

# ISOW1044 具有集成式低发射、低噪声、高效直流/直流转换器的隔离式 CAN FD 收发器

## 1 特性

- 符合 ISO 11898-2:2016 物理层标准要求
  - 支持经典 CAN : 1Mbps
  - 针对 CAN FD 进行了优化 : 2Mbps 和 5Mbps
- 低发射、低噪声的集成式直流/直流转换器
  - 符合 CISPR 32 和 EN 55032 B 类标准，在双层 PCB 上具有大于 6dB 的裕度
  - 25 MHz 的低频电源转换器可实现低噪声性能
- 其他 10Mbps GPIO 通道
- 高效率输出功率
  - 典型效率 : 47%
  - 隔离式输出电压精度 :  $\pm 5\%$
  - 额外输出电流 : 20mA
- 用于 CAN 和直流/直流的独立电源
  - 逻辑电源 ( $V_{IO}$ ) : 1.71V 至 5.5V
  - 电源转换器电源 ( $V_{DD}$ ) : 4.5V 至 5.5V
- 支持故障保护的 CAN FD 收发器
  - 直流总线故障保护电压 :  $\pm 58V$
  - 接收器共模输入电压 :  $\pm 12V$
  - 通过总线唤醒模式实现远程唤醒
- 典型循环延迟 : 167ns
- 增强型和基础型隔离选项
- 高 CMTI : 100 kV/ $\mu s$  (典型值)
- 具有以 GND2 为基准的高 ESD 总线保护
  - HBM ESD :  $\pm 12kV$
  - IEC 61000-4-2 接触放电 :  $\pm 8kV$
- 工作温度范围 :  $-40^{\circ}C$  至  $125^{\circ}C$
- 电流限制和热关断
- 20 引脚宽体 SOIC 封装
- 安全相关认证 (计划) :
  - 符合 DIN VDE V 0884-11:2017-01 标准的 VDE 增强型和基础型绝缘

- UL 1577 组件认证计划
- IEC 62368-1、IEC 61010-1、IEC 60601-1 和 GB 4943.1-2011 认证

## 2 应用

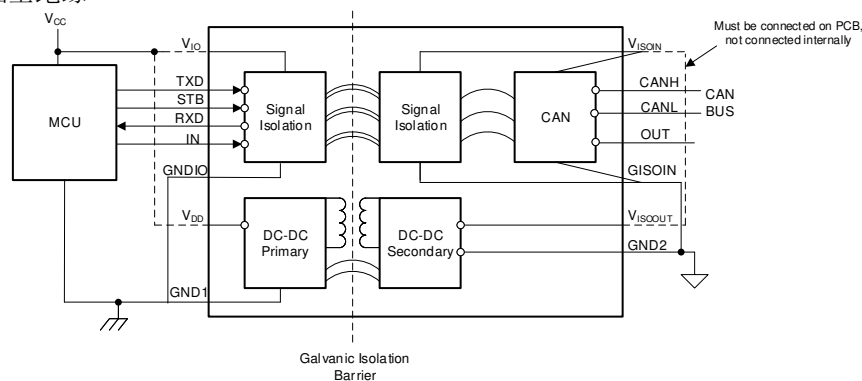

- 工厂自动化
- 楼宇自动化
- 工业运输
- 光伏逆变器，保护继电器
- 电机驱动器

## 3 说明

ISOW1044 器件是一款电隔离式控制器局域网 (CAN) 收发器，内置隔离式直流/直流转换器，无需在空间受限的隔离式设计中使用单独的隔离式电源。低发射、隔离式直流/直流转换器符合 CISPR 32 辐射发射 B 类标准，在简单的两层 PCB 上仅使用两个铁氧体磁珠。额外的 20mA 输出电流可用于为板上的其他电路供电。该器件具有一个集成的 10Mbps GPIO 通道，有助于去除额外用于诊断、LED 指示或电源监测的数字隔离器或光耦合器。

器件信息

特性	ISOW1044	ISOW1044B
保护级别	增强型	基本型
浪涌测试电压	10kV <sub>PK</sub>	7.8kV <sub>PK</sub>
隔离额定值	5000V <sub>RMS</sub>	5000V <sub>RMS</sub>
工作电压	1000V <sub>RMS</sub> /1500V <sub>PK</sub>	1000V <sub>RMS</sub> /1500V <sub>PK</sub>
封装	DFM (20)	DFM (20)
封装尺寸 (标称值)	12.83mm x 7.5mm	12.83mm x 7.5mm

## 5 说明 (续)

该器件支持传统 CAN 和 CAN FD 网络，数据速率高达 5 兆位/秒 (Mbps)。它提供  $\pm 58V$  直流总线故障保护功能和  $\pm 12V$  共模电压范围。信号和电源路径均按照 UL1577 进行  $5kV_{RMS}$  隔离，并符合 VDE、CSA、TUV 和 CQC 的增强型和基础型隔离要求。这些器件的总线引脚可承受高达 8kV 的 IEC 61000-4-2 静电放电 (ESD)。

ISOW1044 器件通过将 PCB 上的  $V_{IO}$  和  $V_{DD}$  连接到一起，可在 4.5V 至 5.5V 的单一电源电压下运行。如果需要较低的逻辑电平，这些器件支持 1.71V 至 5.5V 逻辑电源 ( $V_{IO}$ )，这些电源可与 4.5V 至 5.5V 的功率转换器电源 ( $V_{DD}$ ) 相互独立。这些器件支持从  $-40^{\circ}C$  到  $+125^{\circ}C$  的宽工作环境温度范围，并采用 20 引脚 DFM (SOIC-20 尺寸兼容封装)，提供最小 8mm 的爬电距离和间隙。

ISOW1044 支持待机模式，并且可通过符合 ISO 11898-2:2016 所定义唤醒模式 (WUP) 的 CAN 来唤醒。该器件还具有保护和诊断特性，支持热关断 (TSD)、TXD 显性超时 (DTO) 和电源欠压检测。

## 6 Device Comparison Table

PART NUMBER	ISOLATION	PACKAGE	BODY SIZE (NOM)
ISOW1044	Reinforced	20-DFM (SOIC)	12.83 mm x 7.5 mm
ISOW1044B	Basic	20-DFM (SOIC)	12.83 mm x 7.5 mm

