USB 端口单刀双掷 (SP2T) 开关支持 USB 和通用异步接收发器 (UART)

查询样品: **TSU6111A**

## 特性

- 开关矩阵
  - **USB**
  - **UART** 支持高速 **USB 2.0**
- 充电设备侦测
  - 与 **USB BCDv1.1** 兼容
  - **VBUS** 检测
  - 数据接触检测
  - 一级和二级检测
- 兼容附件
  - **USB** 充电器 （专用充电端口 **(DCP)**，充电下行端口 **(CDP)**）
  - 厂家电缆
- 附加特性
  - 与主机处理器的 **I²C** 接口
  - 由自动侦测或者手动控制的开关
  - 为插**/**拔生成的中断
  - 支持制造中使用的控制信号 **(JIG，BOOT)**

- 最大电压
  - 额定 **28V VBUS**
- 静电放电 **(ESD)** 性能测试符合 **JESD 22** 标准
  - **5000V** 人体模型（**A114-B，II** 类）
  - **1000-V** 充电器件模型 **(C101)**
- **IEC ESD** 性能
  - 针对 **VBUS/DP_CON/DM_CON/ID_CON** 接地 **(GND)** 的**±8kV** 接触放电 **(IEC 61000-4-2)**
- **VBUS/DP_CON/DM_CON** 上的冲击保护
  - 无需外部组件的 **USB** 连接器引脚

应用范围

- 手机与智能电话
- 平板电脑
- 数码相机与摄像机
- 全球卫星定位 **(GPS)** 导航系统
- 具有 **USB/UART** 的微型 **USB** 接口

说明

TSU6111A 是一款支持阻抗侦测的高性能差分自主 SP2T 开关。 此开关支持对多种通过 DP，DM，和 ID 所连接的附件的侦测。 此充电器侦测满足 USB 充电器规格 v1.1 并且 V_{BUS_IN} 具有一个 28V 的容压以消除对外部保护的需要。 当附加在一个充电器上时，通过系统的 VBAT 或者 V_{BUS_IN}为这个器件供电。

SP2T 开关由自动侦测逻辑电路或者通过 I²C 的手动配置进行控制。 当使用 USB 或者 UART 线缆来测试开发和制造中的器件时，JIG 和 BOOT 引脚被启用。 TSU6111A 具有开漏 JIG 输出（低电平有效）。
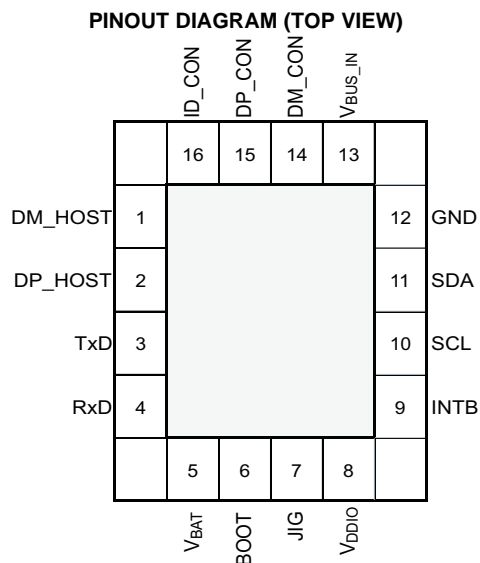

BLOCK DIAGRAM

SWITCH MATRIX

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PINOUT DIAGRAM (TOP VIEW)

DM_HOST 1				12 GND
DP_HOST 2				11 SDA
TxD 3				10 SCL
RxD 4				9 INTB

DYNAMIC							
t_{ON}	Turn-ON time	From receipt of I²C ACK bit	V_I or V_O = V_{BAT}, R_L = 50 Ω, C_L = 35 pF		95		µs
t_{OFF}	Turn-OFF time	From receipt of I²C ACK bit	V_I or V_O = V_{BAT}, R_L = 50 Ω, C_L = 35 pF		3.5		µs
$C_{I(OFF)}$	V_I OFF capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch OFF		4		pF
$C_{O(OFF)}$	V_O OFF capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch OFF		7		pF
$C_{I(ON)}$, $C_{O(ON)}$	V_I, V_O ON capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch ON		9		pF
BW	Bandwidth		R_L = 50 Ω, Switch ON		920		MHz
O_{ISO}	OFF Isolation		f = 240 MHz, R_L = 50 Ω, Switch OFF		–26		dB
X_{TALK}	Crosstalk		f = 240 MHz, R_L = 50 Ω		–32		dB

(1) V_O is equal to the asserted voltage on DP_CON and DM_CON pins. V_I is equal to the asserted voltage on DP_HT and DM_HT pins. I_O is equal to the current on the DP_CON and DM_CON pins. I_I is equal to the current on the DP_HT and DM_HT pins.

