

# Clock Generator: Key Parameters and Specifications

TI Precision Labs – Clocks and Timing

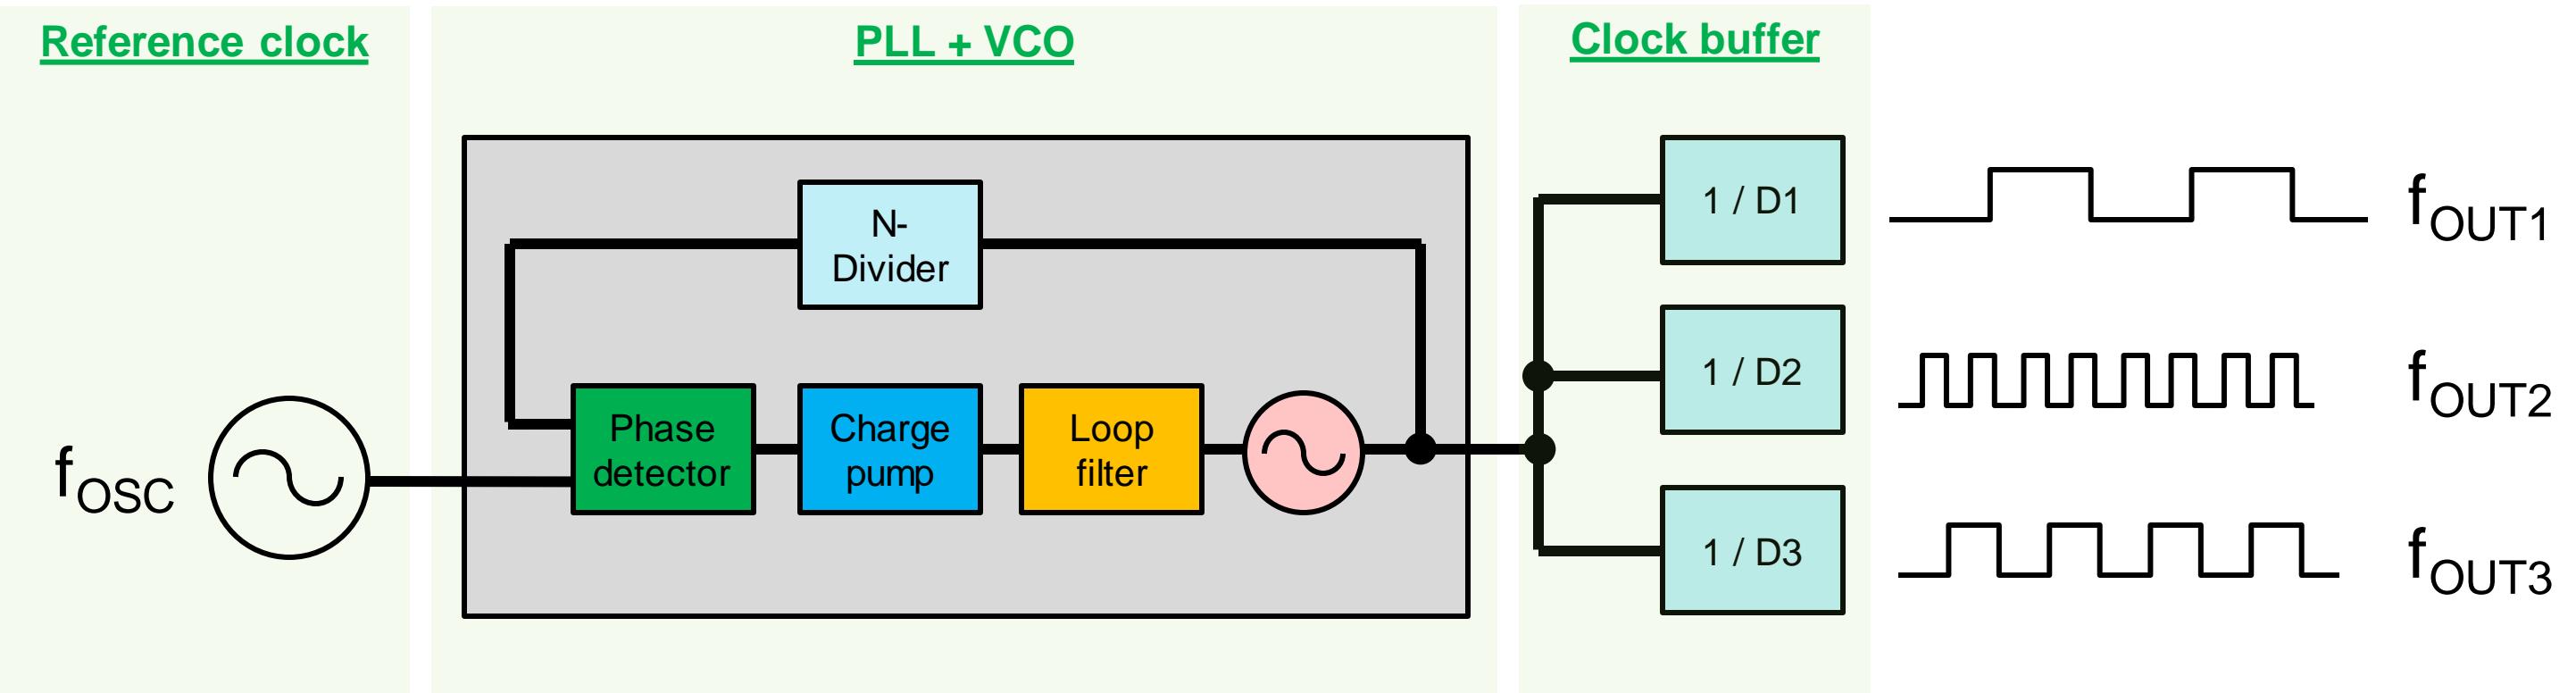

Presented by Liam Keesee

Prepared by Noel Fung

