

具有 I²C 接口、GPIO 和 CRC 的 ADS7138-Q1 小型 8 通道 12 位 ADC

1 特性

- 符合面向汽车应用的 AEC-Q100 标准：
 - 温度等级 1: -40°C 至 125°C, T_A
- 小封装尺寸：
 - 3mm × 3mm WQFN
 - 可湿性侧面，可目视检查焊点
- 8 通道，可配置为以下任意组合：
 - 最多 8 个模拟输入、数字输入或数字输出
- 用于 I/O 扩展的 GPIO：
 - 开漏、推挽数字输出
- 宽工作范围：
 - AVDD：2.35V 至 5.5V
 - DVDD1.65V 至 5.5V
 - 温度范围：-40°C 至 +125°C
- 用于读取/写入操作的 CRC：
 - 数据读取/写入 CRC
 - 上电配置 CRC
- I²C 接口：
 - 高达 3.4MHz (高速模式)
 - 8 个可配置 I²C 地址
- 可编程均值滤波器：
 - 用于求平均值的可编程样本大小
 - 利用内部转换求平均值
 - 用于计算平均输出的 16 位分辨率
- 速度高达 3.2MSPS 的涡轮比较器模式

2 应用

- 不具有处理功能的摄像头模块
- 汽车中心信息显示屏
- 汽车仪表组显示屏

3 说明

ADS7138-Q1 是一款易于使用的 8 通道多路复用 12 位逐次逼近寄存器模数转换器 (SAR ADC)。8 个通道可独立配置为模拟输入、数字输入或数字输出。该器件具有一个用于执行 ADC 转换过程的内部振荡器。

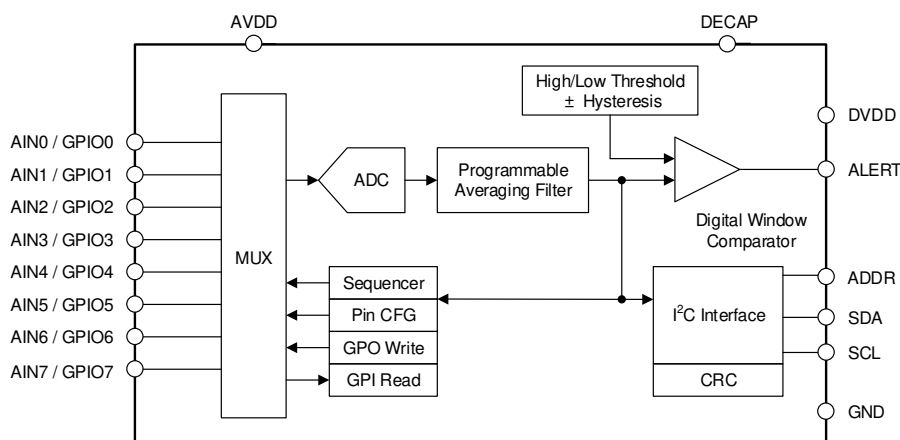

ADS7138-Q1 通过兼容 I²C 的接口进行通信，既可在自主转换模式下工作，也可在单冲转换模式下工作。ADS7138-Q1 使用具有可编程高低阈值、迟滞和事件计数器的数字窗口比较器，通过每通道事件触发的中断来实现模拟看门狗功能。ADS7138-Q1 具有用于数据读取/写入操作和上电配置的内置循环冗余校验 (CRC) 功能。

器件信息 (1)

| 器件名称 | 封装 | 封装尺寸 (标称值) |
|------------|-----------|-----------------|
| ADS7138-Q1 | WQFN (16) | 3.00mm × 3.00mm |

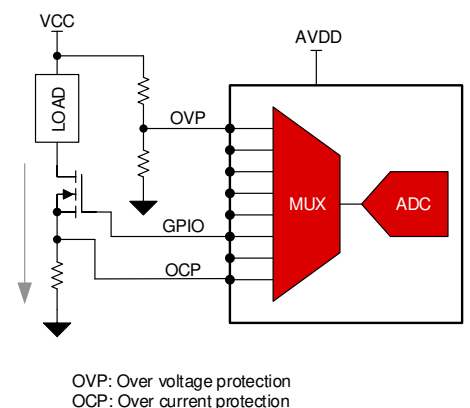

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

6 Pin Configuration and Functions

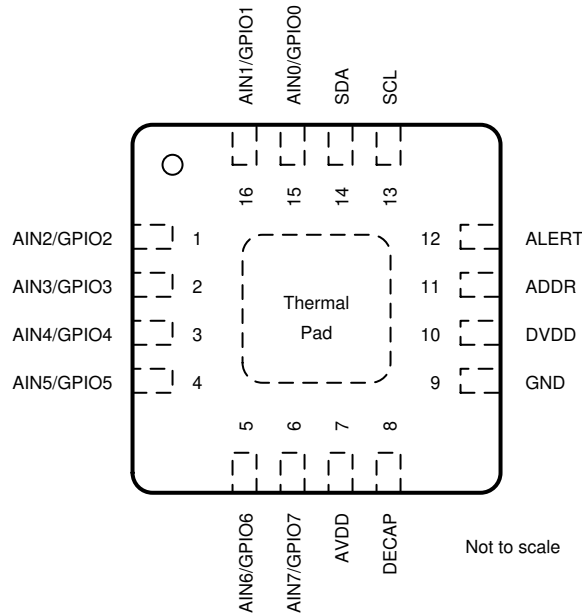

图 6-1. RTE Package, 16-Pin WQFN, Top View

表 6-1. Pin Functions

| PIN | | FUNCTION ⁽¹⁾ | DESCRIPTION |
|-------------|-----|-------------------------|---|
| NAME | NO. | | |
| AIN0/GPIO0 | 15 | AI, DI, DO | Channel 0; configurable as either an analog input (default) or a general-purpose input/output (GPIO). |
| AIN1/GPIO1 | 16 | AI, DI, DO | Channel 1; configurable as either an analog input (default) or a GPIO. |
| AIN2/GPIO2 | 1 | AI, DI, DO | Channel 2; configurable as either an analog input (default) or a GPIO. |
| AIN3/GPIO3 | 2 | AI, DI, DO | Channel 3; configurable as either an analog input (default) or a GPIO. |
| AIN4/GPIO4 | 3 | AI, DI, DO | Channel 4; configurable as either an analog input (default) or a GPIO. |
| AIN5/GPIO5 | 4 | AI, DI, DO | Channel 5; configurable as either an analog input (default) or a GPIO. |
| AIN6/GPIO6 | 5 | AI, DI, DO | Channel 6; configurable as either an analog input (default) or a GPIO. |
| AIN7/GPIO7 | 6 | AI, DI, DO | Channel 7; configurable as either an analog input (default) or a GPIO. |
| ADDR | 11 | AI | Input for selecting the device I ² C address. Connect a resistor to this pin from DECAP pin or GND to select one of the eight addresses. |
| ALERT | 12 | Digital output | Open-drain (default) or push-pull output for the digital comparator. |
| AVDD | 7 | Supply | Analog supply input, also used as the reference voltage to the ADC; connect a 1- μ F decoupling capacitor to GND. |
| DECAP | 8 | Supply | Connect a 1- μ F decoupling capacitor between the DECAP and GND pins for the internal power supply. |
| DVDD | 10 | Supply | Digital I/O supply voltage; connect a 1- μ F decoupling capacitor to GND. |
| GND | 9 | Supply | Ground for the power supply; all analog and digital signals are referred to this pin voltage. |
| SDA | 14 | DI, DO | Serial data input or output for the I ² C interface. |
| SCL | 13 | DI | Serial clock for the I ² C interface. |
| Thermal pad | — | Supply | Exposed thermal pad; connect to GND. |

Pin Functions

| PIN | | FUNCTION ⁽¹⁾ | DESCRIPTION |
|-------------|-----|-------------------------|---|
| NAME | NO. | | |
| AIN0/GPIO0 | 15 | AI, DI, DO | Channel 0; configurable as either an analog input (default) or a general-purpose input/output (GPIO). |
| AIN1/GPIO1 | 16 | AI, DI, DO | Channel 1; configurable as either an analog input (default) or a GPIO. |
| AIN2/GPIO2 | 1 | AI, DI, DO | Channel 2; configurable as either an analog input (default) or a GPIO. |
| AIN3/GPIO3 | 2 | AI, DI, DO | Channel 3; configurable as either an analog input (default) or a GPIO. |
| AIN4/GPIO4 | 3 | AI, DI, DO | Channel 4; configurable as either an analog input (default) or a GPIO. |
| AIN5/GPIO5 | 4 | AI, DI, DO | Channel 5; configurable as either an analog input (default) or a GPIO. |
| AIN6/GPIO6 | 5 | AI, DI, DO | Channel 6; configurable as either an analog input (default) or a GPIO. |
| AIN7/GPIO7 | 6 | AI, DI, DO | Channel 7; configurable as either an analog input (default) or a GPIO. |
| ADDR | 11 | AI | Input for selecting the device I ² C address. Connect a resistor to this pin from DECAP pin or GND to select one of the eight addresses. |
| ALERT | 12 | Digital output | Open-drain (default) or push-pull output for the digital comparator. |
| AVDD | 7 | Supply | Analog supply input, also used as the reference voltage to the ADC; connect a 1- μ F decoupling capacitor to GND. |
| DECAP | 8 | Supply | Connect a 1- μ F decoupling capacitor between the DECAP and GND pins for the internal power supply. |
| DVDD | 10 | Supply | Digital I/O supply voltage; connect a 1- μ F decoupling capacitor to GND. |
| GND | 9 | Supply | Ground for the power supply; all analog and digital signals are referred to this pin voltage. |
| SDA | 14 | DI, DO | Serial data input or output for the I ² C interface. |
| SCL | 13 | DI | Serial clock for the I ² C interface. |
| Thermal pad | — | Supply | Exposed thermal pad; connect to GND. |

(1) AI = analog input, DI = digital input, and DO = digital output.