## 7 Pin Configuration and Functions

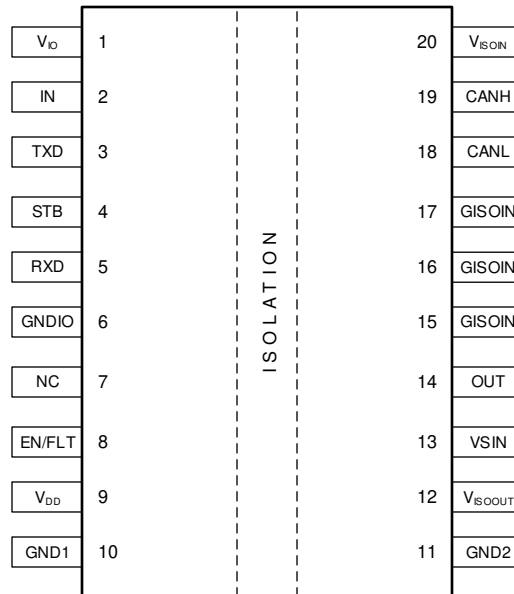

图 7-1. ISOW1044 20-pin DFM Top View

表 7-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
V <sub>IO</sub>	1	--	Side 1 Logic supply
IN	2	I	General purpose logic (GPIO) input (internal pull-down)
TXD	3	I	Driver enable. If this pin is floating, the driver is disabled (internal pull-down)
STB	4	I	Standby enable. Connect this pin to GNDIO in normal mode. If this pin is floating or logic high, driver is in standby mode.
RXD	5	O	Receiver data output
GNDIO	6	--	Ground connection on side 1 for V <sub>IO</sub> . GNDIO and GND1 are not internally connected and need be shorted on PCB.
NC	7	--	Not connected internally
EN/FLT	8	I/O	Multi-function power converter enable input pin or fault output pin. Can only be used as either an input pin or an output pin. <ul style="list-style-type: none"> <li>If it's used as Power converter enable input pin, it enables and disables the integrated DC-DC power converter. Connect directly to microcontroller or through a series current limiting resistor to use as an enable input pin. DC-DC power converted is enabled when EN is high (connected to V<sub>IO</sub>) and disabled when low (connected to GND1). If EN is floating, DC-DC converter is enabled (internal pull-up resistor)</li> <li>If it's used as Fault output pin, it gives an alert signal if power converter is not operating properly. This pin is active low. Connect to microcontroller through a 5 k<math>\Omega</math> or greater pull-up resistor in order to use as a fault outpin pin.</li> </ul>
V <sub>DD</sub>	9	--	Side 1 DC-DC converter power supply
GND1	10	--	Ground connections on side for V <sub>DD</sub> . GNDIO and GND1 are not internally connected and need be shorted on PCB.
GND2	11	--	Ground connections on side for V <sub>ISOOOUT</sub> . GND2 and GISOIN are not internally connected and need be shorted directly on PCB, or connected through a ferrite bead.
V <sub>ISOOOUT</sub>	12	--	Isolated power converter output voltage. V <sub>ISOOOUT</sub> and V <sub>ISOIN</sub> need be shorted directly on PCB, or connected through a ferrite bead.

表 7-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
V <sub>SIN</sub>	13	I	Power converter input . Pin 12 and pin 13 need be shorted directly on PCB.
OUT	14	O	General purpose logic (GPIO) output (default output is low)
GISOIN	15, 16, 17	--	Ground connections for V <sub>ISOIN</sub> . GND2 and GISOIN need be shorted directly on PCB, or connected through a ferrite bead.
CANL	18	I/O	Low-level CAN bus line
CANH	19	I/O	High-level CAN bus line
V <sub>ISOIN</sub>	20	--	Power supply input for CAN transceiver. V <sub>ISOIN</sub> and V <sub>ISOOUT</sub> need be shorted directly on PCB, or connected through a ferrite bead.

## 8 Specifications

### 8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup> <sup>(2)</sup>

		MIN	MAX	UNIT
V <sub>DD</sub>	Power converter supply voltage	- 0.5	6	V
V <sub>ISOIN</sub>	Isolated supply voltage, input supply for CAN transceiver	- 0.5	6	V
V <sub>ISOOUT</sub>	Isolated supply voltage, Power converter output	- 0.5	6	V
V <sub>IO</sub>	Logic supply voltage	- 0.5	6	V
V <sub>BUS</sub>	Voltage on bus pins (CANH, CANL with respect to GND2)	-58	58	V
V <sub>BUS_DIFF</sub>	Max Differential voltage on bus pins (CANH-CANL)	-45	45	V
V <sub>logic_IO</sub>	Logic I/O voltage level ( RXD, TXD, STB, EN, IN)	- 0.5	V <sub>IO</sub> + 0.5 <sup>(3)</sup>	V
	OUT	-0.5	V <sub>ISOIN</sub> + 0.5	V
I <sub>O</sub>	Output current on RXD, OUT pins	- 15	15	mA
T <sub>J</sub>	Junction temperature	- 40	150	°C
T <sub>stg</sub>	Storage temperature	- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground pin (GND1 or GND2). All voltage values except differential I/O bus voltages are peak voltage values.
- (3) The maximum voltage must not be greater than 6 V.

### 8.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		All pins except bus pins CANH, CANL Bus pins w.r.t GND2(pin15/16/17)	±12000	
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	V
V <sub>(ESD)</sub>	Electrostatic discharge	per IEC61000-4-2 contact discharge, CANH and CANL w.r.t. GND2	±8000	V
V <sub>(ESD)</sub>	Electrostatic discharge	per IEC61000-4-2 contact discharge, CANH and CANL w.r.t. GND1 (across Isolation barrier)	±8000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IO</sub>	Logic supply voltage	1.8-V operation	1.71	1.89	V
		2.5-V, 3.3-V, and 5.5-V operation	2.25	5.5	
V <sub>DD</sub>	Power converter supply voltage	4.5		5.5	V
V <sub>DD(UVLO+)</sub>	Supply threshold when Power converter supply is rising		2.7	2.95	V
V <sub>DD(UVLO-)</sub>	Supply threshold when Power converter supply is falling	2.40	2.55		V
V <sub>HYS1(UVLO)</sub>	Power converter supply voltage hysteresis	0.15	0.24		V
V <sub>IO(UVLO+)</sub>	Rising threshold of Logic supply voltage			1.7	V
V <sub>IO(UVLO-)</sub>	Falling threshold of Logic supply voltage	1			V
V <sub>HYS2(UVLO)</sub>	Logic supply voltage hysteresis	75	125		mV

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT	
V <sub>IH</sub>	High-level input voltage (TXD, STB, EN, and IN inputs)	0.7 × V <sub>IO</sub>		V <sub>IO</sub>	V	
V <sub>IL</sub>	Low-level input voltage (TXD, STB, EN, and IN inputs)	0		0.3 × V <sub>IO</sub>	V	
I <sub>OH</sub>	High-level output current RXD	V <sub>IO</sub> = 5V		-4	mA	
		V <sub>IO</sub> = 3.3V		-2	mA	
		V <sub>IO</sub> = 1.8 or 2.5V		-1	mA	
I <sub>OL</sub>	Low-level output current RXD	V <sub>IO</sub> = 5V		4	mA	
		V <sub>IO</sub> = 3.3V		2	mA	
		V <sub>IO</sub> = 1.8 or 2.5V		1	mA	
I <sub>OH</sub>	High-level output current OUT	V <sub>DD</sub> =4.5 to 5.5V		-4	mA	
I <sub>OL</sub>	Low-level output current OUT	V <sub>DD</sub> =4.5 to 5.5V		4	mA	
1/t <sub>UI</sub>	Signaling rate	CAN		5	Mbps	
DR	Data rate for extra GPIO channel	GPIO		10	Mbps	
T <sub>pwrap</sub>	Power up time after applying input supply(Isolated output supply reaches 90% of setpoint and data transmission can start after this)		5		ms	
T <sub>A</sub>	Ambient operating temperature	≤ 50% of bits are dominant		- 40	125	°C
				- 40	105	°C

## 8.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ISOW1044		UNIT
		DFM		
		20 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	68.5		°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	20.9		°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	44.8		°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	13		°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	44		°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	--		°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

## 8.5 Power Ratings

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
P <sub>D</sub>	Maximum power dissipation (both sides)			1060	mW
P <sub>D1</sub>	Maximum power dissipation (side-1)			490	mW
P <sub>D2</sub>	Maximum power dissipation by (side-2)			570	mW

V<sub>IO</sub> = V<sub>DD</sub> = 5.5 V, STB = GND1, CAN Bus load  
R<sub>L</sub> = 60 Ω, TXD = repetitive pattern of 1 ms time period with 990 μs LOW time, 10 μs HIGH time,  
Extra load on V<sub>ISOOUT</sub> = 20 mA

