

1 TMS320DM6431 Digital Media Processor

1.1 Features

- **High-Performance Digital Media Processor (DM6431)**
 - 3.33-ns Instruction Cycle Time
 - 300-MHz C64x+™ Clock Rate
 - Eight 32-Bit C64x+ Instructions/Cycle
 - 2400 MIPS
 - Fully Software-Compatible With C64x
 - Commercial and Automotive (Q or S suffix) Grades
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2 Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Load-Store Architecture With Non-Aligned Support
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
 - Additional C64x+™ Enhancements
 - Protected Mode Operation
 - Exceptions Support for Error Detection and Program Redirection
 - Hardware Support for Modulo Loop Auto-Focus Module Operation
- **C64x+ Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2 Increased Orthogonality
 - C64x+ Extensions
 - Compact 16-bit Instructions
 - Additional Instructions to Support Complex Multiplies
- **C64x+ L1/L2 Memory Architecture**
 - 256K-Bit (32K-Byte) L1P Program RAM/Cache [Flexible Allocation]
 - 512K-Bit (64K-Byte) L1D Data RAM/Cache [Flexible Allocation]
 - 512K-Bit (64K-Byte) L2 Unified Mapped RAM/Cache [Flexible Allocation]
- **Supports Little Endian Mode Only**
- **Video Processing Subsystem (VPSS), VPFE Only**
 - Front End Provides:
 - CCD and CMOS Imager Interface
 - BT.601/BT.656 Digital YCbCr 4:2:2 (10-Bit) Interface
 - Glueless Interface to Common Video Decoders
- **External Memory Interfaces (EMIFs)**
 - 16-Bit DDR2 SDRAM Memory Controller With 128M-Byte Address Space (1.8-V I/O)
 - Supports up to 266-MHz (data rate) bus and interfaces to DDR2-400 SDRAM
 - Asynchronous 8-Bit Wide EMIF (EMIFA) With up to 64M-Byte Address Reach
 - Flash Memory Interfaces
 - NOR (8-Bit-Wide Data)
 - NAND (8-Bit-Wide Data)
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Two 64-Bit General-Purpose Timers (Each Configurable as Two 32-Bit Timers)**
- **One 64-Bit Watch Dog Timer**
- **One UART With RTS and CTS Flow Control**
- **Master/Slave Inter-Integrated Circuit (I²C Bus™)**
- **One Multichannel Buffered Serial Port (McBSP0)**
 - I2S and TDM
 - AC97 Audio Codec Interface
 - SPI
 - Standard Voice Codec Interface (AIC12)
 - Telecom Interfaces – ST-Bus, H-100
 - 128 Channel Mode
- **Multichannel Audio Serial Port (McASP0)**
 - Four Serializers and SPDIF (DIT) Mode

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this document.

All trademarks are the property of their respective owners.

- **High-End CAN Controller (HECC)**
 - **10/100 Mb/s Ethernet MAC (EMAC)**
 - IEEE 802.3 Compliant
 - Supports Media Independent Interface (MII)
 - Management Data I/O (MDIO) Module
 - **Three Pulse Width Modulator (PWM) Outputs**
 - **On-Chip ROM Bootloader**
 - **Individual Power-Savings Modes**
 - **Flexible PLL Clock Generators**
 - **IEEE-1149.1 (JTAG™) Boundary-Scan-Compatible**
 - **Up to 111 General-Purpose I/O (GPIO) Pins**
- (Multiplexed With Other Device Functions)**
- **Packages:**
 - **361-Pin Pb-Free PBGA Package (ZWT Suffix), 0.8-mm Ball Pitch**
 - **376-Pin Plastic BGA Package (ZDU Suffix), 1.0-mm Ball Pitch**
 - **0.09- μ m/6-Level Cu Metal Process (CMOS)**
 - **3.3-V and 1.8-V I/O, 1.2-V Internal (-3/-3Q/-3S)**
 - **Applications:**
 - **Digital Media**
 - **Networked Media Encode**
 - **Video Imaging**

1.2 Description

The TMS320C64x+™ DSPs (including the TMS320DM6431 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The DM6431 device is based on the third-generation high-performance, advanced *VelociTI™* very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for digital media applications. The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform. The C64x™ DSPs support added functionality and have an expanded instruction set from previous devices.

Any reference to the C64x DSP or C64x CPU also applies, unless otherwise noted, to the C64x+ DSP and C64x+ CPU, respectively.

With performance of up to 2400 million instructions per second (MIPS) at a clock rate of 300 MHz, the C64x+ core offers solutions to high-performance DSP programming challenges. The DSP core possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x+ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs). The eight functional units include instructions to accelerate the performance in video and imaging applications. The DSP core can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 1200 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 2400 MMACS. For more details on the C64x+ DSP, see the *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number [SPRU732](#)).

The DM6431 also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000 DSP platform devices. The DM6431 core uses a two-level cache-based architecture. The Level 1 program memory/cache (L1P) consists of 32K-byte (KB) memory space that can be configured as mapped memory or direct mapped cache. The Level 1 data/memory memory/cache (L1D) consists of a 64KB memory space that can be configured as mapped memory or 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 64KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

The peripheral set includes: 1 configurable video port; a 10/100 Mb/s Ethernet MAC (EMAC) with a management data input/output (MDIO) module; an inter-integrated circuit (I2C) Bus interface; a multichannel buffered serial port (McBSP0); a multichannel audio serial port (McASP0) with 4 serializers; 2 64-bit general-purpose timers each configurable as 2 independent 32-bit timers; 1 64-bit watchdog timer; up to 111-pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; 1 UART with hardware handshaking support; 3 pulse width modulator (PWM) peripherals; 1 high-end controller area network (CAN) controller [HECC]; and 2 glueless external memory interfaces: an asynchronous external memory interface (EMIFA) for slower memories/peripherals, and a higher speed synchronous memory interface for DDR2.

The DM6431 device includes a Video Processing Subsystem (VPSS) with a Video Processing Front-End (VPFE) input used for video capture.

The Video Processing Front-End (VPFE) is comprised of a CCD Controller (CCDC). The CCDC is capable of interfacing to common video decoders, CMOS sensors, and Charge Coupled Devices (CCDs).

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the DM6431 and the network. The DM6431 EMAC support both 10Base-T and 100Base-TX, or 10 Mbits/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QOS) support.

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The I2C port allows DM6431 to easily control peripheral devices and/or communicate with host processors.

The high-end controller area network (CAN) controller [HECC] module provides a network protocol in a harsh environment to communicate serially with other controllers, typically in automotive applications.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections later in this document and the associated peripheral reference guides.

The DM6431 has a complete set of development tools. These include C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

1.3 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the DM6431 device.

2.2 CPU (DSP Core) Description

The C64x+ Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in [Figure 2-1](#). The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C64x+ CPU extends the performance of the C64x core through enhancements and new features.

Each C64x+ .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, one 16 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, two 16 x 16 bit multiplies with add/subtract capabilities, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes for 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for audio and other high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C64x+ core enhances the .S unit in several ways. In the C64x core, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C64x+ core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C64x+ compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancement** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exceptions Handling** - Intended to aid the programmer in isolating bugs. The C64x+ CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.

- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is *not* sensitive to system stalls.

For more details on the C64x+ CPU and its enhancements over the C64x architecture, see the following documents:

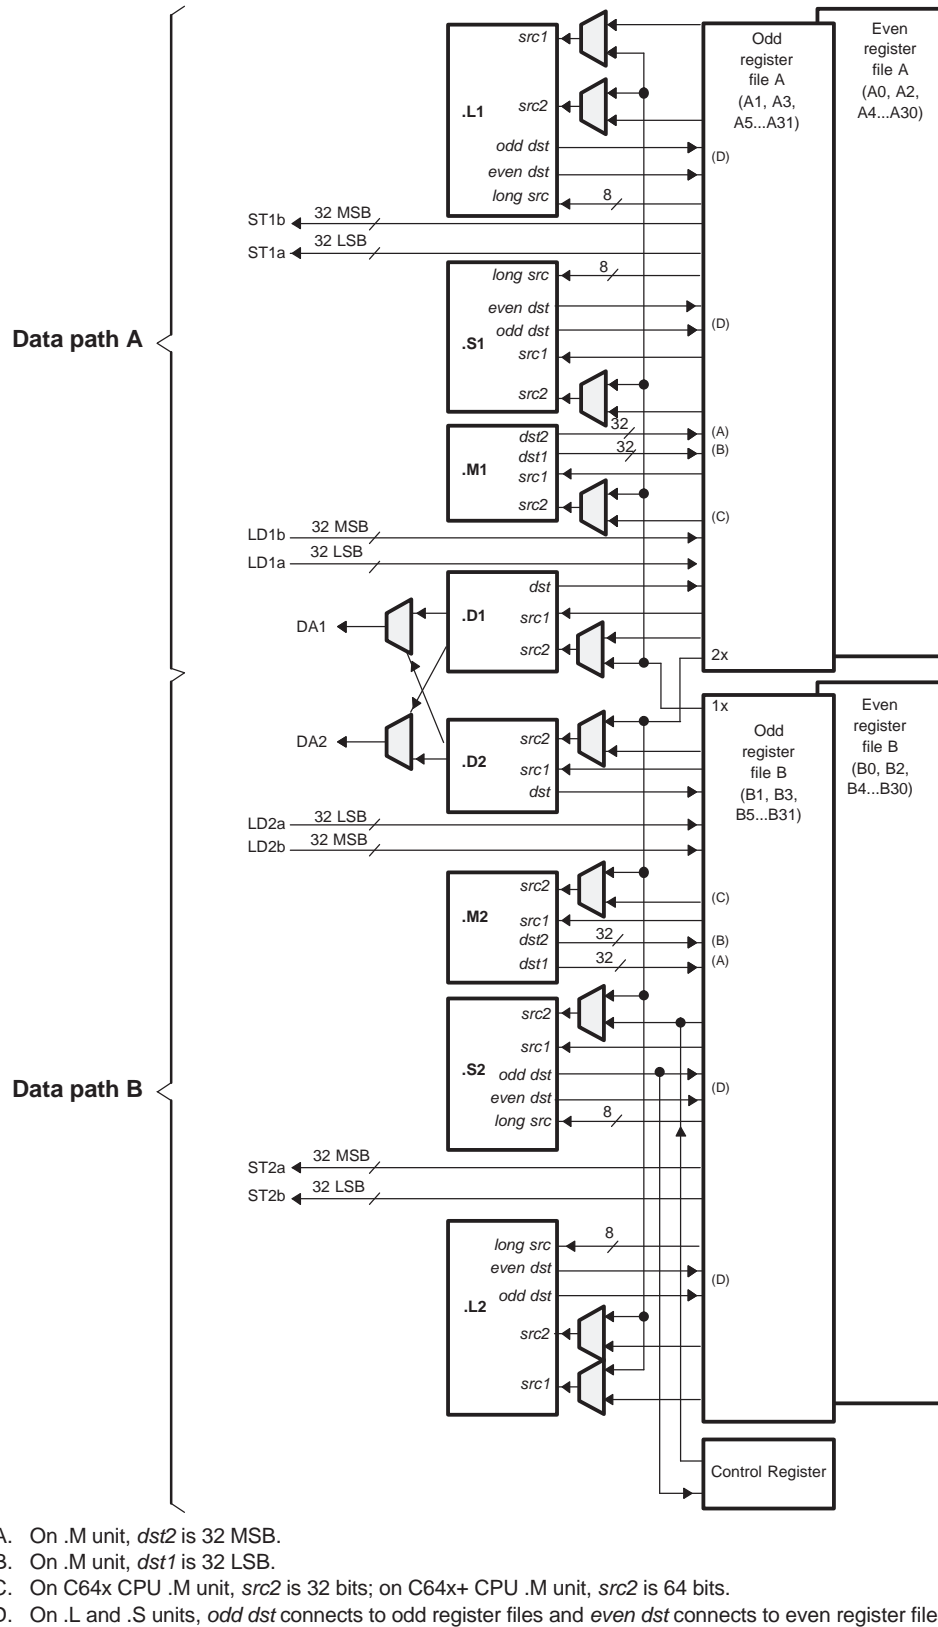

Figure 2-1. TMS320C64x+™ CPU (DSP Core) Data Paths

2.3 C64x+ CPU

The C64x+ core uses a two-level cache-based architecture. The Level 1 Program memory/cache (L1P) consists of 32 KB memory space that can be configured as mapped memory or direct mapped cache. The Level 1 Data memory/cache (L1D) consists of a 64 KB memory space that can be configured as mapped memory or 2-way set associated cache. The Level 2 memory/cache (L2) consists of a 64 KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

Table 2-2 shows a memory map of the C64x+ CPU cache registers for the device.

2.4 Memory Map Summary

[Table 2-3](#) shows the memory map address ranges of the device. [Table 2-4](#) depicts the expanded map of the Configuration Space (0x0180 0000 through 0x0FFF FFFF). The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

Table 2-3. Memory Map Summary

| START ADDRESS | END ADDRESS | SIZE (Bytes) | C64x+ MEMORY MAP | EDMA PERIPHERAL MEMORY MAP | VPSS MEMORY MAP | |

- (1) For all bootmodes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)). For the EMIFA ROM Direct Boot (BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader is not executed—that is, L2 RAM/Cache defaults to all RAM (L2CFG.L2MODE = 0h); L1P RAM/Cache defaults to all cache (L1PCFG.L1PMODE = 7h); and L1D RAM/Cache defaults to all cache (L1DCFG.L1DMODE = 7h).
- (2) The EMIFA $\overline{CS0}$ and $\overline{CS1}$ are **not** functionally supported on the DM6431 device, and therefore, are **not** pinned out.

2.5 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings. For more information on pin muxing, see [Section 3.7, Multiplexed Pin Configurations](#) of this document.

2.5.1 Pin Map (Bottom View)

Figure 2-2 through Figure 2-5 show the bottom view of the **ZWT** package pin assignments in four quadrants (A, B, C, and D). Figure 2-6 through Figure 2-9 show the bottom view of the **ZDU** package pin assignments in four quadrants (A, B, C, and D).

2.6 Terminal Functions

The terminal functions tables ([Table 2-5](#) through [Table 2-26](#)) identify the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type, whether the pin has any internal pullup or pulldown resistors, and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pin, and debugging considerations, see the Device Configurations section of this data manual.

All device boot and configuration pins are multiplexed configuration pins— meaning they are multiplexed with functional pins. These pins function as device boot and configuration pins only during device reset. The input states of these pins are sampled and latched into the BOOTCFG register when device reset is deasserted (see **Note** below). After device reset is deasserted, the values on these multiplexed pins no longer have to hold the configuration.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. [Section 3.9.1](#), *Pullup/Pulldown Resistors* discusses situations where external pullup/pulldown resistors are required.

Note: Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together for the purpose of latching device boot and configuration pins. The values on all device boot and configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

Table 2-5. BOOT Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|--|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| BOOT | | | | | |
| GP[25]/ (BOOTMODE3) | G16 | H21 | I/O/Z | IPD DV _{DD33} | Bootmode configuration bits. These bootmode functions along with the FASTBOOT function determine what device bootmode configuration is selected. The DM6431 device supports several types of bootmodes along with a FASTBOOT option; for more details on the types/options, see Section 3.4.1, Boot Modes . |
| GP[24]/ (BOOTMODE2) | G15 | L20 | | | |
| GP[23]/ (BOOTMODE1) | F15 | K20 | | | |
| GP[22]/ (BOOTMODE0) | F18 | J20 | | | |
| GP[26]/ (FASTBOOT) | G17 | K19 | I/O/Z | IPD DV _{DD33} | Fast Boot 0 = Not Fast Boot 1 = Fast Boot |
| EM_A[4]/GP[10]/ (AEAW2/PLLMS2) | A17 | B21 | I/O/Z | IPD DV _{DD33} | EMIFA Address Bus Width (AEAW) and Fast Boot PLL Multiplier Select (PLLMS). These configuration pins serve two purposes which are based on AEM[2:0] settings. For AEM[2:0] = 001 [8-bit EMIFA (Async) Pinout Mode 1], the AEAW/PLLMS pins serve as the AEAW function to select EMIFA Address Bus Width. |
| EM_A[1]/(ALE)/ GP[9]/ (AEAW1/PLLMS1) | A16 | B20 | I/O/Z | IPD DV _{DD33} | For all other AEM modes, the AEAW/PLLMS pins select the PLL multiplier for fast boot. For more details, see Section 3.5.1.2, EMIFA Address Width Select (AEAW) and Fast Boot PLL Multiplier Select (PLLMS) . |
| EM_A[2]/(CLE)/ GP[8]/ (AEAW0/PLLMS0) | B16 | A20 | I/O/Z | IPD DV _{DD33} | For more details, see Section 3.5.1.2, EMIFA Address Width Select (AEAW) and Fast Boot PLL Multiplier Select (PLLMS) . |
| EM_A[0]/ GP[7]/(AEM2) | B17 | C21 | I/O/Z | IPD DV _{DD33} | Selects EMIFA Pinout Mode |
| EM_BA[0]/ GP[6]/(AEM1) | C17 | E20 | I/O/Z | IPD DV _{DD33} | The DM6431 supports the following EMIFA Pinout Modes: AEM[2:0] = 000, No EMIFA AEM[2:0] = 001, 8-bit EMIFA (Async) Pinout Mode 1 AEM[2:0] = 101, 8-bit EMIFA (NAND) Pinout Mode 5 |
| EM_BA[1]/ GP[5]/(AEM0) | C16 | C20 | I/O/Z | IPD DV _{DD33} | This signal doesn't actually affect the EMIFA module. It only affects how the EMIFA is pinned out. |
| GP[28] | H16 | J21 | I/O/Z | IPD DV _{DD33} | For proper DM6431 device operation, if this pin is both routed and 3-stated (not driven) during device reset, it must be pulled down via an external resistor. For more detailed information on pullup/pulldown resistors, see Section 3.9.1, Pullup/Pulldown Resistors . |
| GP[27] | H17 | L19 | I/O/Z | IPU DV _{DD33} | For proper DM6431 device operation, if this pin is both routed and 3-stated (not driven) during device reset, it must be pulled up via an external resistor. For more detailed information on pullup/pulldown resistors, see Section 3.9.1, Pullup/Pulldown Resistors . |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-6. Oscillator/PLL Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾ | DESCRIPTION |
|------------------------|---------|---------|---------------------|----------------------|--|
| NAME | ZWT NO. | ZDU NO. | | | |
| OSCILLATOR, PLL | | | | | |
| MXI/CLKIN | K19 | N22 | I | MXV _{DD} | Crystal input MXI for MX oscillator (system oscillator, typically 27 MHz). If the internal oscillator is bypassed, this is the external oscillator clock input. ⁽³⁾ |
| MXO | J19 | M22 | O | MXV _{DD} | Crystal output for MX oscillator |
| MXV _{DD} | L18 | N21 | S | (4) | 1.8 V power supply for MX oscillator. On the board, this pin can be connected to the same 1.8 V power supply as DV _{DDR2} . |
| MXV _{SS} | K18 | M21 | GND | (4) | Ground for MX oscillator |
| PLL _{PWR18} | L16 | N20 | S | (4) | 1.8 V power supply for PLLs |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) Specifies the operating I/O supply voltage for each signal
- (3) For more information on external board connections, see [Section 6.6, External Clock Input From MXI/CLKIN Pin](#).
- (4) For more information, see the *Recommended Operating Conditions* table