7 Specifications

7.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

| | MIN | MAX | UNIT |
|---|-----------|------------|------|
| DVDD to GND | - 0.3 | 5.5 | V |
| AVDD to GND | - 0.3 | 5.5 | V |
| AINx/GPOx ⁽³⁾ | GND - 0.3 | AVDD + 0.3 | V |
| ADDR | GND - 0.3 | 2.1 | V |
| Digital inputs | GND - 0.3 | 5.5 | V |
| Current through any pin except supply pins, SCL, and SDA ⁽²⁾ | - 10 | 10 | mA |
| Junction temperature, T _J | - 40 | 125 | °C |
| Storage temperature, T _{stg} | - 60 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Pin current must be limited to 10mA or less.
- (3) AINx/GPIOx refers to pins 1, 2, 3, 4, 5, 6, 15, and 16.

7.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|---|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per AEC Q100-011; corner pins (1, 4, 5, 8, 9, 12, 13, 16) | ±750 |
| | | Charged-device model (CDM), per AEC Q100-011; all other pins | ±500 |

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--------------------------|------------------------|---------------------------------------|-------|-----|------------|------|
| POWER SUPPLY | | | | | | |
| AVDD | Analog supply voltage | | 2.35 | 3.3 | 5.5 | V |
| DVDD | Digital supply voltage | | 1.65 | 3.3 | 5.5 | V |
| ANALOG INPUTS | | | | | | |
| FSR | Full-scale input range | AIN _x ⁽¹⁾ - GND | 0 | | AVDD | V |
| V _{IN} | Absolute input voltage | AIN _x - GND | - 0.1 | | AVDD + 0.1 | V |
| TEMPERATURE RANGE | | | | | | |
| T _A | Ambient temperature | | - 40 | 25 | 125 | °C |

- (1) AIN_x refers to AIN0, AIN1, AIN2, AIN3, AIN4, AIN5, AIN6, and AIN7.

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | ADS7138-Q1 | UNIT |
|-------------------------------|--|------------|------|
| | | RTE (WQFN) | |
| | | 16 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 49.7 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 53.4 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 24.7 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 1.3 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 24.7 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 9.3 | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C; typical values at T_A = 25°C.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--|------------------------------------|--|------------|------------|------------|--------|
| ANALOG INPUTS | | | | | | |
| C _{SH} | Sampling capacitance | | | 12 | | pF |
| DC PERFORMANCE | | | | | | |
| | Resolution | No missing codes | | 12 | | bits |
| DNL | Differential nonlinearity | | - 0.75 | ±0.2 | 0.75 | LSB |
| INL | Integral nonlinearity | | - 1.5 | ±0.45 | 1.5 | LSB |

| V _{OL} | Output low logic level | I _{SINK} = 2 mA | 0 | 0.2 x AVDD | | V |
| I _{OH} | Output high source current | V _{OH} > 0.7 x AVDD | | | 5 | mA |
| I _{OL} | Output low sink current | V _{OL} < 0.3 x AVDD | | | 5 | mA |
| DIGITAL OUTPUT (ALERT) | | | | | | |
| V _{OH} | Output high logic level | GPO_DRIVE_CFG = push-pull, I _{SOURCE} = 2 mA | 0.8 x DVDD | | DVDD | V |
| V _{OL} | Output low logic level | I _{SINK} = 2 mA | 0 | 0.2 x DVDD | | V |

7.5 Electrical Characteristics (continued)

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C; typical values at T_A = 25°C.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------------|--------------------------|--|-----|-----|-----|------|
| I _{OH} | Output high sink current | V _{OH} > 0.7 × DVDD | | | 5 | mA |
| I _{OL} | Output low sink current | V _{OL} < 0.3 × DVDD | | | 5 | mA |
| POWER SUPPLY CURRENTS | | | | | | |
| I _{AVDD} | Analog supply current | I ² C high-speed mode, AVDD = 5 V | | 130 | 210 | μA |
| | | I ² C fast mode plus, AVDD = 5 V | | 45 | 85 | |
| | | I ² C fast mode, AVDD = 5 V | | 25 | 46 | |
| | | I ² C standard mode, AVDD = 5 V | | 12 | 26 | |
| | | No conversion, AVDD = 5 V | | 7 | 20 | |

7.6 I²C Timing Requirements

| | | MODE ⁽²⁾ | | | | UNIT |
|---------------------|--|------------------------------------|------|-----------------|------|------|
| | | STANDARD, FAST, AND FAST MODE PLUS | | HIGH-SPEED MODE | | |
| | | MIN | MAX | MIN | MAX | |
| f _{SCL} | SCL clock frequency ⁽¹⁾ | 1 | | 3.4 | | MHz |
| t _{SU,STA} | Setup time for a repeated START condition | 260 | | 160 | | ns |
| t _{HD,STA} | Hold time after repeated START condition. After this period, the first clock is generated. | 260 | | 160 | | ns |
| t _{LOW} | Low period of the SCL clock pin | 500 | | 160 | | ns |
| t _{HIGH} | High period for the SCL clock pin | 260 | | 60 | | ns |
| t _{SU,DAT} | Data in setup time | 50 | | 10 | | ns |
| t _{HD,DAT} | Data in hold time | 0 | | 0 | | ns |
| t _R | SCL rise time, standard mode | | 1000 | | 1000 | ns |
| | SCL rise time, fast mode | | 300 | | 300 | ns |
| | SCL rise time, fast mode plus | | 120 | | 120 | ns |
| | SCL rise time, high-speed mode | | - | | 80 | ns |
| t _F | SCL fall time, standard mode | | 300 | | 300 | ns |
| | SCL fall time, fast mode | | 300 | | 300 | ns |
| | SCL fall time, fast mode plus | | 120 | | 120 | ns |
| | SCL fall time, high-speed mode | | - | | 80 | ns |
| t _{SU,STO} | STOP condition hold time | 260 | | 60 | | ns |
| t _{BUF} | Bus free time before new transmission | 500 | | 300 | | ns |

(1) Bus load (C_B) consideration; C_B ≤ 400 pF for f_{SCL} ≤ 1 MHz; C_B < 100 pF for f_{SCL} = 3.4 MHz.

(2) The device supports standard, full-speed, and fast modes by default on power-up. For selecting high-speed mode refer to the section on [Configuring the Device for High-Speed I2C Mode](#).

7.7 Timing Requirements

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C; typical values at T_A = 25°C.

| | | MIN | MAX | UNIT |
|------------------|---|-----|-----|------|
| t _{ACQ} | Acquisition time (CONV_MODE = 00b or 01b) | 300 | | ns |
| | Acquisition time in turbo comparator mode (CONV_MODE = 10b) | 90 | | |

7.8 I²C Switching Characteristics

| | | MODE | | | | UNIT |
|----------------------|--|------------------------------------|------|-----------------|------|------|
| | | STANDARD, FAST, AND FAST MODE PLUS | | HIGH-SPEED MODE | | |
| | | MIN | MAX | MIN | MAX | |
| t _F | Fall time for SDA | | 120 | | 80 | ns |
| t _{VD,DATA} | SCL low to SDA data out valid | | 450 | | 200 | ns |
| t _{VD,DATA} | SCL low to SDA data out valid | | 450 | | 200 | ns |
| t _{VD,ACK} | SCL low to SDA acknowledge time | | 450 | | 200 | ns |
| t _{STRETCH} | Clock stretch time (OSR[2:0] = 000b) | | 1400 | | 1000 | ns |
| t _{SP} | Noise suppression time constant on SDA and SCL | | 50 | | 10 | ns |

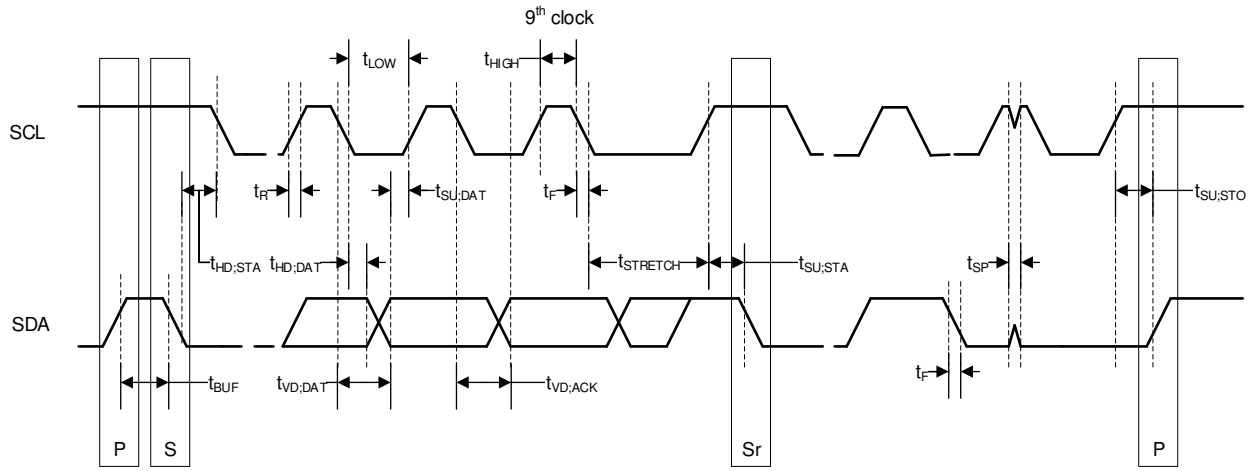

7.9 Switching Characteristics

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C ; typical values at T_A = 25°C.

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|-------------------------|--|---|-----|----------------------|------|
| CONVERSION CYCLE | | | | | |
| t _{CONV} | ADC conversion time | <i>Manual Mode and Auto-Sequence Mode</i> | | t _{STRETCH} | ns |
| | | <i>Autonomous Mode</i> | | 600 | |
| | ADC comparison time in turbo comparator mode | <i>Turbo Comparator Mode</i> | | 192 | |
| RESET AND ALERT | | | | | |
| t _{PU} | Power-up time for device | AVDD ≥ 2.35 V | | 5 | ms |
| t _{RST} | Delay time; RST bit = 1b to device reset complete ⁽¹⁾ | | | 5 | ms |
| t _{ALERT_HI} | ALERT high period | ALERT_LOGIC[1:0] = 1x | 50 | 150 | ns |
| t _{ALERT_LO} | ALERT low period | ALERT_LOGIC[1:0] = 1x | 50 | 150 | ns |

(1) RST bit is automatically reset to 0b after t_{RST}.

