mode	(V ⁻) - 0.5	(V ⁺) + 0.5	V
		Differential	(V ⁺) - (V ⁻) + 0.2		
	Current ⁽²⁾	- 10	10	mA	
Output short-circuit ⁽³⁾		Continuous		mA	
Temperature	Specified, T _A	- 40	125	°C	
	Junction, T _J		150		
	Storage, T _{stg}	- 65	150		

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input pins are diode-clamped to the power-supply rails. Current limit input signals that can swing more than 0.5 V beyond the supply rails to 10 mA or less.
- (3) Short-circuit to ground, one amplifier per package.

6.2 ESD Ratings

			VALUE	UNIT
TLV9051 X2SON PACKAGE				
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±3000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	
ALL OTHER PACKAGES				
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _S	Supply voltage, V _S = (V ⁺) - (V ⁻)	1.8	6.0	V
V _{IN}	Input pin voltage	(V ⁻) - 0.1	(V ⁺) + 0.1	V
	Specified temperature	- 40	125	°C

6.4 Thermal Information for Single Channel

THD + N	Total harmonic distortion + noise ⁽¹⁾	$V_S = 5.5\text{ V}$, $V_{CM} = 2.5\text{ V}$, $V_O = 1\text{ V}_{RMS}$, $G = +1$, $f = 1\text{ kHz}$		0.0006%		
OUTPUT						

6.7 Electrical Characteristics: V_S (Total Supply Voltage) = $(V+) - (V-) = 1.8\text{ V to }5.5\text{ V}$ (续)

at $T_A = 25^\circ\text{C}$, $R_L = 10\text{ k}\Omega$ connected to $V_S / 2$, $V_{CM} = V_S / 2$, and $V_{OUT} = V_S / 2$ (unless otherwise noted);

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_O	Voltage output swing from supply rails	$V_S = 5.5\text{ V}$, $R_L = 10\text{ k}\Omega$,			16	mV
		$V_S = 5.5\text{ V}$, $R_L = 2\text{ k}\Omega$,			40	
I_{SC}	Short-circuit current	$V_S = 5\text{ V}$		± 50		mA
Z_O	Open-loop output impedance	$V_S = 5\text{ V}$, $f = 5\text{ MHz}$		250		Ω
POWER SUPPLY						
I_Q	Quiescent current per amplifier	$V_S = 5.5\text{ V}$, $I_O = 0\text{ mA}$,		330	450	μA
		$V_S = 5.5\text{ V}$, $I_O = 0\text{ mA}$, $T_A = -40^\circ\text{C to }+125^\circ\text{C}$			475	
SHUTDOWN						
I_{QSD}	Quiescent current per amplifier	$V_S = 1.8\text{ to }5.5\text{ V}$, all amplifiers disabled, SHDN = V-		0.35	1	μA
Z_{SHDN}	Output impedance	$V_S = 1.8\text{ to }5.5\text{ V}$, amplifier disabled		$10 \parallel 2$		$\text{G}\Omega \parallel \text{pF}$
	High-level voltage shutdown threshold (amplifier enabled)	$V_S = 1.8\text{ to }5.5\text{ V}$		$(V-) + 0.9$	$(V-) + 1.1$	V
	Low-level voltage shutdown threshold (amplifier disabled)	$V_S = 1.8\text{ to }5.5\text{ V}$	$(V-) + 0.2$	$(V-) + 0.7$		V
t_{ON}	Amplifier enabled time (full shutdown) ^{(3) (4)}			35		μs
t_{ON}	Amplifier enabled time (partial shutdown) ^{(3) (4)}			10		μs
t_{OFF}	Amplifier disabled time ⁽³⁾			6		μs
	SHDN pin input bias current (per pin)	$V_S = 1.8\text{ V to }5.5\text{ V}$, $V+ \geq (V+) - 0.8\text{ V}$		6.5		nA
	SHDN pin input bias current (per pin)	$V_S = 1.8\text{ V to }5.5\text{ V}$, $V+ \leq (V-) + 0.8\text{ V}$		155		nA

- (1) Third-order filter; bandwidth = 80 kHz at -3 dB.
- (2) Specified by design and characterization; not production tested.
- (3) Disable time (t_{OFF}) and enable time (t_{ON}) are defined as the time interval between the 50% point of the signal applied to the SHDN pin and the point at which the output voltage reaches the 10% (disable) or 90% (enable) level.
- (4) Full shutdown refers to the dual TLV9052S having both channels 1 and 2 disabled (SHDN1 = SHDN2 = V-) and the quad TLV9054S having all channels 1 to 4 disabled (SHDN12 = SHDN34 = V-). For partial shutdown, only one SHDN pin is exercised; in this mode, the internal biasing circuitry remains operational and the enable time is shorter.