Table 2-7. Clock Generator Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-------------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| CLOCK GENERATOR | | | | | |
| CLKOUT0/ PWM2/GP[84] | M1 | R1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For the System Clock generator (PLL1), it is clock output CLKOUT0. This is configurable for 27 MHz or other 27 MHz-divided-down (/1 to /32) clock outputs. |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-8. RESET and JTAG Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|------------------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| RESET | | | | | |
| $\overline{\text{RESET}}$ | M4 | R3 | I | IPU DV _{DD33} | Device reset |
| $\overline{\text{RESETOUT}}$ | N3 | T3 | O/Z | – DV _{DD33} | Reset output status pin. The $\overline{\text{RESETOUT}}$ pin indicates when the device is in reset. |
| $\overline{\text{POR}}$ | N4 | R2 | I | IPU DV _{DD33} | Power-on reset. |
| JTAG | | | | | |
| TMS | R3 | V3 | I | IPU DV _{DD33} | JTAG test-port mode select input. For proper device operation, do not oppose the IPU on this pin. |
| TDO | P3 | U2 | O/Z | – DV _{DD33} | JTAG test-port data output |
| TDI | P4 | U3 | I | IPU DV _{DD33} | JTAG test-port data input |
| TCK | N1 | U1 | I | IPU DV _{DD33} | JTAG test-port clock input |
| $\overline{\text{TRST}}$ | R2 | V2 | I | IPD DV _{DD33} | JTAG test-port reset. For IEEE 1149.1 JTAG compatibility, see the IEEE 1149.1 JTAG compatibility statement portion of this data sheet |
| EMU1 | N2 | T2 | I/O/Z | IPU DV _{DD33} | Emulation pin 1 |
| EMU0 | P2 | T1 | I/O/Z | IPU DV _{DD33} | Emulation pin 0 |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-9. EMIFA Terminal Functions (Boot Configuration)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|--|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| EMIFA: BOOT CONFIGURATION | | | | | |
| EM_A[4]/GP[10]/ (AEAW2/PLLMS2) | A17 | B21 | I/O/Z | IPD DV _{DD33} | These pins are multiplexed between the EMIFA and GPIO. When RESET or POR is asserted, these pins function as EMIFA configuration pins. At reset if AEM[2:0] = 001 (EMIFA in 8-bit Async mode), then the input states of AEAW[2:0] are sampled to set the EMIFA Address Bus Width. After reset, these pins function as EMIFA or GPIO pin functions based on pin mux selection. For more details on the AEAW/PLLMS functions, see Section 3.5.1.2, EMIFA Address Bus Width (AEAW) and Fast Boot PLL Multiplier Select (PLLMS) . |
| EM_A[1]/(ALE)/GP[9]/ (AEAW1/PLLMS1) | A16 | B20 | I/O/Z | IPD DV _{DD33} | |
| EM_A[2]/(CLE)/GP[8]/ (AEAW0/PLLMS0) | B16 | A20 | I/O/Z | IPD DV _{DD33} | |
| EM_BA[1]/ GP[5]/(AEM0) | C16 | C20 | I/O/Z | IPD DV _{DD33} | |
| EM_BA[0]/ GP[6]/(AEM1) | C17 | E20 | I/O/Z | IPD DV _{DD33} | |
| EM_A[0]/ GP[7]/(AEM2) | B17 | C21 | I/O/Z | IPD DV _{DD33} | |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-10. EMIFA Terminal Functions (EMIFA Pinout Mode 1, AEM[2:0] = 001)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|---|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| EMIFA FUNCTIONAL PINS: 8-Bit ASYNC/NOR (EMIFA Pinout Mode 1, AEM[2:0] = 001) | | | | | |
| Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., AEAW[2:0], AEM[2:0], etc.). For more details, see Section 3.7, Multiplexed Pin Configurations | | | | | |
| $\overline{\text{EM_CS2}}/\text{GP}[12]$ | C19 | C22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM_CS2}}$ for use with asynchronous memories (i.e., NOR flash). This is the chip select for the default boot and ROM boot modes. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS3}}/\text{GP}[13]$ | C18 | D22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM_CS3}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS4}}/\text{GP}[32]$ | E19 | H22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM_CS4}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS5}}/\text{GP}[33]$ | F19 | J22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM_CS5}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| C_WE/ $\overline{\text{EM_R}}/\overline{\text{W}}/\text{GP}[35]$ | D13 | C17 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. For EMIFA, it is read/write output $\overline{\text{EM_R}}/\overline{\text{W}}$. |
| EM_WAIT/ (RDY/BSY) | E15 | D20 | I/O/Z | IPU DV _{DD33} | For EMIFA (ASYNC/NOR), this pin is wait state extension input EM_WAIT. |
| $\overline{\text{EM_OE}}$ | D15 | D19 | I/O/Z | IPU DV _{DD33} | For EMIFA, it is output enable output $\overline{\text{EM_OE}}$. |
| $\overline{\text{EM_WE}}$ | E14 | C19 | I/O/Z | IPU DV _{DD33} | For EMIFA, it is write enable output $\overline{\text{EM_WE}}$. |
| EM_BA[0]/ GP[6]/(AEM1) | C17 | E20 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 0 output (EM_BA[0]). When connected to an 8-bit asynchronous memory, this pin is the lowest order bit of the byte address. |
| EM_BA[1]/ GP[5]/(AEM0) | C16 | C20 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 1 output EM_BA[1]. When connected to an 8-bit asynchronous memory, this pin is the 2nd bit of the address. |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-10. EMIFA Terminal Functions (EMIFA Pinout Mode 1, AEM[2:0] = 001) (continued)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-----------------------------------|---------|---------|---------------------|---------------------------|--|
| NAME | ZWT NO. | ZDU NO. | | | |
| C_FIELD/ EM_A[21]/GP[34] | D12 | C16 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. For EMIFA, it is address bit 21 output EM_A[21]. |
| C10(CCD8)/ EM_A[20]/GP[44] | C12 | C15 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 20 output EM_A[20] if AEAW[2:0] = 100b. |
| C11(CCD9)/ EM_A[19]/GP[45] | B12 | C14 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 19 output EM_A[19] if AEAW[2:0] = 100b. |
| EM_A[18]/GP[46] | D11 | A14 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 18 output EM_A[18] if AEAW[2:0] = 011/100b. |
| EM_A[17]/GP[47] | A11 | B14 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 17 output EM_A[17] if AEAW[2:0] = 011/100b. |
| EM_A[16]/GP[48] | C11 | B13 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 16 output EM_A[16] if AEAW[2:0] = 010/011/100b. |
| EM_A[15]/GP[49] | B11 | C13 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 15 output EM_A[15] if AEAW[2:0] = 010/011/100b. |
| EM_A[14]/GP[50] | A10 | A13 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 14 output EM_A[14] if AEAW[2:0] = 001/010/011/100b. |
| EM_A[13]/GP[51] | B10 | A12 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA (AEM[2:0] = 001), this pin is address bit 13 output EM_A[13] if AEAW[2:0] = 001/010/011/100b. |
| EM_A[12]/GP[89] | D10 | B12 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 12 output EM_A[12]. |
| EM_A[11]/GP[90] | C10 | C12 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 11 output EM_A[11]. |
| EM_A[10]/GP[91] | A9 | B11 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 10 output EM_A[10]. |
| EM_A[9]/GP[92] | D9 | C11 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 9 output EM_A[9]. |
| EM_A[8]/GP[93] | B9 | A11 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 8 output EM_A[8]. |
| EM_A[7]/GP[94] | C9 | C10 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 7 output EM_A[7]. |
| EM_A[6]/GP[95] | D8 | B10 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 6 output EM_A[6]. |
| EM_A[5]/GP[96] | B8 | A10 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 5 output EM_A[5]. |
| EM_A[4]/GP[10]/ (AEAW2/PLLMS2) | A17 | B21 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is address bit 4 output EM_A[4]. |

Table 2-10. EMIFA Terminal Functions (EMIFA Pinout Mode 1, AEM[2:0] = 001) (continued)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |

| Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., AEAW[2:0], AEM[2:0], etc.). For more details, see Section 3.7, Multiplexed Pin Configurations | | | | | |
| EM_A[1]/(ALE)/GP[9]/(AEAW1/PLLMS1) | A16 | B20 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. When used for EMIFA (NAND), this pin is the Address Latch Enable output (ALE). |
| EM_A[2]/(CLE)/GP[8]/(AEAW0/PLLMS0) | B16 | A20 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. When used for EMIFA (NAND), this pin is the Command Latch Enable output (CLE). |
| EM_WAIT/(RDY/BSY) | E15 | D20 | I/O/Z | IPU DV _{DD33} | When used for EMIFA (NAND), it is ready/busy input (RDY/ $\overline{\text{BSY}}$). |
| $\overline{\text{EM_OE}}$ | D15 | D19 | I/O/Z | IPU DV _{DD33} | When used for EMIFA (NAND), this pin is read enable output ($\overline{\text{RE}}$). |
| $\overline{\text{EM_WE}}$ | E14 | C19 | I/O/Z | IPU DV _{DD33} | When used for EMIFA (NAND), this pin is write enable output ($\overline{\text{WE}}$). |
| $\overline{\text{EM_CS2}}$ /GP[12] | C19 | C22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM_CS2}}$ for use with NAND flash. This is the chip select for the default boot and ROM boot modes. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS3}}$ /GP[13] | C18 | D22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM_CS3}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS4}}$ /GP[32] | E19 | H22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM_CS4}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |
| $\overline{\text{EM_CS5}}$ /GP[33] | F19 | J22 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM_CS5}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state. |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-11. EMIFA Terminal Functions (EMIFA Pinout Mode 5, AEM[2:0] = 101) (continued)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |

| DDR_VSSDLL | T13 | W15 | GND | ⁽³⁾ | Ground for the DDR2 DLL |
| DDR_VDDDLL | T12 | W14 | S | ⁽³⁾ | Power (1.8 Volts) for the DDR2 Digital Locked Loop |
| DDR_ZN | T10 | W12 | | ⁽³⁾ | Impedance control for DDR2 outputs. This must be connected via a 200-Ω resistor to DV _{DDR2} . |
| DDR_ZP | T11 | W13 | | ⁽³⁾ | Impedance control for DDR2 outputs. This must be connected via a 200-Ω resistor to V _{SS} . |

Table 2-13. EMAC and MDIO Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|---------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| EMAC | | | | | |
| MTXEN/GP[75] | D3 | C4 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Enable input MTXEN. |
| MTXCLK/GP[73] | A4 | A4 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Clock input MTXCLK. |
| MCOL/GP[67] | C6 | C6 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Collision Detect input MCOL. |
| MTXD3/GP[69] | C5 | A5 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Data 3 output MTXD3. |
| MTXD2/GP[70] | D5 | C5 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Data 2 output MTXD2. |
| MTXD1/GP[71] | B4 | B4 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Data 1 output MTXD1. |
| MTXD0/GP[72] | D4 | B5 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Transmit Data 0 output MTXD0. |
| MRXCLK/GP[77] | A3 | A3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Clock input MRXCLK. |
| MRXDV/GP[74] | C4 | D3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Data Valid input MRXDV. |
| MRXER/GP[76] | B3 | B2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Error input MRXER. |
| MCRS/GP[68] | B5 | B6 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Carrier Sense input MCRS. |
| MRXD3/GP[82] | C2 | D2 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Data 3 input MRXD3. |
| MRXD2/GP[80] | D2 | C3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Data 2 input MRXD2. |
| MRXD1/GP[79] | B2 | B3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive data 1 input MRXD1. |
| MRXD0/GP[78] | C3 | C2 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between Ethernet MAC (EMAC) and GPIO. In Ethernet MAC mode, it is Receive Data 0 input MRXD0. |
| MDIO | | | | | |
| MDCLK/GP[81] | C1 | D1 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between MDIO and GPIO. In Ethernet MAC mode, it is Management Data Clock output MDCLK. |
| MDIO/GP[83] | D1 | C1 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between MDIO and GPIO. In Ethernet MAC mode, it is Management Data IO MDIO (I/O/Z). |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-14. VPFE Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-------------------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| VIDEO/IMAGE IN (VPFE) | | | | | |
| PCLK/GP[54] | A14 | A18 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the pixel clock input (PCLK) used to load image data into the CCD Controller (CCDC) on pins C[7:0] and Y[7:0]. |
| VD/GP[53] | A13 | A17 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the vertical synchronization signal (VD) that can be either an input (slave mode) or an output (master mode), which signals the start of a new frame to the CCDC. |
| HD/GP[52] | A15 | A19 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the horizontal synchronization signal (HD) that can be either an input (slave mode) or an output (master mode), which signals the start of a new line to the CCDC. |
| C11(CCD9)/ EM_A[19]/GP[45] | B12 | C14 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. This pin is CCDC input C11 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD9. In 8-bit YCbCr mode, this pin should not be used. |
| C10(CCD8)/ EM_A[20]/GP[44] | C12 | C15 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. This pin is CCDC input C10 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD8. In 8-bit YCbCr mode, this pin should not be used. |
| Y17(CCD7)/ GP[43] | A12 | A15 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y17 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD7. In 8-bit YCbCr mode, it is time multiplexed between Y7, CB7, and CR7 of the lower 8-bit channel. |
| Y16(CCD6)/ GP[42] | B13 | B15 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y16 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD6. In 8-bit YCbCr mode, it is time multiplexed between Y6, CB6, and CR6 of the lower 8-bit channel. |
| Y15(CCD5)/ GP[41] | C13 | B16 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y15 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD5. In 8-bit YCbCr mode, it is time multiplexed between Y5, CB5, and CR5 of the lower 8-bit channel. |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-14. VPFE Terminal Functions (continued)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|---------------------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| Y14(CCD4)/ GP[40] | D14 | C18 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE(CCDC) and GPIO. This pin is CCDC input Y14 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD4. In 8-bit YCbCr mode, it is time multiplexed between Y4, CB4, and CR4 of the lower 8-bit channel. |
| Y13(CCD3)/ GP[39] | B14 | A16 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y13 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD3. In 8-bit YCbCr mode, it is time multiplexed between Y3, CB3, and CR3 of the lower 8-bit channel. |
| Y12(CCD2)/ GP[38] | C14 | B17 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y12 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD2. In 8-bit YCbCr mode, it is time multiplexed between Y2, CB2, and CR2 of the lower 8-bit channel. |
| Y11(CCD1)/ GP[37] | B15 | B18 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y11 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD1. In 8-bit YCbCr mode, it is time multiplexed between Y1, CB1, and CR1 of the lower 8-bit channel. |
| Y10(CCD0)/ GP[36] | C15 | B19 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input Y10 and it supports several modes: In 10-bit CCD Raw mode, it is input CCD0. In 8-bit YCbCr mode, it is time multiplexed between Y0, CB0, and CR0 of the lower 8-bit channel. |
| C_WE/EM_R \bar{W} / GP[35] | D13 | C17 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. In VPFE mode, it is the CCD Controller write enable input C_WE. |
| C_FIELD/EM_A[21]/ GP[34] | D12 | C16 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. In VPFE mode, it is CCDC field identification bidirectional signal C_FIELD. |

Table 2-15. I2C Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|------------|---------|---------|---------------------|-------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| I2C | | | | | |
| SCL | M2 | N2 | I/O/Z | DV _{DD33} | For I2C, this pin is I2C clock. In I2C master mode, this pin is an output. In I2C slave mode, this pin is an input. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor. |
| SDA | M3 | P2 | I/O/Z | DV _{DD33} | For I2C, this pin is the I2C bi-directional data signal. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor. |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-16. Multichannel Buffered Serial Port 0 (McBSP0) Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|---|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| Multichannel Buffered Serial Port 0 (McBSP0) | | | | | |
| For more details on pin multiplexing, see Section 3.7, Multiplexed Pin Configurations. | | | | | |
| CLKS0/TOUT0/ GP[97] | J4 | L3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McBSP0, Timer0, and GPIO. For McBSP0, it is McBSP0 external clock source (I). |
| ACLKR0/CLKX0/ GP[99] | H1 | J1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit clock CLKX0 (I/O/Z). |
| AHCLKR0/CLKR0/ GP[101] | J2 | K1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive clock CLKR0 (I/O/Z). |
| AXR0[2]/FSX0/ GP[103] | H3 | J2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit frame synchronization FSX0 (I/O/Z). |
| AXR0[3]/FSR0/ GP[102] | G4 | J3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive frame synchronization FSR0 (I/O/Z). |
| AXR0[1]/DX0/ GP[104] | J3 | K2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data transmit output DX0 (O/Z). |
| AFSR0/DR0/ GP[100] | H4 | K3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data receive input DR0 (I). |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-17. Multichannel Audio Serial Port (McASP0) Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-----------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| McASP0 | | | | | |
| AMUTEIN0/GP[109] | F2 | G3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute input AMUTEIN0 (I). |
| AMUTE0/GP[110] | G3 | H3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute output AMUTE0 (O/Z). |
| ACLKR0/CLKX0/GP[99] | H1 | J1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive bit clock ACLKR0 (I/O/Z). |
| AHCLKR0/CLKR0/GP[101] | J2 | K1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive high-frequency master clock AHCLKR0 (I/O/Z). |
| ACLKX0/GP[106] | F1 | G1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit bit clock ACLKX0 (I/O/Z). |
| AHCLKX0/GP[108] | G1 | H1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit high-frequency master clock AHCLKX0 (I/O/Z). |
| AFSR0/DR0/GP[100] | H4 | K3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive frame synchronization AFSR0 (I/O/Z). |
| AFSX0/GP[107] | G2 | G2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit frame synchronization AFSX0 (I/O/Z). |
| AXR0[3]/FSR0/GP[102] | G4 | J3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 3 AXR0[3] (I/O/Z). |
| AXR0[2]/FSX0/GP[103] | H3 | J2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 2 AXR0[2] (I/O/Z). |
| AXR0[1]/DX0/GP[104] | J3 | K2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 1 AXR0[1] (I/O/Z). |
| AXR0[0]/GP[105] | H2 | H2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 0 AXR0[0] (I/O/Z). |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-18. High-End Controller Area Network (HECC)