# System level clocking

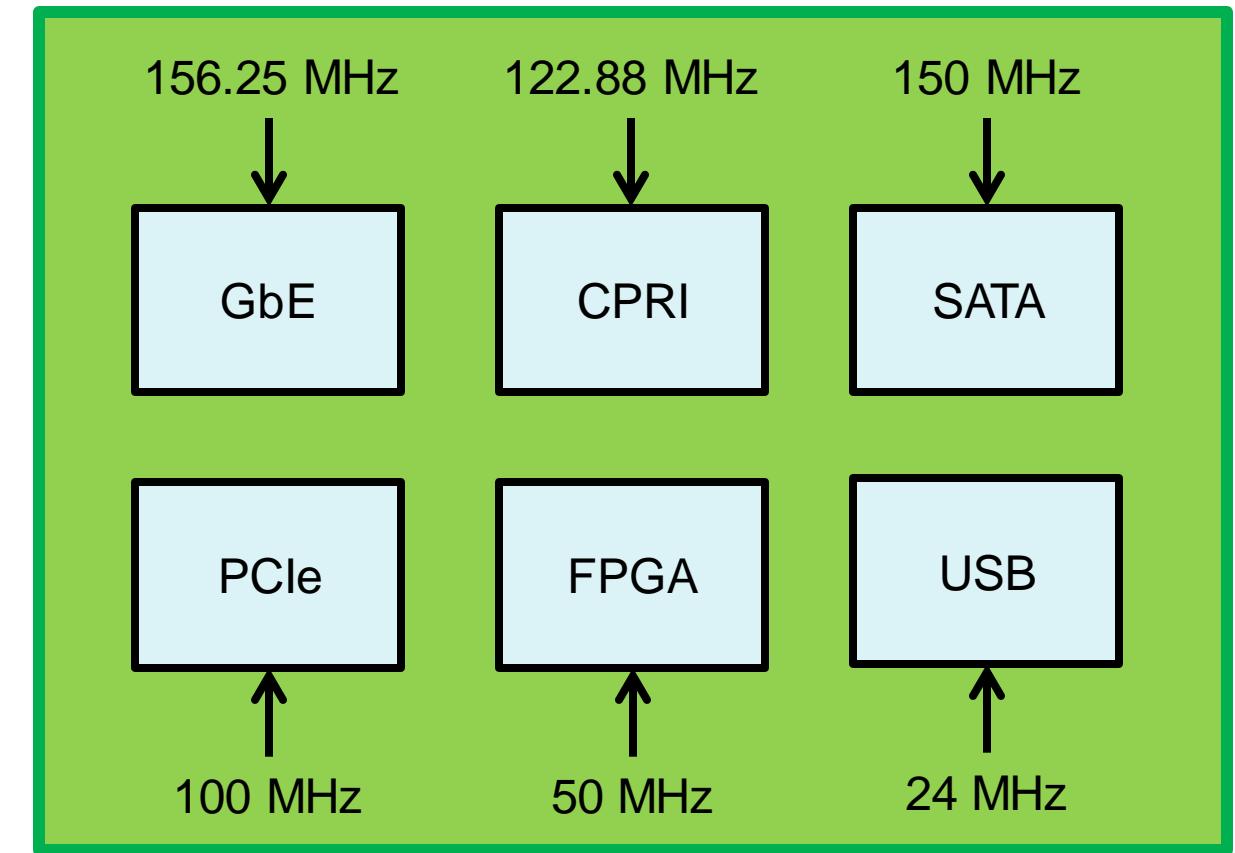

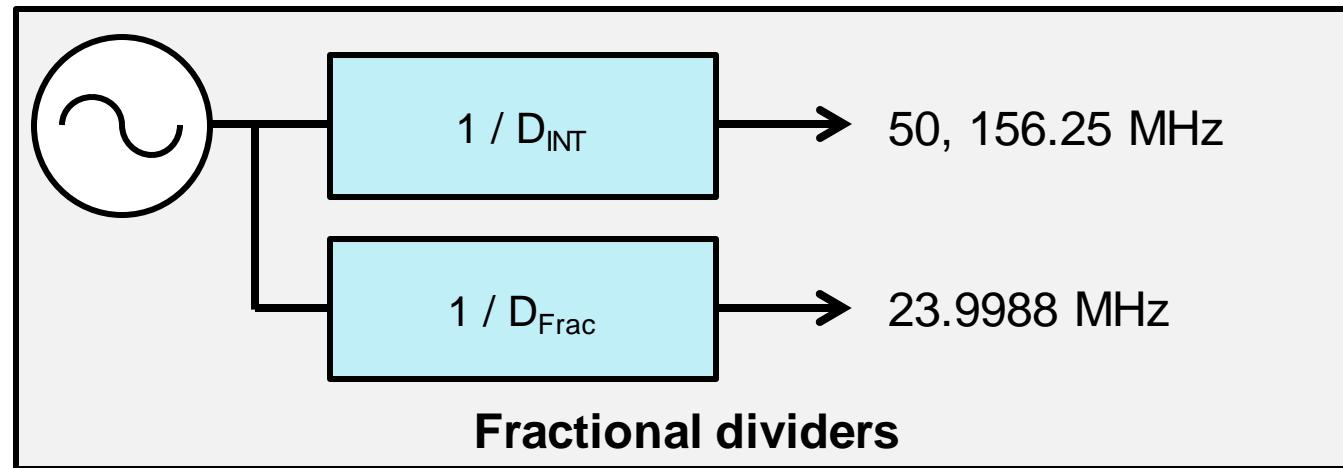

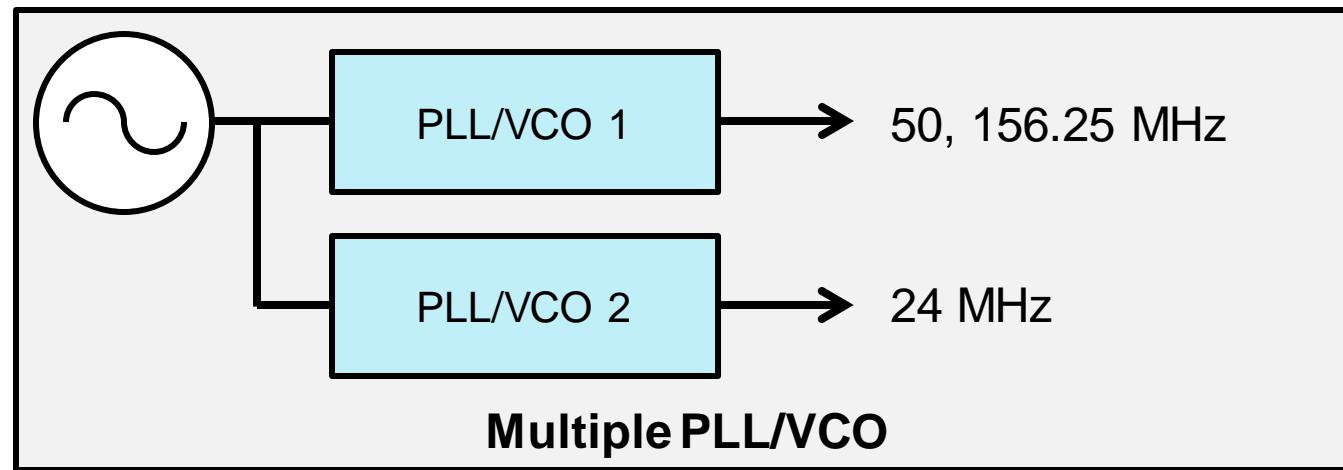

# Clock generator structure

$$\rightarrow f_{OSC} \leq f_{OUT} \leq f_{OSC}$$