7 Detailed Description

7.1 Overview

The TLV905x devices are a 5MHz family of low-power, rail-to-rail input and output op amps. These devices operate from 1.8V to 5.5V, are unity-gain stable, and are designed for a wide range of general-purpose applications. The input common-mode voltage range includes both rails and allows the TLV905x family to be used in virtually any single-supply application. The unique combination of a high slew rate and low quiescent current makes this family a potential choice for battery-powered motor-drive applications. Rail-to-rail input and output swing significantly increase dynamic range, especially in low-supply applications.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Operating Voltage

The TLV905x family of op amps is specified for operation from 1.8V to 6.0V. In addition, many specifications apply from -40°C to 125°C . Parameters that vary significantly with operating voltages or temperature are illustrated in the [# 6.8](#).

7.3.2 Rail-to-Rail Input

The input common-mode voltage range of the TLV905x family extends 100mV beyond the supply rails for the full supply voltage range of 1.8V to 6.0V. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in the [# 7.2](#). The N-channel pair is active for input voltages close to the positive rail, typically $(V+) - 1.4\text{V}$ to 200mV above the positive supply, whereas the P-channel pair is active for inputs from 200mV below the negative supply to approximately $(V+) - 1.4\text{V}$. There is a small transition region, typically $(V+) - 1.2\text{V}$ to $(V+) - 1\text{V}$, in which both pairs are on. This 200-mV transition region can vary up to 200mV with process variation. Thus, the transition region (with both stages on) can range from $(V+) - 1.4\text{V}$ to $(V+) - 1.2\text{V}$ on the low end, and up to $(V+) - 1\text{V}$ to $(V+) - 0.8\text{V}$ on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can degrade compared to device operation outside this region.

7.3.3 Rail-to-Rail Output

Designed as low-power, low-voltage operational amplifiers, the TLV905x family delivers a robust output drive capability. A class AB output stage with common-source transistors achieves full rail-to-rail output swing capability. For resistive loads of $10\text{k}\Omega$, the output swings to within 16mV of either supply rail, regardless of the applied power-supply voltage. Different load conditions change the ability of the amplifier to swing close to the rails.

7.3.4 EMI Rejection

The TLV905x uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the TLV905x benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10MHz to 6GHz. [图 7-1](#) shows the results of this testing on the TLV905x. [表 7-1](#) shows the EMIRR IN+ values for the TLV905x at particular frequencies commonly encountered in real-world applications. The [EMI Rejection Ratio of Operational Amplifiers](#) application report contains detailed information on the topic of EMIRR performance as it relates to op amps and is available for download from www.ti.com.

图 7-1. EMIRR Testing

表 7-1. TLV905x EMIRR IN+ for Frequencies of Interest

FREQUENCY	APPLICATION OR ALLOCATION	EMIRR IN+
400MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	41.8dB
900MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6GHz), GSM, aeronautical mobile, UHF applications	53.1dB
1.8GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1GHz to 2GHz)	71.8dB
2.4GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2GHz to 4GHz)	70.0dB
3.6GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	81.2dB
5GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4GHz to 8GHz)	92.5dB

7.3.5 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, because of the high input voltage or high gain. After the device enters the saturation region, the output devices require time to return to the linear operating state. After the output devices return to their linear operating state, the device begins to slew at the specified slew rate. Therefore, the propagation delay (in case of an overload condition) is the sum of the overload recovery time and the slew time. The overload recovery time for the TLV905x family is approximately 300 ns.

7.3.6 Packages With an Exposed Thermal Pad

The TLV905x family is available in packages such as the WSON-8 (DSG) and WQFN-16 (RTE) which feature an exposed thermal pad. Inside the package, the die is attached to this thermal pad using an electrically conductive compound. For this reason, when using a package with an exposed thermal pad, the thermal pad must either be connected to V₋ or left floating. Attaching the thermal pad to a potential other than V₋ is not allowed, and the performance of the device is not verified when doing so.

