TLE4275-Q1 5-V Low-Dropout Voltage Regulator

1 Features

- Qualified for Automotive Applications
- Output Voltage 5 V ± 2%
- Very Low Current Consumption
- Power-On and Undervoltage Reset
- Reset Low-Level Output Voltage < 1 V
- Very Low Dropout Voltage
- Short-Circuit Proof
- Reverse-Polarity Proof

2 Applications

- Qualified for Automotive Applications
- Cluster
- Body Control Modules
- Heating Ventilation and Air Conditioning (HVAC)

3 Description

The TLE4275-Q1 is a monolithic integrated low-dropout voltage regulator offered in a 5-pin TO package. The device regulates an input voltage up to 45 V to V_{OUT} = 5 V (typical). The device can drive loads up to 450 mA and is short-circuit proof. At overtemperature, the incorporated temperature protection turns off the TLE4275-Q1. The device generates a reset signal for an output voltage, $V_{OUT,rt}$, of 4.65 V (typical). By the use of an external delay capacitor, one can program the reset delay time.

The input capacitor, C_{IN}, compensates for line fluctuation. Using a resistor of approximately 1 Ω in series with C_{IN} dampens the oscillation of input inductance and input capacitance. The output capacitor, C_{OUT}, stabilizes the regulation circuit. The specification for stability is at C_{OUT} ≥ 22 µF and ESR ≤ 5 Ω, within the operating temperature range. Stability for electrolytic capacitors specifically is at C_{OUT} ≥ 68 µF within the operating temperature range. See the application report on low-temperature stability, SLVA501, for further details.

The control amplifier compares a reference voltage to a voltage that is proportional to the output voltage and drives the base of the series transistor through a buffer. Saturation control as a function of the load current prevents any oversaturation of the power element. The device also incorporates a number of internal circuits for protection against: *overload*, *overtemperature*, and *reverse polarity*.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TLE4275-Q1	DDPAK/TO-263 (5)	10.16 mm × 8.42 mm
	TO-252 (5)	6.10 mm × 6.60 mm
	HTSSOP (20)	6.50 mm × 4.40 mm

Pin Functions

PIN				TYPE	DESCRIPTION
NAME	NO.				
	KTT	KVU	PWP		
DELAY	4	4	3	O	Reset delay. Connect to ground with a capacitor to set delay time.
GND	3	3	8	O	Ground. Internally connected to heatsink
IN	1	1	19	I	Input. Connect to ground as close to device as possible, through a ceramic capacitor.
NC	—	—	2, 5–7, 9–18, 20	—	Not connected
OUT	5	5	4	O	Output. Connect to ground with ≥ 22-µF capacitor, ESR < 5 Ω at 10 kHz.
RESET	2	2	1	I	Reset output. Open-collector output

7 Specifications

7.1 Absolute Maximum Ratings(1)

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_I	Input voltage range(2)	IN	–42	45	V
		DELAY	–0.3	7	
V_O	Output voltage range	OUT	–1	16	V
		RESET	–0.3	25	
I_I	Input current	DELAY		±2	mA
I_O	Output current	RESET		±5	mA
T_J	Operating junction temperature		–40	150	°C
T_{stg}	Storage temperature		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to the network ground terminal.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1)	6000	V
		Machine model (MM)(2)	400	

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
(2) MM ESD rating tested per JESD22-A115.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_I	Input voltage	5.5	42	V
T_J	Junction temperature	–40	150	°C