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-------------------------------|---------|---------|---------------------|---------------------------|--|
| NAME | ZWT NO. | ZDU NO. | | | |
| HECC | | | | | |
| HECC_RX/ TINP1L/ GP[56] | L4 | P3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between HECC, Timer 1, and GPIO. For HECC, this pin is HECC receive serial data HECC_RX (I). |
| HECC_TX/ TOUT1L/ GP[55] | K4 | N3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between HECC, Timer 1, and GPIO. For HECC, this pin is HECC transmit serial data HECC_TX (O/Z). |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-19. UART0 Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-------------------------|---------|---------|---------------------|---------------------------|--|
| NAME | ZWT NO. | ZDU NO. | | | |
| UART0 | | | | | |
| URXD0/ GP[85] | L2 | M2 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between UART0 (Data) and GPIO. When used by UART0 this pin is the receive data input URXD0. |
| UTXD0/ GP[86] | K3 | N1 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between UART0 (Data) and GPIO. In UART0 mode, this pin is the transmit data output UTXD0. |
| UCTS0 GP[87] | L1 | P1 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between the UART0 (Flow Control) and GPIO. In UART0 mode, this pin is the clear to send input UCTS0. |
| URTS0 PWM0 GP[88] | L3 | M3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. In UART0 mode, this pin is the ready to send output URTS0. |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-20. PWM0, PWM1, and PWM2 Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|-------------------------|---------|---------|---------------------|---------------------------|--|
| NAME | ZWT NO. | ZDU NO. | | | |
| PWM2 | | | | | |
| CLKOUT0/PWM2/ GP[84] | M1 | R1 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For PWM2, this pin is output PWM2. |
| PWM1 | | | | | |
| GP[4]/PWM1 | F3 | F3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between GPIO and PWM1. For PWM1, this pin is output PWM1. |
| PWM0 | | | | | |
| URTS0/PWM0/ GP[88] | L3 | M3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. For PWM0, this pin is output PWM0. |

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-21. Timer 0, Timer 1, and Timer 2 Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|---|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| Timer 2 | | | | | |
| No external pins. The Timer 2 (watchdog) peripheral pins are not pinned out as external pins. | | | | | |
| Timer 1 | | | | | |
| HECC_RX/ TINP1L/ GP[56] | L4 | P3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between the HECC, Timer 1, and GPIO. For Timer 1, this pin is the timer 1 input pin for the lower 32-bit counter |
| HECC_TX/ TOUT1L/ GP[55] | K4 | N3 | I/O/Z | IPU DV _{DD33} | This pin is multiplexed between the HECC, Timer 1, and GPIO. For Timer 1, this pin is the timer 1 output pin for the lower 32-bit counter |
| Timer 0 | | | | | |
| TINP0L/ GP[98] | K2 | L2 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the Timer 0 and GPIO. For Timer 0, this pin is the timer 0 input pin for the lower 32-bit counter |
| CLKS0/ TOUT0L/ GP[97] | J4 | L3 | I/O/Z | IPD DV _{DD33} | This pin is multiplexed between the McBSP0, Timer 0, and GPIO. For Timer 0, this pin is the timer 0 output pin for the lower 32-bit counter |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-22. GPIO Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|--|---------|---------|---------------------|-------------------------|-------------|
| NAME | ZWT NO. | ZDU NO. | | | |
| GPIO | | | | | |
| 87 out of 111 GPIO pins on the DM6431 device are multiplexed with other peripherals pin functions (e.g., VPFE, EMAC/MDIO, McASP0, McBSP0, Timer 0, Timer 1, UART0, PWM0, PWM1, PWM2, EMIFA, and the CLKOUT0 pin), see the peripheral-specific Terminal Functions tables for the GPIO multiplexing. | | | | | |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1](#), *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-23. Standalone GPIO 3.3 V Terminal Functions

| SIGNAL | | | TYPE ⁽¹⁾ | OTHER ⁽²⁾⁽³⁾ | DESCRIPTION |
|------------------------------|---------|---------|---------------------|---------------------------|---|
| NAME | ZWT NO. | ZDU NO. | | | |
| Standalone GPIO 3.3 V | | | | | |
| GP[0] | E1 | E1 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 0. |
| GP[1] | E2 | E2 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 1. |
| GP[2] | E3 | F1 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 2. |
| GP[3] | E4 | F2 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 3. |
| GP[22]/ (BOOTMODE0) | F18 | J20 | I/O/Z | IPD DV _{DD33} | These pins function as boot configuration pins during device reset. After device reset, these pins function as standalone GPIO. |
| GP[23]/ (BOOTMODE1) | F15 | K20 | I/O/Z | IPD DV _{DD33} | |
| GP[24]/ (BOOTMODE2) | G15 | L20 | I/O/Z | IPD DV _{DD33} | |
| GP[25]/ (BOOTMODE3) | G16 | H21 | I/O/Z | IPD DV _{DD33} | |
| GP[26]/ (FASTBOOT) | G17 | K19 | I/O/Z | IPD DV _{DD33} | |
| GP[27] | H17 | L19 | I/O/Z | IPU DV _{DD33} | For proper DM6431 device operation, this pin must be pulled up via an external resistor. After device reset, this pin functions as standalone GPIO pin 27. |
| GP[28] | H16 | J21 | I/O/Z | IPD DV _{DD33} | For proper DM6431 device operation, this pin must be pulled down via an external resistor. After device reset, this pin functions as standalone GPIO pin 28. |
| GP[29] | H15 | K21 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 29. |
| GP[30] | G19 | K22 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 30. |
| GP[31] | D19 | G22 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 31. |
| GP[57] | A7 | A8 | I/O/Z | IPU DV _{DD33} | This pin functions as standalone GPIO pin 57. |
| GP[58] | C8 | B9 | I/O/Z | IPU DV _{DD33} | This pin functions as standalone GPIO pin 58. |
| GP[59] | D7 | C9 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 59. |
| GP[60] | A8 | A9 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 60. |
| GP[61] | B7 | B8 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 61. |
| GP[62] | C7 | C8 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 62. |
| GP[63] | A6 | A7 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 63. |
| GP[64] | D6 | C7 | I/O/Z | IPD DV _{DD33} | This pin functions as standalone GPIO pin 64. |

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
(3) Specifies the operating I/O supply voltage for each signal

2.7 Device Support

2.7.1 Development Support

TI offers an extensive line of development tools for the TMS320DM643x DMP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320DM643x DMP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools
Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any SoC application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports TMS320DM643x DMP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320DM643x DMP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

2.8 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320DM6431ZWTQ3**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications.
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
- TMS** Fully-qualified production device.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "3" indicates [300-MHz]).

Figure 2-10 provides a legend for reading the complete device name for any TMS320DM643x DMP platform member.

- A. BGA = Ball Grid Array
- B. For "TMX" initial devices, the device number is DM6437.

Figure 2-10. Device Nomenclature

2.9 Documentation Support

2.9.1 Related Documentation From Texas Instruments

The following documents describe the TMS320DM643x Digital Media Processor (DMP). Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the DM643x DMP, related peripherals, and other technical collateral, is available in the C6000 DSP product folder at: www.ti.com/c6000.

[SPRU978](#) **TMS320DM643x DMP DSP Subsystem Reference Guide.** Describes the digital signal processor (DSP) subsystem in the TMS320DM643x Digital Media Processor (DMP).

[SPRU983](#) **TMS320DM643x DMP Peripherals Overview Reference Guide.** Provides an overview and briefly describes the peripherals available on the TMS320DM643x Digital Media Processor (DMP).

[SPRAA84](#) **TMS320C64x to TMS320C64x+ CPU Migration Guide.** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

[SPRU732](#) **TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

[SPRU871](#) **TMS320C64x+ DSP Megamodule Reference Guide.** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

3 Device Configurations

3.1 System Module Registers

The system module includes status and control registers required for configuration of the device. Brief descriptions of the various registers are shown in [Table 3-1](#). System Module registers required for device configurations are discussed in the following sections.

Table 3-1. System Module Register Memory Map

| HEX ADDRESS RANGE | REGISTER ACRONYM | DESCRIPTION |
|---------------------------|------------------|---|
| 0x01C4 0000 | PINMUX0 | Pin Multiplexing Control 0 (see Section 3.7.2.1 , <i>PINMUX0 Register Description</i>). |
| 0x01C4 0004 | PINMUX1 | Pin Multiplexing Control 1 (see Section 3.7.2.2 , <i>PINMUX1 Register Description</i>). |
| 0x01C4 0008 | DSPBOOTADDR | DSP Boot Address (see Section 3.4.2.3 , <i>DSPBOOTADDR Register</i>). |
| 0x01C4 000C | BOOTCOMPLT | Boot Complete (see Section 3.4.2.2 , <i>BOOTCOMPLT Register</i>). |
| 0x01C4 0010 | – | Reserved |
| 0x01C4 0014 | BOOTCFG | Device Boot Configuration (see Section 3.4.2.1 , <i>BOOTCFG Register</i>). |
| 0x01C4 0018 - 0x01C4 0027 | – | Reserved |
| 0x01C4 0028 | JTAGID | JTAG ID (see Section 6.21.1 , <i>JTAG ID (JTAGID) Register Description(s)</i>). |
| 0x01C4 002C | – | Reserved |
| 0x01C4 0030 | – | Reserved |
| 0x01C4 0034 | – | Reserved |
| 0x01C4 0038 | – | Reserved |
| 0x01C4 003C | MSTPRI0 | Bus Master Priority Control 0 (see Section 3.6.1 , <i>Switch Central Resource (SCR) Bus Priorities</i>). |
| 0x01C4 0040 | MSTPRI1 | Bus Master Priority Control 1 (see Section 3.6.1 , <i>Switch Central Resource (SCR) Bus Priorities</i>). |
| 0x01C4 0044 | VPSS_CLKCTL | VPSS Clock Control (see Section 3.3.2 , <i>VPSS Clocks</i>). |
| 0x01C4 0048 | VDD3P3V_PWDN | V _{DD} 3.3-V I/O Powerdown Control (see Section 3.2 , <i>Power Considerations</i>). |
| 0x01C4 004C | DDRVTPER | DDR2 VTP Enable Register (see Section 6.9.4 , <i>DDR2 Memory Controller</i>). |
| 0x01C4 0050 - 0x01C4 0080 | – | Reserved |
| 0x01C4 0084 | TIMERCTL | Timer Control (see Section 3.6.2.1 , <i>Timer Control Register</i>). |
| 0x01C4 0088 | EDMATCCFG | EDMA Transfer Controller Default Burst Size Configuration (see Section 3.6.2.2 , <i>EDMA TC Configuration Register</i>). |
| 0x01C4 008C | – | Reserved |

3.2 Power Considerations

The DM6431 provides several means of managing power consumption.

As described in the [Section 6.3.4, DM6431 Power and Clock Domains](#), the DM6431 has one single power domain—the “Always On” power domain. Within this power domain, the DM6431 utilizes local clock gating via the Power and Sleep Controller (PSC) to achieve power savings. For more details on the PSC, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

Some of the DM6431 peripherals support additional power saving features. For more details on power saving features supported, see the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#)).

Most DM6431 3.3-V I/Os can be powered-down to reduce power consumption. The VDD3P3V_PWDN register in the System Module (see [Figure 3-1](#)) is used to selectively power down unused 3.3-V I/O pins. For independent control, the 3.3-V I/Os are separated into functional groups—most of which are named according to the pin multiplexing groups (see [Table 3-2](#)). Only the I/O buffers in these groups are powered up by default: CLKOUT Block, EMIFA/VPSS Block, Host Block, and GPIO Block.

Note: To save power, all other I/O buffers are powered down by default. Before using these pins, the user **must** program the VDD3P3V_PWDN register to power up the corresponding I/O buffers.

For a list of multiplexed pins on the device and the pin mux group each pin belongs to, see [Section 3.7.3.1, Multiplexed Pins on DM6431](#).

Figure 3-1. VDD3P3V_PWDN Register— 0x01C4 0048

Table 3-2. VDD3P3V_PWDN Register Bit Descriptions⁽¹⁾

| BIT | NAME | DESCRIPTION |
|-------|----------|--|
| 31:14 | RESERVED | Reserved. Read-only, writes have no effect. |
| 13 | RSV | Reserved. This bit should be programmed to 1 during device initialization (see Section 3.8, Device Initialization Sequence After Reset). |
| 12 | EMBK3 | EMIFA/VPSS Sub-Block 3 I/O Power Down Control. Controls the power of the 8 I/O pins in the EMIFA/VPSS Sub-Block 3. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z). |
| 11 | UR0FC | UART0 Flow Control Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Flow Control Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default]. |

(1) For more details on I/O pins belonging to each pin mux block, see [Section 3.7, Multiplexed Pin Configurations](#).

Table 3-2. VDD3P3V_PWDN Register Bit Descriptions (continued)

| BIT | NAME | DESCRIPTION |
|-----|--------|---|
| 10 | UR0DAT | <p>UART0 Data Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Data Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p> |
| 9 | TIMER1 | <p>Timer1 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer1 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p> |
| 8 | TIMER0 | <p>Timer0 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer0 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p> |
| 7 | SP | <p>Serial Port Block I/O Power Down Control. Controls the power of the 12 I/O pins in the Serial Port Block (Serial Port Sub-Block 0 and Serial Port Sub-Block 1).</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p> |
| 6 | PWM1 | <p>PWM1 Block I/O Power Down Control. Controls the power of the 1 I/O pin in the PWM1 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p> |
| 5 | GPIO | <p>GPIO Block I/O Power Down Control. Controls the power of the 4 I/O pins in the GPIO Block (GP[3:0]). Note: The GPIO Block contains standalone GPIO pins and is not a pin mux group.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |
| 4 | HOST | <p>Host Block I/O Power Down Control. Controls the power of the 27 I/O pins in the Host Block.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |
| 3 | EMBK2 | <p>EMIFA/VPSS Sub-Block 2 I/O Power Down Control. Controls the power of the 3 I/O pins in the EMIFA/VPSS Sub-Block 2.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |
| 2 | EMBK1 | <p>EMIFA/VPSS Sub-Block 1 I/O Power Down Control. Controls the power of the 29 I/O pins in the EMIFA/VPSS Sub-Block 1.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |
| 1 | EMBK0 | <p>EMIFA/VPSS Sub-Block 0 I/O Power Down Control. Controls the power of the 21 I/O pins in the EMIFA/VPSS Sub-Block 0.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |
| 0 | CLKOUT | <p>CLKOUT Block I/O Power Down Control. Controls the power of the 1 I/O pin in the CLKOUT Block.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p> |

3.3 Clock Considerations

Global device and local peripheral clocks are controlled by the PLL Controllers (PLLC1 and PLLC2) and the Power and Sleep Controller (PSC). In addition, the System Module VPSS_CLKCTL register configures the clock source to the Video Processing Subsystem (VPSS).

3.3.1 Clock Configurations after Device Reset

After device reset, the user is responsible for programming the PLL Controllers (PLLC1 and PLLC2) and the Power and Sleep Controller (PSC) to bring the device up to the desired clock frequency and the desired peripheral clock state (clock gating or not).

For additional power savings, some of the DM6431 peripherals support clock gating within the peripheral boundary. For more details on clock gating and power saving features supported by a specific peripheral, see the peripheral-specific reference guides [listed/linked in the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#))].

3.3.1.1 Device Clock Frequency

The DM6431 defaults to PLL bypass mode. To bring the device up to the desired clock frequency, the user should program PLLC1 and PLLC2 after device reset.

DM6431 supports a FASTBOOT option, where upon exit from device reset the internal bootloader code automatically programs the PLLC1 into PLL mode with a specific PLL multiplier and divider to speed up device boot. While the FASTBOOT option is beneficial for faster boot, the PLL multiplier and divider selected for boot *may not* be the exact frequency desired for the run-time application. It is the user's responsibility to reconfigure PLLC1 after fastboot to bring the device into the desired clock frequency. [Section 3.4.1, Boot Modes](#) discusses the different fast boot modes in more detail.

The user **must** adhere to the various clock requirements when programming the PLLC1 and PLLC2:

- Fixed frequency ratio requirements between CLKDIV1, CLKDIV3, and CLKDIV6 clock domains. For more details on the frequency ratio requirements, see [Section 6.3.4, DM6431 Power and Clock Domains](#).
- PLL multiplier and frequency ranges. For more details on PLL multiplier and frequency ranges, see [Section 6.7.1, PLL1 and PLL2](#).

3.3.1.2 Module Clock State

The clock and reset state for each of the modules is controlled by the Power and Sleep Controller (PSC). [Table 3-3](#) shows the default state of each module after a device-level global reset. The DM6431 device has four different module states—Enable, Disable, SyncReset, or SwRstDisable. For more information on the definitions of the module states, the PSC, and PSC programming, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

Table 3-3. DM6431 Default Module States

| LPSC # | MODULE NAME | DEFAULT MODULE STATE [PSC Register MDSTATn.STATE] |
|--------|------------------------|--|
| 0 | VPSS (Master) | SwRstDisable |
| 1 | VPSS (Slave) | SwRstDisable |
| 2 | EDMACC | SwRstDisable |
| 3 | EDMATC0 | SwRstDisable |
| 4 | EDMATC1 | SwRstDisable |
| 5 | EDMATC2 | SwRstDisable |
| 6 | EMAC Memory Controller | SwRstDisable |
| 7 | MDIO | SwRstDisable |
| 8 | EMAC | SwRstDisable |
| 9 | McASP0 | SwRstDisable |

Table 3-3. DM6431 Default Module States (continued)

| LPSC # | MODULE NAME | DEFAULT MODULE STATE [PSC Register MDSTATn.STATE] |
|--------|-----------------------|--|
| 13 | DDR2 Memory Contoller | SwRstDisable |
| 14 | EMIFA | SwRstDisable, if configuration pins AEM[2:0] = 000b Enable, if configuration pins AEM[2:0] = Others [001b and 101b] |
| 16 | McBSP0 | SwRstDisable |
| 18 | I2C | SwRstDisable |
| 19 | UART0 | SwRstDisable |
| 22 | HECC | SwRstDisable |
| 23 | PWM0 | SwRstDisable |
| 24 | PWM1 | SwRstDisable |
| 25 | PWM2 | SwRstDisable |
| 26 | GPIO | SwRstDisable |
| 27 | TIMER0 | SwRstDisable |
| 28 | TIMER1 | SwRstDisable |
| 39 | C64x+ CPU | Enable |

3.3.2 VPSS Clocks

The Video Processing SubSystem (VPSS) clocks are controlled via the VPSS_CLKCTL register. The VPSS_CLKCTL register format is shown in Figure 3-2 and the bit field descriptions are given in Table 3-4.