7.3.7 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but can involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Having a good understanding of this basic ESD circuitry and its relevance to an electrical overstress event is helpful. 图 7-2 shows the ESD circuits contained in the TLV905x devices. The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power supply lines, where they meet at an absorption device internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.

图 7-2. Equivalent Internal ESD Circuitry

7.3.8 Input Protection

The TLV905x family incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10mA, as shown in the 节 6.1. 图 7-3 shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

图 7-3. Input Current Protection

7.3.9 Shutdown Function

The TLV905xS devices feature $\overline{\text{SHDN}}$ pins that disable the op amp, placing the device into a low-power standby mode. In this mode, the op amp consumes 1 μ A of maximum quiescent current, referred to as I_{QSD}. The $\overline{\text{SHDN}}$ pins are active low, meaning that shutdown mode is enabled when the input to the $\overline{\text{SHDN}}$ pin is a valid logic low.

The $\overline{\text{SHDN}}$ pins are referenced to the negative supply voltage of the op amp. The threshold of the shutdown feature lies around 800mV (typical) and does not change with respect to the supply voltage. Hysteresis has been included in the switching threshold for smooth switching characteristics. For shutdown behavior, the $\overline{\text{SHDN}}$ pins should be driven with valid logic signals. A valid logic low is defined as a voltage between V₋ and V₋ + 0.4V. A valid logic high is defined as a voltage between V₋ + 1.2V and V₊. The shutdown pin circuitry includes a pull-up resistor, which will inherently pull the voltage of the pin to the positive supply rail if not driven. Thus, to enable the amplifier, the $\overline{\text{SHDN}}$ pins must either be left floating or driven to a valid logic high. To disable the amplifier, the $\overline{\text{SHDN}}$ pins must be driven to a valid logic low. While TI highly recommends that the shutdown pin be connected to a valid high or a low voltage or driven, TI has included a pull-up resistor connected to VCC. The maximum voltage allowed at the $\overline{\text{SHDN}}$ pins is (V₊) + 0.5V. Exceeding this voltage level will damage the device.

The $\overline{\text{SHDN}}$ pins are high-impedance CMOS inputs. Dual op amp versions are independently controlled and quad op amp versions are controlled in pairs with logic inputs. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is 35 μs for full shutdown of all channels; disable time is 6 μs . When disabled, the output assumes a high-impedance state. This architecture allows the TLV905xS to be operated as a gated amplifier (or to have the device output multiplexed onto a common analog output bus). Shutdown time (t_{OFF}) depends on loading conditions and increases as load resistance increases. For shutdown (disable) within a specific shutdown time, the specified 10k Ω load to midsupply ($V_{\text{S}} / 2$) is required. If using the TLV905xS without a load, the resulting turnoff time is significantly increased.

7.4 Device Functional Modes

The TLV905x family is operational when the power-supply voltage is between 1.8V ($\pm 0.9\text{V}$) and 6.0V ($\pm 3.0\text{V}$).

The TLV905xS devices feature a shutdown mode and are shutdown when a valid logic low is applied to the shutdown pin.

8 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Application Information

The TLV905x family features 5MHz bandwidth and very high slew rate of 15V/ μ s with only 330 μ A of supply current per channel, providing excellent AC performance at very low-power consumption. DC applications are well served with a very low input noise voltage of 15nV/ $\sqrt{\text{Hz}}$ at 10kHz, low input bias current, and a typical input offset voltage of 0.33mV.

8.2 Typical Low-Side Current Sense Application

图 8-1 shows the TLV905x configured in a low-side current sensing application.

图 8-1. TLV905x in a Low-Side, Current-Sensing Application

8.2.1 Design Requirements

The design requirements for this design are:

- Load current: 0A to 1A
- Output voltage: 4.95V
- Maximum shunt voltage: 100mV

8.2.2 Detailed Design Procedure

The transfer function of the circuit in [图 8-1](#) is given in [方程式 1](#).