7.4 Thermal Information

THERMAL METRIC(1)		TLE4275-Q1			UNIT
		KTT	KVU	PWP

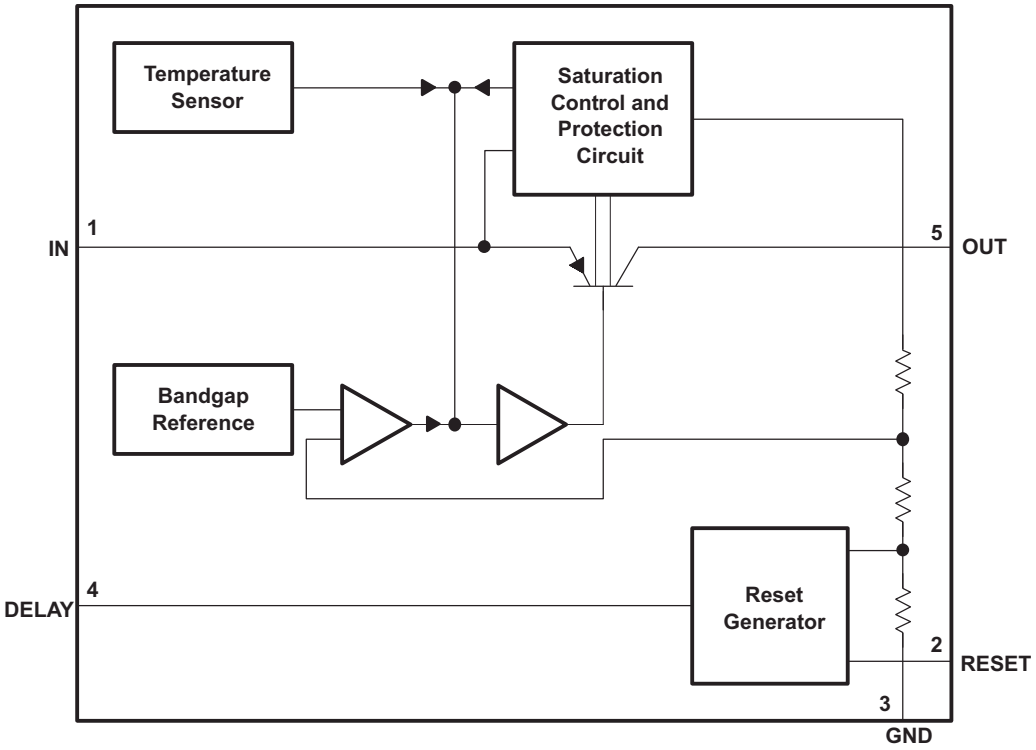
9 Detailed Description

9.1 Overview

The TLE4275-Q1 device is a monolithic integrated low-dropout voltage regulator offered in a 5-pin TO package. The device regulates an input voltage up to 45 V to V_{OUT} = 5 V (typical). The device can drive loads up to 450 mA and is short circuit proof. At over temperature, the incorporated temperature protection turns off the TLE4275-Q1 device. The device generates a reset signal for an output voltage, $V_{OUT,rt}$, of 4.65 V (typical). By the use of an external delay capacitor, one can program the reset delay time.

9.2 Functional Block Diagram



9.3 Feature Description

9.3.1 Regulated Output (OUT)

The OUT terminal is the regulated 5-V output. The output has current limitation. During initial power up, the regulator has a soft start incorporated to control the initial current through the pass element. In the event that the regulator drops out of regulation, the output tracks the input minus a drop based on the load current.

9.3.2 Power-On-Reset (RESET)

The power-on-reset is an output with an external pull up resistor to the regulated supply. The reset output remains low until the regulated V_O exceeds approximately 4.65 V and the power-on-reset delay has expired.

9.3.3 Reset Delay Timer (DELAY)

An external capacitor on this terminal sets the timer delay before the reset terminal is asserted high. The constant output current charges an external capacitor until the voltage exceeds a threshold to trip an internal comparator. The reset pulse delay time t_d, is defined with the charge time of an external capacitor DELAY.

$$t_d = \frac{C_{delay} \times V_{DU}}{I_{D,c}} \quad (1)$$

9.4 Device Functional Modes

9.4.1 Low-Voltage Tracking

At low input voltages, the regulator drops out of regulation and the output voltage tracks input minus a voltage based on the load current (I_O) and switch resistance ($R_{(SW)}$). This allows for a smaller input capacitor and can possibly eliminate the need of using a boost convertor during cold-crank conditions.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

Figure 19 shows typical application circuits for the TLE4275-Q1. Based on the end-application, different values of external components can be used. An application can require a larger output capacitor during fast load steps in order to prevent a reset from occurring. TI recommends a low-ESR ceramic capacitor with a dielectric of type X5R or X7R for better load transient response.