# VCO frequency

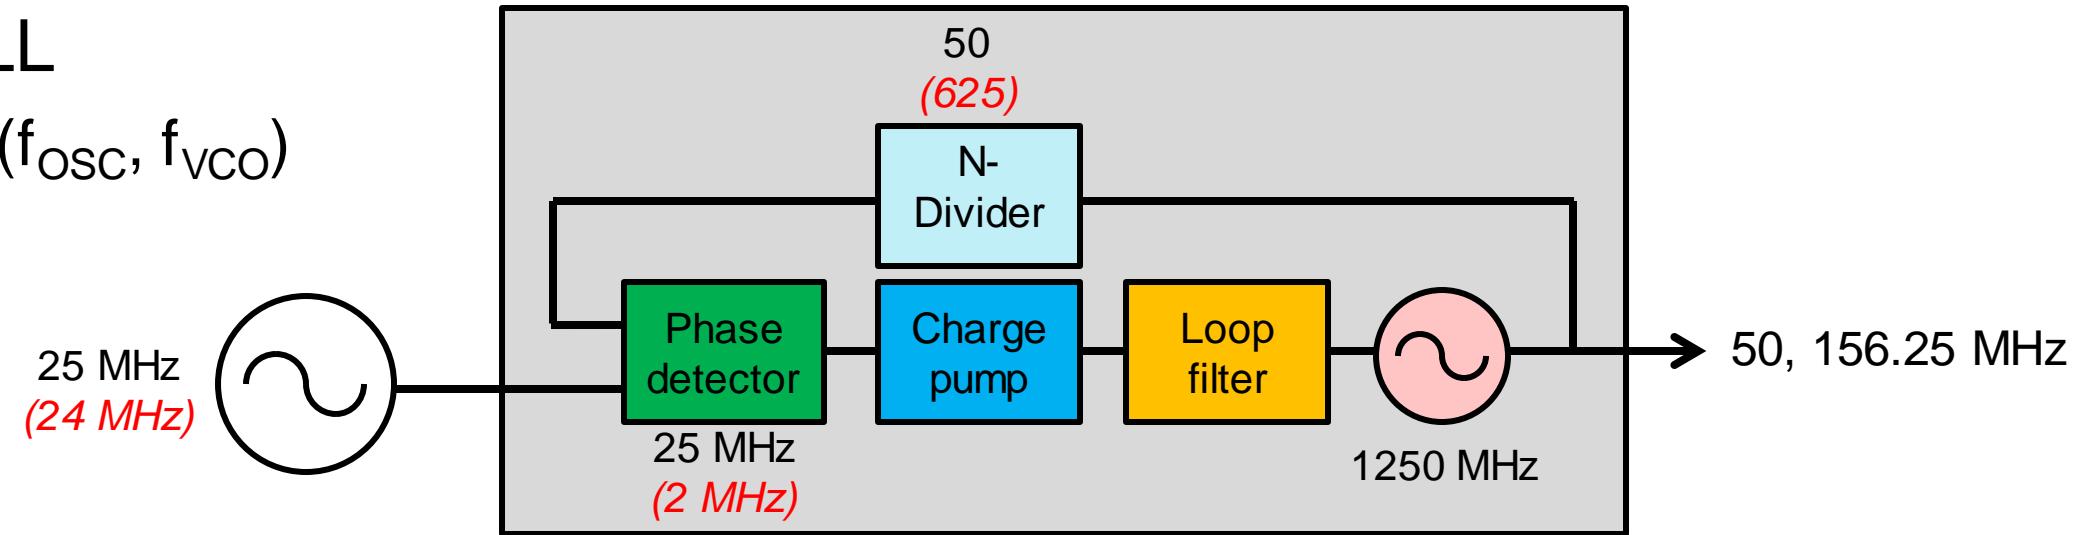

- Minimum VCO frequency =  $\text{LCM}(f_{\text{OUT}1}, f_{\text{OUT}2}, \dots)$
- $\text{LCM}(156.25 \text{ MHz}, 24 \text{ MHz}) = 15 \text{ GHz!}$