Figure 3-2. VPSS_CLKCTL Register— 0x01C4 0044

Table 3-4. VPSS_CLKCTL Register Description

| BIT | NAME | DESCRIPTION |
|------|----------|---|
| 31:5 | RESERVED | Reserved. Read-only, writes have no effect. |
| 4:3 | RESERVED | Reserved. For proper device operation, the user must only write "0" to these bits. |
| 2 | PCLKINV | PCLK polarity 0 = VPSS receives normal PCLK [default]. 1 = VPSS receives inverted PCLK. |
| 1:0 | RESERVED | Reserved. For proper device operation, the user must only write "0" to these bits. |

3.4 Boot Sequence

The boot sequence is a process by which the device's memory is loaded with program and data sections, and by which some of the device's internal registers are programmed with predetermined values. The boot sequence is started automatically after each device-level global reset. For more details on device-level global resets, see Section 6.5, Reset.

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset. For more information on the bootmode selections, see [Section 3.4.1, Boot Modes](#).

The device is booted through multiple means—primary bootloaders within internal ROM or EMIFA, and secondary user bootloaders from peripherals or external memories. Boot modes, pin configurations, and register configurations required for booting the device, are described in the following subsections.

3.4.1 Boot Modes

The DM6431 boot modes are determined by these device boot and configuration pins. For information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

- BOOTMODE[3:0]
- FASTBOOT
- AEM[2:0]
- PLLMS[2:0]

Note: The PLLMS[2:0] configuration pins are actually multiplexed with the AEAW[2:0] configuration pins. For more details on the multiplexed AEAW[2:0]/PLLMS[2:0] configuration pins and control, see [Section 3.5.1.2, EMIFA Address Width Selects \(AEA W\[2:0\]\) and FASTBOOT PLL Multiplier Selects \(PLLMS\[2:0\]\)](#).

BOOTMODE[3:0] determines the type of boot (e.g., I2C Boot or EMIFA Boot, etc.). FASTBOOT determines if the PLL is enabled during boot to speed up the boot process.

The combination of AEM[2:0] and PLLMS[2:0] is used by bootloader code to determine the PLL multiplier used during fastboot modes (FASTBOOT = 1).

The DM6431 boot modes are grouped into three categories—Non-Fastboot Modes, Fixed-Multiplier Fastboot Modes, and User-Select Multiplier Fastboot Modes.

- **Non-Fastboot Modes (FASTBOOT = 0):** The device operates in default PLL bypass mode during boot. The Non-Fastboot bootmodes available on the DM6431 are shown in [Table 3-5](#).
- **Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b):** The bootloader code speeds up the device during boot according to the fixed PLL multipliers. The Fixed-Multiplier Fastboot bootmodes available on the DM6431 are shown in [Table 3-6](#).
Note: The PLLMS[2:0] configurations have *no* effect on the Fixed-Multiplier Fastboot Modes, as these pins function as AEA W[2:0] to select the EMIFA address width when AEM[2:0] = 001b.
- **User-Select Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 000b and 101b):** The bootloader code speeds up the device during boot. The PLL multiplier is selected by the user via the PLLMS[2:0] pins. The User-Select Multiplier Fastboot bootmodes available on the DM6431 are shown in [Table 3-7](#).

All other modes *not* shown in these tables are reserved and invalid settings.

For more information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

Table 3-5. Non-Fastboot Modes (FASTBOOT = 0)

| DEVICE BOOT AND CONFIGURATION PINS | BOOT DESCRIPTION ⁽¹⁾ | DM6431 DMP (Master/Slave) | PLL1 CLOCK SETTING AT BOOT | | | DSPBOOTADDR (DEFAULT) ⁽¹⁾ |
|------------------------------------|---|---------------------------|----------------------------|----------------------------------|----------------------------|--------------------------------------|
| | | | PLL MODE ⁽²⁾ | CLKDIV1 DOMAIN (SYSCLK1 DIVIDER) | DEVICE FREQUENCY (SYSCLK1) | |
| BOOTMODE[3:0] | | | | | | |
| 0000 | No Boot (Emulation Boot) | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 0001 | Reserved | – | – | – | – | – |
| 0010 | Reserved | – | – | – | – | – |
| 0011 | Reserved | – | – | – | – | – |
| 0100 | EMIFA ROM Direct Boot [PLL Bypass Mode] | Master | Bypass | /1 | CLKIN | 0x4200 000 |
| 0101 | I2C Boot [STANDARD MODE] ⁽³⁾ | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 0110 | 16-bit SPI Boot [McBSP0] | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 0111 | NAND Flash Boot | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 1000 | UART Boot without Hardware Flow Control [UART0] | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 1001 | Reserved | – | – | – | – | – |
| 1010 | Reserved | – | – | – | – | – |
| 1011 | Reserved | – | – | – | – | – |
| 1100 | Reserved | – | – | – | – | – |
| 1101 | Reserved | – | – | – | – | – |
| 1110 | UART Boot with Hardware Flow Control [UART0] | Master | Bypass | /1 | CLKIN | 0x0010 0000 |
| 1111 | 24-bit SPI Boot (McBSP0 + GP[97]) | Master | Bypass | /1 | CLKIN | 0x0010 0000 |

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
- (2) The PLL MODE for Non-Fastboot Modes is fixed as shown in this table; therefore, the PLLMS[2:0] configuration pins have no effect on the PLL MODE.
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is *not* available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-6. Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b)

| DEVICE BOOT AND CONFIGURATION PINS | BOOT DESCRIPTION ⁽¹⁾ | DM6431 DMP (Master/Slave) | PLL1 CLOCK SETTING AT BOOT | | | DSPBOOTADDR (DEFAULT) ⁽¹⁾ |
|------------------------------------|--|---------------------------|----------------------------|----------------------------------|----------------------------|--------------------------------------|
| | | | PLL MODE ⁽²⁾ | CLKDIV1 DOMAIN (SYSCLK1 DIVIDER) | DEVICE FREQUENCY (SYSCLK1) | |

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
- (2) The PLL MODE for Fixed-Multiplier Fastboot Modes is fixed as shown in this table; therefore, the PLLMS[2:0] configuration pins have no effect on the PLL MODE.
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is **not** available for MXI/CLKIN frequencies less than 21 MHz.

| | 100 | x22 | /2 | CLKIN x22 / 2 |
| | 101 | x25 | /2 | CLKIN x25 / 2 |
| | 110 | x27 | /2 | CLKIN x27 / 2 |
| | 111 | x30 | /2 | CLKIN x30 / 2 |

As shown in [Table 3-5](#), [Table 3-6](#), and [Table 3-7](#), at device reset the Boot Controller defaults the DSPBOOTADDR to one of two values based on the boot mode selected. In all boot modes, the C64x+ is immediately released from reset and begins executing from address location indicated in DSPBOOTADDR.

- **Internal Bootloader ROM (0x0010 0000):** For most boot modes, the DSPBOOTADDR defaults to the internal Bootloader ROM so that the DSP can immediately execute the bootloader code in the internal ROM. The bootloader code decodes the captured BOOTMODE, FASTBOOT, default AEM (DAEM), and PLLMS information (in the BOOTCFG register) to determine the proper boot operation.

Note: For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

- **EMIFA Chip Select Space 2 (0x4200 0000):** The EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0) is the **only** exception where the DSPBOOTADDR defaults to the EMIFA Chip Select Space 2. The DSP begins execution directly from the external ROM at this EMIFA space.

For more information how the bootloader code handles each boot mode, see *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

3.4.1.1 FASTBOOT

When DM6431 exits pin reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$ released), the PLL Controllers (PLLC1 and PLLC2) default to PLL Bypass Mode. This means the PLLs are disabled, and the MXI/CLKIN clock input is driving the chip. All the clock domain divider ratios discussed in [Section 6.3.4, DM6431 Power and Clock Domains](#), still apply. For example, assume an MXI/CLKIN frequency of 27 MHz—meaning the internal clock source for EMIFA is at CLKDIV3 domain = 27 MHz/3 = 9 MHz, a very slow clock. In addition, the EMIFA registers are reset to the slowest configuration which translates to very slow peripheral operation/boot.

To optimize boot time, the user should reprogram clock settings via the PLLC as early as possible during the boot process. The FASTBOOT pin facilitates this operation by allowing the device to boot at a faster clock rate.

Except for the EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0), all other boot modes default to executing from the Internal Bootloader ROM. The first action that the bootloader code takes is to decode the boot mode. If the FASTBOOT option is selected (BOOTCFG.FASTBOOT = 1), the bootloader software begins by programming the PLLC1 (System PLLC) to PLL Mode to give the device a slightly faster operation before fetching code from external devices. The exact PLL multiplier that the bootloader uses is determined by the AEM[2:0] and PLLMS[2:0] settings, as shown in [Table 3-6](#) and [Table 3-7](#).

Some boot modes *must* be accompanied with FASTBOOT = 1 so that the corresponding peripheral can run at a reasonable rate to communicate to the external device(s).

Note: PLLC2 still stays in PLL Bypass Mode, the bootloader *does not* reconfigure it.

3.4.1.2 Selecting FASTBOOT PLL Multiplier

Table 3-6, Table 3-7, and Table 3-8 show the PLL multipliers used by the bootloader code during fastboot (FASTBOOT = 1) and the resulting device frequency. The user is responsible for selecting the bootmode with the appropriate PLL multiplier for their MXI/CLKIN clock source so that the device speed and PLL frequency range requirements are met. For the PLLC1 Clock Frequency Ranges, see Table 6-15, *PLLC1 Clock Frequency Ranges* in Section 6.7.1, *PLL1 and PLL2*.

The following are guidelines for PLL output frequency and device speed (frequency):

- **PLL Output Frequency:** (PLLOUT = CLKIN frequency * boot PLL Multiplier) **must** stay within the PLLOUT frequency range in Table 6-15, *PLLC1 Clock Frequency Ranges*.
- **Device Frequency:** (SYSCLK1) calculated from Table 3-6 and Table 3-7 **must not** exceed the SYSCLK1 maximum frequency in Table 6-15, *PLLC1 Clock Frequency Ranges*.

For example, for a 300-MHz device with a CLKIN = 27 MHz, in order to stay within the PLLOUT frequency range and SYSCLK1 maximum frequency from Table 6-15, *PLLC1 Clock Frequency Ranges*, the user **must** select a boot mode with a PLL1 multiplier between x15 and x22.

3.4.1.3 EMIFA Boot Modes

As shown in Table 3-5, Table 3-6, and Table 3-7, there are different types of EMIFA Boot Modes. This subsection summarizes these types of EMIFA boot modes. For further detailed information, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

- **EMIFA ROM Direct Boot in PLL Bypass Mode** (FASTBOOT = 0, BOOTMODE[3:0] = 0100b)
 - The C64x+ fetches the code directly from EMIFA Chip Select 2 Space [$\overline{\text{EM_CS2}}$] (address 0x4200 0000)
 - The PLL is in Bypass Mode
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].
- **EMIFA ROM Fastboot with AIS** (FASTBOOT = 1, BOOTMODE[3:0] = 0100b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
 - The bootloader code reads code from the EMIFA $\overline{\text{EM_CS2}}$ space using the application image script (AIS) format.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].
- **EMIFA ROM Fastboot without AIS:** (FASTBOOT = 1, BOOTMODE[3:0] = 1001b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
 - The bootloader code then jumps to the EMIFA $\overline{\text{EM_CS2}}$ space, at which point the C64x+ fetches the code directly from address 0x4200 0000.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].

- **NAND Flash Boot:** (FASTBOOT = 0 or 1, BOOTMODE[3:0] = 0111b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x00100000.
 - Depending on the FASTBOOT, AEM[2:0], and PLLMS[2:0] settings, the bootloader code may program the PLLC1 to PLL Mode to speed up the boot process. See [Table 3-5](#), [Table 3-6](#), and [Table 3-7](#).
 - The bootloader code reads the code from EMIFA (NAND) $\overline{\text{EM_CS2}}$ (address 0x42000000) using AIS format.
 - EMIFA is configured in NAND mode. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **can** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1] or 101b [8-bit EMIFA (NAND) Pinout Mode 5].

3.4.1.4 Serial Boot Modes (I2C, UART[UART0], SPI[McBSP0])

This subsection discusses how the bootloader configures the clock dividers for the serial boot modes—I2C boot, UART boot, and SPI boot.

3.4.1.4.1 I2C Boot

If FASTBOOT = 0, then I2C Boot (BOOTMODE = 0101) is performed in Standard-Mode (up-to 100 kbps). If FASTBOOT = 1, then I2C Boot is performed in Fast-Mode (up-to 400 kbps). The actual I2C data transfer rate is dependent on the MXI/CLKIN frequency.

This is how the bootloader programs the I2C:

- I2C Boot in Fast-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 1)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 8₁₀, ICCKH.ICCH = 8₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 78 * 1000
 - SCL low pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
- I2C Boot in Standard-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 0)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 45₁₀, ICCKH.ICCH = 45₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 300 * 1000
 - SCL low pulse duration (in μs) = 150 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 150 / (CLKIN frequency in MHz)

Note: The I2C peripheral requires that the prescaled module clock frequency **must** be between 7 MHz and 12 MHz. Therefore, the I2C boot is *only* available for MXI/CLKIN frequency between 21 MHz and 30 MHz.

For more details on the I2C peripheral configurations and clock requirements, see the *TMS320DM643x DMP Inter-Integrated Circuit (I2C) Peripheral User's Guide* (literature number [SPRU991](#)).

3.4.1.4.2 UART Boot

For UART Boot (BOOTMODE[3:0] = 1000b or 1110b), the bootloader programs the UART0 peripheral as follows:

- UART0 divisor is set to 15₁₀
- Resulting in this UART0 baud rate in kilobit per second (kbps):
 - (CLKIN frequency in MHz) * 1000 / (15 * 16)

The user is responsible for ensuring the resulting baud rate is appropriate for the system. The UART0 divisor (/15) is optimized for CLKIN frequency between 27 to 29 MHz to stay within 5% of the 115200-bps baud rate.

For more details on the UART peripheral configurations and clock generation, see the *TMS320DM643x DMP Universal Asynchronous Receiver/Transmitter (UART) User's Guide* (literature number [SPRU997](#)).

3.4.1.4.3 SPI Boot

Both 16-bit address SPI Boot (BOOTMODE = 0110) and 24-bit address SPI boot are performed through the McBSP0 peripheral. The bootloader programs the McBSP0 peripheral as follows:

- McBSP0 register settings: SRGR.CLKGDV = 2₁₀
- Resulting in this SPI serial clock frequency:
 - (SYSCLK3 frequency in MHz) / 3

SYSCLK3 frequency = SYSCLK1 frequency / 6. SYSCLK1 frequency during boot can be found in [Table 3-5](#), [Table 3-6](#), [Table 3-7](#), and/or [Table 3-8](#) based on the boot mode selection.

For example, if BOOTMODE[3:0] = 0110b, FASTBOOT = 1, the MXI/CLKIN frequency = 27 MHz, AEM[2:0] = 000b, PLLMS[2:0] = 100b, the combination of [Table 3-7](#) and [Table 3-8](#) indicates that the device frequency (SYSCLK1) is CLKIN x 22 / 2 = 297 MHz. This means SYSCLK3 frequency is 297 / 6 = 49.5 MHz, resulting in SPI serial clock frequency of 49.5 / 3 = 16.5 MHz.

3.4.2 Bootmode Registers

3.4.2.1 BOOTCFG Register

The Device Bootmode (see [Section 3.4.1, Boot Modes](#)) and Configuration pins (see [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#)) latched at reset are captured in the Device Boot Configuration (BOOTCFG) register which is accessible through the System Module. This is a *read-only* register. The bits show the values latched from the corresponding configuration pins sampled at device reset. For more information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#). For the corresponding device boot and configuration pins, see [Table 2-5, BOOT Terminal Functions](#).

3.4.2.2 BOOTCMPLT Register

If the bootloader code detects an error during boot, it records the error status in the Boot Complete (BOOTCMPLT) register.

The BOOTCMPLT register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5](#), Reset.

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-4. BOOTCMPLT Register— 0x01C4 000C

Table 3-10. BOOTCMPLT Register Description

| Bit | Field Name | Description |
|-------|------------|---|
| 31:20 | RESERVED | Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits. |
| 19:16 | ERR | Boot Error 0000 = No Error (default). 0001 - 1111 = bootloader software detected a boot error and aborted the boot. For the error codes, see the <i>Using the TMS320DM643x Bootloader</i> Application Report (literature number SPRAAG0). |
| 15:0 | RESERVED | Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits. |

3.4.2.3 DSPBOOTADDR Register

The DSP Boot Address (DSPBOOTADDR) register contains the starting address for the C64x+ CPU. Whenever the C64x+ is released from reset, it begins executing from the location pointed to by DSPBOOTADDR register. Software can leave the DSPBOOTADDR register at default.

The DSPBOOTADDR register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5, Reset](#).

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-5. DSPBOOTADDR Register— 0x01C4 0008

Table 3-11. DSPBOOTADDR Register Description

| Bit | Field Name | Description |
|------|-------------|---|
| 31:0 | DSPBOOTADDR | DSP Boot Address After boot, the C64x+ CPU begins execution from this 32-bit address location. The lower 10 bits (bits 9:0) should <i>always</i> be programmed to "0" as they are ignored by the C64x+. The default value of the DSPBOOTADDR depends on the boot mode selected. The DSPBOOTADDR defaults to 0x00100000 when the Internal Bootloader ROM is used. <i>or</i> The DSPBOOTADDR defaults to 0x42000000 when EMIFA $\overline{CS2}$ Space is used. For the boot mode selections, see Table 3-5, Non-Fastboot Modes ; Table 3-6, Fixed-Multiplier Fastboot Modes ; and Table 3-7, User-Select Multiplier Fastboot Modes . |

3.5 Configurations At Reset

Some device configurations are determined at reset. The following subsections give more details.

3.5.1 Device and Peripheral Configurations at Device Reset

Table 2-5, BOOT Terminal Functions lists the device boot and configuration pins that are latched at device reset for configuring basic device settings for proper device operation. Table 3-12, summarizes the device boot and configuration pins, and the device functions that they affect.