## 8.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	VALUE	UNIT
<b>GENERAL</b>				
CLR	External clearance <sup>(1)</sup>	Shortest terminal-to-terminal distance through air	>8	mm
CPG	External creepage <sup>(1)</sup>	Shortest terminal-to-terminal distance across the package surface	>8	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance - capacitive signal isolation)	>17	um
DTI	Distance through the insulation	Minimum internal gap (internal clearance- transformer power isolation)	>120	um
CTI	Comparative tracking index	IEC 60112; UL 746A	>600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage Category	Rated mains voltage $\leq 600 V_{RMS}$	I-IV	
		Rated mains voltage $\leq 1000 V_{RMS}$	I-III	
<b>DIN VDE V 0884-11:2017-01<sup>(2)</sup></b>				
$V_{IORM}$	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	1500	$V_{PK}$
$V_{IOWM}$	Maximum working isolation voltage	AC voltage (sine wave) Time dependent dielectric breakdown (TDDB) test	1000	$V_{RMS}$
		DC voltage	1500	
$V_{IOTM}$	Maximum transient isolation voltage	$V_{TEST} = V_{IOTM}$ , $t = 60s$ (qualification); $V_{TEST} = 1.2 \times V_{IOTM}$ , $t = 1s$ (100% production)	7071	$V_{PK}$
$V_{IOSM}$	Maximum surge isolation voltage ISOW1044 <sup>(3)</sup>	Test method per IEC 62368-1, 1.2/50 $\mu s$ waveform, $V_{TEST} = 1.6 \times V_{IOSM} = 10000 V_{PK}$ (qualification)	6250	$V_{PK}$
$V_{IOSM}$	Maximum surge isolation voltage ISOW1044B <sup>(3)</sup>	Test method per IEC 62368-1, 1.2/50 $\mu s$ waveform, $V_{TEST} = 1.3 \times V_{IOSM} = 7800 V_{PK}$ (qualification)	6000	$V_{PK}$
$q_{pd}$	Apparent charge <sup>(4)</sup>	Method a: After I/O safety test subgroup 2/3, $V_{ini} = V_{IOTM}$ , $t_{ini} = 60 s$ ; $V_{pd(m)} = 1.2 \times V_{IORM}$ , $t_m = 10 s$	$\leq 5$	pC
		Method a: After environmental tests subgroup 1, $V_{ini} = V_{IOTM}$ , $t_{ini} = 60 s$ ; ISOW1044: $V_{pd(m)} = 1.6 \times V_{IORM}$ , $t_m = 10 s$ . ISOW1044B: $V_{pd(m)} = 1.2 \times V_{IORM}$ , $t_m = 10 s$	$\leq 5$	
		Method b1: At routine test (100% production) and preconditioning (type test) $V_{ini} = 1.2 \times V_{IOTM}$ , $t_{ini} = 1 s$ ; ISOW1044: $V_{pd(m)} = 1.875 \times V_{IORM}$ , $t_m = 1 s$ . ISOW1044B: $V_{pd(m)} = 1.5 \times V_{IORM}$ , $t_m = 1 s$	$\leq 5$

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation (ISOW1044)* and *basic electrical insulation (ISOW1044B)* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-terminal device

## 8.7 Safety-Related Certifications

VDE	CSA	UL	TUV	CQC
Plan to certify according to DIN VDE V 0884-11 :2017-01	Plan to certify according to IEC 62368-1, IEC 61010-1 and IEC 60601-1	Plan to certify under UL 1577 Component Recognition Program	Plan to certify according to GB4943.1-2011	Plan to certify according to EN 61010-1:2010/ A1:2019 and EN 62368-1:2014
Maximum transient isolation voltage 7071 V <sub>PK</sub> ; Maximum repetitive peak isolation voltage, 1500 V <sub>PK</sub> ; Maximum surge isolation voltage, ISOW1044: 6250 V <sub>PK</sub> (Reinforced), ISOW1044B: 6000 V <sub>PK</sub> (Basic)	Per CSA62368-1:19, IEC 62368-1:2018 Ed. 3, CSA 61010-1-12+A1 and IEC 61010-1 3rd Ed., ISOW1044 (Reinforced): 600 V <sub>RMS</sub> , ISOW1044B (Basic): 1000 V <sub>RMS</sub> maximum working voltage (pollution degree 2, material group I, ambient temperature 90 °C), 1 MOPP (Means of Patient Protection) per CSA 60601-1:14 . Certification planned	Certification planned	Certification planned	Certification planned	Certification planned

## 8.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub>	Safety input, output, or supply current <sup>(1)</sup>	R <sub>θJA</sub> = 68.5 °C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150 °C, T <sub>A</sub> = 25 °C, See <a href="#">Figure 8-1</a>			332	mA
		R <sub>θJA</sub> = 68.5 °C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150 °C, T <sub>A</sub> = 25 °C, See <a href="#">Figure 8-1</a>			507	
P <sub>S</sub>	Safety input, output, or total power <sup>(1)</sup>	R <sub>θJA</sub> = 68.5 °C/W, T <sub>J</sub> = 150 °C, T <sub>A</sub> = 25 °C, See <a href="#">Figure 8-2</a>			1826	mA
T <sub>S</sub>	Safety temperature <sup>(1)</sup>				150	°C

- (1) The maximum safety temperature, T<sub>S</sub>, has the same value as the maximum junction temperature, T<sub>J</sub>, specified for the device. The I<sub>S</sub> and P<sub>S</sub> parameters represent the safety current and safety power respectively. The maximum limits of I<sub>S</sub> and P<sub>S</sub> should not be exceeded. These limits vary with the ambient temperature, T<sub>A</sub>.

The junction-to-air thermal resistance, R<sub>θJA</sub>, in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$$T_J = T_A + R_{\theta JA} \times P, \text{ where } P \text{ is the power dissipated in the device.}$$

$$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S, \text{ where } T_{J(max)} \text{ is the maximum allowed junction temperature.}$$

$$P_S = I_S \times V_I, \text{ where } V_I \text{ is the maximum input voltage.}$$

## 8.9 Electrical Characteristics

over recommended operating conditions, typical values are at  $V_{DD} = 5V$ ,  $GND1 = GNDIO$ ,  $GND2 = GISOIN$ ,  $V_{IO} = 3.3V$  and  $T_A = 25^\circ C$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Device</b>						
$V_{ISOOUT}$	Isolated Output supply voltage	EN= $V_{DD}$ , STB, TXD, IN floating	4.75	5	5.25	V
$I_{out}$	Extra current available on Visoout	$V_{DD} = 4.5$ to $5.5V$ , CAN full loaded $60\ \Omega$ , TXD toggling 5 Mbps, IN toggling 10 Mbps		20		mA
$V_{OH}$	Output high voltage on OUT pin	$V_{DD} = 5V \pm 10\%$ , $I_{OH} = -4$ mA, IN = $V_{IO}$	$V_{ISOIN} - 0.4$			V
$V_{OL}$	Output low voltage on OUT pin	$V_{DD} = 5V \pm 10\%$ , $I_{OL} = 4$ mA, IN = GND2			0.4	V
$I_I$	Input current, IN	IN at GND1 or $V_{IO}$	-25		25	$\mu A$
$I_I$	Input current, EN	EN at GND1 or $V_{IO}$	-25		25	$\mu A$
<b>TXD TERMINAL</b>						
$I_I$	Input leakage current	TXD = $V_{IO}$ or GND1	-25		25	$\mu A$

- A.  $V_{CCI}$  and  $V_{CCO}$  refers to the power supplies  $V_{IO}$  and  $V_{ISOIN}$ , respectively.  $C_L = 15$  pF and The input pulse is supplied by a generator having the following characteristics:  $PRR \leq 50$  kHz, 50% duty cycle,  $t_r \leq 3$  ns,  $t_f \leq 3$  ns,  $Z_0 = 50 \Omega$ . At the input,  $50 \Omega$  resistor is required to terminate Input Generator signal. It is not needed in actual application.
- B.  $C_L = 15$  pF and includes instrumentation and fixture capacitance within  $\pm 20\%$ .