8 Detailed Description

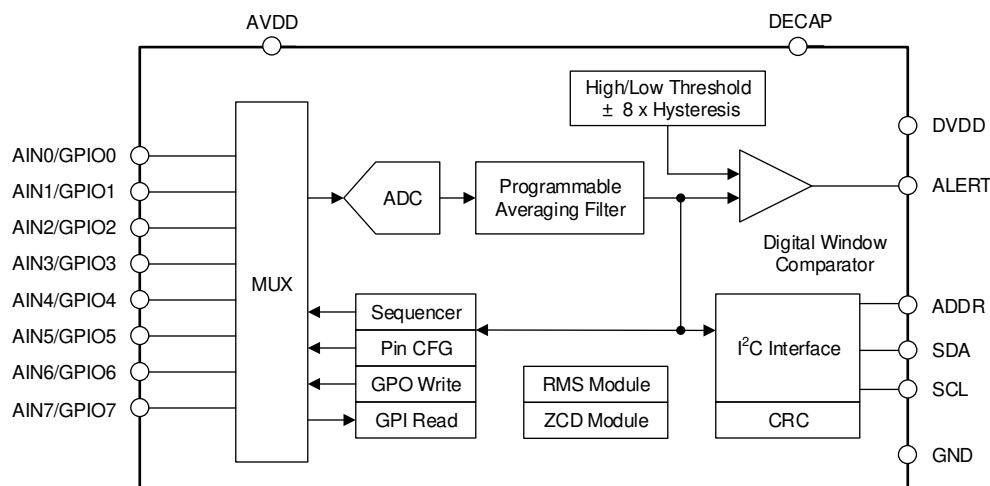

8.1 Overview

The ADS7138-Q1 is a small, eight-channel, multiplexed, 12-bit, analog-to-digital converter (ADC) with an I²C-compatible serial interface. The eight channels of the ADS7138-Q1 can be individually configured as either analog inputs, digital inputs, or digital outputs. The device includes a digital window comparator with a dedicated ALERT pin that can be used to alert the host when a programmed high or low threshold is crossed on any input channel. The device uses an internal oscillator for conversion. The ADC can be used in manual mode for reading ADC data over the I²C interface or in autonomous and turbo comparator modes for monitoring the analog inputs without an active I²C interface.

The device features a programmable averaging filter that outputs a 16-bit result for enhanced resolution.

The I²C serial interface supports standard-mode, fast-mode, fast-mode plus, and high-speed mode. The device also features an 8-bit cyclic redundancy check (CRC) for the serial communication interface.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Multiplexer and ADC

The eight channels of the multiplexer can be independently configured as ADC inputs or general-purpose inputs/outputs (GPIOs). As shown in [Figure 8-1](#) every AINx/GPIOx channel has ESD protection diodes to AVDD and GND. On power-up or after device reset, all eight multiplexer channels are configured as analog inputs.

[Figure 8-1](#) shows an equivalent circuit for pins configured as analog inputs. The ADC sampling switch is represented by an ideal switch (SW) in series with the resistor (R_{SW} , typically $150\ \Omega$), and the sampling capacitor (C_{SH}).

Figure 8-1. Analog Inputs, GPIOs, and ADC Connections

The SW switch is closed to allow the signal on the selected analog input channel to charge the internal sampling capacitor during acquisition time. The switch SW is opened to disconnect the sampling capacitor on the ninth falling edge of SCL.

The multiplexer channels can be configured as GPIOs using the PIN_CFG register. The direction of a GPIO (either as an input or an output) can be set in the GPIO_CFG register. The logic level on all device channels can be read from the GPI_VALUE register. The digital outputs can be configured by writing to the GPO_VALUE register. The digital outputs can be configured as either open-drain or push-pull in the GPO_DRIVE_CFG register.

8.3.2 Reference

The device uses the analog supply voltage (AVDD) as the reference for the analog-to-digital conversion process. TI recommends connecting a $1\text{-}\mu\text{F}$, low-equivalent series resistance (ESR) ceramic decoupling capacitor between the AVDD and GND pins.

8.3.3 ADC Transfer Function

The ADC output is in straight binary format. 方程式 1 computes the ADC resolution:

$$1 \text{ LSB} = V_{\text{REF}} / 2^N \tag{1}$$

where:

- $V_{\text{REF}} = \text{AVDD}$
- $N = 12$

图 8-2 和 表 8-1 detail the transfer characteristics for the device.

图 8-2. Ideal Transfer Characteristics

表 8-1. Transfer Characteristics

| INPUT VOLTAGE | CODE | IDEAL OUTPUT CODE |
|--|---------------------|-------------------|
| $\leq 1 \text{ LSB}$ | Zero | 000 |
| 1 LSB to 2 LSBs | Zero + 1 | 001 |
| $(\text{AVDD} / 2)$ to $(\text{AVDD} / 2) + 1 \text{ LSB}$ | Mid-scale code | 800 |
| $(\text{AVDD} / 2) + 1 \text{ LSB}$ to $(\text{AVDD} / 2) + 2 \text{ LSB}$ | Mid- scale code + 1 | 801 |
| $\geq \text{AVDD} - 1 \text{ LSB}$ | Full-scale code | FFF |

8.3.4 ADC Offset Calibration

The variation in the ADC offset error resulting from changes in temperature or AVDD can be calibrated by setting the CAL bit in the GENERAL_CFG register. The CAL bit is reset to 0 after calibration. The host can poll the CAL bit to check the ADC offset calibration completion status.

Multiplexer sequencing must be stopped (SEQ_START = 0b) before initiating offset calibration.

8.3.5 I²C Address Selector

The I²C address for the device is determined by connecting external resistors on the ADDR pin. The device address is determined at power-up based on the resistor values. The device retains this address until the next power-up event, until the next device reset, or until the device receives a command to program its own address .

图 8-3 shows a connection diagram for the ADDR pin and 表 8-2 lists the resistor values for selecting different addresses of the device.

图 8-3. External Resistor Connection Diagram for the ADDR Pin

表 8-2. I²C Address Selection

| RESISTORS | | ADDRESS |
|-------------------|--------------------|-----------------|
| R1 ⁽²⁾ | R2 ⁽²⁾ | |
| 0 Ω | DNP ⁽¹⁾ | 001 0111b (17h) |
| 11 kΩ | DNP | 001 0110b (16h) |
| 33 kΩ | DNP | 001 0101b (15h) |
| 100 kΩ | DNP | 001 0100b (14h) |
| DNP | 0 Ω or DNP | 001 0000b (10h) |
| DNP | 11 kΩ | 001 0001b (11h) |
| DNP | 33 kΩ | 001 0010b (12h) |
| DNP | 100 kΩ | 001 0011b (13h) |

(1) DNP = Do not populate.

(2) Tolerance for R1, R2 ≤ ±5%.

8.3.6 Oscillator and Timing Control

The device uses an internal oscillator for conversions. The host initiates the first conversion and all subsequent conversions are generated internally by the device when using the averaging module. However, in the autonomous mode of operation, the start of the conversion signal is generated by the device. As described in [表 8-3](#), the sampling rate can be controlled by the OSC_SEL and CLK_DIV register fields when the device initiates conversions internally.

The conversion time of the device, given by t_{CONV} in the [Switching Characteristics](#) table, is independent of the OSC_SEL and CLK_DIV configuration.

表 8-3. Configuring Sampling Rate for Internal Conversion Start Control

| CLK_DIV[3:0] | OSC_SEL = 0 | | OSC_SEL = 1 | |
|--------------|--|--|--|--|
| | SAMPLING FREQUENCY, f_{CYCLE_OSR} (KSPS) | CYCLE TIME, t_{CYCLE_OSR} (μ S) | SAMPLING FREQUENCY, f_{CYCLE_OSR} (KSPS) | CYCLE TIME, t_{CYCLE_OSR} (μ S) |
| 0000b | 1000 | 1 | 31.25 | 32 |
| 0001b | 666.7 | 1.5 | 20.83 | 48 |
| 0010b | 500 | 2 | 15.63 | 64 |
| 0011b | 333.3 | 3 | 10.42 | 96 |
| 0100b | 250 | 4 | 7.81 | 128 |
| 0101b | 166.7 | 6 | 5.21 | 192 |
| 0110b | 125 | 8 | 3.91 | 256 |
| 0111b | 83 | 12 | 2.60 | 384 |
| 1000b | 62.5 | 16 | 1.95 | 512 |
| 1001b | 41.7 | 24 | 1.3 | 768 |
| 1010b | 31.3 | 32 | 0.98 | 1024 |
| 1011b | 20.8 | 48 | 0.65 | 1536 |
| 1100b | 15.6 | 64 | 0.49 | 2048 |
| 1101b | 10.4 | 96 | 0.33 | 3072 |
| 1110b | 7.8 | 128 | 0.24 | 4096 |
| 1111b | 5.2 | 192 | 0.16 | 6144 |

The comparison time in the *turbo comparator mode* can be controlled by the OSC_SEL and CLK_DIV register fields, as shown in 表 8-4.

表 8-4. Configuring Comparison Rate for Turbo Comparator Mode

| CLK_DIV[3:0] | OSC_SEL = 0 | | OSC_SEL = 1 | |
|--------------|---|--|---|--|
| | COMPARISON RATE, $f_{\text{COMPARISON}}$ (kSPS) | CYCLE TIME, $t_{\text{CYCLE_COMP}}$ (μs) | COMPARISON RATE, $f_{\text{COMPARISON}}$ (kSPS) | CYCLE TIME, $t_{\text{CYCLE_COMP}}$ (μs) |
| 0000b | 3200 | 0.3125 | 100 | 10 |
| 0001b | 2133.3 | 0.46875 | 66.7 | 15 |
| 0010b | 1600 | 0.625 | 50 | 20 |
| 0011b | 1066.7 | 0.9375 | 33.3 | 30 |
| 0100b | 800 | 1.25 | 25 | 40 |
| 0101b | 533.3 | 1.875 | 16.67 | 60 |
| 0110b | 400 | 2.5 | 12.5 | 80 |
| 0111b | 266.7 | 3.75 | 8.33 | 120 |
| 1000b | 200 | 5 | 6.25 | 160 |
| 1001b | 133.3 | 7.5 | 4.17 | 240 |
| 1010b | 100 | 10 | 3.13 | 320 |
| 1011b | 66.7 | 15 | 2.08 | 480 |
| 1100b | 50 | 20 | 1.56 | 640 |
| 1101b | 33.3 | 30 | 1.04 | 960 |
| 1110b | 25 | 40 | 0.78 | 1280 |
| 1111b | 16.67 | 60 | 0.52 | 1920 |

8.3.7 General-Purpose I/Os (GPIOs)

The eight channels of the ADS7138-Q1 can be independently configured as analog inputs, digital inputs, or digital outputs. The device channels, as described in 表 8-5, can be configured as analog inputs or GPIOs using the PIN_CFG and GPIO_CFG registers.