Table 3-12. Default Functions Affected by Device Boot and Configuration Pins

| DEVICE BOOT AND CONFIGURATION PINS ⁽¹⁾ | BOOT SELECTED | PIN MUX CONTROL | GLOBAL SETTING | PERIPHERAL SETTING |
|---|--|---|---|---|
| BOOTMODE[3:0] | Boot Mode | PINMUX0/PINMUX1 Registers: Based on BOOTMODE[3:0], the bootloader code programs PINMUX0 and PINMUX1 registers to select the appropriate pin functions required for boot. | I/O Pin Power: Based on BOOTMODE[3:0], the bootloader code programs VDD3P3V_PWDN register to power up the I/O pins required for boot. | PSC/Peripherals: Based on BOOTMODE[3:0], the bootloader code programs the PSC to put boot-related peripheral(s) in the Enable State, and programs the peripheral(s) for boot operation. |
| FASTBOOT | Fastboot | – | Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1. | – |
| AEAW[2:0]/PLLMS[2:0] | If FASTBOOT = 1 and AEM = 000b or 101b the PLLMS[2:0] selects the FASTBOOT PLL Multiplier. | PINMUX0.AEAW: AEAW[2:0] sets the default of this field to control the EMIFA address bus width (<i>only applicable if</i> PINMUX0.AEM = 001b). Affects the pin muxing in EMIFA/VPSS Sub-Block 0. | Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1. | – |
| AEM[2:0] | Together with FASTBOOT and PLLMS[2:0], determines the FASTBOOT PLL Multiplier. | PINMUX0.AEM: Sets the default of this field to control the EMIFA Pinout Mode. Affects the pin muxing in EMIFA/VPSS Sub-Block 0, 1, and 3. | Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1. | PSC/EMIFA: The EMIFA module state defaults to SwRstDisable if AEM = 0; otherwise, the EMIFA module state defaults to Enable. |

(1) Software can modify all PINMUX0 and PINMUX1 bit fields from their defaults.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. For discussion situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.

Note: All DM6431 configuration inputs (BOOTMODE[3:0], FASTBOOT, AEAW[2:0]/PLLMS[2:0] and AEM[2:0]) are multiplexed with other functional pins. These pins function as device boot and configuration pins only during device reset. The user **must** take care of any potential data contention in the system. To help avoid system data contention, the DM6431 puts these configuration pins into a high-impedance state (Hi-Z) when device reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$) is asserted, and continues to hold them in a high-impedance state until the internal global reset is removed; at which point, the default peripheral (either GPIO or EMIFA based on default of AEM[2:0]) will now control these pins.

All of the device boot and configuration pin settings are captured in the corresponding bit fields in the BOOTCFG register (see Section 3.4.2.1).

The following subsections provide more details on the device configurations determined at device reset: AEM and AEAW/PLLMS.

3.5.1.1 EMIFA Pinout Mode (AEM[2:0])

To support different usage scenarios, the DM6431 provides intricate pin multiplexing between the EMIFA and other peripherals. The PINMUX0.AEM register bit field in the System Module determines the EMIFA Pinout Mode. The AEM[2:0] pins only select the default EMIFA Pinout Mode. It is latched at device reset de-assertion (high) into the BOOTCFG.DAEM bit field. The AEM[2:0] value also sets the default of the PINMUX0.AEM bit field. While the BOOTCFG.DAEM bit field shows the actual latched value and *cannot* be modified, the PINMUX0.AEM value can be changed by software to modify the EMIFA Pinout Mode.

Note: The AEM[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which EMIFA pins are brought out to the device pins. For more details on the AEM settings, see [Section 3.7, Multiplexed Pin Configurations](#).

In addition, for Fastboot modes (FASTBOOT = 1), the bootloader code determines the PLL1 multiplier based on the default settings of AEM[2:0] and PLLMS[2:0]. For more details, see [Section 3.4.1.1, Fastboot](#), and [Section 3.5.1.2, EMIFA Address Width Select \(AEAW\) and FASTBOOT PLL Multiplier Select \(PLLMS\)](#).

3.5.1.2 EMIFA Address Width Select (AEAW) and FASTBOOT PLL Multiplier Select (PLLMS)

The AEAW[2:0]/PLLMS[2:0] pins serve two functional purposes (AEAW or PLLMS), depending on the FASTBOOT and AEM settings. The AEAW[2:0]/PLLMS[2:0] pins are latched at device reset de-assertion (high) and captured in the BOOTCFG.PLLMS bit field. This value also sets the default of the PINMUX0.AEAW field.

While the BOOTCFG.PLLMS field shows the actual latched value and *cannot* be modified, the PINMUX0.AEAW value *can* be changed by software to modify the EMIFA pinout.

AEAW as EMIFA Address Width Select (AEAW)

If AEM[2:0] = 001b [8-bit EMIFA (Async) Pinout Mode 1], the AEAW[2:0]/PLLMS[2:0] pins serve as AEAW to set the default of the EMIFA Address Width Selection.

When EMIFA is used in the 8-bit EMIFA (Async) Pinout Mode 1 (PINMUX0.AEM = 001b), the user has the option to determine how many address pins are needed. The unused address pins can be used as general-purpose input/output (GPIO) pins or extra data pins for VPFE. For more details on how the AEAW settings control the exact pin out when AEM = 001b, see [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#). For other EMIFA Pinout Modes (AEM not 001b), AEAW is *not* applicable in determining the EMIFA address width.

Note: AEAW[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which of the EMIFA address bits are brought out to the device pins.

AEAW as Fast Boot PLL Multiplier Select (PLLMS)

If FASTBOOT = 1, and AEM[2:0] = 000b [No EMIFA] or 101b [8-bit EMIFA (NAND) Pinout Mode 5], the AEAW[2:0]/PLLMS[2:0] pins serve as PLLMS to select PLL multiplier for Fastboot modes.

For more information on boot modes and the FASTBOOT PLL multiplier selection, see [Section 3.4.1, Boot Modes](#).

3.6 Configurations After Reset

The following sections provide details on configuring the device after reset.

Multiplexed pins are configured both at and after reset. [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#), discusses multiplexed pin control at reset. For more details on multiplexed pins control after reset, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.1 Switch Central Resource (SCR) Bus Priorities

Prioritization within the Switched Central Resource (SCR) is programmable for each master. The register bit fields and default priority levels for DM6431 bus masters are shown in [Table 3-13](#), *DM6431 Default Bus Master Priorities*. The priority levels should be tuned to obtain the best system performance for a particular application. Lower values indicate higher priority. For most masters, their priority values are programmed at the system level by configuring the MSTPRI0 and MSTPRI1 registers. Details on the MSTPRI0/1 registers are shown in [Figure 3-6](#) and [Figure 3-7](#). The C64x+, VPSS, and EDMA masters contain registers that control their own priority values.

Table 3-13. DM6431 Default Bus Master Priorities

| Priority Bit Field | Bus Master | Default Priority Level |
|--------------------|-------------|-------------------------------|
| VPSSP | VPSS | 0 (VPSS PCR Register) |
| EDMATC0P | EDMATC0 | 0 (EDMACC QUEPRI Register) |
| EDMATC1P | EDMATC1 | 0 (EDMACC QUEPRI Register) |
| EDMATC2P | EDMATC2 | 0 (EDMACC QUEPRI Register) |
| C64X+_DMAP | C64X+ (DMA) | 7 (C64x + MDMAARBE.PRI field) |
| C64X+_CFGP | C64X+ (CFG) | 1 (MSTPRI0 Register) |

3.6.2 Peripheral Selection After Device Reset

After device reset, most peripheral configurations are done within the peripheral's registers. This section discusses some additional peripheral controls in the System Module. For information on multiplexed pin controls that determine what peripheral pins are brought out to the pins, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.2.1 Timer Control Register (TIMERCTL)

The Timer Control Register (TIMERCTL) provides additional control for Timer0 and Timer2. **The user should only modify this register once during device initialization, when the corresponding Timer is not in use.**

- **Timer 2 Control:** The TIMERCTL.WDRST bit determines if the WatchDog timer event (Timer 2) can cause a device max reset. For more details on the description of a maximum reset, see [Section 6.5.3, Maximum Reset](#).
- **Timer 0 Control:** The TINP0SEL bit selects the clock source connected to Timer0's TIN0 input.

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-8. TIMERCTL Register— 0x01C4 0084

Table 3-16. TIMERCTL Register Description

| Bit | Field Name | Description |
|------|------------|--|
| 31:2 | RESERVED | Reserved. Read-Only, writes have no effect. |
| 1 | TINP0SEL | Timer0 External Input (TIN0) Select 0 = Timer0 external input comes directly from the TINP0L pin (default). 1 = Timer0 external input is TINP0L pin divided by 6. For example, if TINP0L = 27MHz, Timer0 input TIN0 is 27MHz / 6 = 4.5 MHz. |
| 0 | WDRST | WatchDog Reset Enable 0 = WatchDog Timer Event (WDINT from Timer2) does not cause device reset. 1 = WatchDog Timer Event (WDINT from Timer2) causes a device max reset (default). |

3.6.2.2 EDMA TC Configuration Register (EDMATCCFG)

The EDMA Transfer Controller Configuration (EDMATCCFG) register configures the default burst size (DBS) for EDMA TC0, EDMA TC1, and EDMA TC2. For more information on the correct usage of DBS, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA) Controller User's Guide* (literature number [SPRU987](#)). **The user should only modify this register once during device initialization and when the corresponding EDMA TC is not in use.**

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-9. EDMATCCFG Register— 0x01C4 0088

Table 3-17. EDMATCCFG Register Description

| Bit | Field | Description |
|------|----------|--|
| 31:6 | RESERVED | Reserved. Read-Only, writes have no effect. |
| 5:4 | TC2DBS | EDMA TC2 Default Burst Size 00 = 16 byte 01 = 32 byte 10 = 64 byte (default) 11= reserved EDMA TC2 is intended for miscellaneous transfers. TC2 FIFO size is 128 bytes, regardless of Default Burst Size setting. |

Table 3-17. EDMATCCFG Register Description (continued)

| Bit | Field | Description |
|-----|--------|---|
| 3:2 | TC1DBS | EDMA TC1 Default Burst Size 00 = 16 byte 01 = 32 byte (default) 10 = 64 byte 11 = reserved EDMA TC1 is intended for high throughput bulk transfers. TC1 FIFO size is 256 bytes, regardless of Default Burst Size setting. |
| 1:0 | TC0DBS | EDMA TC0 Default Burst Size 00 = 16 byte (default) 01 = 32 byte 10 = 64 byte 11 = reserved EDMA TC0 is intended for short burst transfers with stringent deadlines (e.g., McBSP, McASP). TC0 FIFO size is 128 bytes, regardless of Default Burst Size setting. |

3.7 Multiplexed Pin Configurations

DM6431 makes extensive use of pin multiplexing to accommodate a large number of peripheral functions in the smallest possible package, providing ultimate flexibility for end applications.

The Pin Multiplex Registers PINMUX0 and PINMUX1 in the System Module are responsible for controlling all pin multiplexing functions on the DM6431. The default setting of some of the PINMUX0 and PINMUX1 bit fields are configured by configuration pins latched at reset (see [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#)). After reset, software may program the PINMUX0 and PINMUX1 registers to switch pin functionalities.

The following peripherals have multiplexed pins: VPSS (VPFE), EMIFA, EMAC, McASP0, McBSP0, PWM0, PWM1, PWM2, Timer0, Timer1, UART0, HECC, and GPIO.

The device is divided into the following Pin Multiplexed Blocks (Pin Mux Blocks):

- **EMIFA/VPSS Block:** VPSS (VPFE), EMIFA, and GPIO. This block is further subdivided into these sub-blocks:
 - **Sub-Block 0:** VPFE (CCDC), part of EMIFA (address and control), and GPIO
 - **Sub-Block 1:** part of EMIFA (data, address, control), and GPIO
 - **Sub-Block 2:** part of EMIFA (control signals EM_WAIT/(RDY/BSY), $\overline{\text{EM_OE}}$, and $\overline{\text{EM_WE}}$)
 - **Sub-Block 3:** part of EMIFA (address EM_A[12:5]), and GPIO
- **Host Block:** EMAC and GPIO
- **Serial Port Block:** McBSP0, McASP0, and GPIO. This block is further sub-divided into sub-blocks.
 - **Serial Port Sub-Block 0:** McBSP0, part of McASP0, and GPIO
 - **Serial Port Sub-Block 1:** part of McASP0 and GPIO
- **UART0 Flow Control Block:** UART0 flow control, PWM0, and GPIO
- **UART0 Data Block:** UART0 data and GPIO
- **Timer0 Block:** Timer0 and McBSP0 CLKS pins
- **Timer1 Block:** Timer1 and HECC
- **PWM1 Block:** PWM1 and GPIO
- **CLKOUT Block:** CLKOUT0, PWM2, and GPIO

As shown in the list above, the McBSP0 and UART0 peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all relevant Pin Mux Blocks. For more details, see [Section 3.7.3, Pin Multiplexing Details](#), and [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

Note: There is no actual pin multiplexing in EMIFA/VPSS Sub-Block 2. However, this is still considered a "pin mux block" because it contains part of the pins necessary for EMIFA.

A high level view of the Pin Mux Blocks is shown in Figure 3-10. In each Pin Mux Block, the PINMUX0/PINMUX1 default settings are underlined.

Note: Some default pin functions are determined by configuration pins (AEAW[2:0] and AEM[2:0]); therefore, more than one configuration setting can serve as default based on the configuration pin settings latched at device reset.

- A. Default settings for PINMUX0 and PINMUX1 registers are underlined.
- B. EMIFA/VPSS Block: shows the Major Config Options based on the AEM settings. Actual pin functions in the EMIFA/VPSS Block are further determined by other PINMUX fields.
- C. McBSP0 pins span multiple blocks (Serial Port Sub-Block0 and Timer0 Block). Serial Port Sub-Block0 contains most of the pins needed for McBSP0 operation. Timer0 Block contains the optional external clock source input CLKS0.

Figure 3-10. Pin Mux Block Selection

3.7.1 Pin Muxing Selection At Reset

This section summarizes pin mux selection at reset.

The configuration pins AEM[2:0] and AEAW[2:0] latched at device reset determine default pin muxing for the following Pin Mux Blocks:

- EMIFA/VPSS Block: default pin mux determined by AEM[2:0] and AEAW[2:0]. **After reset, software may modify settings in the PINMUX0 register to add VPFE functionalities into this block.**
 - AEM[2:0] = 000b, AEAW[2:0] = don't care: Major Config Option A is selected. This block defaults to 61 GPIO pins.
 - AEM[2:0] = 001b, AEAW[2:0] = 000b to 100b: Major Config Option B is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 1, plus 24-to-32 GPIO pins.
 - AEM[2:0] = 101b, AEAW[2:0] = don't care: Major Config Option E is selected. This block defaults to 8-bit EMIFA (NAND) Pinout mode 5, plus 47 GPIO pins.

For a description of the PINMUX0 and PINMUX1 registers and more details on pin muxing, see [Section 3.7.2, Pin Muxing Selection After Reset](#).

3.7.2 Pin Muxing Selection After Reset

The PINMUX0 and PINMUX1 registers in the System Module allow software to select the pin functions in the Pin Mux Blocks. The pin control of some of the Pin Mux Blocks requires a combination of PINMUX0/PINMUX1 bit fields. For more details on the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on DM6431](#).

This section only provides an overview of the PINMUX0 and PINMUX1 registers. For more detailed discussion on how to program each Pin Mux Block, see [Section 3.7.3, Pin Multiplexing Details](#).

3.7.2.1 PINMUX0 Register Description

The Pin Multiplexing 0 Register (PINMUX0) controls the pin function in the EMIFA/VPSS Block. The PINMUX0 register format is shown in [Figure 3-11](#) and the bit field descriptions are given in [Table 3-18](#). Some muxed pins are controlled by more than one PINMUX bit field. For the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on DM6431](#). For more information on EMIFA/VPSS Block pin muxing, see [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#). For the pin-by-pin muxing control of the EMIFA/VPSS Block, see [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#).

(1) For proper DM6431 device operation, **always** write a value of "0" to all RESERVED/RSV bits.

Figure 3-11. PINMUX0 Register— 0x01C4 0000 (1)

Table 3-18. PINMUX0 Register Description

| Bit | Field Name | Description | Pins Controlled |
|-------|------------|--|---|
| 31 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | |
| 30 | CI10SEL | CI[1:0] Function Select. 0 = No CCDC CI[1:0]. Pins function as GPIO or EMIFA based on AEM and AEAW settings (default). 1 = Selects CCDC [1:0] (as CCD8 and CCD9, respectively) to get a 10-bit CCDC. To use the 10-bit CCDC, the user must also configure PINMUX0.CCDCSEL = 1. | Sub-Block 0 CI1(CCD9)/EM_A[19]/GP[45] CI0(CCD8)/EM_A[20]/GP[44] The combination of PINMUX0 fields AEM, AEAW, and CI10SEL bits control the pin muxing of these 2 pins. ⁽¹⁾ |
| 29:25 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | |
| 24 | CFLDSEL | CCDC Field Select. 0 = No CCDC Field (C_FIELD). Pin functions as EMIFA EM_A[21] or GPIO based on AEM setting (default). 1 = CCDC Field (C_FIELD). | Sub-Block 0 C_FIELD/EM_A[21]/GP[34] The combination of PINMUX0/1 fields CFLDSEL and AEM control the muxing of this pin. ⁽¹⁾ |
| 23 | CWENSEL | CCDC Write Enable Select. 0 = No CCDC Write Enable. Pin functions as EMIFA EM_R \bar{W} or GPIO based on AEM setting (default). 1 = CCDC Write Enable (C_WE). Pin functions as CCDC Write Enable C_WE. Applicable <i>only</i> for AEM = 0 (000b) or 5 (101b). | Sub-Block 0 C_WE/EM_R \bar{W} /GP[35] The combination of PINMUX0 fields CWENSEL and AEM control the muxing of this pin. ⁽¹⁾ |
| 22 | HVDSEL | CCDC HD and VD Select. 0 = No CCDC HD and VD. Pins function as GPIO (GP[53] and GP[52]) (default). 1 = CCDC HD and VD. | Sub-Block 0 VD/GP[53] HD/GP[52] The PINMUX0 field HVDSEL alone controls the muxing of these 2 pins. |
| 21 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | |
| 20 | CCDCSEL | CCDC Select. This bit field determines if CCDC is supported or not. 0 = CCDC <i>not</i> supported. Pins function as GPIO (GP[54] and GP[43:36]) (default). 1 = CCDC supported. Pins function as CCDC PCLK, YI[7:0]. | Sub-Block 0 PCLK/GP[54] Y17(CCD7)/GP[43] Y16(CCD6)/GP[42] Y15(CCD5)/GP[41] Y14(CCD4)/GP[40] Y13(CCD3)/GP[39] Y12(CCD2)/GP[38] Y11(CCD1)/GP[37] Y10(CCD0)/GP[36] The PINMUX0 field CCDCSEL alone controls the muxing of these 9 pins. |
| 19 | RSV | Reserved. For proper device operation, the user should <i>only</i> write "0" to this bit (default). | |

(1) For the full set of valid configurations of these pins, see [Section 3.7.3.11.7](#), EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary.