# Input frequency

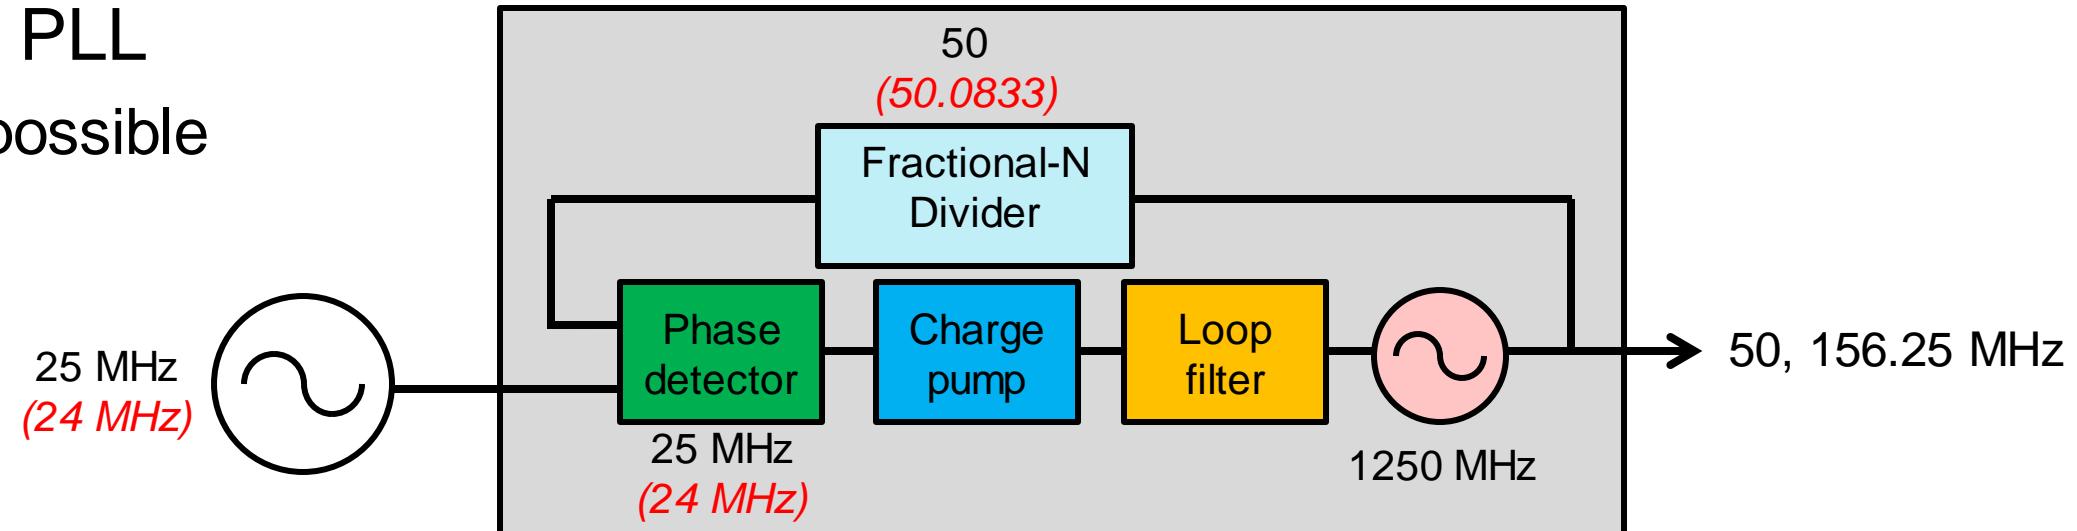

- Integer-N PLL

- $f_{PD} = \text{GCD}(f_{\text{osc}}, f_{\text{VCO}})$

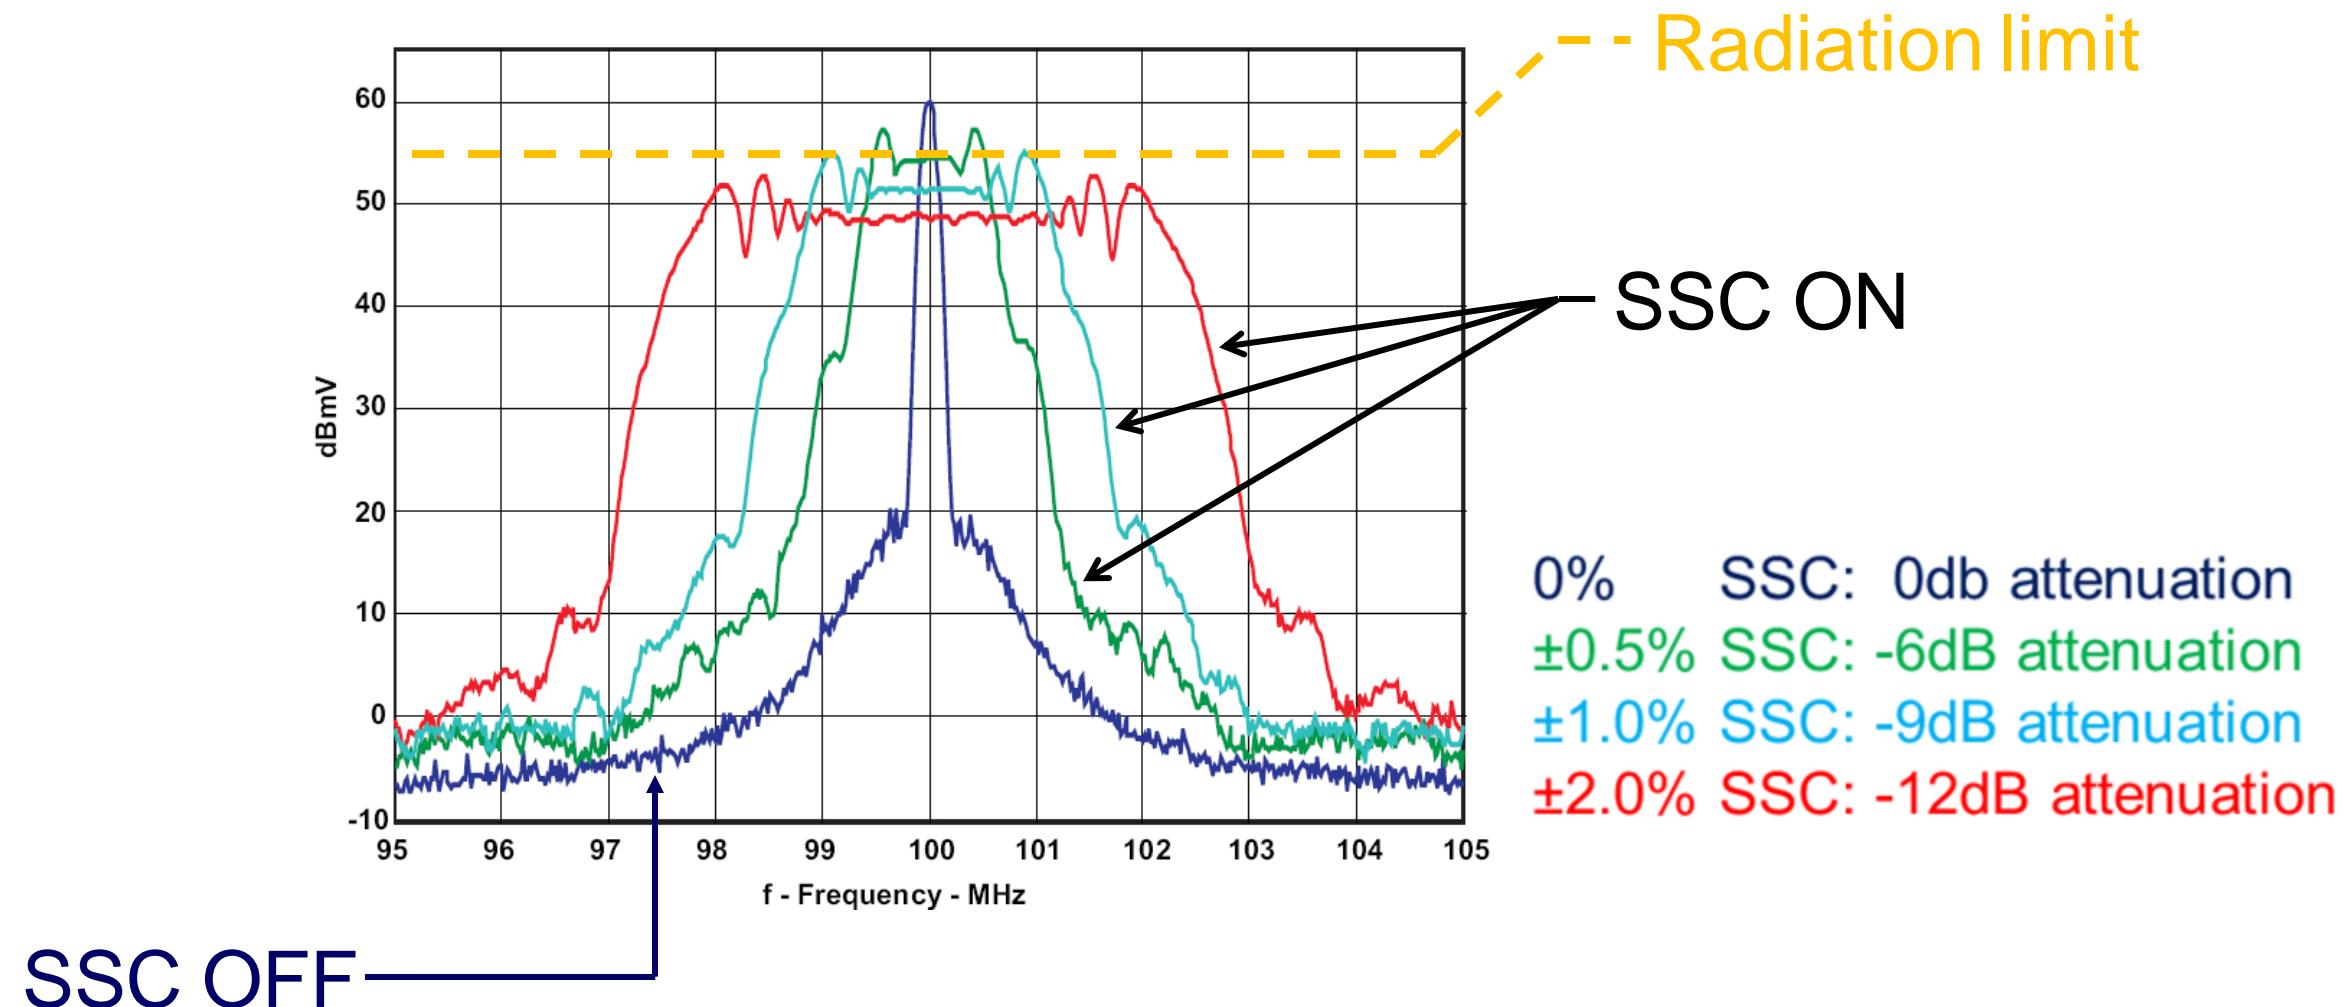