**9-10. Switching Characteristics Test Circuit and Voltage Waveforms**

## 10 Detailed Description

### 10.1 Overview

The ISOW1044 has signal isolation channels, power isolation with integrated transformer and CAN transceiver all integrated in one package. ISOW1044 supports maximum signaling rate up to 1Mbps for CAN, and 5 Mbps for CAN FD. [Functional Block Diagram](#) shows functional block diagram of ISOW1044.

### 10.2 Power Isolation

The integrated isolated DC-DC converter uses advanced circuit and on-chip layout techniques to reduce radiated emissions and achieve upto 47% typical efficiency. The integrated transformer uses thin film polymer as the insulation barrier. In case bus communication is not needed, the DC-DC converter can be switched off using EN pin to save power. The output voltage,  $V_{ISOOUT}$ , is monitored and feedback information is conveyed to the primary side through a dedicated isolation channel. The duty cycle of the primary switching stage is adjusted accordingly. The fast feedback control loop of the power converter ensures low overshoots and undershoots during load transients. Undervoltage lockout (UVLO) with hysteresis is integrated on the  $V_{IO}$ ,  $V_{DD}$  and  $V_{ISOOUT}$  supplies which ensures robust fails-safe system performance under noisy conditions. An integrated soft-start mechanism ensures controlled inrush current and avoids any overshoot on the output during power up.

### 10.3 Signal Isolation

The integrated signal isolation channels for CAN transceiver and GPIO employ an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon-dioxide based isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one state and sends no signal to represent the other state. The receiver demodulates the signal after signal conditioning and produces the output through a buffer stage. The signal-isolation channels incorporate advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions from the high frequency carrier and IO buffer switching. [Figure 10-3](#) shows a functional block diagram of a typical signal isolation channel.

In order to keep any noise coupling from power converter away from signal path, power supplies on side1 for power converter ( $V_{DD}$ ) and signal path( $V_{IO}$ ) are kept separate. Similarly on side2, power converter output ( $V_{ISOOUT}$ ) needs to be connected to power supply for CAN ( $V_{ISOIN}$ ) externally on PCB. For more details, refer to [Layout Guidelines](#) section.

### 10.4 CAN Transceiver

The ISOW1044 device includes a digitally isolated CAN transceiver that offers  $\pm 58$ -V DC bus fault protection and  $\pm 12$ -V common-mode voltage range. The device supports up to 5-Mbps data rate in CAN FD mode allowing much faster transfer of payload compared to classic CAN. The power converter operates from a 5-V supply on side 1 ( $V_{DD}$ ) and a 5-V supply on side 2 ( $V_{ISOOUT}$ ). The logic supply  $V_{IO}$  on side 1 can operate from 1.71-V up to 5.5-V. This wide  $V_{IO}$  supply range is of particular advantage for applications operating in harsh industrial environments because the low voltage on side 1 enables the connection to low voltage microcontrollers for power conservation, whereas the 5 V on side 2 maintains a high signal-to-noise ratio of the bus signals.

The ISOW1044 supports a standby mode and remote BUS Wake-UP (WUP). The STB pin can be supplied from either the system processor or from a static system voltage source. In standby mode, the CAN driver and main receiver are switched off and bidirectional CAN communication is not possible. The DC-DC converter, low-power receiver, and bus monitor circuits are still enabled to allow for RXD wake-up requests via the CAN bus. The CAN bus pins are weakly pulled to GND in this mode. If normal mode is the only intended mode of operation than the STB pin can be tied directly to GND.

#### 10.4.1 Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode

The ISOW1044 supports a remote wake-up request that is used to indicate to the host controller that the bus is active and the node should return to normal operation.

The device uses the multiple filtered dominant wake-up pattern (WUP) from the ISO 11898-2:2016 standard to qualify bus activity. Once a valid WUP has been received, the wake request is indicated to the controller by a falling edge and low period corresponding to a filtered dominant on the RXD output of the ISOW1044.

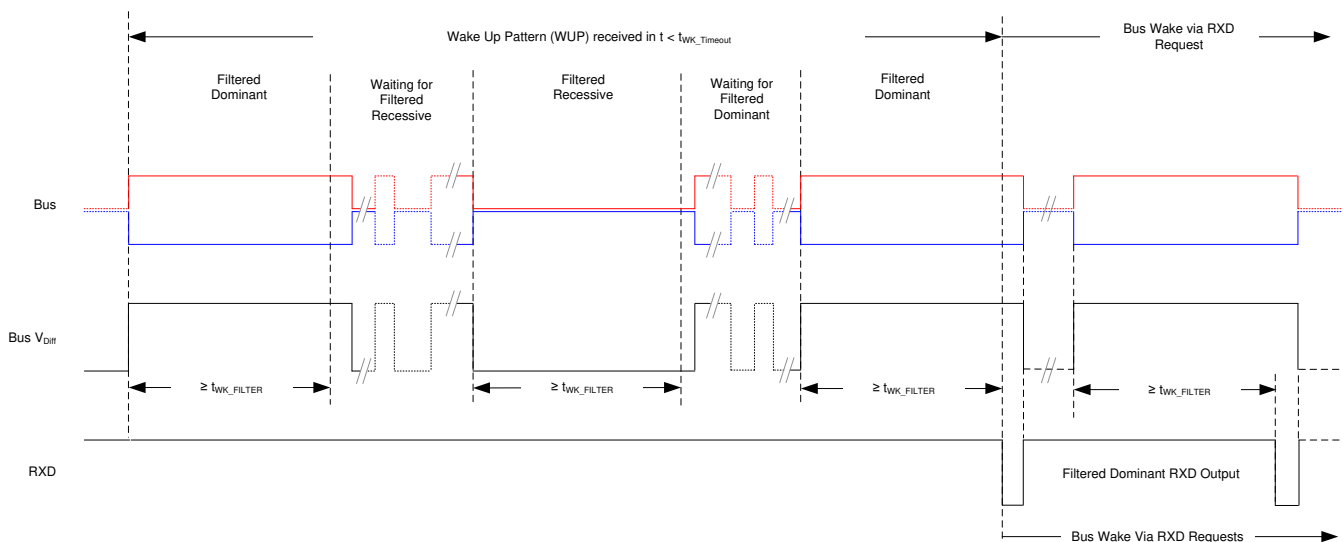

The WUP consists of a filtered dominant pulse, followed by a filtered recessive pulse, and finally by a second filtered dominant pulse. The first filtered dominant initiates the WUP, and the bus monitor then waits on a filtered recessive; other bus traffic does not reset the bus monitor. Once a filtered recessive is received the bus monitor is waiting for a filtered dominant and again, other bus traffic does not reset the bus monitor. Immediately upon reception of the second filtered dominant the bus monitor recognizes the WUP and drives the RXD output low every time an additional filtered dominant signal is received from the bus.