10.2 Typical Application

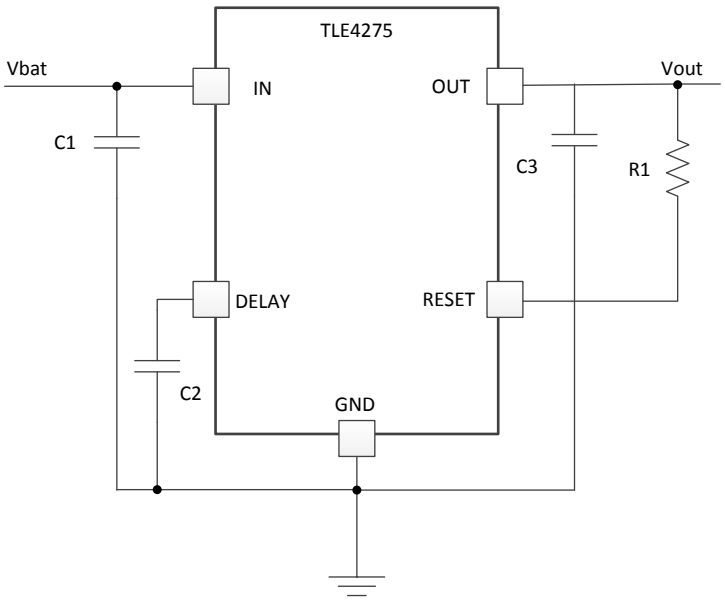


Figure 19. Typical Application Diagram

10.2.1 Design Requirements

For this design example, use the parameters listed in Table 1.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	4 to 40 V
Output voltage	5 V
Output current rating	400 mA
Output capacitor range	10 to 500 µF
Output capacitor ESR range	1 mΩ to 20 Ω
DELAY capacitor range	100 pF to 500 nF

10.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
- Output voltage
- Output current rating
- Output capacitor
- Power-up reset delay time

10.2.2.1 Power-Up Reset Capacitance

To calculate the power-up reset capacitance, use Equation 2.

$$t_d = \frac{C_{delay} \times V_{DU}}{I_{D,c}}$$

$$C_{delay} t_d = \frac{t_d \times I_{D,c}}{V_{DU}} = \frac{t_d \times 5.5 \times 10^{-6}}{1.8} \quad (2)$$

10.2.2.2 Thermal Consideration

Calculate the power dissipated by the device according to Equation 3.

$$P_T = I_O \times (V_I - V_O) + V_I \times I_Q$$

where

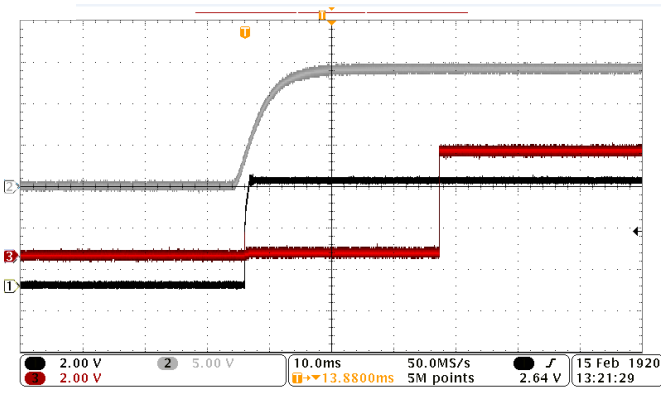
- P_T = Total power dissipation of the device.
- I_O = output current
- V_I = input voltage
- V_O = output voltage (3)

After determining the power dissipated by the device, calculate the junction temperature from the ambient temperature and the device thermal impedance.