表 8-5. Configuring Channels as Analog Inputs or GPIOs

| PIN_CFG[7:0] | GPIO_CFG[7:0] | GPO_DRIVE_CFG[7:0] | CHANNEL CONFIGURATION |
|--------------|---------------|--------------------|-----------------------------------|
| 0 | x | x | Analog input (default) |
| 1 | 0 | x | Digital input |
| 1 | 1 | 0 | Digital output; open-drain driver |
| 1 | 1 | 1 | Digital output; push-pull driver |

Digital outputs can be configured to logic 1 or 0 by writing to the GPO_VALUE register. Digital outputs can also be updated in response to event flags set by the digital window comparator (see the *Triggering Digital Outputs With a Digital Window Comparator* section for more details). Reading the GPI_VALUE register returns the logic level for all channels configured as analog inputs, digital inputs, and digital outputs.

8.3.8 Programmable Averaging Filter

The ADS7138-Q1 features a built-in oversampling (OSR) module that can be used to average several samples. The averaging filter can be enabled by programming the OSR[2:0] bits in the OSR_CFG register. The averaging filter configuration is common to all analog input channels. As shown in [图 8-4](#), the averaging filter module output is 16 bits long. Only the first conversion for the selected analog input channel must be initiated by the host. Any remaining conversions for the selected averaging factor are generated internally. The time required to complete the averaging operation is determined by the sampling speed and number of samples to be averaged; see the [Oscillator and Timing Control](#) section. The 16-bit result can be read out after the averaging operation completes. For more information about programmable averaging filters and performance results, see the [Resolution-Boosting ADS7138 Using Programmable Averaging Filter application report](#).

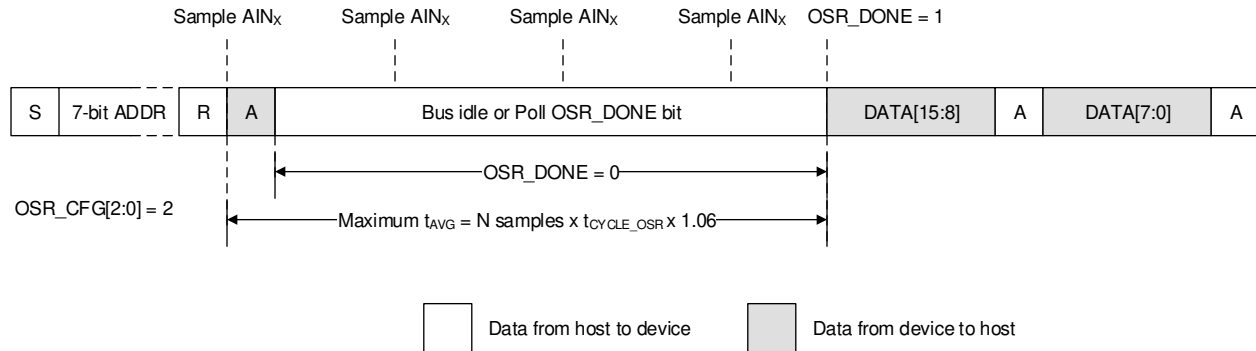

图 8-4. Averaging Example

As shown in [图 8-4](#), SCL is stretched by the device after the start of conversions until the averaging operation is complete.

If SCL stretching is not required during averaging, enable the statistics registers by setting STATS_EN to 1b and initiate conversions by writing 1b to the CNVST bit. The OSR_DONE bit in the SYSTEM_STATUS register can be polled to check the averaging completion status. When using the CNVST bit to initiate conversion, the result can be read in the RECENT_CHx_LSB and RECENT_CHx_MSB registers.

In the autonomous mode of operation, samples from the analog input channels that are enabled in the AUTO_SEQ_CH_SEL register are averaged sequentially; see the [Autonomous Mode](#) section. The digital window comparator compares the top 12 bits of the 16-bit average result with the thresholds.

方程式 2 provides the LSB value of the 16-bit average result.

$$1 \text{ LSB} = \frac{AVDD}{2^{16}} \tag{2}$$

8.3.9 CRC on Data Interface

The cyclic redundancy check (CRC) is an error checking code that detects errors in communication between the device and the host. The CRC module is optional and can be enabled by the CRC_EN bit in the GENERAL_CFG register.

The CRC data byte is the 8-bit remainder of the bitwise exclusive-OR (XOR) operation of the argument by a CRC polynomial. The CRC polynomial is based on the CRC-8-CCITT: $X^8 + X^2 + X + 1$. The nine binary polynomial coefficients are 100000111. The CRC calculation is preset with 0 data values.

8.3.9.1 Input CRC (From Host To Device)

The host must compute the appropriate 8-bit CRC corresponding to the 8-bit I²C data (see [图 8-5](#)). The ADC also computes the expected 8-bit CRC corresponding to the 8-bit data received from the host and compares the calculated CRC code to the CRC received from the host. The host must not send a CRC byte corresponding to the I²C frame containing the device address.

NOTE: S = Start, Sr = Repeated Start, and P = Stop.

图 8-5. I²C Write With a CRC

If a CRC error is detected by the device, the command does not execute, and the CRCERR_IN flag is set to 1b. The ADC conversion data read and register read, with a valid CRC from the host, are still supported. The error condition can be detected, as listed in 表 8-6, by either status flags or by a register read. Further register writes to the device are blocked until the CRCERR_IN flag is cleared to 0b. Register write operations, with a valid CRC from the host, to the SYSTEM_STATUS and GENERAL_CFG registers are still supported.

The device can be configured to set all channels to analog inputs on detecting a CRC error by setting the CH_RST bit to 1b. This setting ensures channels configured as digital outputs are not driven by the device when a CRC error is detected. All channels are reset as per the configuration in the PIN_CFG and GPIO_CFG registers when the CRCERR_IN flag is cleared.

The device can be configured to abort further conversions in autonomous and turbo comparator modes (see the [Autonomous Mode](#) and [Turbo Comparator Mode](#) sections), on detecting a CRC error, by setting CONV_ON_ERR = 1b.

表 8-6. Configuring Notifications When a CRC Error is Detected

| CRC ERROR NOTIFICATION | CONFIGURATION | DESCRIPTION |
|------------------------|---------------------|--|
| ALERT | ALERT_CRCIN = 1b | ALERT pin is asserted if a CRC error is detected. |
| Status flags | APPEND_STATUS = 10b | See the Status Flags section for details. |
| Register read | — | Read the CRCERR_IN bit to check if a CRC error was detected. |

8.3.9.2 Output CRC (From Device to Host)

As shown in 图 8-6, the device sends an 8-bit CRC corresponding to every byte sent by the device over the I²C interface.

NOTE: S = Start, Sr = Repeated Start, and P = Stop.

图 8-6. I²C Read With CRC

8.3.10 Output Data Format

图 8-7 illustrates various I²C frames for reading data.

- Read the ADC conversion result: Two 8-bit I²C packets are required (frame A).
- Read the averaged conversion result: Two 8-bit I²C packets are required (frame B).
- Read data with the channel ID or status flags appended: The 4-bit channel ID or status flags can be appended to the 12-bit ADC result by configuring the APPEND_STATUS field in the GENERAL_CFG register. The status flags can be used to detect if a CRC error is detected and if an alert condition is detected by the digital window comparator. When the channel ID or status flags are appended to the 12-bit ADC data, two I²C packets are required (frame C). If the channel ID or status flags are appended to the 16-bit average result, three I²C frames are required (frame D).

8.3.11 Digital Window Comparator

The digital window comparator (DWC) compares the conversion result for an analog input channel with programmable high and low thresholds with hysteresis. As shown in 图 8-8, the DWC sets the EVENT_HIGH_FLAG and EVENT_LOW_FLAG registers based on the comparison result sounds better. The logical OR of the EVENT_HIGH_FLAG and EVENT_LOW_FLAG registers is available in the EVENT_FLAG register. The ALERT pin is asserted when a bit in the EVENT_FLAG register is high and the corresponding bit in the ALERT_CH_SEL register is enabled.

The ALERT pin can be configured as open-drain (default) or push-pull output using the ALERT_DRIVE bit in the ALERT_PIN_CFG register.

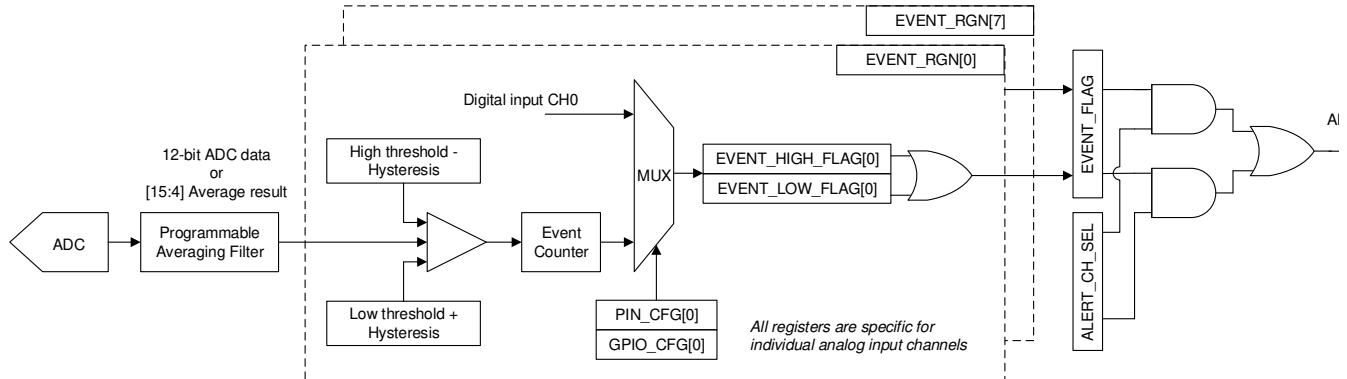

图 8-8. Digital Window Comparator Block Diagram

The low-side threshold, high-side threshold, event counter, and hysteresis parameters are independently programmable for each input channel. 图 8-9 shows the events that can be monitored for every analog input channel by the window comparator.