GENERAL OPERATION

The TSU6111A will automatically detect accessories plugged into the phone via the mini/micro USB 5 pin connector. The type of accessory detected will be stored in I^{2}C registers within the TSU6111A for retrieval by the host. The TSU6111A has a network of switches that are automatically opened and closed based on the accessory detection. See Table 1 for details of which switches are open during each mode of operation. The TSU6111A also offers a manual switching mode that allows the host processor to decide which switches should be opened and closed. The manual switching settings are executed through the I^{2}C interface.

STANDBY MODE

Standby mode is the default mode upon power up and occurs when no accessory has been detected. During this mode, the VBUS and ID lines are continually monitored through comparators to determine when an accessory is inserted. Power consumption is minimal during standby mode.

POWER SUPERVISOR

TSU6111A uses VBAT as the primary supply voltage. VBUS is the secondary supply. VDDIO is used for I^{2}C communication.

Table 1. Function Table

EYE DIAGRAM USB 2.0 HIGH SPEED
ACCESSORY ID DETECTION

If V_{BUS_IN} is high and the attachment is not a charger, then determine the impedance on the ID pin. If V_{BUS_IN} is low and an accessory is attached, then use an ADC for impedance sensing on the ID pin to identify which accessory is attached.

IMPEDANCE BUCKETS FOR EACH ACCESSORY

In order to implement ID detection, each accessory should contain a ID impedance resistor value (refer to Table 2) which has a 5% tolerance accuracy.

Table 2. Accessory ID and Switch States

ACCCESSORY	DETECTED IMPEDANCE ON ID	RESISTOR TOLERANCE (%)	ADC VALUE	SWITCH STATE		FACTORY CABLE

Power-On Reset

When power (from 0 V) is applied to V_{BAT}, an internal power-on reset holds the TSU6111A in a reset condition until V_{BAT} has reached V_{POR}. Once V_{BAT} has reached V_{POR}, the reset condition is released, and the TSU6111A registers and I^{2}C state machine initialize to their default states.

After the initial power-up phase, V_{BAT} must be lowered to below 0.2 V and then back up to the operating voltage (V_{DDIO}) for a power-reset cycle.

Software Reset

The TSU6111A has software reset feature.
* Hold low both I^{2}C_SCL and I^{2}C_SDA for more than 30ms to reset digital logic of the TSU6111A.

After resetting the digital logic, INTB will keep low until INT_Mask bit of Control register (0x02) is cleared.
Figure 1. Software Reset

Standard I2C Interface Details

The bidirectional I^{2}C bus consists of the serial clock (SCL) and serial data (SDA) lines. The SCL and SDA lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I^{2}C communication with this device is initiated by the master sending a START condition, a high-to-low transition on the SDA input/output while the SCL input is high (see Figure 2). After the start condition, the device address byte is sent, MSB first, including the data direction bit (R/W). This device does not respond to the general call address. After receiving the valid address byte, the device responds with an ACK, a low on the SDA input/output during the high of the ACK-related clock pulse.

Figure 2. Definition of Start and Stop Conditions

The data byte follows the address ACK. The R/W bit is kept low for transfer from the master to the slave. The data byte is followed by an ACK sent from this device. Data is sent only if complete bytes are received and acknowledged. The output data is valid at time (tpv) after the low-to-high transition of SCL, during the clock cycle for the ACK.

On the I^{2}C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (START or STOP, see Figure 3).

Figure 3. Bit Transfer

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see Figure 2).

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit.