- Fractional-N PLL

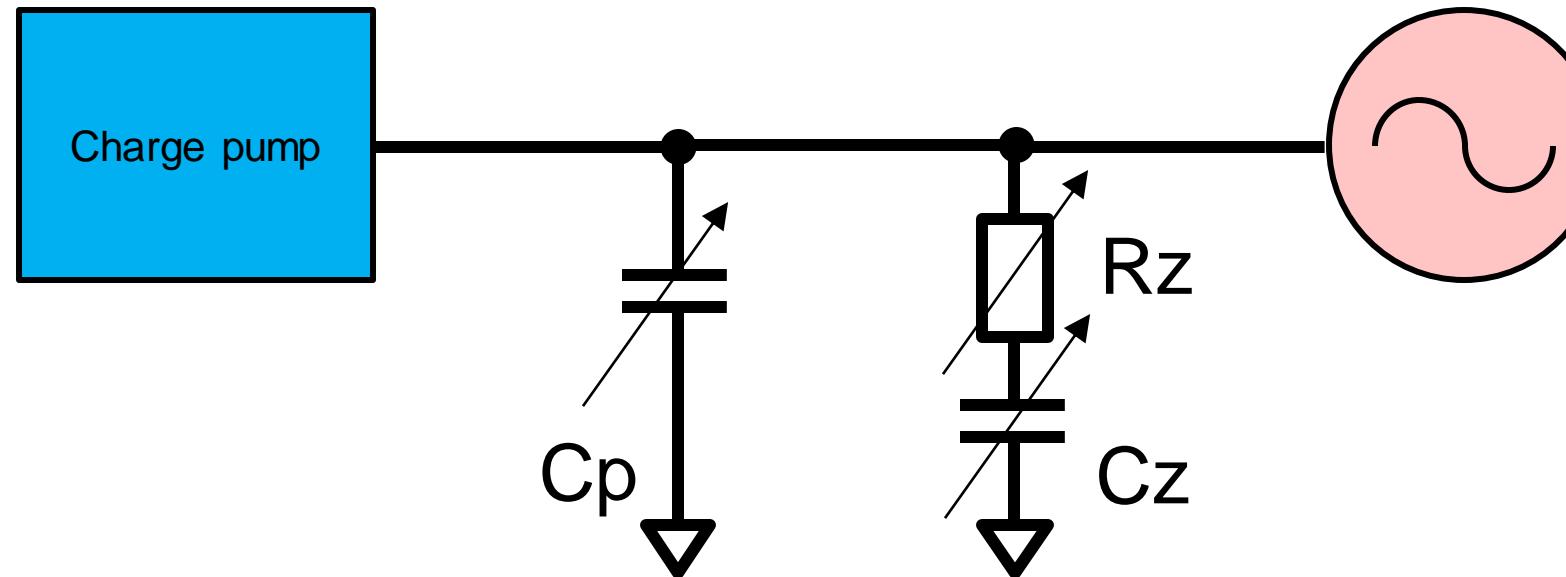

- $f_{PD} = f_{\text{osc}}$  possible

# Other considerations – Spread Spectrum Clocking

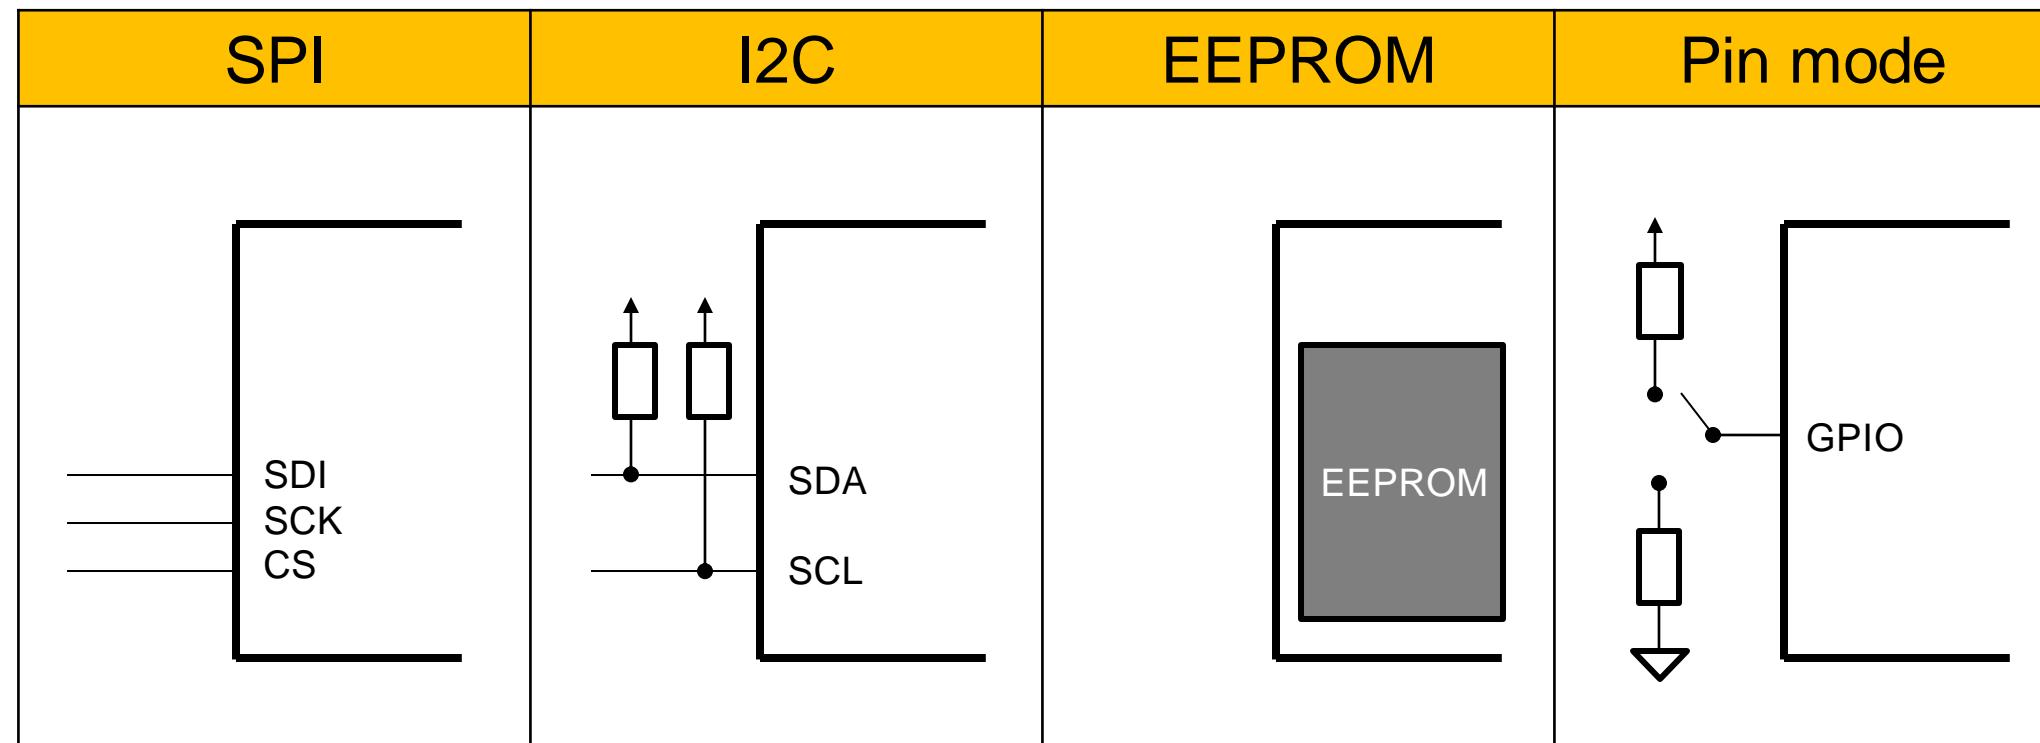