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times \text{Gain} \quad (1)$$

The load current (I_{LOAD}) produces a voltage drop across the shunt resistor (R_{SHUNT}). The load current is set from 0A to 1A. To keep the shunt voltage below 100mV at maximum load current, the largest shunt resistor is defined using [方程式 2](#).

$$R_{SHUNT} = \frac{V_{SHUNT_MAX}}{I_{LOAD_MAX}} = \frac{100 \text{ mV}}{1 \text{ A}} = 100 \text{ m}\Omega \quad (2)$$

Using [方程式 2](#), R_{SHUNT} equals 100 m Ω . The voltage drop produced by I_{LOAD} and R_{SHUNT} is amplified by the TLV905x device to produce an output voltage of approximately 0V to 4.95V. [方程式 3](#) calculates the gain required for the TLV905x device to produce the required output voltage.

$$\text{Gain} = \frac{(V_{OUT_MAX} - V_{OUT_MIN})}{(V_{IN_MAX} - V_{IN_MIN})} \quad (3)$$

Using [方程式 3](#), the required gain equals 49.5V/V, which is set with the R_F and R_G resistors. [方程式 4](#) sizes the R_F and R_G , resistors to set the gain of the TLV905x device to 49.5V/V.

$$\text{Gain} = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Selecting R_F to equal 165k Ω and R_G to equal 3.4k Ω provides a combination that equals approximately 49.5V/V. [图 8-2](#) shows the measured transfer function of the circuit shown in [图 8-1](#).

8.2.3 Application Curve

图 8-2. Low-Side, Current-Sense Transfer Function

8.3 Power Supply Recommendations

The TLV905x family is specified for operation from 1.8V to 6.0V ($\pm 0.9V$ to $\pm 3.0V$); many specifications apply from -40°C to 125°C . The [§ 6.8](#) section presents parameters that can exhibit significant variance with regard to operating voltage or temperature.

小心

Supply voltages larger than 7V can permanently damage the device; see the [§ 6.1](#) table.

Place 0.1 μF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more-detailed information on bypass capacitor placement, see the [§ 8.4.2](#) section.

8.4 Layout

8.4.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and of the op amp itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
 - Connect low-ESR, 0.1 μF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see [Circuit Board Layout Techniques](#).
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicular is much better as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. As illustrated in [图 8-4](#), keeping R_F and R_G close to the inverting input minimizes parasitic capacitance on the inverting input.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

10 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision I (November 2022) to Revision J (February 2024)

	Page
• Changed pins 3 and 4 the TLV9051S DBV pin diagram.....	3
• Added shutdown section into the Electrical Characteristics table.....	11

Changes from Revision H (October 2019) to Revision I (November 2022) **Page**

- Increased maximum supply voltage in *Absolute Maximum Ratings* from 6 V to 7 V..... 9
 - Added maximum limits for input bias current and input offset current..... 11
-

Changes from Revision G (September 2019) to Revision H (October 2019) **Page**

- Added new human-body model and charged-device model ratings for TLV9051 X2SON package to the *ESD Ratings* 9
 - Added *Packages With an Exposed Thermal Pad* section to *Feature Description* section..... 22
-

Changes from Revision F (June 2019) to Revision G (September 2019) **Page**

- 删除了所有 TLV9051 封装的预发布标记..... 1
 - 删除了 TLV9052 SOT-23 (8) - DDF 封装的预发布标记..... 1
 - Added link to *Shutdown Function* section in all of the $\overline{\text{SHDN}}$ pin function rows.....3
 - Added *EMI Rejection* section to *Feature Description* section.....21
 - Added clarification to the *Shutdown Function* section.....23
-

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4221848/A 02/2015

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

GENERIC PACKAGE VIEW

RUC 14

X2QFN - 0.4 mm max height

2 x 2, 0.4 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4229871/A

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 23X

SOLDER MASK DETAILS

4220584/A 05/2019

NOTES: (continued)

- For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

EXAMPLE STENCIL DESIGN

RUC0014A

X2QFN - 0.4 mm max height

PLASTIC QUAD FLAT PACK- NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.100mm THICK STENCIL
SCALE: 23X

4220584/A 05/2019

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

DGS0010A

PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

4221984/A 05/2015

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187, variation BA.

EXAMPLE BOARD LAYOUT

DGS0010A

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
SCALE:10X

SOLDER MASK DETAILS
NOT TO SCALE

4221984/A 05/2015

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DGS0010A

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:10X

4221984/A 05/2015

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