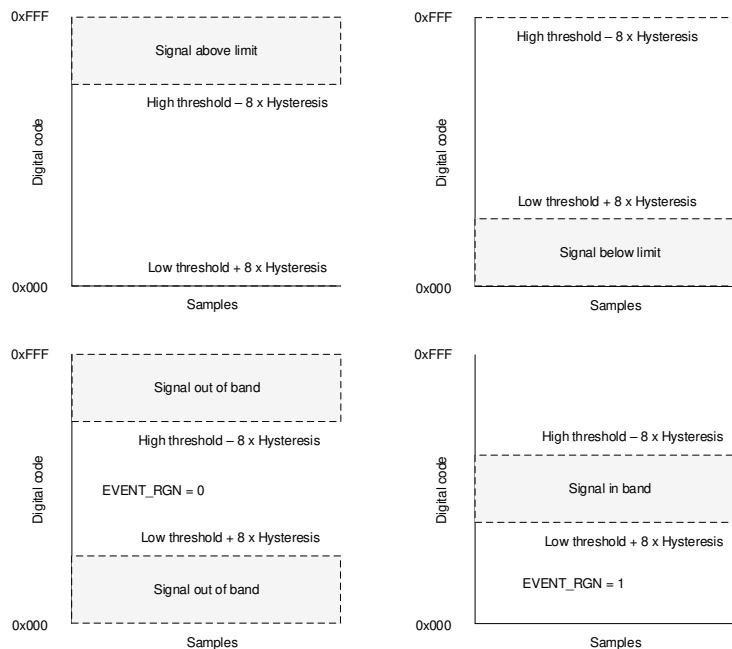

图 8-9. Event Monitoring With the Window Comparator

To enable the digital window comparator, set the DWC_EN bit in the GENERAL_CFG register. By default, hysteresis is 0, the high threshold is 0xFFFF, and the low threshold is 0x000. Configure the EVENT_RGN register

to detect when a signal is within a band defined by the high and low thresholds. In each of the cases shown in 图 8-9, either or both EVENT_HIGH_FLAG and EVENT_LOW_FLAG can be set.

The device features a programmable event counter that counts consecutive threshold violations before either EVENT_HIGH_FLAG or EVENT_LOW_FLAG are set. An example is shown in 图 8-10 where the EVENT_HIGH_FLAG is not set until eight consecutive conversion results of the corresponding analog input channel exceed the threshold configuration. The event count can be set to a higher value to avoid transients in the input signal from setting the event flags.

图 8-10. False Trigger Avoidance Using the Event Counter

In order to assert the ALERT pin when the alert flag is set for a particular analog input channel, set the corresponding bit in the ALERT_CH_SEL register.

8.3.11.1 Interrupts From Digital Inputs

Rising edge or falling edge events can be detected on channels configured as digital inputs. As described in 表 8-7, configure the EVENT_RGN register to select either a rising edge or falling edge event.

表 8-7. Configuring Interrupts From Digital Inputs

| PIN_CFG[7:0] | GPIO_CFG[7:0] | EVENT_RGN [7:0] | EVENT DESCRIPTION |
|--------------|---------------|-----------------|---|
| 1 | 0 | 0 | A rising edge on the digital input sets the corresponding flag in the EVENT_HIGH_FLAG register. |
| 1 | 0 | 1 | A falling edge on the digital input sets the corresponding flag in the EVENT_LOW_FLAG register. |

8.3.11.2 Triggering Digital Outputs With a Digital Window Comparator

As shown in 图 8-11, the output value of channels configured as digital outputs can be updated in response to one or more flags being set in the EVENT_FLAG register.

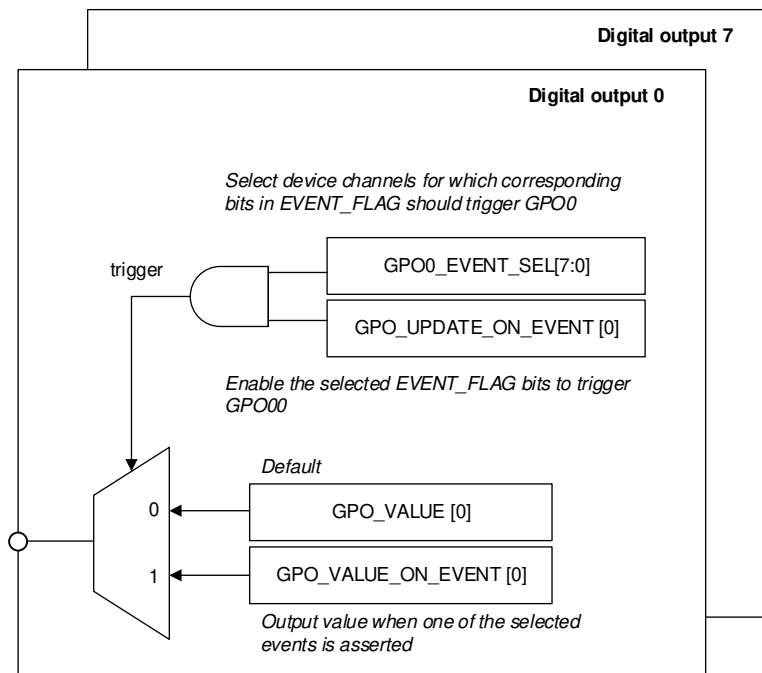

图 8-11. Block Diagram of the Digital Output Logic

The following procedure enables updating the output value of a digital output in response to event flags:

1. Configure the device channels as either analog inputs (default), digital inputs, or digital outputs.
2. Configure the digital outputs as either open-drain (default) or push-pull outputs.
3. Configure the digital window comparator for the input channels. The digital window comparator updates the flags in the EVENT_FLAG register corresponding to individual channels. See the [Digital Window Comparator](#) section for more details.
4. Select the bits corresponding to the input channels that are to be enabled for triggering the digital output in the GPOx_EVENT_SEL register (where x is the digital output channel number).
5. The default output value of the digital output, when no event flag is set, is configured in the GPO_VALUE register. The output value of the digital output, when event flags are set, is configured in the GPO_VALUE_ON_EVENT register.
6. Configure the GPO_UPDATE_ON_EVENT register to enable the logic to update the selected digital output in response to event flags.

The configuration in GPO_VALUE sets the output value of a digital output when either no event flags are set or when event flags are reset in the EVENT_FLAG register corresponding to channels selected in the GPOx_EVENT_SEL register.

8.3.12 Minimum, Maximum, and Latest Data Registers

The ADS7138-Q1 can record the minimum, maximum, and latest code (statistics registers) for every analog input channel. To enable or re-enable recording statistics, set the STATS_EN bit in the GENERAL_CFG register. Writing 1 to the STATS_EN bit reinitializes the statistics module. Previous values can be read from the statistics registers until a new conversion result is available. Set STATS_EN = 0b to prevent any updates to this block of registers before reading the statistics registers.

8.3.13 I²C Protocol Features

8.3.13.1 General Call

On receiving a general call (00h), the device provides an acknowledge (ACK).

8.3.13.2 General Call With Software Reset

On receiving a general call (00h) followed by a software reset (06h), the device resets itself.

8.3.13.3 General Call With a Software Write to the Programmable Part of the Slave Address

On receiving a general call (00h) followed by 04h, the device reevaluates its own I²C address configured by the ADDR pin. During this operation, the device does not respond to other I²C commands except the general-call command.

8.3.13.4 Configuring the Device for High-Speed I²C Mode

The device can be configured in high-speed I²C mode by providing an I²C frame with one of these codes: 0x09, 0x0B, 0x0D, or 0x0F.

After receiving one of these codes, the device sets the I²C_SPEED bit in the SYSTEM_STATUS register and remains in high-speed I²C mode until a STOP condition is received in an I²C frame.

8.4 Device Functional Modes

表 8-8 lists the functional modes supported by the ADS7138-Q1. The device powers up in manual mode (see the [Manual Mode](#) section) and can be configured into any mode listed in 表 8-8 by writing the configuration registers for the desired mode.

表 8-8. Functional Modes

| FUNCTIONAL MODE | CONVERSION CONTROL | MUX CONTROL | CONV_MODE[1:0] | SEQ_MODE[1:0] |
|------------------|---|-------------------------------|----------------|---------------|
| Manual | 9 th falling edge of SCL (ACK) | Register write to MANUAL_CHID | 00b | 00b |
| Auto-sequence | 9 th falling edge of SCL (ACK) | Channel sequencer | 00b | 01b |
| Autonomous | Internal to the device | Channel sequencer | 01b | 01b |
| Turbo comparator | Internal to the device | Channel sequencer | 10b | 01b |

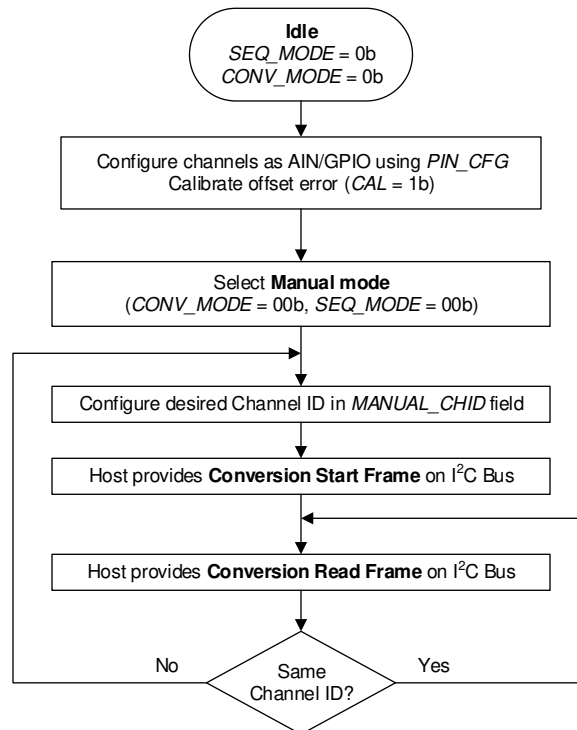

8.4.1 Device Power-Up and Reset

On power-up, the device calculates the address from the resistors connected on the ADDR pin and the BOR bit is set, thus indicating a power-cycle or reset event.