$$T_J = T_A + R_{\theta JA} \times P_T \quad (4)$$

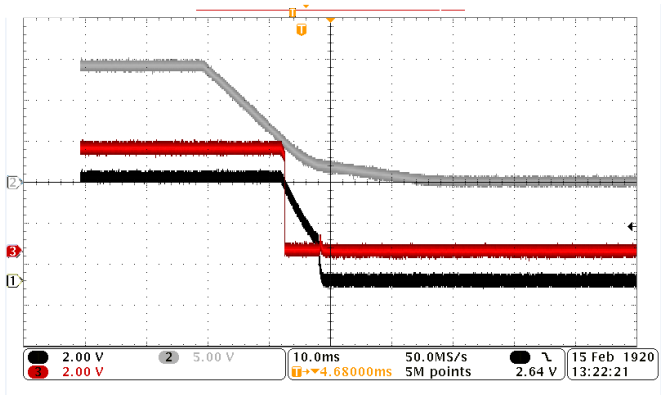
10.2.3 Application Curves

Load = 200 mA, C_{in} = 22 µF, C_{out} = 10 µF



CH1 : V_{out}, CH2: V_{in}, CH3: V_{reset}.

Figure 20. Power Up Waveform



CH1 : V_{out}, CH2: V_{in}, CH3: V_{reset}.

Figure 21. Power Down Waveform

11 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 4 V and 40 V. This input supply must be well regulated. If the input supply is located more than a few inches from the TLE4275-Q1 device, an electrolytic capacitor with a value of 47 µF and a ceramic bypass capacitor are recommended to add at the input.

12 Layout

12.1 Layout Guidelines

- Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. The use of vias and long traces is strongly discouraged because of the negative impact on system performance. Vias and long traces can also cause instability.
- Equivalent series inductance (ESL) and ESR must be minimized in order to maximize performance and ensure stability. Every capacitor must be placed as close to the device as possible and on the same side of the PCB as the regulator.

12.2 Layout Example

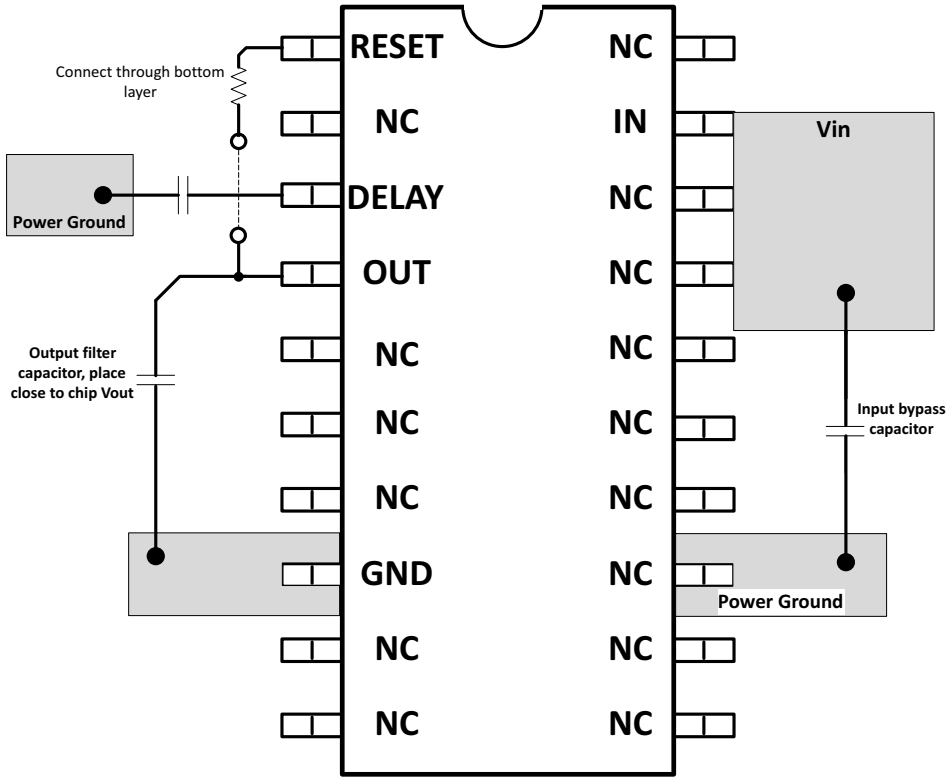


Figure 22. TLE4275-Q1 HTSSOP Layout Design Example

13 Device and Documentation Support

13.1 Documentation Support

13.1.1 Related Documentation

For related documentation see the following:

TLE4275QPWPRQ1	ACTIVE	HTSSOP	PWP	20	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	TLE4275Q	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