Table 3-18. PINMUX0 Register Description (continued)

| Bit | Field Name | Description | Pins Controlled |
|-------|---------------------|--|---|
| 18:16 | AEAW ⁽¹⁾ | <p>8-bit EMIFA (Async) Pinout Mode 1 Address Width Select or Fast Boot PLL Multiplier Select This field serves two purposes:</p> <ol style="list-style-type: none"> If AEM = 001b, this field serves as the 8-bit EMIFA (Async) Pinout Mode 1 Address Width Select. (1) The AEAW default value is latched at reset from AEAW[2:0] configuration inputs. The latched values are also shown at BOOTCFG.PLLMS (*read-only*).

(2) For the full set of valid configurations of these pins, see [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#).

Table 3-18. PINMUX0 Register Description (continued)

| Bit | Field Name | Description | Pins Controlled |
|-----|--------------------|---|--|
| 2:0 | AEM ⁽¹⁾ | <p>EMIFA Pinout Modes This field does not affect the actual EMIFA operation. It only determines what multiplexed pins in the EMIFA/VPSS Block serves as EMIFA pins.</p> <p>000b = No EMIFA Mode. None of the multiplexed pins in the EMIFA/VPSS Block serves as EMIFA pins.</p> <p>001b = 8-bit EMIFA (Async) Pinout Mode 1. (Up to 16M-Byte address reach per Chip Select Space). Pinout allows up to a maximum of these functions from EMIFA/VPSS Block: 8-bit EMIFA (Async or NAND) + 10-bit CCDC (VPFE)</p> <p>010b = Reserved.</p> <p>011b = Reserved.</p> <p>100b = Reserved.</p> <p>101b = 8-bit EMIFA (NAND) Pinout Mode 5. Pinout allows up to a maximum of these functions from EMIFA/VPSS Block: 8-bit EMIFA (NAND) + 10-bit CCDC (VPFE)</p> <p>110b through 111b = Reserved.</p> | <p>Sub-Block 0 C_WE/EM_R\overline{W}/GP[35] C_FIELD/EM_A[21]/GP[34] EM_A[13]/GP[51] EM_A[14]/GP[50] EM_A[15]/GP[49] EM_A[16]/GP[48] EM_A[17]/GP[47] EM_A[18]/GP[46] C11(CCD9)/EM_A[19]/GP[45] C10(CCD8)/EM_A[20]/GP[44]</p> <p>Sub-Block 1 EM_D[7]/GP[21] EM_D[6]/GP[20] EM_D[5]/GP[19] EM_D[4]/GP[18] EM_D[3]/GP[17] EM_D[2]/GP[16] EM_D[1]/GP[15] EM_D[0]/GP[14] EM_CS2/GP[12] EM_A[3]/GP[11] EM_A[4]/GP[10]/(AEAW2/PLLMS2) EM_A[1]/(ALE)/GP[9]/(AEAW1/PLLMS1) EM_A[2]/(CLE)/GP[8]/(AEAW0/PLLMS0) EM_A[0]/GP[7]/(AEM2) EM_BA[0]/GP[6]/(AEM1) EM_BA[1]/GP[5]/(AEM0)</p> <p>Sub-Block3 EM_A[12]/GP[89] EM_A[11]/GP[90] EM_A[10]/GP[91] EM_A[9]/GP[92] EM_A[8]/GP[93] EM_A[7]/GP[94] EM_A[6]/GP[95] EM_A[5]/GP[96]</p> <p>The pin mux for these pins are controlled by a combination of AEM and other PINMUX0 fields, including CWENSEL, CFLDSEL, AEAW, and C110SEL. ⁽²⁾</p> |

- (1) The AEM default value is latched at reset from AEM[2:0] configuration inputs. The latched values are also shown at BOOTCFG.DAEM (*read-only*).
- (2) For the full set of valid configurations of these pins, see [Section 3.7.3.11.7](#), *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*.

3.7.2.2 PINMUX1 Register Description

The Pin Multiplexing 1 Register (PINMUX1) controls the pin multiplexing of all Pin Mux Blocks except the EMIFA/VPSS block. The PINMUX1 register format is shown in Figure 3-12 and the bit field descriptions are given in Table 3-19. Some muxed pins are controlled by more than one PINMUX bit field. For the combination of PINMUX bit fields that control each muxed pin, see Section 3.7.3.1, *Multiplexed Pins on DM6431*.

LEGEND: R/W = Read/Write; R = Read only; P = specified pin state; -n = value after reset
 (1) For proper DM6431 device operation, **always** write a value of "0" to all RESERVED/RSV bits.

Figure 3-12. PINMUX1 Register— 0x01C4 0004 (1)

Table 3-19. PINMUX1 Register Description

| Bit | Field Name | Description | Pins Controlled |
|-------|------------|---|---|
| 31:26 | RESERVED | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |
| 25:24 | SPBK1 | Serial Port Sub-Block 1 Pin Select. Selects the function of the multiplexed pins in the Serial Port Sub-Block 1. 00 = GPIO Mode (default). Pins function as GPIO (GP[110:105]). 01 = Reserved. 10 = McASP0 Transmit and 1 serializer. Pins function as McASP0: AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0, and AMUTE0. 11 = Reserved. | Serial Port Sub-Block 1: AXR0[0]/GP[105] ACLKX0/GP[106] AFSX0/GP[107] AHCLKX0/GP[108] AMUTEIN0/GP[109] AMUTE0/GP[110] |
| 23:22 | SPBK0 | Serial Port Sub-Block 0 Pin Select. Selects the function of the multiplexed pins in the Serial Port Sub-Block 0. 00 = GPIO Mode (default). Pins function as GPIO (GP[104:99]). 01 = McBSP0 Mode. Pins function as McBSP0 CLKX0, FSX0, DX0, CLKR0, FSR0, and DR0. 10 = McASP0 Receive and 3 serializers. Pins function as McASP0 ACLKR0, AFSR0, AHCLKR0, AXR0_3, AXR0_2, and AXR0_1. 11 = Reserved | Serial Port Sub-Block 0: ACLKR0/CLKX0/GP[99] AFSR0/DR0/GP[100] AHCLKR0/CLKR0/GP[101] AXR0[3]/FSR0/GP[102] AXR0[2]/FSX0/GP[103] AXR0[1]/DX0/GP[104] |
| 21:20 | TIM1BK | Timer1 Block Pin Select. Selects the function of the multiplexed pins in the Timer1 Block. 00 = GPIO Mode (default). Pins function as GPIO (GP[56:55]). 01 = Timer1 Mode. Pins function as Timer1 TINP1L and TOUT1L. 10 = Reserved 11 = HECC Mode. Pins function as HECC HECC_RX and HECC_TX. | Timer1 Block: HECC_RX/TINP1L/GP[56] HECC_TX/TOUT1L/GP[55] |
| 19:18 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |

Table 3-19. PINMUX1 Register Description (continued)

| Bit | Field Name | Description | Pins Controlled |
|-------|------------|---|--|
| 17:16 | TIM0BK | <p>Timer0 Block Pin Select. Selects the function of the multiplexed pins in the Timer0 Block.</p> <p>00 = GPIO Mode (default). Pins function as GPIO (GP[98:97]).</p> <p>01 = Timer0 Mode. Pins function as Timer0 TINP0L and TOUT0L.</p> <p>10 =Reserved.</p> <p>11 = McBSP0 External Clock Source + Timer0 Input Mode. Pins function as McBSP0 external clock source CLKS0, and Timer0 input TINP0L.</p> | <p>Timer0 Block: TINP0L/GP[98] CLKS0/TOUT0L/GP[97]</p> |
| 15:14 | CK0BK | <p>CLKOUT Block Pin Select. Selects the function of the multiplexed pins in the CLKOUT Block.</p> <p>00 = GPIO Mode. Pin functions as GPIO (GP[84]).</p> <p>01 = CLKOUT Mode (default). Pin functions as device clock output CLKOUT0, sourced from PLLC1 OBSCLK.</p> <p>10 = PWM2 Mode. Pin functions as PWM2.</p> <p>11 = Reserved</p> | <p>CLKOUT Block: CLKOUT0/PWM2/GP[84]</p> |
| 13 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |
| 12 | PWM1BK | <p>PWM1 Block Pin Select. Selects the function of the multiplexed pins in the PWM1 Block.</p> <p>0 = GPIO Mode (default). Pin functions as GPIO (GP[4]).</p> <p>1 = PWM1 Mode. Pin functions as PWM1.</p> | <p>PWM1 Block: GP[4]/PWM1</p> |
| 11:10 | UR0FCBK | <p>UART0 Flow Control Block Pin Select. Selects the function of the multiplexed pins in the UART0 Flow Control Block.</p> <p>00 = GPIO Mode (default). Pins function as GPIO (GP[88:87]).</p> <p>01 = UART0 Flow Control Mode. Pins function as UART0 Flow Control UCTS0 and URTS0.</p> <p>10 = PWM0 + GPIO Mode. Pins function as PWM0 and GPIO (GP[87]).</p> <p>11 = Reserved</p> | <p>UART0 Flow Control Block: UCTS0/GP[87] URTS0/PWM0/GP[88]</p> |
| 9 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |
| 8 | UR0DBK | <p>UART0 Data Block Pin Select. Selects the function of the multiplexed pins in the UART0 Data Block.</p> <p>0 = GPIO Mode (default). Pins function as GPIO (GP[86:85]).</p> <p>1 = UART0 Data Mode. Pins function as UART0 data URXD0 and UTXD0.</p> | <p>UART0 Data Block: URXD0/GP[85] UTXD0/GP[86]</p> |

Table 3-19. PINMUX1 Register Description (continued)

| Bit | Field Name | Description | Pins Controlled |
|-----|------------|--|--|
| 7 | RSV | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |
| 6:4 | HOSTBK | <p>Host Block Pin Select. If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1 HOSTBK to select EMAC pins.</p> <p>HOSTBK = 000: GPIO Mode (default). Pins function as GPIO (GP[83:57]).</p> <p>HOSTBK = 001: Reserved</p> <p>HOSTBK = 010: Reserved</p> <p>HOSTBK = 011: Reserved</p> <p>HOSTBK = 100: MII + MDIO +10 GPIO Mode. Pins function as MII (TXCLK, CRS, COL, TXD[3:0], RXVD, TXEN, RXER, RXCLK, RXD[3:0]), MDIO (MDIO, MDC), and GP[66:57].</p> <p>All other HOSTBK combinations reserved.</p> | <p>Host Block: GP[57] GP[58] GP[59] GP[60] GP[61] GP[62] GP[63] GP[64] GP[65] GP[66] MCOL/GP[67] MCRS/GP[68] MTXD3/GP[69] MTXD2/GP[70] MTXD1/GP[71] MTXD0/GP[72] MTXCLK/GP[73] MRXDV/GP[74] MTXEN/GP[75] MRXER/GP[76] MRXCLK/GP[77] MRXD0/GP[78] MRXD1/GP[79] MRXD2/GP[80] MDCLK/GP[81] MRXD3/GP[82] MDIO/GP[83]</p> |
| 3:1 | RESERVED | Reserved. For proper device operation, the user should only write "0" to this bit (default). | – |
| 0 | RSV | Reserved. Writes have no effect. | – |

3.7.3 Pin Multiplexing Details

This section discusses how to program each Pin Mux Block to select the desired peripheral functions.

The following steps can be used to determine pin muxing suitable for the application:

1. Understand the major configuration choices available for the specific application.
 - a. Device Major Configuration Choices: [Figure 3-10](#) shown in [Section 3.7, Multiplexed Pin Configurations](#), provides a high-level view of the device pin muxing and can be used to determine the possible mix of peripheral options for a specific application.
 - b. EMIFA/VPSS Block Major Configuration Choices: The EMIFA/VPSS block features extensive pin multiplexing to accommodate a variety of applications. In addition to [Figure 3-10, Section 3.7.3.11, EMIFA/VPSS Block Muxing](#), provides more details on the Major Configuration choices for this block.
2. See [Section 3.7.3.1, Multiplexed Pins on DM6431](#), for a summary of all the multiplexed pins on this device and the pin mux group they belong to.
3. Refer to the individual pin mux sections ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#)) for pin muxing details for a specific pin mux block.
 - a. For peripherals that span multiple pin mux blocks, the user must select the appropriate pins for that peripheral in all relevant pin mux blocks. For more details, see [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

For details on PINMUX0 and PINMUX1 registers, see [Section 3.7.2](#).

3.7.3.1 Multiplexed Pins on DM6431

[Table 3-20](#) summarizes all of the multiplexed pins on DM6431, the pin mux group for each pin, and the PINMUX register fields that control the pin. For pin mux details, see the specific pin mux group section ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#)). For a description of the PINMUX register fields, see [Section 3.7.2](#).

| AMUTEIN0/GP[109] | F2 | G3 | Serial Port Sub-Block 1 | SPBK1 |
| AMUTE0/GP[110] | G3 | H3 | Serial Port Sub-Block 1 | SPBK1 |
| HECC_RX/TINP1L/GP[56] | L4 | P3 | Timer 1 Block | TIM1BK |
| HECC_TX/TOUT1L/GP[55] | K4 | N3 | Timer 1 Block | TIM1BK |
| TINPOL/GP[98] | K2 | L2 | Timer 0 Block | TIM0BK |
| CLKS0/TOUT0L/GP[97] | J4 | L3 | Timer 0 Block | TIM0BK |
| URXD0/GP[85] | L2 | M2 | UART0 Data Block | UR0DBK |
| UTXD0/GP[86] | K3 | N1 | UART0 Data Block | UR0DBK |
| UCTS0/GP[87] | L1 | P1 | UART0 Flow Control Block | UR0FCBK |
| URTS0/PWM0/GP[88] | L3 | M3 | UART0 Flow Control Block | UR0FCBK |
| CLKOUT0/PWM2/GP[84] | M1 | R1 | CLKOUT Block | CKOBK |

Note: PINMUX group EMIFA/VPSS Sub-Block 2 is not shown in the above table because there is no actual pin multiplexing in that block. But this block is still considered a "pin mux block" because it contains some of the pins necessary for EMIFA. The pins in this block are as follows:

- **EMIFA/VPSS Sub-Block 2**
 - EM_WAIT/(RDY/BSY)
 - EM_OE
 - EM_WE

3.7.3.2 Peripherals Spanning Multiple Pin Mux Blocks

Some peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all of the relevant Pin Mux Blocks. The following is the list of peripherals that span multiple Pin Mux Blocks:

- **McBSP0:** Six McBSP0 pins are located in the Serial Port Sub-Block 0, but the CLKS0 pin is muxed in the Timer0 Block. To select McBSP0 pins, program PINMUX registers as follows:
 - **Serial Port Sub-Block 0:** SPBK0 = 01
 - **Timer0 Block:** If CLKS0 pin is desired, program TIM0BK = 10 or 11.
- **UART0:** The two UART0 data pins are located in the UART0 Data Block, but the two UART0 flow control pins are located in the UART0 Flow Control Block. To select UART0, program PINMUX registers as follows:
 - **UART0 Data Block:** UR0BK = 1
 - **UART0 Flow Control Block:** If flow control pins are desired, program UR0FCBK = 01.

3.7.3.3 Host Block Muxing

This block of 27 pins consists of EMAC, MDIO, and GPIO muxed pins. The following register field selects the pin functions in the Host Block:

- PINMUX1.HOSTBK

Table 3-21 summarizes the 27 pins in the Host Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-21. Host Block Muxed Pins Selection

| SIGNAL NAME | MULTIPLEXED FUNCTIONS | | | |
|---------------|-----------------------|--------------|----------|--------------|
| | EMAC/MDIO | | GPIO | |
| | FUNCTION | SELECT | FUNCTION | SELECT |
| GP[57] | – | – | GP[57] | _(1) |
| GP[58] | – | – | GP[58] | |
| GP[59] | – | – | GP[59] | |
| GP[60] | – | – | GP[60] | |
| GP[61] | – | – | GP[61] | |
| GP[62] | – | – | GP[62] | |
| GP[63] | – | – | GP[63] | |
| GP[64] | – | – | GP[64] | |
| GP[65] | – | – | GP[65] | |
| GP[66] | – | – | GP[66] | |
| MCOL/GP[67] | MCOL | HOSTBK = 100 | GP[67] | HOSTBK = 000 |
| MCRS/GP[68] | MCRS | | GP[68] | |
| MTXD3/GP[69] | MTXD3 | | GP[69] | |
| MTXD2/GP[70] | MTXD2 | | GP[70] | |
| MTXD1/GP[71] | MTXD1 | | GP[71] | |
| MTXD0/GP[72] | MTXD0 | | GP[72] | |
| MTXCLK/GP[73] | MTXCLK | | GP[73] | |
| MRXDV/GP[74] | MRXDV | | GP[74] | |
| MTXEN/GP[75] | MTXEN | | GP[75] | |
| MRXER/GP[76] | MRXER | | GP[76] | |
| MRXCLK/GP[77] | MRXCLK | | GP[77] | |
| MRXD0/GP[78] | MRXD0 | | GP[78] | |
| MRXD1/GP[79] | MRXD1 | | GP[79] | |
| MRXD2/GP[80] | MRXD2 | | GP[80] | |
| MDCLK/GP[81] | MDCLK | | GP[81] | |
| MRXD3/GP[82] | MRXD3 | | GP[82] | |
| MDIO/GP[83] | MDIO | | GP[83] | |

(1) GP[66:57] are standalone pins. They are not muxed with any other functions, but they are included in this table because they are grouped in the Host Block.

Table 3-22 provides a different view of the Host Block pin muxing, showing the Host Block function based on PINMUX1 settings. The selection options are also shown pictorially in Figure 3-10.

If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.

Table 3-22. Host Block Function Selection

| PINMUX1 SETTING | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|------------------------|-------------------------------|---|
| HOSTBK | | |
| 000 | GPIO (27) (default) | GPIO: GP[83:57] |
| 001 | Reserved | Reserved |
| 010 | Reserved | Reserved |
| 011 | Reserved | Reserved |
| 100 | EMAC (MII) + MDIO + GPIO (10) | EMAC (MII): TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] MDIO: MDC, MDIO GPIO: GP[66:57] If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins. |
| 101 to 111 | Reserved | Reserved |

The VDD3P3V_PWDN.HOST field determines the power state of the Host Block pins. The Host Block pins default to powered up. For more details on the VDD3P3V_PWDN.HOST field, see Section 3.2, *Power Considerations*.

3.7.3.4 UART0 Data Block Muxing

This block of 2 pins consists of UART0 Data and GPIO muxed pins. The PINMUX1.UR0DBK register field select the pin functions in the UART0 Data Block.