A slave receiver address must generate an ACK after the reception of each byte. The device that acknowledges has to pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see Figure 4). Setup and hold times must be taken into account.
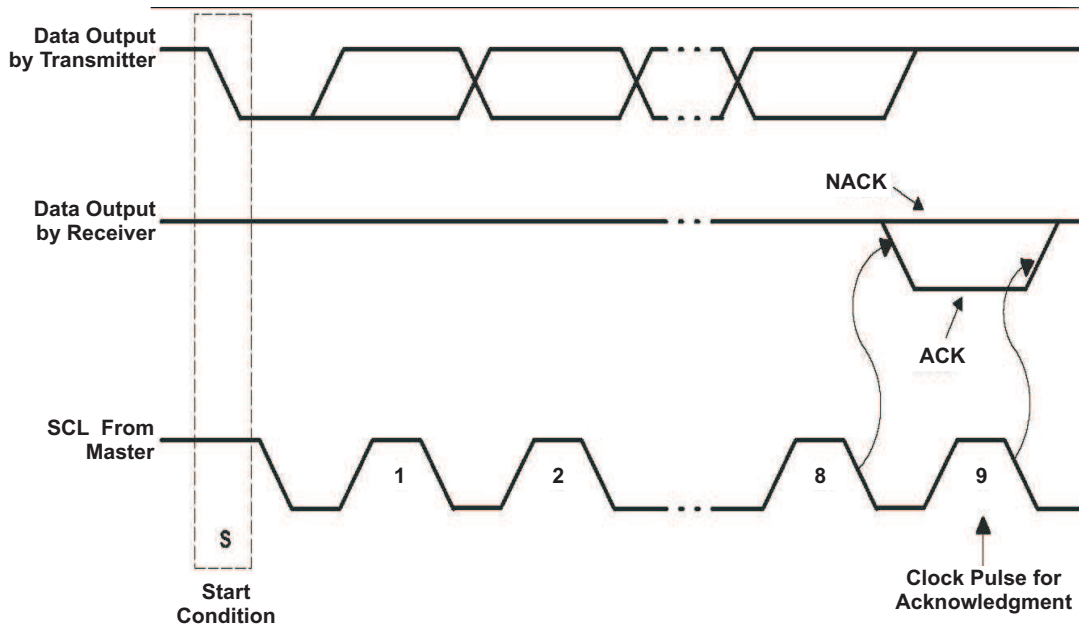

Figure 4. Acknowledgment on I²C Bus

Writes

Data is transmitted to the TSU6111A by sending the device slave address and setting the LSB to a logic 0 (see Figure 5 for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. The next byte is written to the specified register on the rising edge of the ACK clock pulse.

**Figure 5. Repeated Data Write to a Single Register**

Figure 6. Burst Data Write to Multiple Registers

Reads

The bus master must first send the TSU6111A slave address with the LSB set to logic 0. The command byte is sent after the address and determines which register is accessed. After a restart, the device slave address is sent again but, this time, the LSB is set to logic 1. Data from the register defined by the command byte then is sent by the TSU6111A. Data is clocked into the SDA output shift register on the rising edge of the ACK clock pulse (See Figure 7).
**Figure 7. Repeated Data Read from a Single Register – Combined Mode**

**Figure 8. Burst Data Read from Multiple Registers – Combined Mode**

Figure 9. Repeated Data Read from a Single Register – Split Mode
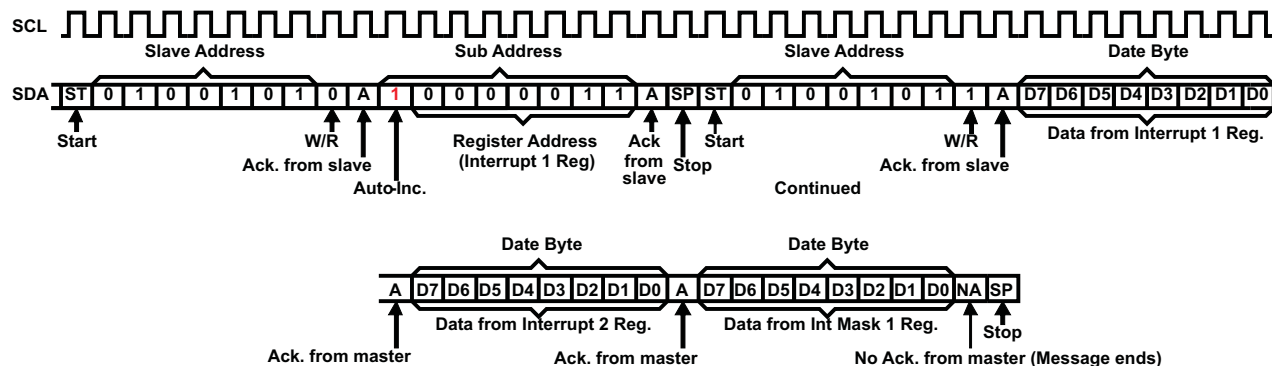