The device can be reset by an I²C general call (00h) followed by a software reset (06h), by setting the RST bit, or by recycling the power on the AVDD pin.

8.4.2 Manual Mode

Manual mode allows the external host processor to directly select the analog input channel. 图 8-12 lists the steps for operating the device in manual mode.

Manual mode with channel selection using register write

图 8-12. Device Operation in Manual Mode

Provide an I²C start or restart frame to initiate a conversion, as illustrated in the conversion start frame of 图 8-13, after configuring the device registers. ADC data can be read in subsequent I²C frames. The number of I²C frames required to read conversion data depends on the output data frame size; see the [Output Data Format](#)

section for more details. A new conversion is initiated on the ninth falling edge of SCL (ACK bit) when the last byte of output data is read.

图 8-13. Starting a Conversion and Reading Data in Manual Mode

8.4.3 Auto-Sequence Mode

In auto-sequence mode, the internal channel sequencer switches the multiplexer to the next analog input channel after every conversion. The desired analog input channels can be configured for sequencing in the AUTO_SEQ_CH_SEL register. To enable the channel sequencer, set SEQ_START to 1b. After every conversion, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set SEQ_START to 0b. 图 8-14 lists the conversion start and read frames for auto-sequence mode.

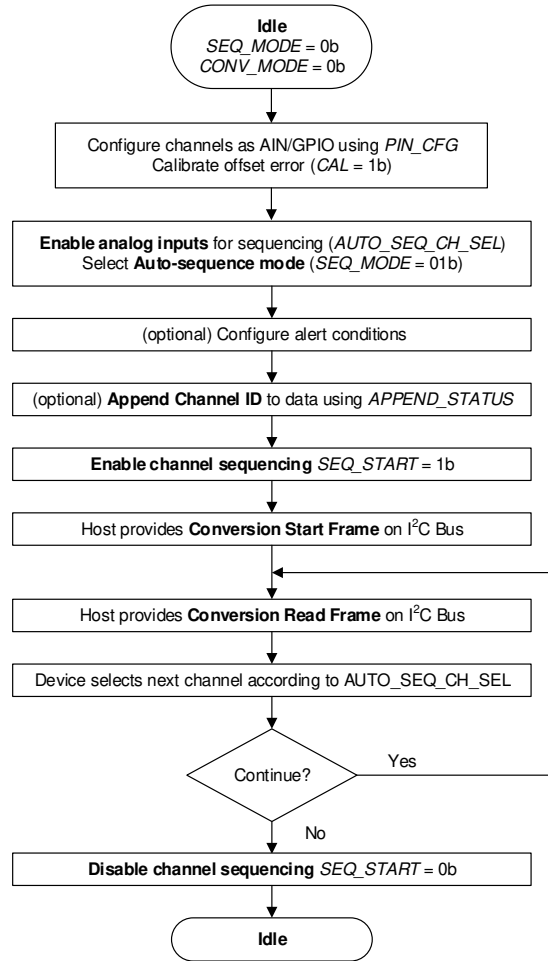

图 8-14. Device Operation in Auto-Sequence Mode

8.4.4 Autonomous Mode

In autonomous mode, the device can be programmed to monitor the voltage applied on the analog input pins of the device and generate a signal on the ALERT pin when the programmable high or low threshold values are crossed. In this mode, the device generates the start of conversion using the internal oscillator. The first start of conversion must be provided by the host and the device then generates the subsequent start of conversions.

图 8-15 shows the steps for configuring the operation mode to autonomous mode. Abort the ongoing sequence by setting SEQ_START to 0b before changing the functional mode or device configuration.

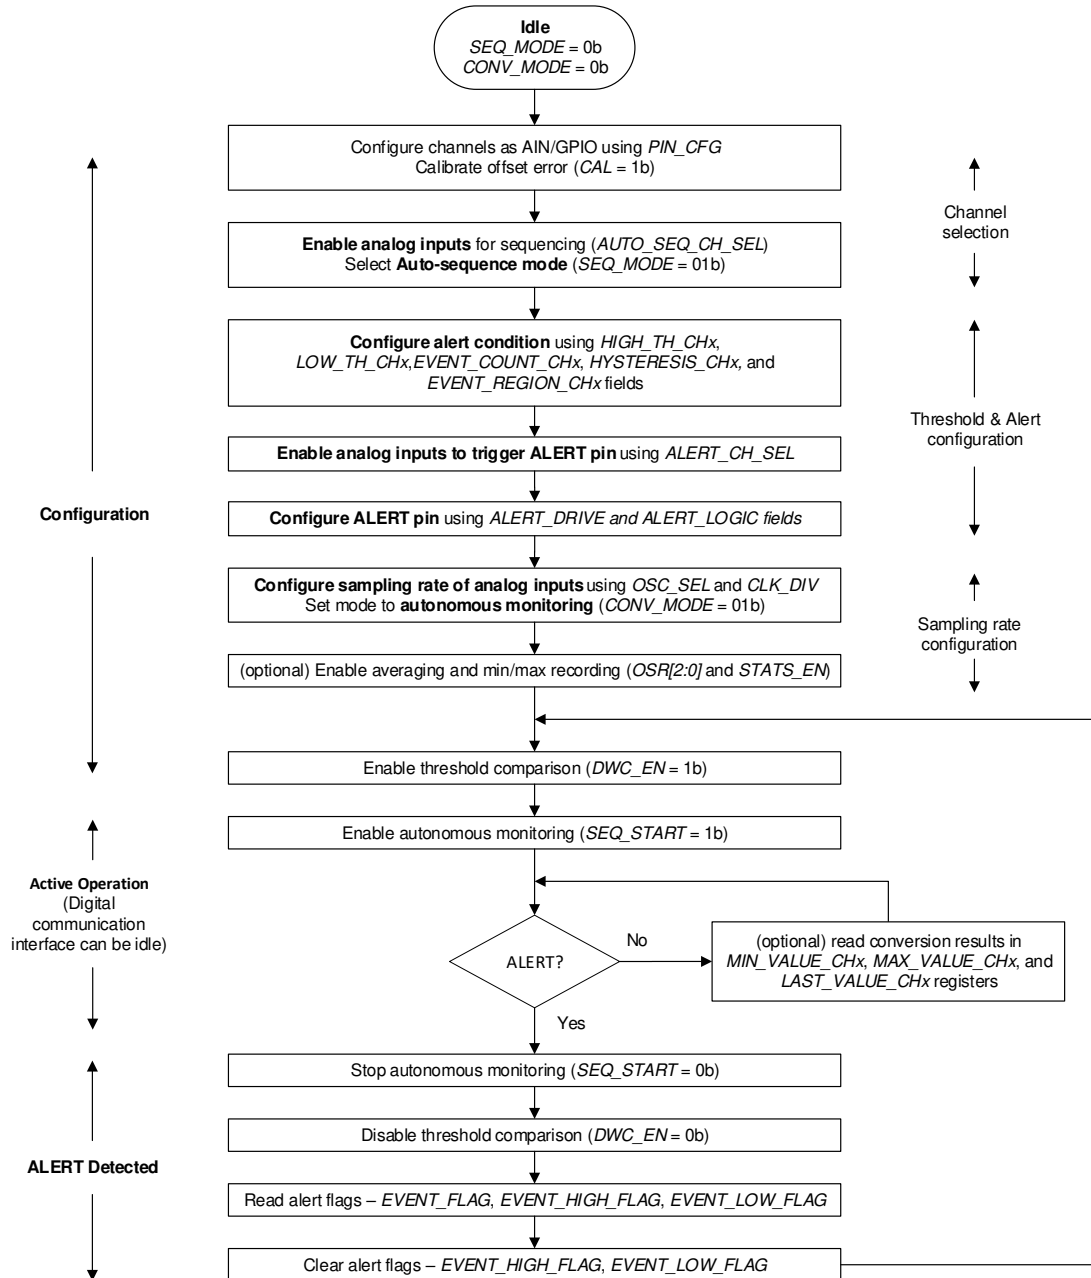

图 8-15. Configuring the Device in Autonomous Mode

8.4.5 Turbo Comparator Mode

Turbo comparator mode allows fast comparison with high and low thresholds using the digital window comparator. ADC output data are not available in this mode.

图 8-16 lists the comparison start and read frames for turbo comparator mode. The desired analog input channels can be configured for sequencing in the `AUTO_SEQ_CH_SEL` register. To enable the channel sequencer, set `SEQ_START` to 1b. After every comparison, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set `SEQ_START` to 0b. See the *Oscillator and Timing Control* section for more details on configuring the speed in turbo comparator mode.

Abort the ongoing sequence by setting `SEQ_START` to 0b before changing the functional mode or device configuration.

图 8-16. Device Operation in Turbo Comparator Mode

8.5 Programming

表 8-9 provides the acronyms for different conditions in an I²C frame. 表 8-10 lists the various command opcodes.

表 8-9. I²C Frame Acronyms

| SYMBOL | DESCRIPTION |
|--------|--|
| S | Start condition for the I ² C frame |
| Sr | Restart condition for the I ² C frame |
| P | Stop condition for the I ² C frame |
| A | ACK (low) |
| N | NACK (high) |
| R | Read bit (high) |
| W | Write bit (low) |

表 8-10. Opcodes for Commands

| OPCODE | COMMAND DESCRIPTION |
|------------|---|
| 0001 0000b | Single register read |
| 0000 1000b | Single register write |
| 0001 1000b | Set bit |
| 0010 0000b | Clear bit |
| 0011 0000b | Reading a continuous block of registers |
| 0010 1000b | Writing a continuous block of registers |

8.5.1 Register Read

The I²C master can either read a single register or a continuous block registers from the device, as described in the [Single Register Read](#) and [Reading a Continuous Block of Registers](#) sections.