For a dominant or recessive to be considered filtered, the bus must be in that state for more than the  $t_{WK\_FILTER}$  time. Due to variability in  $t_{WK\_FILTER}$  the following scenarios are applicable. Bus state times less than  $t_{WK\_FILTER(MIN)}$  are never detected as part of a WUP and thus no wake request is generated. Bus state times between  $t_{WK\_FILTER(MIN)}$  and  $t_{WK\_FILTER(MAX)}$  may be detected as part of a WUP and a wake-up request may be generated. Bus state times greater than  $t_{WK\_FILTER(MAX)}$  are always detected as part of a WUP, and thus a wake request is always generated. See [Figure 10-1](#) for the timing diagram of the wake-up pattern.

The pattern and  $t_{WK\_FILTER}$  time used for the WUP prevents noise and bus stuck dominant faults from causing false wake-up requests while allowing any valid message to initiate a wake-up request.

The ISO 11898-2:2016 standard has defined times for a short and long wake-up filter time. The  $t_{WK\_FILTER}$  timing for the device has been picked to be within the minimum and maximum values of both filter ranges. This timing has been chosen such that a single bit time at 500 kbps, or two back-to-back bit times at 1 Mbps triggers the filter in either bus state. Any CAN frame at 500 kbps or less would contain a valid WUP.

For an additional layer of robustness and to prevent false wake-ups, the device implements a wake-up timeout feature. For a remote wake-up event to successfully occur, the entire WUP must be received within the timeout value  $t \leq t_{WK\_TIMEOUT}$ . If not, the internal logic is reset and the transceiver remains in its current state without waking up. The full pattern must then be transmitted again, conforming to the constraints mentioned in this section. See [Figure 10-1](#) for the timing diagram of the wake-up pattern with wake timeout feature.

**图 10-1. Wake-Up Pattern (WUP) with  $t_{WK\_TIMEOUT}$**

## 10.5 Functional Block Diagram

图 10-2. Block Diagram

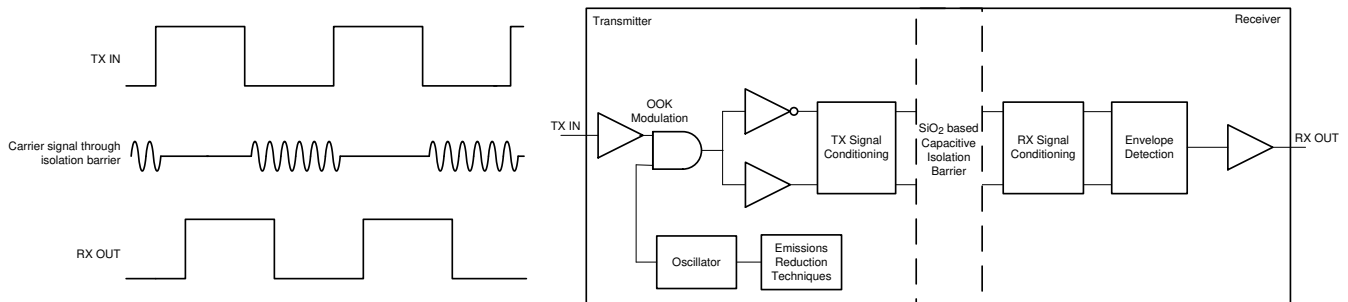

图 10-3. Signal Isolation channel

## 10.6 Feature Description

### 10.6.1 CAN Bus States

The CAN bus has two logical states during operation: *recessive* and *dominant*. A dominant bus state occurs when the bus is driven differentially and corresponds to a logic low on the TXD and RXD pins. A recessive bus state occurs when the bus is biased to  $V_{CC}/2$  via the high-resistance internal input resistors ( $R_{IN}$ ) of the receiver and corresponds to a logic high on the TXD and RXD pins.

A dominant state overwrites the recessive state during arbitration. Multiple CAN nodes may be transmitting a dominant bit at the same time during arbitration, and in this case the differential voltage of the bus is greater than the differential voltage of a single driver.

The ISOW1044 transceiver implements a standby (STB) mode which enables a third bus state where the bus pins are weakly biased to ground via the high resistance internal resistors of the receiver.

图 10-4. Bus States (Physical Bit Representation)

图 10-5. Simplified Recessive Common Mode Bias and Receiver

A. A - Normal Mode B - Standby Mode

### 10.6.2 Digital Inputs and Outputs: TXD (Input) and RXD (Output)

The  $V_{IO}$  supply for the isolated digital input and output side of the device can be supplied by 1.8-V, 2.5-V, 3.3-V, and 5-V supplies and therefore the digital inputs and outputs are 1.8-V, 2.5-V, 3.3-V, and 5-V compatible.

### 10.6.3 TXD Dominant Timeout (DTO)

The TXD DTO circuit prevents the transceiver from blocking network communication in the event of a hardware or software failure where the TXD pin is held dominant longer than the timeout period,  $t_{TXD\_DTO}$ . The DTO circuit timer starts on a falling edge on the TXD pin. The DTO circuit disables the CAN bus driver if no rising edge occurs before the timeout period expires, which frees the bus for communication between other nodes on the network. The CAN driver is activated again when a recessive signal occurs on the TXD pin, clearing the TXD DTO condition. The receiver and RXD pin still reflect activity on the CAN bus, and the bus terminals are biased to the recessive level during a TXD dominant timeout.

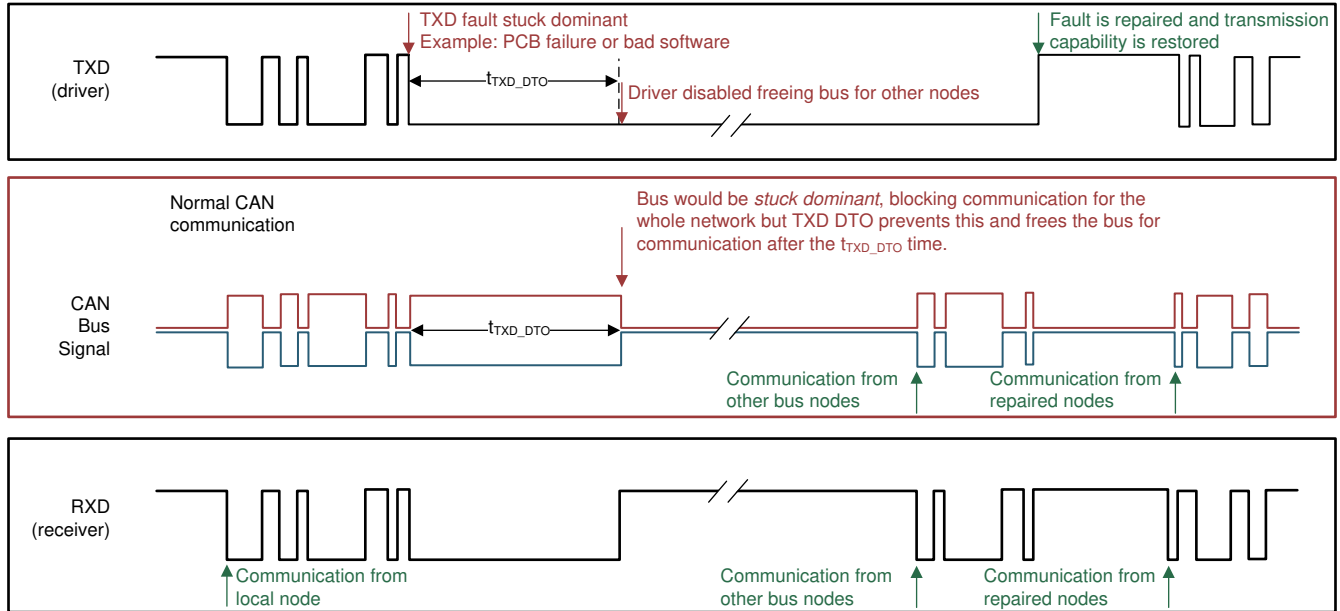

图 10-6. Example Timing Diagram for TXD DTO

备注

The minimum dominant TXD time ( $t_{TXD\_DTO}$ ) allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{TXD\_DTO}$  minimum, limits the minimum data rate. Calculate the minimum transmitted data rate with [方程式 1](#).