# Other considerations - loop filter

Example configurable loop filter characteristic:

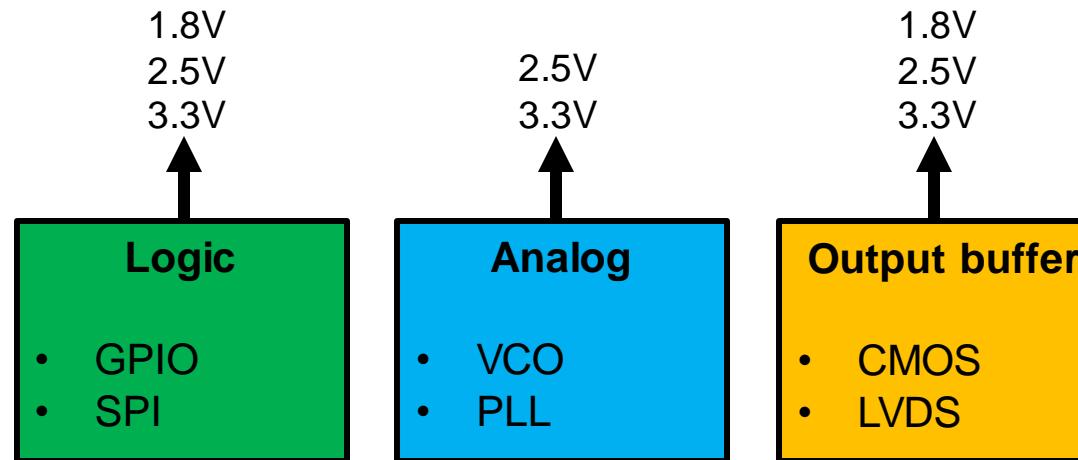

$f_{VCO}$ (MHz)	$f_{PD}$ (MHz)	Loop bandwidth (kHz)	Phase margin (deg)	Charge pump current ( $\mu$ A)	$C_p$ (pF)	$R_z$ (k $\Omega$ )	$C_z$ (pF)
2400	25	459	70	600	16.1	2.5	580
2400	50	938	70	600	8.2	2.5	276
2400	100	1600	70	800	8.2	2.5	303