8.5.1.1 Single Register Read

To read a single register from the device, the I²C master must provide an I²C command with three frames to set the register address for reading data. The opcodes for commands supported by the device are listed in 表 8-10. After an I²C command is provided, the I²C master must provide another I²C frame (as shown in 图 8-17) containing the device address and the read bit. The device provides the register data in the next I²C frame. The device provides the same register data even if the host provides more I²C frames. To end the register read command, the master must provide a STOP or a RESTART condition in the I²C frame.

S = start, Sr = repeated start, and P = stop.

图 8-17. Single Register Read

8.5.1.2 Reading a Continuous Block of Registers

To read a continuous block of registers, the I²C master must provide an I²C command to set the register address. The register address is the address of the first register in the block that must be read. After this command is provided, the I²C master must provide another I²C frame, as shown in [图 8-18](#), containing the device address and the read bit. After this frame, the device provides the register data. The device provides data for the next register when more clocks are provided. When data are read from addresses that do not exist in the register map of the device, the device returns zeros. If the device does not have any further registers to provide data on, the device provide zeros. To end the register read command, the master must provide a STOP or a RESTART condition in the I²C frame.

S = start, Sr = repeated start, and P = stop.

图 8-18. Reading a Continuous Block of Registers

8.5.2 Writing Registers

The I²C master can either write a single register or a continuous block of registers to the device, set a few bits in a register, or clear a few bits in a register.

8.5.2.1 Single Register Write

To write a single register from the device, as shown in [图 8-19](#), the I²C master must provide an I²C command with four frames. The register address is the address of the register that must be written and the register data is the value that must be written. [表 8-10](#) lists the opcodes for different commands. To end the register write command, the master must provide a STOP or a RESTART condition in the I²C frame.

S = start, Sr = repeated start, and P = stop.

图 8-19. Writing a Single Register

8.5.2.2 Set Bit

The I²C master must provide an I²C command with four frames, as shown in [图 8-19](#), to set bits in a register without changing the other bits. The register address is the address of the register that the bits must set and the register data is the value representing the bits that must be set. Bits with a value of 1 in the register data are set and bits with a value of 0 in the register data are not changed. [表 8-10](#) lists the opcodes for different commands. To end this command, the master must provide a STOP or RESTART condition in the I²C frame.

8.5.2.3 Clear Bit

The I²C master must provide an I²C command with four frames, as shown in [图 8-19](#), to clear bits in a register without changing the other bits. The register address is the address of the register that the bits must clear and the register data is the value representing the bits that must be cleared. Bits with a value of 1 in the register data are cleared and bits with a value of 0 in the register data are not changed. [表 8-10](#) lists the opcodes for different commands. To end this command, the master must provide a STOP or a RESTART condition in the I²C frame.

8.5.2.4 Writing a Continuous Block of Registers

The I²C master must provide an I²C command, as shown in 图 8-20, to write a continuous block of registers. The register address is the address of the first register in the block that must be written. The I²C master must provide data for registers in subsequent I²C frames in an ascending order of register addresses. Writing data to addresses that do not exist in the register map of the device have no effect. 表 8-10 lists the opcodes for different commands. If the data provided by the I²C master exceeds the address space of the device, the device ignores the data beyond the address space. To end the register write command, the master must provide a STOP or a RESTART condition in the I²C frame.

S = start, Sr = repeated start, and P = stop.

图 8-20. Writing a Continuous Block of Registers

8.6 ADS7138-Q1 Registers

表 8-11 lists the memory-mapped registers for the ADS7138-Q1 registers. All register offset addresses not listed in 表 8-11 should be considered as reserved locations and the register contents should not be modified.

表 8-11. ADS7138-Q1 Registers

| Address | Acronym | Register Name | Section |

Complex bit access types are encoded to fit into small table cells. 表 8-12 shows the codes that are used for access types in this section.

表 8-12. ADS7138-Q1 Access Type Codes

| Access Type | Code | Description |
|--------------------------|------|--|
| Read Type | | |
| R | R | Read |
| Write Type | | |
| W | W | Write |
| Reset or Default Value | | |
| -n | | Value after reset or the default value |
| Register Array Variables | | |

表 8-12. ADS7138-Q1 Access Type Codes
(continued)

| Access Type | Code | Description |
|-------------|------|--|
| i,j,k,l,m,n | | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y | | When this variable is used in a register name, an offset, or an address it refers to the value of a register array. |

8.6.1 SYSTEM_STATUS Register (Address = 0x0) [Reset = 0x81]

SYSTEM_STATUS is shown in 图 8-17 and described in 表 8-13.

Return to the 表 8-11.

图 8-17. SYSTEM_STATUS Register

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|------------|------------------------|----------|----------|--------------|------------|--------|
| RSVD | SEQ_STATUS | I ² C_SPEED | RESERVED | OSR_DONE | CRC_ERR_FUSE | CRC_ERR_IN | BOR |
| R-1b | R-0b | R-0b | R-0b | R/W-0b | R-0b | R/W-0b | R/W-1b |

表 8-13. SYSTEM_STATUS Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|---|
| 7 | RSVD | R | 1b | Reads return 1b. |
| 6 | SEQ_STATUS | R | 0b | Status of the channel sequencer. 0b = Sequence stopped 1b = Sequence in progress |
| 5 | I ² C_SPEED | R | 0b | I ² C high-speed status. 0b = I ² C bus is not in high-speed mode. 1b = I ² C bus is in high-speed mode. |
| 4 | RESERVED | R | 0b | Reserved Bit |
| 3 | OSR_DONE | R/W | 0b | Averaging status. Clear this bit by writing 1b to this bit. 0b = Averaging in progress or not started; average result is not ready. 1b = Averaging complete; average result is ready. |
| 2 | CRC_ERR_FUSE | R | 0b | Device power-up configuration CRC check status. To re-evaluate this bit, software reset the device or power cycle AVDD. 0b = No problems detected in power-up configuration. 1b = Device configuration not loaded correctly. |
| 1 | CRC_ERR_IN | R/W | 0b | Status of CRC check on incoming data. Write 1b to clear this error flag. 0b = No CRC error. 1b = CRC error detected. All register writes, except to addresses 0x00 and 0x01, are blocked. |
| 0 | BOR | R/W | 1b | Brown out reset indicator. This bit is set if brown out condition occurs or device is power cycled. Write 1b to this bit to clear the flag. 0b = No brown out condition detected from last time this bit was cleared. 1b = Brown out condition detected or device power cycled. |

8.6.2 GENERAL_CFG Register (Address = 0x1) [Reset = 0x0]

GENERAL_CFG is shown in [图 8-18](#) and described in [表 8-14](#).

Return to the [表 8-11](#).

图 8-18. GENERAL_CFG Register

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------|--------|----------|--------|-------|--------|--------|------|
| RESERVED | CRC_EN | STATS_EN | DWC_EN | CNVST | CH_RST | CAL | RST |
| R-0b | R/W-0b | R/W-0b | R/W-0b | W-0b | R/W-0b | R/W-0b | W-0b |

表 8-14. GENERAL_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 7 | RESERVED | R | 0b | Reserved Bit |
| 6 | CRC_EN | R/W | 0b | Enable or disable the CRC on device interface. 0b = CRC module disabled. 1b = CRC appended to data output. CRC check is enabled on incoming data. |
| 5 | STATS_EN | R/W | 0b | Enable or disable the statistics module to update minimum, maximum, and latest output code registers. 0b = Statistics registers are not updated. 1b = Clear statistics registers and continue updating with new conversion results. |
| 4 | DWC_EN | R/W | 0b | Enable or disable the digital window comparator. 0b = Reset or disable the digital window comparator. 1b = Enable the digital window comparator. |
| 3 | CNVST | W | 0b | Control start conversion on selected analog input. Readback of this bit returns 0b. 0b = Normal operation; conversions starts on the 9 th falling edge of I ² C frame. Device stretches SCL until end of conversion or completion of averaging. 1b = Initiate start of conversion. Device does not stretch SCL until end of conversion or completion of averaging. |
| 2 | CH_RST | R/W | 0b | Force all channels to be analog inputs. 0b = Normal operation. 1b = All channels are configured as analog inputs irrespective of configuration in other registers. |
| 1 | CAL | R/W | 0b | Calibrate ADC offset. 0b = Normal operation. 1b = ADC offset is calibrated. After calibration is complete, this bit is set to 0b by the device. |
| 0 | RST | W | 0b | Software reset all registers to default values. 0b = Normal operation. 1b = Device is reset. After reset is complete, this bit is set to 0b and BOR bit is set to 1b by the device. |

8.6.3 DATA_CFG Register (Address = 0x2) [Reset = 0x0]

DATA_CFG is shown in [图 8-19](#) and described in [表 8-15](#).

Return to the [表 8-11](#).

图 8-19. DATA_CFG Register

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---|
| 7-3 | RESERVED | R | 0b | Reserved Bit |
| 2-0 | OSR[2:0] | R/W | 0b | Selects the oversampling ratio for ADC conversion result. 0b = No averaging 1b = 2 samples 10b = 4 samples 11b = 8 samples 100b = 16 samples 101b = 32 samples 110b = 64 samples 111b = 128 samples |

8.6.5 OPMODE_CFG Register (Address = 0x4) [Reset = 0x0]

OPMODE_CFG is shown in 图 8-21 and described in 表 8-17.

Return to the 表 8-11.

图 8-21. OPMODE_CFG Register

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------------|----------------|---|---------|--------------|---|---|---|
| CONV_ON_ER R | CONV_MODE[1:0] | | OSC_SEL | CLK_DIV[3:0] | | | |
| R/W-0b | R/W-0b | | R/W-0b | R/W-0b | | | |

表 8-17. OPMODE_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|--|
| 7 | CONV_ON_ERR | R/W | 0b | Control continuation of autonomous and turbo comparator modes if CRC error is detected on communication interface. 0b = If CRC error is detected, device continues channel sequencing and pin configuration is retained. See the CRC_ERR_IN bit for more details. 1b = If CRC error is detected, device changes all channels to analog inputs and channel sequencing is paused until CRC_ERR_IN = 1b. After clearing CRC_ERR_IN flag, device resumes channel sequencing and pin configuration is restored. |
| 6-5 | CONV_MODE[1:0] | R/W | 0b | These bits set the mode of conversion of the ADC. 0b = Manual mode; conversions are initiated by host. 1b = Autonomous mode; conversions are initiated by internal state machine. 10b = Turbo mode; comparisons are initiated by internal state machine. |
| 4 | OSC_SEL | R/W | 0b | Selects the oscillator for internal timing generation. 0b = High-speed oscillator. 1b = Low-power oscillator. |
| 3-0 | CLK_DIV[3:0] | R/W | 0b | Sampling speed control. See the section on oscillator and timing control for details. |

8.6.6 PIN_CFG Register (Address = 0x5) [Reset = 0x0]

PIN_CFG is shown in 图 8-22 and described in 表 8-18.