$$\text{Minimum Data Rate} = 11 / t_{TXD\_DTO} \quad (1)$$

### 10.6.4 Power-Up and Power-Down Behavior

The ISOW1044 has built-in under-voltage lockout (UVLO) on all supplies ( $V_{DD}$ ,  $V_{IO}$  and  $V_{ISOOUT}$ ) with positive-going and negative-going thresholds and hysteresis. Both the power converter supply ( $V_{DD}$ ) and Logic supply ( $V_{IO}$ ) need to be present for the device to work. If either of them is below its UVLO, both the signal path and the power converter are disabled.

Assuming  $V_{IO}$  is above its UVLO+, when the  $V_{DD}$  voltage crosses the positive-going UVLO threshold during power-up, the DC-DC converter initializes and the power converter duty cycle is increased in a controlled manner. This soft-start scheme limits primary peak currents drawn from the  $V_{DD}$  supply and charges the  $V_{ISOOUT}$  output in a controlled manner, avoiding overshoots. CAN BUS is in high impedance state in this duration. When the UVLO positive-going threshold is crossed on the secondary side  $V_{ISOOUT}$  pin, the feedback channel starts providing feedback to the primary controller. The regulation loop takes over and CAN drive output, Received data output (RXD) and general purpose logic channel (OUT) take their respective states defined by the inputs to the device i.e. Standby (STB), Driver data to be transmitted TXD, and general purpose logic input IN respectively. Designers should consider a sufficient time margin (typically 5 ms with 10- $\mu$ F load capacitance) to allow this power up sequence before any usable system functionality.

When either of  $V_{DD}$  or  $V_{IO}$  is lost, the primary side DC-DC controller turns off when the UVLO lower threshold is reached. The  $V_{ISOOUT}$  capacitor then discharges depending on the isolation channels and BUS load.

### 10.6.5 Protection Features

The ISOW1044 device has multiple protection features to create a robust system level solution.

- The first feature is an Enable/Fault protection feature. This EN/FLT pin can be used as either an input pin to enable or disable the integrated DC-DC power converter or as an output pin which works as an alert signal if the power converter is not operating properly. In the /Fault use case, a fault is reported if  $V_{DD} > 7\text{ V}$ ,  $V_{DD} < 2.5\text{ V}$ , or if the junction temperature  $> 170^\circ\text{C}$ . When a fault is detected, this pin will go low, disabling the DC-DC converter to prevent any damage.

**图 10-7. EN Fault Pin Diagram**

- An over-voltage clamp feature is present on  $V_{ISOOUT}$  which will clamp the voltage at 6 V if there is an increase in voltage seen. For device reliability, it is recommended that  $V_{ISOOUT}$  stays lower than the over-clamp voltage for device reliability.
- Over-Voltage Lock Out (OVLO) on  $V_{DD}$  will occur when a voltage higher than 7 V on  $V_{DD}$  is seen. At OVLO, the device will go into a low power state and the EN/FLT pin will go low.
- In cases of overload or short on power converter output  $V_{ISOOUT}$ , maximum duty cycle of power converter is limited. In cases of driver bus short circuit due to the external power supply cable shorting to the bus cable, short circuit current protection on CAN chip restricts the bus current to  $\pm 115\text{ mA}$  maximum.
- Thermal protection is also integrated to help prevent the device from getting damaged under such scenarios. An increase in the die temperature is monitored and the device is disabled when the die temperature becomes  $165^\circ\text{C}$  (typical), thus disabling the short condition. The device is re-enabled when the junction temperature becomes  $155^\circ\text{C}$  (typical). If an overload or output short-circuit condition prevails, this protection cycle is repeated. Care should be taken in the system design to prevent repeated or prolonged exposure to bus shorts as this exposes the device to high junction temperatures for extreme amounts of time affecting device reliability.

### 10.6.6 Floating Pins, Unpowered Device

The ISOW1044 is designed to be ideal passive or no load to the CAN bus if it is unpowered. The bus pins (CANH, CANL) have extremely low leakage currents when the device is unpowered to avoid loading down the bus which is critical if some nodes of the network are unpowered while the rest of the of network remains in operation.

The device has internal pull-ups on critical pins (TXD and STB) which places the device into known states if the pin floats. This internal bias should not be relied upon by design though, especially in noisy environments, but instead should be considered a failsafe protection feature. When a CAN controller supporting open drain outputs is used, an adequate external pull-up resistor must be used to ensure that the TXD output of the CAN controller maintains adequate bit timing to the input of the CAN transceiver. See [表 10-3](#) for more details.

### 10.6.7 Glitch-Free Power Up and Power Down

Communication on the bus that already exist between a master node and slave node in a CAN network must not be disturbed when a new node is swapped in or out of the network. No glitches on the bus should occur when the device is:

- Hot plugged into the network in an unpowered state
- Hot plugged into the network in a powered state and recessive state
- Powered up or powered down in a recessive state when already connected to the bus

The ISOW1044 device meets above criteria and does not cause any false data toggling on the bus when powered up or powered down in a recessive state with supply ramp rates  $\geq 50\text{ us}$ .

## 10.7 Device Functional Modes

表 10-1 lists the supply configuration for these devices:

**表 10-1. Supply configuration Function Table**

INPUTS			OUTPUTS		
V <sub>DD</sub>	V <sub>IO</sub>	EN/FLT	BUS OUTPUT (CANH/ CANL)	RXD	V <sub>ISOOUT</sub> <sup>(2)</sup>
< V <sub>DD(UVLO+)</sub>	>V <sub>IO(UVLO+)</sub>	X	High-Z	Recessive (Default High)	OFF
>V <sub>DD(UVLO+)</sub>	<V <sub>IO(UVLO+)</sub>	X	High-Z	Recessive (Default High)	Invalid Operation
5 V	1.71 V to 5.5 V	H or Open	Per Device Mode <sup>(1)</sup> and TXD	Mirrors Bus	5 V
5 V	1.71 V to 5.5 V	L	High-Z	Recessive (Default High)	OFF

- (1) At Normal mode (STB = L), BUS OUTPUT follows TXD. Otherwise if at Standby mode (STB = H or Open), BUS OUTPUT is High-Z.  
 (2) V<sub>ISOOUT</sub> shorted to V<sub>ISOIN</sub> on PCB. GND2 and GISOIN pins are shorted together and EN/FLT = High.