# Other considerations – programming

# Other considerations – operating conditions

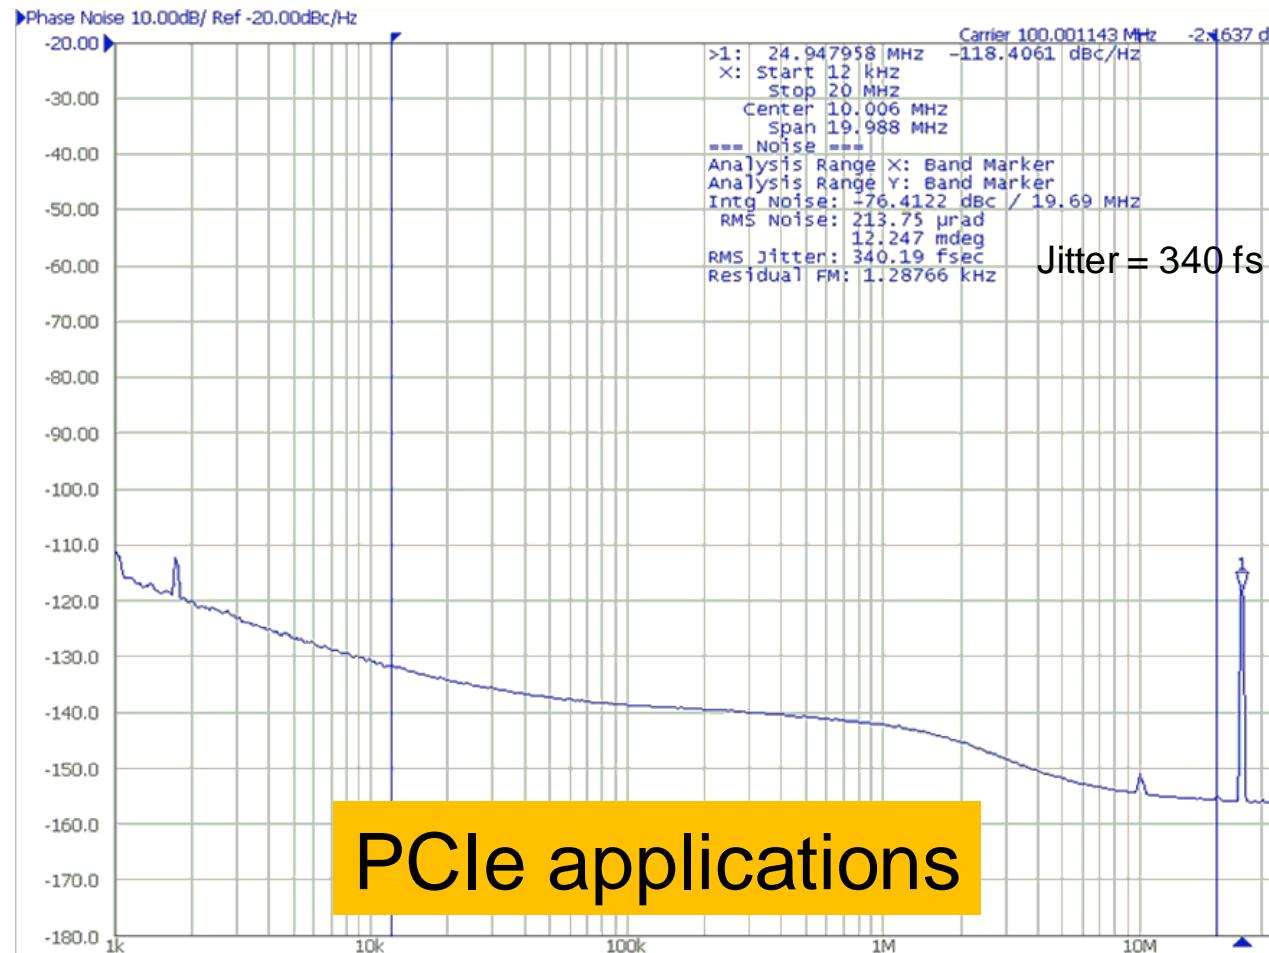

- Supply voltage
- Operating temperature range

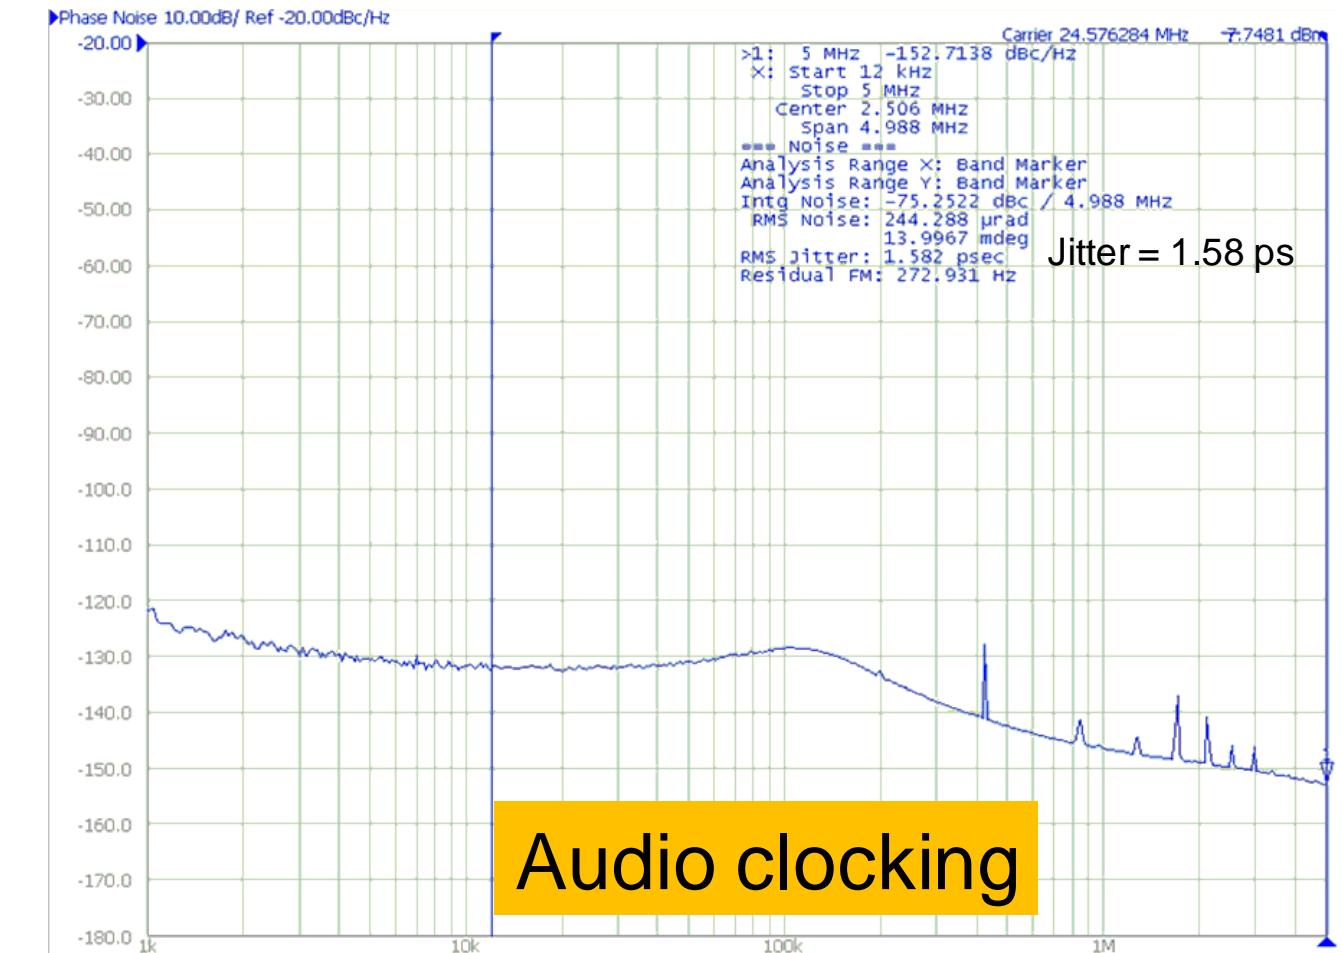

Grade	Temperature range	
Commercial	0 °C to 70 °C	
Industrial	–40 °C to 85 °C	
Automotive	Q1	–40 °C to 125 °C
	Q2	–40 °C to 105 °C

# Other considerations – jitter performance

- General purpose: > 300 fs rms
- High performance: < 300 fs rms

PCIe applications

Audio clocking