[Table 3-23](#) summarizes the 2 pins in the UART0 Data Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-23. UART0 Data Block Muxed Pins Selection

| SIGNAL | MULTIPLEXED FUNCTIONS | | | |
|--------------|-----------------------|------------|----------|------------|
| | UART0 | | GPIO | |
| NAME | FUNCTION | SELECT | FUNCTION | SELECT |
| URXD0/GP[85] | URXD0 | UR0DBK = 1 | GP[85] | UR0DBK = 0 |
| UTXD0/GP[86] | UTXD0 | | GP[86] | |

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

[Table 3-24](#) provides a different view of the UART0 Data Block pin muxing, showing the UART0 Data Block function based on PINMUX1.UR0DBK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-24. UART0 Data Block Function Selection

| PINMUX1.UR0DBK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|----------------|--------------------|-------------------------|
| 0 | GPIO (2) (default) | GPIO: GP[86:85] |
| 1 | UART0 Data | UART0: URXD0, UTXD0 |

In addition, the VDD3P3V_PWDN.UR0DAT field determines the power state of the UART0 Data Block pins. The UART0 Data Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0DAT = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0DAT field, see [Section 3.2, Power Considerations](#).

The UART0 Data Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.5 UART0 Flow Control Block

This block of 2 pins consists of UART0 Flow Control, PWM0, and GPIO muxed pins. The PINMUX1.UR0FCBK register field selects the pin functions in the UART0 Flow Control Block.

[Table 3-25](#) summarizes the 2 pins in the UART0 Flow Control Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-25. UART0 Flow Control Block Muxed Pins Selection

| SIGNAL | MULTIPLEXED FUNCTIONS | | | | | |
|---------------------------|-----------------------|--------------|----------|--------------|----------|-----------------|
| | UART0 | | PWM0 | | GPIO | |
| NAME | FUNCTION | SELECT | FUNCTION | SELECT | FUNCTION | SELECT |
| UCTS0/ GP[87] | UCTS0 | UR0FCBK = 01 | – | – | GP[87] | UR0FCBK = 00/10 |
| URTS0/ PWM0/ GP[88] | URTS0 | | PWM0 | UR0FCBK = 10 | GP[88] | UR0FCBK = 00 |

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

[Table 3-26](#) provides a different view of the UART0 Flow Control Block pin muxing, showing the UART0 Flow Control Block function based on PINMUX1.UR0FCBK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-26. UART0 Flow Control Block Function Selection

| PINMUX1.UR0FCBK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|-----------------|--------------------|----------------------------|
| 00 | GPIO (2) (default) | GPIO: GP[88:87] |
| 01 | UART0 Flow Control | UART0: UCTS0, URTS0 |
| 10 | PWM0 + GPIO (1) | PWM0: PWM0 GPIO: GP[87] |
| 11 | Reserved | Reserved |

In addition, the VDD3P3V_PWDN.UR0FC field determines the power state of the UART0 Flow Control Block pins. The UART0 Flow Control Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0FC = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0FC field, see [Section 3.2, Power Considerations](#).

The UART0 Flow Control Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.6 Timer0 Block

This block of 2 pins consists of Timer0, McBSP0, and GPIO muxed pins. The PINMUX1.TIM0BK register field selects the pin functions in the Timer0 Block.

[Table 3-27](#) summarizes the 2 pins in the Timer0 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-27. Timer0 Block Muxed Pins Selection

| SIGNAL | MULTIPLEXED FUNCTIONS | | | | | |
|-----------------------------|-----------------------|-------------|----------|----------------|----------|-------------|
| | McBSP | | Timer0 | | GPIO | |
| NAME | FUNCTION | SELECT | FUNCTION | SELECT | FUNCTION | SELECT |
| TINPOL/ GP[98] | – | – | TINPOL | TIM0BK = 01/11 | GP[98] | TIM0BK = 00 |
| CLKS0/ TOUT0L/ GP[97] | CLKS0 | TIM0BK = 11 | TOUT0L | TIM0BK = 01 | GP[97] | |

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

[Table 3-28](#) provides a different view of the Timer0 Block pin muxing, showing the Timer0 Block function based on PINMUX1.TIM0BK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-28. Timer0 Block Function Selection

| PINMUX1.TIM0BK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|----------------|---|---------------------------------|
| 00 | GPIO (2) (default) | GPIO: GP[98:97] |
| 01 | Timer0 | Timer0: TINP0L, TOUT0L |
| 10 | Reserved | – |
| 11 | McBSP0 External Clock Source, Timer0 Input | McBSP0: CLKS0 Timer0: TINP0L |

In addition, the VDD3P3V_PWDN.TIMER0 field determines the power state of the Timer0 Block pins. The Timer0 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER0 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER0 field, see [Section 3.2, Power Considerations](#).

3.7.3.7 Timer1 Block

This block of 2 pins consists of Timer1, HECC, and GPIO muxed pins. The PINMUX1.TIM1BK register field selects the pin functions in the Timer1 Block.

[Table 3-29](#) summarizes the 2 pins in the Timer1 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-29. Timer1 Block Muxed Pins Selection

| SIGNAL NAME | MULTIPLEXED FUNCTIONS | | | | | |
|-------------------------------|-----------------------|-------------|----------|-------------|----------|-------------|
| | HECC | | TIMER1 | | GPIO | |
| | FUNCTION | SELECT | FUNCTION | SELECT | FUNCTION | SELECT |
| HECC_RX/ TINP1L/ GP[56] | HECC_RX | TIM1BK = 11 | TINP1L | TIM1BK = 01 | GP[56] | TIM1BK = 00 |
| HECC_TX/ TOUT1L/ GP[55] | HECC_TX | | TOUT1L | | GP[55] | |

[Table 3-30](#) provides a different view of the Timer1 Block pin muxing, showing the Timer1 Block function based on PINMUX1.TIM1BK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-30. Timer1 Block Function Selection

| PINMUX1.TIM1BK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|----------------|--------------------|-------------------------|
| 00 | GPIO (2) (default) | GPIO: GP[56:55] |
| 01 | Timer1 | Timer1: TINP1L, TOUT1L |
| 10 | Reserved | – |
| 11 | HECC | HECC: HECC_RX, HECC_TX |

In addition, the VDD3P3V_PWDN.TIMER1 field determines the power state of the Timer1 Block pins. The Timer1 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER1 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER1 field, see [Section 3.2, Power Considerations](#).

The Timer1 Block features internal pull up resistors, which matches the HECC inactive polarity.

3.7.3.8 Serial Port Block

This block of 12 pins consists of McASP0, McBSP0, and GPIO muxed pins. The following register fields select the pin functions in the Serial Port Block:

- PINMUX1.SPBK0
- PINMUX1.SPBK1

The Serial Port Block is further subdivided into these sub-blocks:

- Serial Port Sub-Block 0: McBSP0, part of McASP0, and GPIO.
- Serial Port Sub-Block 1: part of McASP0 and GPIO.

Table 3-31 summarizes the 12 pins in the Serial Port Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-31. Serial Port Block Muxed Pins Selection

| SIGNAL NAME | MULTIPLEXED FUNCTIONS | | | | | |
|--------------------------------|-----------------------|------------|----------|------------|----------|------------|
| | McASP0 | | McBSP0 | | GPIO | |
| | FUNCTION | SELECT | FUNCTION | SELECT | FUNCTION | SELECT |
| Serial Port Sub-block 0 | | | | | | |
| ACLKR0/CLKX0/GP[99] | ACLKR0 | SPBK0 = 10 | CLKX0 | SPBK0 = 01 | GP[99] | SPBK0 = 00 |
| AFSR0/DR0/GP[100] | AFSR0 | | DR0 | | GP[100] | |
| AHCLKR0/CLKR0/GP[101] | AHCLKR0 | | CLKR0 | | GP[101] | |
| AXR0[3]/FSR0/GP[102] | AXR0[3] | | FSR0 | | GP[102] | |
| AXR0[2]/FSX0/GP[103] | AXR0[2] | | FSX0 | | GP[103] | |
| AXR0[1]/DX0/GP[104] | AXR0[1] | | DX0 | | GP[104] | |
| Serial Port Sub-block 1 | | | | | | |
| AXR0[0]/GP[105] | AXR0[0] | SPBK1 = 10 | – | – | GP[105] | SPBK1 = 00 |
| ACLKX0/GP[106] | ACLKX0 | | – | – | GP[106] | |
| AFSX0/GP[107] | AFSX0 | | – | – | GP[107] | |
| AHCLKX0/GP[108] | AHCLKX0 | | – | – | GP[108] | |
| AMUTEIN0/GP[109] | AMUTEIN0 | | – | – | GP[109] | |
| AMUTE0/GP[110] | AMUTE0 | | – | – | GP[110] | |

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

Table 3-32 and Table 3-33 provide a different view of the Serial Port Block. Table 3-32 shows the Serial Port Sub-Block 0 function based on PINMUX1.SPBK0 setting. Table 3-33 shows the Serial Port Sub-Block 1 function based on PINMUX1.SPBK1 setting. These selection options are also shown pictorially in Figure 3-10.

Table 3-32. Serial Port Sub-Block 0 Function Selection

| PINMUX1.SPBK0 | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|---------------|-------------------------------|---|
| 00 | GPIO (6) (default) | GPIO: GP[104:99] |
| 01 | McBSP0 | McBSP0: CLKX0, FSX0, DX0, CLKR0, FSR0, DR0 |
| 10 | McASP0 Receive, 3 Serializers | McASP0: ACLKR0, AFSR0, AHCLKR0, AXR0[3], AXR0[2], AXR0[1] |
| 11 | Reserved | Reserved |

Table 3-33. Serial Port Sub-Block 1 Function Selection

| PINMUX1.SPBK1 | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|---------------|--|--|
| 00 | GPIO (6) (default) | GPIO: GP[110:105] |
| 01 | Reserved | – |
| 10 | McASP0 Transmit with 1 Serializer and Mute Control | McASP0: AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0 ⁽¹⁾ , AMUTE0 |
| 11 | Reserved | – |

(1) The input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and GPIO.

In addition, the VDD3P3V_PWDN.SP field determines the power state of the Serial Port Block pins. The Serial Port Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.SP = 0 to power up the pins. For more details on the VDD3P3V_PWDN.SP field, see [Section 3.2, Power Considerations](#).

To facilitate McASP0 operation, the input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and the GPIO module. Therefore when an external mute event occurs, in addition to notifying the McASP0, it can also cause an interrupt through the GPIO module.

3.7.3.9 PWM1 Block

This block of 1 pin consists of PWM1 and GPIO muxed pins (GP[4]/PWM1). The PINMUX1.PWM1BK register field selects the pin function in the PWM1 Block.

[Table 3-34](#) summarizes the 1 pin in the PWM1 Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-34. PWM1 Block Muxed Pin Selection

| SIGNAL | MULTIPLEXED FUNCTIONS | | | |
|------------|-----------------------|------------|----------|------------|
| | PWM1 | | GPIO | |
| NAME | FUNCTION | SELECT | FUNCTION | SELECT |
| GP[4]/PWM1 | PWM1 | PWM1BK = 1 | GP[4] | PWM1BK = 0 |

[Table 3-35](#) provides a different view of the PWM1 Block pin muxing, showing the PWM1 Block function based on PINMUX1.PWM1BK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-35. PWM1 Block Function Selection

| PINMUX1.PWM1BK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|----------------|--------------------|-------------------------|
| 0 | GPIO (1) (default) | GPIO: GP[4] |
| 1 | PWM1 | PWM1: PWM1 |

In addition, the VDD3P3V_PWDN.PWM1 field determines the power state of the PWM1 Block pin. The PWM1 Block pin defaults to powered down and not operational. To use this pin, user must first program VDD3P3V_PWDN.PWM1 = 0 to power up the pin. For more details on the VDD3P3V_PWDN.PWM1 field, see [Section 3.2, Power Considerations](#).

3.7.3.10 CLKOUT Block

This block of 1 pin consists of CLKOUT, PWM2, and GPIO muxed pin (CLKOUT0/PWM2/GP[84]). The PINMUX1.CKOBK register field selects the pin function in the CLKOUT Block.

Table 3-36 summarizes the 1 pin in the CLKOUT Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-36. CLKOUT Block Multiplexed Pin Selection

| SIGNAL | MULTIPLEXED FUNCTIONS | | | | | |
|-----------------------------|-----------------------|------------|----------|------------|----------|------------|
| | CLKOUT0 | | PWM2 | | GPIO | |
| NAME | FUNCTION | SELECT | FUNCTION | SELECT | FUNCTION | SELECT |
| CLKOUT0/ PWM2/ GP[84] | CLKOUT0 | CKOBK = 01 | PWM2 | CKOBK = 10 | GP[84] | CKOBK = 00 |

Table 3-37 provides a different view of the CLKOUT Block pin muxing, showing the CLKOUT Block function based on PINMUX1.CKOBK setting. The selection options are also shown pictorially in Figure 3-10.

Table 3-37. CLKOUT Block Function Selection

| PINMUX1.CKOBK | BLOCK FUNCTION | RESULTING PIN FUNCTIONS |
|---------------|------------------|---------------------------|
| 00 | GPIO (1) | GPIO: GP[84] |
| 01 | CLKOUT (default) | Device Clock-Out: CLKOUT0 |
| 10 | PWM2 | PWM2: PWM2 |
| 11 | Reserved | Reserved |

This block defaults to CLKOUT0 pin function.

In addition, the VDD3P3V_PWDN.CLKOUT field determines the power state of the CLKOUT Block pin. The CLKOUT Block pin defaults to powered up. For more details on the VDD3P3V_PWDN.CLKOUT field, see Section 3.2, *Power Considerations*.

3.7.3.11 EMIFA/VPSS Block Muxing

This block of 61 pins consists of VPSS, EMIFA, and GPIO muxed pins. The following register fields affect the pin functions in the EMIFA/VPSS Block:

- All PINMUX0 register fields: AEM, CS5SEL, CS4SEL, CS3SEL, AEAW, CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, and C110SEL

The EMIFA/VPSS Block is divided into multiple sub-blocks for ultimate flexibility in pin multiplexing to accommodate a wide variety of applications:

- Sub-Block 0: multiplexed between VPFE, EMIFA address/control pins, and GPIO.
- Sub-Block 1: multiplexed between EMIFA data/address/control pins, and GPIO.
- Sub-Block 2: no multiplexing. EMIFA control pins EM_WAIT/(RDY/BSY), EM_OE, EM_WE.
- Sub-Block 3: multiplexed between EMIFA address pins EM_A[12:6] and GPIO.

The EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register determine the power state of the EMIFA/VPSS Block pins. The EMIFA/VPSS Block pins default to powered up. For more details on the EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register, see Section 3.2, *Power Considerations*.

To understand pin multiplexing in the EMIFA/VPSS Block, the user should start with Section 3.7.3.11.1, *EMIFA/VPSS Block Pin Selection Procedure*, which outlines the procedures to select pin functions of this block. Section 3.7.3.11.7, *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*, provides a pin-by-pin multiplexing summary for the EMIFA/VPSS Block. For more information on the PINMUX0 and PINMUX1 registers, see Section 3.7.2, *Pin Muxing Selection After Device Reset*.

3.7.3.11.1 EMIFA/VPSS Block Pin Selection Procedure

Follow the steps below to perform pin selection for the EMIFA/VPSS Block and its sub-blocks.

1. **Major Configuration Options:** start with [Table 3-38](#), *EMIFA/VPSS Block Major Configuration Choices*. Based on the peripheral needs, the user should select from the major configuration options in this block: Major Config Options A, B, and E.
2. **Sub-Block 2 and Sub-Block 3 Selection:** After selecting the major configuration option from [Table 3-38](#), *EMIFA/VPSS Block Major Configuration Choices*, the pin selection for Sub-Block 2 and Sub-Block 3 is complete.
3. **Sub-Block 0 Selection:** Use [Table 3-39](#) through [Table 3-41](#), *EMIFA/VPSS Sub-Block 0 Configuration Choices*, to refine Sub-Block 0 pin selections.
 - a. Go to the table with the Major Configuration Option chosen in Step 1.
 - b. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
 - c. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, and C110SEL.
 - d. The *Selection Fields* columns show the settings needed to program the PINMUX0 register.
4. **Sub-Block 1 Selection:** Use [Table 3-42](#) through [Table 3-44](#), *EMIFA/VPSS Sub-Block 1 Configuration Choices*, to refine Sub-Block 1 pin selection.
 - a. Go to the table with the Major Configuration Option chosen in Step 1.
 - b. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
 - c. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CS3SEL, CS4SEL, and CS5SEL.
 - d. The *Selection Fields* columns show the settings needed to program the PINMUX0 register.

After following the procedure in this section to determine pin functions for the EMIFA/VPSS Block, the user should refer to [Section 3.7.3.11.7](#), *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*, for pin-multiplexing information on a pin-by-pin basis.

3.7.3.11.2 EMIFA/VPSS Block Major Configuration Choices

[Table 3-38](#) shows the major configuration choices in the EMIFA/VPSS Block. For instructions on how to use the *EMIFA/VPSS Block Major Configuration Choices* table for the EMIFA/VPSS Block and Sub-Blocks, see [Section 3.7.3.11.1](#).

Table 3-38. EMIFA/VPSS Block Major Configuration Choices

| MAJOR CONFIG. OPTION | PINMUX SELECTION FIELDS ⁽¹⁾ | | RESULTING PERIPHERALS/PINS | | | |
|----------------------|--|---------|---|---------------------------|-------------------------------------|--|
| | AEM | CCDCSEL | EMIFA | # GP PINS (FROM GP[33:5]) | VPFE AND # GP PINS (FROM GP[54:34]) | |
| | | | | # GP Pins | CCDCSEL | VPFE & # GP Pins |
| A | 000 | 0, 1 | - | 29 GP pins | 0 | No CCDC 21 GP pins |
| | | | | | 1 | 8-to-10-bit CCDC 6-to-12 GP pins |
| B | 001 ⁽²⁾ | 0, 1 | 8-bit EMIFA (ASYNC) Pinout Mode 1 <i>with address pins to support 32KB to 16MB per CS.</i> | 9-to-13 GP pins | 0 | No CCDC 11-to-19 GP pins |
| | | | | | 1 ⁽²⁾ | 8-to-10-bit CCDC ⁽²⁾ 0-to-10 GP pins |
| E | 101 | 0, 1 | 8-bit EMIFA (NAND) Pinout Mode 5 | 14-to-18 GP pins | 0 | No CCDC 21 GP pins |
| | | | | | 1 | 8-to-10-bit CCDC 6-to-12 GP pins |

(1) For additional pin mux details for each Sub-Block, see [Table 3-39](#) through [Table 3-41](#), *EMIFA/VPSS Sub-Block 0 Configuration Choices*, and [Table 3-42](#) through [Table 3-44](#), *EMIFA/VPSS Sub-Block 1 Configuration Choices*.

(2) If PINMUX0.AEM = 001, it is not possible to get the C_WE pin for VPFE.