表 10-2 shows the different driver functional modes:

**表 10-2. Driver Functional Table**

INPUTS					OUTPUTS		
V <sub>DD</sub> <sup>(1)</sup>	V <sub>IO</sub>	EN/FLT	STB	INPUT TXD	CANH <sup>(3)</sup>	CANL <sup>(3)</sup>	DRIVEN BUS STATE
PU	PU	H or Open	L	L	H	L	Dominant
			H or Open	H or Open	Z	Z	Recessive
		L	H or Open	X	Hi-Z	Hi-Z	Weak pull-down to ground
			X	X	Hi-Z	Hi-Z	Weak pull-down to ground
PD	PU	X	X	X	Hi-Z	Hi-Z	Weak pull-down to ground
PU	PD <sup>(2)</sup>	X	X	X	Invalid Operation		

- (1) PU=Powered up, PD=Powered down; H=high level; L=Low level; X=Irrelevant; Z = common-mode (recessive) biased to V<sub>ISOIN</sub>/2 , Hi-Z=High impedance state  
 (2) A strongly driven input signal on TXD can weakly power the floating V<sub>IO</sub> through an internal protection diode and cause an undetermined output.  
 (3) V<sub>ISOOUT</sub> shorted to V<sub>ISOIN</sub> on PCB and GND2 and GISOIN pins are shorted together and EN/FLT = High

At Normal mode (STB = L), the CAN outputs follow the logic states at data input, TXD. A logic low at the TXD input causes the CAN output to go dominant. Therefore the differential output voltage defined by 方程式 2 is positive. A logic high at the TXD input causes the CAN BUS to go recessive. Therefore the differential output voltage defined by 方程式 2 is negative.

$$V_{OD} = V_{CANH} - V_{CANL} \tag{2}$$

At Standby mode (STB = H or Open), both outputs go to the high-impedance (Hi-Z) state. The logic state at the TXD pin is irrelevant when this mode. The driver is disabled (bus outputs are in the Hi-Z) by default when the STB pin is left open. The TXD pin has an internal pullup resistor.

表 10-3 shows the different receiver functional modes:

表 10-3. Receiver Functional Table

INPUTS					OUTPUT	
V <sub>DD</sub> <sup>(1)</sup>	V <sub>IO</sub>	EN/FLT	STB	CAN DIFFERENTIAL INPUTS V <sub>ID</sub> = V <sub>CANH</sub> - V <sub>CANL</sub>	BUS STATE	RXD <sup>(3)</sup>
PU	PU	H or Open	L	V <sub>ID</sub> > 0.9 V	Dominant	L
				0.5 V < V <sub>ID</sub> < 0.9 V	Undefined	Undefined
				V <sub>ID</sub> < 0.5 V	Recessive	H
			H or Open	V <sub>ID</sub> > 1.15 V	Dominant	H (L if a remote wake event occurred)
				0.4 V < V <sub>ID</sub> < 1.15 V	Undefined	
				V <sub>ID</sub> < 0.4 V	Recessive	
			X	Open (V <sub>ID</sub> = 0 V)	Open	H
L	X	X	X	Hi-Z		
PD	PU	X	X	X	X	Hi-Z
PU	PD <sup>(2)</sup>	X	X	X	X	Invalid Operation

(1) PU=Powered up, PD=Powered down; H=high level; L=Low level; X=Irrelevant; Hi-Z=High impedance state

(2) A strongly driven input signal on TXD can weakly power the floating VIO through an internal protection diode and cause an undetermined output.

(3) V<sub>ISOOUT</sub> shorted to V<sub>ISOIN</sub> on PCB. GND2 and GISOIN pins are shorted together and EN/FLT = High

At Normal mode (STB = L), the receiver output, RXD, goes low when the differential input voltage defined by 方程式 3 is greater than the positive input threshold, V<sub>IT+</sub>. The receiver output, RXD, goes high when the differential input voltage defined by 方程式 3 is less than the negative input threshold, V<sub>IT-</sub>. If the V<sub>ID</sub> voltage is between the V<sub>IT+</sub> and V<sub>IT-</sub> thresholds, the output is indeterminate.

$$V_{ID} = V_{CANH} - V_{CANL} \quad (3)$$

At Standby mode (STB = H or Open), RXD output goes high and if a remote wake-up event occurs, it goes low.

Other device feature functional states are shown in 表 10-4 and 表 10-5 below:

表 10-4. DC-DC Converter Enable/Disable

INPUTS			OUTPUT
V <sub>DD</sub>	V <sub>IO</sub>	EN/FLT	V <sub>ISOOUT</sub>
PU	PU	H or Open	5 V
PU	PU	L	OFF

表 10-5. General Purpose Logic Input/Output

INPUTS				OUTPUT	CommentsComments
V <sub>DD</sub> <sup>(1) (2)</sup>	V <sub>IO</sub>	EN/FLT	IN	OUT	
PU	PU	H or Open	H	H	Output channel assumes logic state governed by IN
			L	L	
			Open	L	
	L	X	X	Hi-Z	Device is in disabled state when either of V <sub>DD</sub> or V <sub>IO</sub> is missing
PD	PU	X	X	Hi-Z	
PU	PD	X	X	Invalid Operation	

(1) PU = Powered Up; PD = Powered Down; H = Logic High; L = Logic Low; X = Irrelevant, Hi-Z = High Impedance (OFF) state

(2) V<sub>ISOOUT</sub> shorted to V<sub>ISOIN</sub> on PCB. GND2 and GISOIN pins are shorted together and EN=High

### 10.8 Device I/O Schematics

图 10-8. Device I/O schematics

## 11 Application and Implementation

### 备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 11.1 Application Information

The ISOW1044 device can be used with other components from Texas Instruments such as a microcontroller and a linear voltage regulator to form a fully isolated CAN interface. Typically two power supplies isolated from each other are needed to power up both sides of Isolated CAN device. Due to the integrated DC-DC converter in the device, the isolated supply is generated inside the device that can be used to power isolated side of the CAN device and peripherals on isolated side, thus saving board space.

### 11.2 Typical Application

The ISOW1044 device is suitable for applications that have limited board space and desire more integration. It is also suitable for very high voltage applications, where power transformers meeting the required isolation specifications are bulky and expensive. The device can be used in applications with a host micro-controller or FPGA that includes the link layer portion of the CAN protocol. 图 11-1 shows a typical application configuration for 5 V controller applications. The bus termination is shown for illustrative purposes. The ISOW1044 device meets 8 kV contact ESD (Electrostatic discharge) per IEC 61000-4-2 standalone with no external components on bus. If the application requires the usage of Common mode choke (CMC), then use of Transient voltage suppressor (TVS) is a must to achieve 8kV IEC ESD.

#### Notes:

1. Keep 10 nF bypass capacitors close to  $V_{DD}$  and  $V_{ISOOUT}$  pins ( $< 1$  mm) for optimum Radiated emissions performance
2. GND1 and GNDIO need be shorted directly. GND2 and GISOIN need be shorted directly, or through ferrite beads.
3. All GISOIN pins (pin 15, 16, 17) need be shorted on PCB for optimum IEC-ESD performance.
4.  $V_{SIN}$  and  $V_{ISOOUT}$  must be shorted on PCB.

图 11-1. Application circuit for ISOW1044

#### 11.2.1 Design Requirements

Unlike an optocoupler-based solution, which requires several external components to improve performance, provide bias, or limit current, the ISOW1044 device only requires external bypass capacitors to operate as shown in above application diagram.

Because of very-high current flowing through the device  $V_{DD}$  and  $V_{ISOOUT}$  supplies, higher decoupling capacitors typically provide better noise and ripple performance. Although a 10- $\mu\text{F}$  capacitor is adequate, higher decoupling capacitors (such as 47  $\mu\text{F}$ ) on both the  $V_{DD}$  and  $V_{ISOOUT}$  pins to the respective grounds are strongly recommended to achieve the best performance.