Figure 10. Burst Data Read from Multiple Registers – Split Mode

Notes (Applicable to Figure 5–Figure 10):

- SDA is pulled low on Ack. from slave or Ack. from master.
- Register writes always require sub-address write before first data byte.
- Repeated data that writes to a single register continues indefinitely until a Stop or a Re-Start.
- Repeated data reads from a single register continues indefinitely until No Ack. from master.
- Burst data writes start at the specified register address, then advance to the next register address, even to the read-only registers. For these registers, data write appears to occur; however, no data is changed by the writes. After register 14h is written, writing resumes to register 01h and continues until a Stop or a Re-Start.
- Burst data reads starts at the specified register address, then advances to the next register address. Once register 14h is read, reading resumes from register 01h and continues until No Ack. from master.

SCHEMATIC GUIDELINES

1. V_{BUS_IN}, V_{DDIO}, and V_{BAT} require 1µF~10µF and 0.1µF decoupling capacitors to reduce noise from circuit elements. The capacitors act as a shunt to block off the noise. The 0.1µF capacitor smoothes out high frequencies and has a lower series inductance. The 1µF~10µF capacitors smoothes out the lower frequencies and has a much higher series inductance. Placing both capacitors will provide better load regulation across the frequency spectrum.

2. JIG is an open-drain output and therefore requires a 1kΩ ~ 10kΩ pull-up resistor to VBAT.

3. SCL and SDA require 1kΩ ~ 10kΩ pull-up resistors to VDDIO to prevent floating inputs.

4. V_{BUS_IN}, DM_CON, and DP_CON are recommended to have an external resistor 2.2Ω to provide extra ballasting to protect the chip and internal circuitry.

   (a) For ID_CON, if there is less stress on the ID pin then the external 2.2Ω resistor is optional.

5. DM_CON, DP_CON, and ID_CON are recommended to have a 1pF external ESD Protection Diode rated for 8kV IEC protection to prevent failure in case of an 8kV IEC contact discharge.

6. VBUS_IN is recommended to have a 1pF ~ 10pF external ESD Protection Diode rated for 8kV IEC protection to prevent failure in case of an 8kV IEC contact discharge.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	DESCRIPTION	MIN	MAX	UNIT
V_{BUS_IN}	VBUS voltage	4.0	6.5	V
V_{BAT}	VBAT voltage	3.0	4.4	V
V_{DDIO}	VDDIO voltage	1.65	3.6	V
ID_CON_Cap	ID_CON capacitance		1	nF
USB_I/O	USB path signal range	0	3.6	V
Temperature	Operating Temperature	–40	85	°C

PCB ROUTING GUIDELINES

Routing Guidelines for USB Signal Integrity

1. All the USB lines DP_CON, DM_CON, DP_HT, DM_HT, TxD, and RxD
   - Must have 45Ω single ended characteristic impedance
   - Must have 90Ω differential ended impedance
   - To fulfill USB 2.0 requirements
2. TSU6111A location
   - Close to the USB connector as possible
   - Keep the distance between the USB controller and the device less than 1 inch
   - Shortening the length of the trace will reduce effect of stray noise and radiate less EMI
3. Minimize use of VIAs for USB related signals
   - Differential transmission lines should be matched as close as possible
   - For optimum USB2.0 performance, use no VIAs

Place the USB connector as close as possible to the DUT

TSU6111A
REVISION HISTORY

Changes from Original (February 2012) to Revision A   **Page**

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TSU6111ARSVR	ACTIVE	UQFN	RSV	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	ZTN	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