Return to the 表 8-11.

图 8-22. PIN_CFG Register

| | | | | | | | |
|--------------|---|---|---|---|---|---|---|

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The following sections give example circuits and suggestions for using the ADS7128-Q1 in various applications.

9.2 Typical Applications

9.2.1 Mixed-Channel Configuration

图 9-1. DAQ Circuit: Single-Supply DAQ

9.2.1.1 Design Requirements

The goal of this application is to configure some channels of the ADS7138-Q1 as digital inputs, open-drain digital outputs, and push-pull digital outputs.

9.2.1.2 Detailed Design Procedure

The ADS7138-Q1 can support GPIO functionality at each input pin. Any analog input pin can be independently configured as a digital input, a digital open-drain output, or a digital push-pull output though the PIN_CFG and GPIO_CFG registers; see 表 8-5.

9.2.1.2.1 Digital Input

The digital input functionality can be used to monitor a signal within the system. 图 9-2 shows that the state of the digital input can be read from the GPI_VALUE register.

图 9-2. Digital Input

9.2.1.2.2 Digital Open-Drain Output

The channels of the ADS7138-Q1 can be configured as digital open-drain outputs supporting an output voltage up to 5.5 V. An open-drain output, as shown in 图 9-3, consists of an internal FET (Q) connected to ground. The output is idle when not driven by the device, which means Q is off and the pullup resistor, R_{PULL_UP} , connects the GPOx node to the desired output voltage. The output voltage can range anywhere up to 5.5 V, depending on the external voltage that the GPIOx is pulled up to. When the device is driving the output, Q turns on, thus connecting the pullup resistor to ground and bringing the node voltage at GPOx low.

图 9-3. Digital Open-Drain Output

The minimum value of the pullup resistor, as calculated in 方程式 3, is given by the ratio of V_{PULL_UP} and the maximum current supported by the device digital output (5 mA).

$$R_{MIN} = (V_{PULL_UP} / 5 \text{ mA}) \quad (3)$$

The maximum value of the pullup resistor, as calculated in 方程式 4, depends on the minimum input current requirement, I_{LOAD} , of the receiving device driven by this GPIO.

$$R_{MAX} = (V_{PULL_UP} / I_{LOAD}) \quad (4)$$

Select R_{PULL_UP} such that $R_{MIN} < R_{PULL_UP} < R_{MAX}$.

9.2.1.3 Application Curve

Standard deviation = 0.49 LSB

图 9-4. DC Input Histogram

9.2.2 Digital Push-Pull Output

The channels of the ADS7138-Q1 can be configured as digital push-pull outputs supporting an output voltage up to AVDD. As shown in 图 9-5, a push-pull output consists of two mirrored opposite bipolar transistors, Q1 and Q2. The device can both source and sink current because only one transistor is on at a time (either Q2 is on and pulls the output low, or Q1 is on and sets the output high). A push-pull configuration always drives the line opposed to an open-drain output where the line is left floating.

图 9-5. Digital Push-Pull Output

10 Power Supply Recommendations

10.1 AVDD and DVDD Supply Recommendations

The ADS7138-Q1 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. For supplies greater than 2.35 V, AVDD and DVDD can be shorted externally if single-supply operation is desired. The AVDD supply also defines the full-scale input range of the device. Decouple the AVDD and DVDD pins individually, as shown in 图 10-1, with 1-μF ceramic decoupling capacitors. The minimum capacitor value required for AVDD and DVDD is 200 nF and 20 nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220 nF is required for decoupling.

Connect a 1-μF decoupling capacitor between the DECAP and GND pins for the internal power supply.

图 10-1. Power-Supply Decoupling

11 Layout

11.1 Layout Guidelines

Figure 11-1 shows a board layout example for the ADS7138-Q1. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the AVDD supply away from noise sources.

Use 1- μ F ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect the GND pin to the ground plane using short, low-impedance paths. The AVDD supply voltage also functions as the reference voltage for the ADS7138-Q1. Place the decoupling capacitor for AVDD close to the device AVDD and GND pins and connect the decoupling capacitor to the device pins with thick copper tracks.

11.2 Layout Example

Figure 11-1. Example Layout

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

RTE0016C

PACKAGE OUTLINE
WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

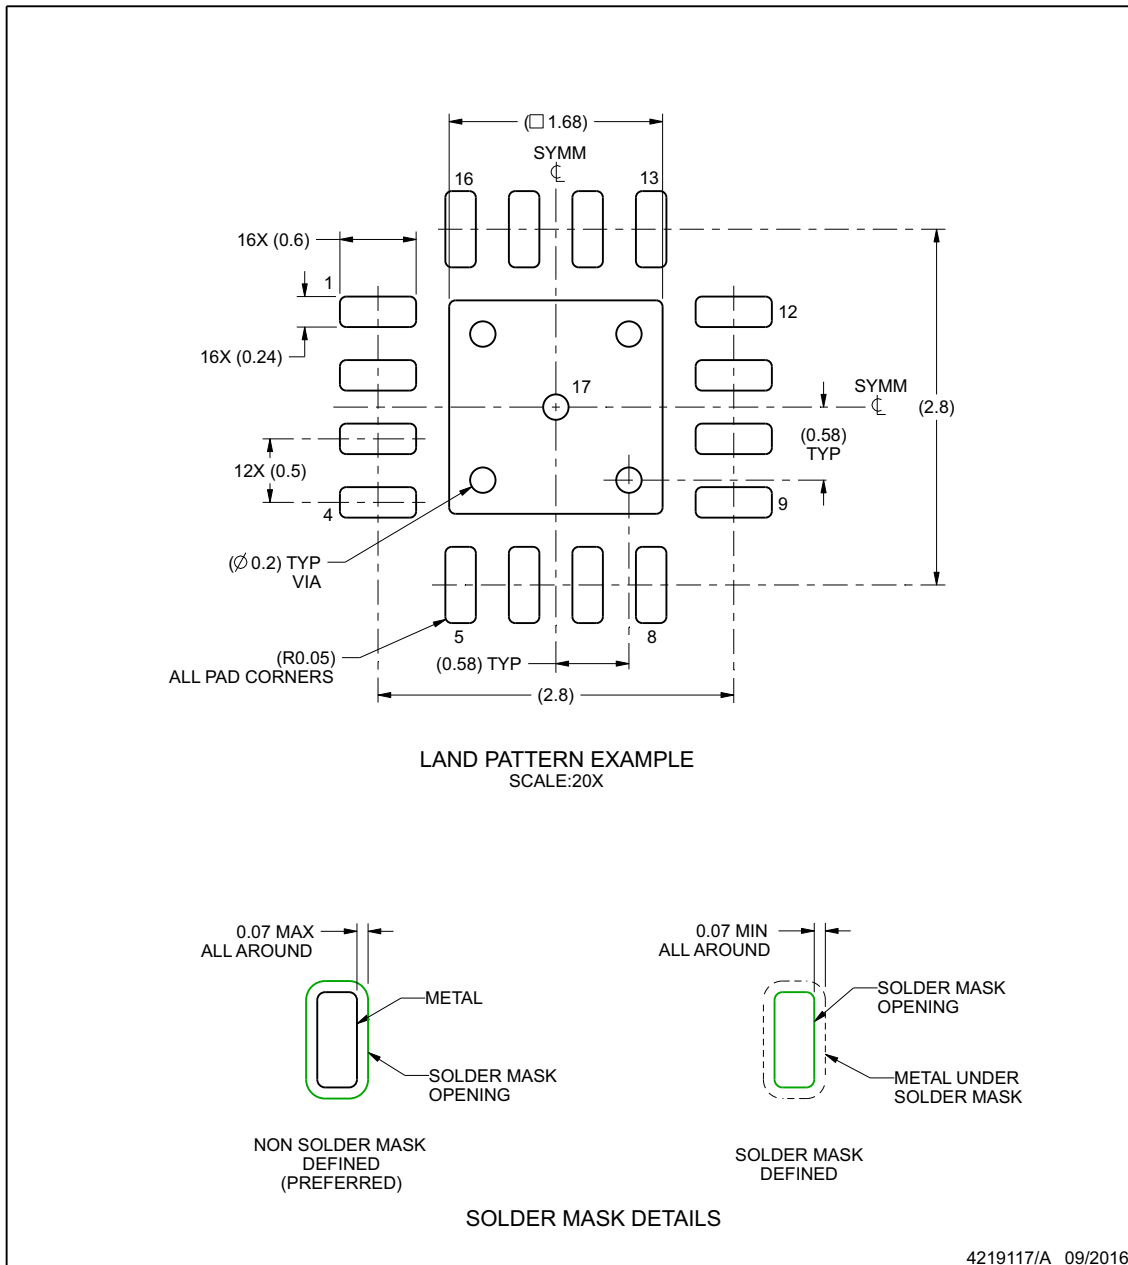

www.ti.com

EXAMPLE BOARD LAYOUT

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|---------|
| ADS7138QRTERQ1 | ACTIVE | WQFN | RTE | 16 | 3000 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | 7138Q | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|----------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| ADS7138QRTERQ1 | WQFN | RTE | 16 | 3000 | 330.0 | 12.4 | 3.3 | 3.3 | 1.1 | 8.0 | 12.0 | Q2 |

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
|----------------|--------------|-----------------|------|------|-------------|------------|-------------|
| ADS7138QRTERQ1 | WQFN | RTE | 16 | 3000 | 367.0 | 367.0 | 35.0 |

GENERIC PACKAGE VIEW

RTE 16

WQFN - 0.8 mm max height

3 x 3, 0.5 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4225944/A

4224938/C 03/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RTE0016K

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:20X

SOLDER MASK DETAILS

4224938/C 03/2022

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RTE0016K

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 17:
84% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:25X

4224938/C 03/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。