## 11.2.2 Detailed Design Procedure

### 11.2.2.1 Bus Loading, Length and Number of Nodes

The ISO 11898-2 Standard specifies a maximum bus length of 40 m and maximum stub length of 0.3 m. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A large number of nodes requires transceivers with high input impedance such as the ISOW1044 transceiver.

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898-2 Standard. These organizations and standards have made system-level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, DeviceNet, and NMEA2000.

The ISOW1044 device is specified to meet the 1.5-V requirement with a 50- $\Omega$  load, incorporating the worst case including parallel transceivers. The differential input resistance of the device is a minimum of 30 k $\Omega$ . If 100 ISOW1044 transceivers are in parallel on a bus, this requirement is equivalent to a 300- $\Omega$  differential load worst case. That transceiver load of 300  $\Omega$  in parallel with the 60  $\Omega$  gives an equivalent loading of 50  $\Omega$ . Therefore, the ISOW1044 device theoretically supports up to 100 transceivers on a single bus segment. However, for CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity, therefore a practical maximum number of nodes is typically much lower. Bus length may also be extended beyond the original ISO 11898 standard of 40 m by careful system design and data-rate tradeoffs. For example, CAN open network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes, and a significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898-2 CAN standard. Using this flexibility requires the responsibility of good network design and balancing these tradeoffs.

### 11.2.2.2 CAN Termination

The ISO11898 standard specifies the interconnect to be a single twisted pair cable (shielded or unshielded) with 120- $\Omega$  characteristic impedance ( $Z_0$ ). Resistors equal to the characteristic impedance of the line should be used to terminate both ends of the cable to prevent signal reflections. Unterminated drop-lines (stubs) connecting nodes to the bus should be kept as short as possible to minimize signal reflections. The termination may be in a node, but if nodes are removed from the bus, the termination must be carefully placed so that it is not removed from the bus.

图 11-2. Typical CAN Bus

Termination may be a single 120-Ω resistor at the end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common-mode voltage of the bus is desired, then split termination can be used as below termination concepts. Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common-mode voltages at the start and end of message transmissions.

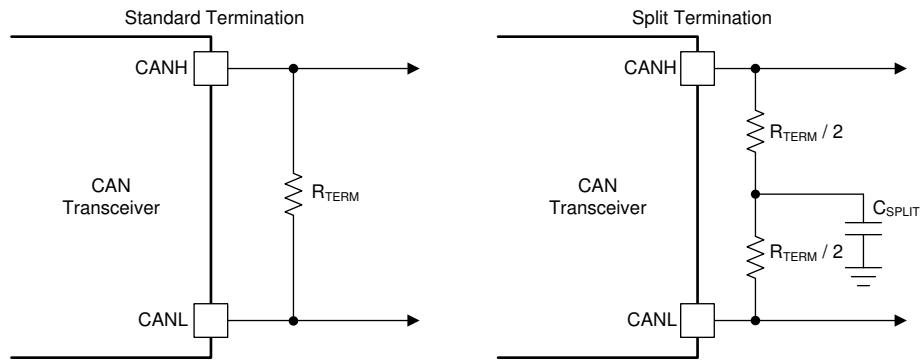

图 11-3. CAN Bus Termination Concepts

### 11.2.3 Application Curve

Red: Peak vertical scan. Green: Peak horizontal scan

$V_{DD} = 5\text{ V}$

$V_{ISOOUT} = 5\text{ V}$

Data rate = 1 Mbps

图 11-4. ISOW1044 Radiated Emissions versus CISPR32B line

### 11.2.4 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See 图 11-5 for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 87.5% for lifetime which translates into minimum required insulation lifetime of 37.5 years at a working voltage that's 20% higher than the specified value. 图 11-6 shows the intrinsic capability of the isolation barrier to withstand high voltage stress over its lifetime. Based on the TDDB data, the intrinsic capability of the insulation is 1000  $V_{RMS}$  with a lifetime of 1184 years.

图 11-5. Test Setup for Insulation Lifetime Measurement

图 11-6. Insulation Lifetime Projection Data

## 12 Power Supply Recommendations

To make sure that operation is reliable at all data rates and supply voltages, adequate decoupling capacitors must be located as close to supply pins as possible. Power converter input  $V_{DD}$  and output  $V_{ISOOUT}$  supply pins should have high frequency ceramic capacitors 10 nF and bulk capacitors 10  $\mu\text{F}$  atleast close to the pins. Signal path supply pins,  $V_{IO}$  and  $V_{ISOIN}$ , should have 100 nF or higher value ceramic bypass capacitors close to device pins. ISOW10144 can consume typical peak pulse currents of upto 250mA under fully loaded conditions for short durations (10s of  $\mu\text{s}$ ) from the power source that is powering  $V_{DD}$  of ISOW1044. Please make sure the current limit of upstream power device is atleast 300mA typical.

## 13 Layout

### 13.1 Layout Guidelines

Figure 11-1 shows the recommended placement and routing of device bypass capacitors. Below guidelines must be followed to achieve low emissions design:

1. High frequency bypass capacitors 10 nF must be placed close to  $V_{DD}$  and  $V_{ISOOUT}$  pins, within 1 mm distance away from device pins. This is very essential for optimised radiated emissions performance. Ensure that these capacitors are 0402 size so that they offer least inductance (ESL).
2. Bulk capacitors of at least 10  $\mu$ F must be placed on power converter input ( $V_{DD}$ ) and output ( $V_{ISOOUT}$ ) supply pins after the 10 nF capacitor with a distance of 2 - 4 mm, as shown in Layout Example.
3. Traces on  $V_{DD}$  and GND1 must be symmetric till bypass capacitors. Similarly traces on  $V_{ISOOUT}$  and GND2 must be symmetric.
4. Place two 0402 size Ferrite beads (Part number: BLM15EX331SN1) on power supply pins, one between  $V_{ISOOUT}$  and  $V_{ISOIN}$  and the other between GND2 (pin 11) and GND2(pin 15), as shown in example PCB layout, so that any high frequency noise from power converter output sees a high impedance before it goes to other components on PCB.
5. Do not have any metal traces or ground pour within 4 mm of power converter output terminals  $V_{ISOOUT}$  (pin12) and GND2 (pin11).
6. Place the CAN BUS protection and filtering circuitry close to the bus connector to prevent transients, ESD, and noise from propagating onto the board. This layout example shows an optional transient voltage suppression (TVS) diode, D1, which may be implemented if the system-level requirements exceed the specified rating of the transceiver. This example also shows two optional 68pF bus filter capacitors
7. Common mode choke or ferrite beads on bus terminals (CANH/CANL) can minimise any high frequency noise that can couple of CAN bus cable which can act as antenna and amplify that noise. This will improve Radiated emissions performance on a system level.
8. Following the layout guidelines of EVM as much as possible is highly recommended for a low radiated emissions design. EVM Link is available in [Related Documentation](#).

## PACKAGE OUTLINE

**DFM0020A**

**SOIC - 3.55 mm max height**

SMALL OUTLINE PACKAGE

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Ref. JEDEC registration MS-013

**EXAMPLE BOARD LAYOUT**

**DFM0020A**

**SOIC - 3.55 mm max height**

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

**DFM0020A**

**SOIC - 3.55 mm max height**

SMALL OUTLINE PACKAGE

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ISOW1044BDFMR	ACTIVE	SOIC	DFM	20	850	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	ISOW1044	<a href="#">Samples</a>
ISOW1044DFMR	ACTIVE	SOIC	DFM	20	850	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	ISOW1044	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