As shown in [Table 3-38](#), the major configuration choices of the EMIFA/VPSS Block are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM and CCDCSEL

Based on the peripheral needs, select from the major configuration options in this block: Major Configuration Options A, B, and E.

The following is an example on how to read [Table 3-38](#). For example, the "PINMUX Selection Fields" columns indicate that Major Configuration Choice B is selected through setting PINMUX0.AEM = 1 and CCDCSEL = 0 or 1 (based on the system's VPFE requirement). The "Resulting Peripherals/Pins" columns indicate that Major Configuration Option B can support the following combination of pin functions:

- Pins for 8-bit EMIFA (Async or NAND) function. The number of address pins supported provide 32KByte to 16MByte address reach per EMIFA Chip Select (CS) space.
- Pins for up to 10-bit VPFE. If 8-to-10-bit VPFE (CCDCSEL = 1) is selected, the user may have 0 to 10 GPIO pins. Exact detail on number of GPIO pins and VPFE control pins is furthered determined by other PINMUX0 settings discussed in the *EMIFA/VPSS Sub-Block 0 Configuration Choices*.
- 9-to-13 GPIO pins from GP[33:5]. For details on the number of GPIO pins, see [Section 3.7.3.11.4](#), *EMIFA/VPSS Sub-Block 1 Configuration Choices*.

After using [Table 3-38](#) to select the Major Configuration Option for the EMIFA/VPSS Block, proceed to select the detailed pin choices in the EMIFA/VPSS Sub-Blocks.

3.7.3.11.3 EMIFA/VPSS Sub-Block 0 Configuration Choices

Table 3-39 through Table 3-41 show the configuration choices in the EMIFA/VPSS Sub-Block 0. For instructions on how to use the different configuration choices tables for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.11.1. **Note:** Italics in these tables indicate mandatory settings for a given Minor Configuration option.

Before using Table 3-39 through Table 3-41 to configure the details of the EMIFA/VPSS Sub-Block 0, the user should first select a Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.11.2). After determining the Major Configuration Option (A, B, or E), the user can now use Table 3-39 through Table 3-41 to refine Sub-Block 0 pin selections:

1. Go to the table with the Major Configuration Option chosen from Table 3-38.
2. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
3. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CCDSEL, HVDSEL, CWENSEL, CFLDSEL, and CI10SEL.
4. The *PINMUX Selection Fields* columns show the settings needed to program the PINMUX0 register.

Table 3-39. EMIFA/VPSS Sub-Block 0 Configuration Choice A⁽¹⁾

| MAJOR CONFIG OPTION | MINOR CONFIG OPTION | PINMUX SELECTION FIELDS | | | RESULTING PERIPHERALS/PINS | | |
|---------------------|---------------------|-------------------------|------|--------------------|----------------------------|-------------------------|------------------------|
| | | AEM | AEAW | OTHERS | EMIFA | VPFE | # GPIO PINS |
| A | A1 | 000 | 000 | Cfg Summary | No EMIFA | No CCDC | 21 GP pins |
| | | | | Basic Pins You Get | | | GP[51:46] |
| | | | | CCDCSEL = 0 | | | 0 = GP[54, 43:36] |
| | | | | HVDSEL = 0 | | | 0 = GP[53:52] |
| | | | | CWENSEL = 0 | | | 0 = GP[35] |

| | | | | | | | | |

(1) Italics indicate mandatory settings for a given Minor Configuration option.

As shown in [Table 3-39](#) through [Table 3-41](#), the configuration choices of the EMIFA/VPSS Sub-Block 0 are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM, AEAW, CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, and CI10SEL.

The following is an example of how to read [Table 3-39](#) through [Table 3-41](#) using Sub-Block 0 Minor Configuration B6 as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 0 Minor Configuration Option B6 is selected through setting, PINMUX0.AEM = 1, PINMUX0.AEAW = 4, CCDCSEL = 1, HVDSEL = 0 or 1 (based on the system's need for VPFE control signals VD and HD), CWENSEL = 0 (mandatory setting), CFLDSEL = 0 or 1 (based on the system's need for VPFE control signal C_FIELD), and CI10SEL = 0 (mandatory).
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. For example, PINMUX0.CCDCSEL = 1 gives the user the PCLK and YI[7:0] pins for the VPFE. PINMUX0.HVDSEL = 1 gives the user VD and HD pins for VPFE, while HVDSEL = 0 gives the user 2 GP pins.

3.7.3.11.4 EMIFA/VPSS Sub-Block 1 Configuration Choices

Table 3-42 through Table 3-44 show the configuration choices in the EMIFA/VPSS Sub-Block 1. For instructions on how to use the different configuration choices tables for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.11.1, *EMIFA/VPSS Block Pin Selection Procedure*.

Before using Table 3-42 through Table 3-44 to configure the details of the EMIFA/VPSS Sub-Block 1, the user should first select the Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.11.2, *EMIFA/VPSS Block Major Configuration Choices*). After determining the Major Configuration Option (A, B, or E), the user can now use Table 3-42 through Table 3-44 to refine the Sub-Block 1 pin selections.

1. Go to the table with the Major Configuration Option chosen from Table 3-38.
2. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
3. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CS3SEL, CS4SEL, and CS5SEL.
4. The *PINMUX Selection Fields* columns give the user the settings needed to program the PINMUX0 register.

Table 3-42. EMIFA/VPSS Sub-Block 1 Configuration Choice A⁽¹⁾

| MAJOR CONFIG OPTION | MINOR CONFIG OPTION | PINMUX SELECTION FIELDS | | RESULTING PERIPHERALS/PINS | |
|---------------------|---------------------|-------------------------|--------------------|----------------------------|-------------------|
| | | AEM | OTHERS | EMIFA | GPIO |
| A | A1 | 000 | Cfg Summary | No EMIFA | 29 GP pins |
| | | | <i>CS3SEL = 0</i> | - | 0 = GP[33:5] |
| | | | <i>CS4SEL = 0</i> | | |
| | | | <i>CS5SEL = 0</i> | | |

(1) Italics indicate mandatory settings for a given Minor Configuration option.

Table 3-43. EMIFA/VPSS Sub-Block 1 Configuration Choice B⁽¹⁾

| MAJOR CONFIG OPTION | MINOR CONFIG OPTION | PINMUX SELECTION FIELDS | | RESULTING PERIPHERALS/PINS | |
|---------------------|---------------------|-------------------------|--------------------|---|-------------------------|
| | | AEM | OTHERS | EMIFA | GPIO |
| B | B1 | 001 | Cfg Summary | 8-bit EMIFA (Async) Pinout Mode 1 | 10-to-13 GP pins |
| | | | Basic Pins You Get | <i>EM_D[7:0], EM_CS2, EM_A[4:0], EM_BA[1:0]</i> | 0 = GP[31:22] |
| | | | CS3SEL = 0,1 | 1 = $\overline{\text{EM_CS3}}$ | 0 = GP[13] |
| | | | CS4SEL = 0,1 | 1 = $\overline{\text{EM_CS4}}$ | 0 = GP[32] |
| | | | CS5SEL = 0,1 | 1 = $\overline{\text{EM_CS5}}$ | 0 = GP[33] |

(1) Italics indicate mandatory setting for a given Minor Configuration option.

Table 3-44. EMIFA/VPSS Sub-Block 1 Configuration Choice E⁽¹⁾

| MAJOR CONFIG OPTION | MINOR CONFIG OPTION | PINMUX SELECTION FIELDS | | RESULTING PERIPHERALS/PINS | |
|---------------------|---------------------|-------------------------|--------------------|---|---------------------------|
| | | AEM | OTHERS | EMIFA | GPIO |
| E | E1 | 101 | Cfg Summary | 8-bit EMIFA (NAND) Pinout Mode 5 | 15-to-18 GP pins |
| | | | Basic Pins You Get | <i>EM_D[7:0], EM_A[2:1], $\overline{\text{EM_CS2}}$</i> | 0 = GP[31:22, 11:10, 7:5] |
| | | | CS3SEL = 0,1 | 1 = $\overline{\text{EM_CS3}}$ | 0 = GP[13] |
| | | | CS4SEL = 0,1 | 1 = $\overline{\text{EM_CS4}}$ | 0 = GP[32] |
| | | | CS5SEL = 0,1 | 1 = $\overline{\text{EM_CS5}}$ | 0 = GP[33] |

(1) Italics indicate mandatory setting for a given Minor Configuration option.

The Sub-Block 1 Minor Configuration Options are independent from the Sub-Block 0 Minor Configuration Options. The user can independently select the appropriate Minor Configuration Option for each Sub-Block.

As shown in [Table 3-42](#) through [Table 3-44](#), the configuration choices of the EMIFA/VPSS Sub-Block 1 are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM, CS3SEL, CS4SEL, and CS5SEL.

The following is an example on how to read [Table 3-42](#) through [Table 3-44](#) using Sub-Block 1 Minor Configuration E1 as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 1 Minor Configuration Option E1 is selected through setting PINMUX0 fields to AEM = 5, CS3SEL = 0/1 (based on the desired pin choice), CS4SEL = 0/1 (based on the desired pin choice), and CS5SEL = 0/1 (based on the desired pin choice).
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. For example, you automatically get EMIFA pins EM_D[7:0], EM_A[2:1], and EM_CS2 in addition to at least 15 GPIO pins in Minor Config Option E1 (GP[31:22], GP[11:10], and GP[7:5]). If you program CS3SEL = 1, CS4SEL = 0, and CS5SEL = 0, you also get EM_CS3, GP[32], and GP[33].

3.7.3.11.5 EMIFA/VPSS Sub-Block 2 Configuration Choices

The 3 pins in the EMIFA/VPSS Sub-Block 2 are standalone (non-multiplexed) pins. They always function as EMIFA control pins EM_WAIT/(RDY/BSY), EM_OE, and EM_WE. No pin mux selection is necessary for this Sub-Block.

3.7.3.11.6 EMIFA/VPSS Sub-Block 3 Configuration Choices

The 8 pins in the EMIFA/VPSS Sub-Block 3 are multiplexed between:

- EMIFA Address Pins EM_A[12:5]
- GPIO pins GP[96:89]

The pin functions in the EMIFA/VPSS Sub-Block 3 are determined by the following PINMUX register fields:

- PINMUX0.AEM

Once the Major Configuration Option for the EMIFA/VPSS Block (see [Section 3.7.3.11.2, EMIFA/VPSS Block Major Configuration Choices](#)) is chosen, no further actions are necessary to refine the EMIFA/VPSS Sub-Block 3 pin selection. For instructions on configuring the EMIFA/VPSS Block, see [Section 3.7.3.11.1, EMIFA/VPSS Block Pin Selection Procedure](#).

[Table 3-45](#) summarizes the pin selections in the EMIFA/VPSS Sub-Block 3 based on the PINMUX selections.

Table 3-45. EMIFA/VPSS Sub-Block 3 Configuration Choices

| MAJOR CONFIG OPTION | PINMUX SELECTION FIELD | RESULTING PERIPHERALS/PINS | |
|---------------------|------------------------|----------------------------|-----------|
| | AEM | EMIFA | GPIO |
| A | 000 | - | GP[96:89] |
| B | 001 | EM_A[12:5] | - |
| E | 101 | - | GP[96:89] |

The following is an example on how to read [Table 3-45](#) using Sub-Block 3 Major Configuration B as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 3 Major Configuration Option B is selected through setting PINMUX0.AEM = 001b.
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. In Major Configuration B, the user gets EMIFA address pins EM_A[12:5] from Sub-Block 3.

3.7.3.11.7 EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary

This section summarizes the EMIFA/VPSS Block muxing on a pin-by-pin basis. It provides an alternative view to pin muxing in the EMIFA/VPSS Block. This section should only be used after following the procedures listed in [Section 3.7.3.11.1](#) to determine the actual EMIFA/VPSS Configuration Option for the application need.

[Table 3-46](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 0. These are the fields in the PINMUX0 and PINMUX1 registers that control the multiplexing in this sub-block:

- PINMUX0: AEM, AEAW, CWENSEL, CFLDSEL, CI10SEL, CCDCSEL, and HVDSEL

[Table 3-47](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 1. These are the fields in the PINMUX0 register that control the multiplexing in this sub-block:

- PINMUX0: AEM, CS5SEL, CS4SEL, and CS3SEL

EMIFA/VPSS Sub-Block 2 is dedicated to EMIFA pins $\overline{\text{EM_WAIT}}/(\overline{\text{RDY}}/\overline{\text{BSY}})$, $\overline{\text{EM_OE}}$, and $\overline{\text{EM_WE}}$. There is no pin multiplexing in this block. These pins always function as EMIFA control pins.

[Table 3-48](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 3. These are the fields in the PINMUX0 register that control the multiplexing in this sub-block:

- PINMUX0: AEM

Table 3-46. EMIFA/VPSS Sub-Block 0 Pin-By-Pin Mux Control

| SIGNAL NAME | MULTIPLEXED FUNCTIONS | | | | | |

3.8 Device Initialization Sequence After Reset

Software should follow this initialization sequence after coming out of device reset.

1. Complete the boot sequence as needed. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
2. If the device is not already at the desired operating frequency, program the PLL Controllers (PLL1 and PLL2) to configure the device frequency. For details on how to program the PLLC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number [SPRU978](#)).
3. Program PINMUX0 and PINMUX1 registers to select device pin functions. For more details on programming the PINMUX0 and PINMUX1 registers to select device pin functions, see [Section 3.7, Multiplexed Pin Configurations](#).
Note: If EMAC operation is desired, the EMAC **must** be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.
4. Program the VDD3P3V_PWDN register to power up the necessary I/O pins. For more details on programming the VDD3P3V_PWDN register, see [Section 3.2, Power Considerations](#). On DM6431, the user should program VDD3P3V_PWDN bit 13 to 1 to power down the reserved pins RSV17, RSV18, and RSV19.
5. As needed by the application, program the following System Module registers when there are no active transactions on the respective peripherals:
 - a. TIMERCTL ([Section 3.6.2.1, Timer Control Register](#)): applicable for Timer0 and Watchdog Timer2 **only**.
 - b. EDMATCCFG ([Section 3.6.2.2, EDMA TC Configuration Register](#)): applicable for EDMA **only**. The recommendation is to leave the EDMATCCFG register at its default.
 - c. VPSS_CLKCTL ([Section 3.3.2, VPSS Clocks](#)): applicable for VPSS **only**.
6. Program the Power and Sleep Controller (PSC) to enable the desired peripherals. For details on how to program the PSC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number [SPRU978](#)).
7. Program the Switched Central Resource (SCR) bus priorities for the master peripherals ([Section 3.6.1](#)). This **must** be configured when there are no active transactions on the respective peripherals:
 - a. Program the MSTPRI0 and MSTPRI1 registers in the System Module. These registers can be programmed **before or after** the respective peripheral is enabled by the PSC in step 6.
 - b. Program the EDMACC QUEPRI register, the C64x+ MDMAARBE.PRI field, and the VPSS PCR register. These registers can only be programmed **after** the respective peripheral is enabled by the PSC in step 6.

8. Configure the C64x+ Megamodule and the peripherals.

- a. For details on C64x+ Megamodule configuration, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number [SPRU871](#)).
 - i. **Special considerations:** Bootloader disables C64x+ cache—For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).
- b. Peripherals configuration: see the respective peripheral user's guide.
 - i. **Special considerations:** DDR2 memory controller—the Peripheral Bus Burst Priority Register (PBBPR) should be programmed to ensure good DDR2 throughput and to prevent command starvation (prevention of certain commands from being processed by the DDR2 memory controller). For more details, see the *TMS320DM643x DMP DDR2 Memory Controller User's Guide* (literature number [SPRU986](#)). A hex value of 0x20 is recommended for the PBBPR PR_OLD_COUNT field to provide a good DSP performance and still allow good utilization by other modules.

3.9 Debugging Considerations

3.9.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for *external* pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot and Configuration Pins:* If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is **strongly recommended**, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins:* If the IPU/IPD *does not* match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.
- *EMIFA Chip Select Outputs:* On DM6431, the EMIFA chip select pins ($\overline{\text{EM_CS2}}$, $\overline{\text{EM_CS3}}$, $\overline{\text{EM_CS4}}$, and $\overline{\text{EM_CS5}}$) feature an internal pulldown (IPD) resistor. If these pins are connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor **must** be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.

For the boot and configuration pins (listed in [Table 2-5, Boot Terminal Functions](#)), if they are both routed out and 3-stated (not driven), it is **strongly recommended** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the , see [Section 5.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature](#).

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

4 System Interconnect

On the DM6431 device, the C64x+ Megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through a switch fabric architecture (see [Figure 4-1](#)). The switch fabric is composed of multiple switched central resources (SCRs) and multiple bridges. The SCRs establish low-latency connectivity between master peripherals and slave peripherals. Additionally, the SCRs provide priority-based arbitration and facilitate concurrent data movement between master and slave peripherals. Through an SCR, the DSP subsystem can send data to the DDR2 Memory Controller without affecting a data transfer between the EMAC and L2 memory. Bridges are mainly used to perform bus-width conversion as well as bus operating frequency conversion. For example, in [Figure 4-1](#), Bridge 6 performs a frequency conversion between a bus operating at DSP/3 clock rate and a bus operating at DSP/6 clock rate. Furthermore, Bridge 5 performs a bus-width conversion between a 64-bit bus and a 32-bit bus.

The C64x+ Megamodule, the EDMA3 transfer controllers (EDMA3TC[2:0]), and the various system peripherals can be classified into two categories: master peripherals and slave peripherals. Master peripherals are typically capable of initiating read and write transfers in the system and **do not** rely on the EDMA3 or on the CPU to perform transfers to and from them. The system master peripherals include the C64x+ Megamodule, the EDMA3 transfer controllers, EMAC, and VPSS. Not all master peripherals may connect to all slave peripherals. The supported connections are designated by "Y" in [Table 4-1](#).

Table 4-1. System Connection Matrix

| MASTER PERIPHERALS/MODULES | SLAVE PERIPHERALS/MODULES | | | |
|------------------------------|---------------------------|------------------------|---------------------|---------------------------------------|
| | C64x+ SDMA | DDR2 MEMORY CONTROLLER | SCR4 ⁽¹⁾ | SCR2, SCR6, SCR7, SCR8 ⁽¹⁾ |
| C64x+ MDMA | – | Y | – | Y |
| VPSS | – | Y | – | – |
| EMAC | Y | Y | Y | Y |
| EDMA3TC's (EDMA3TC2/TC1/TC0) | Y | Y | Y | Y |
| C64x+ CFG | – | – | Y | Y |

(1) All the peripherals/modules that support a connection to SCR2, SCR4, SCR6, SCR7, and SCR8 have access to all peripherals/modules connected to those respective SCRs.

4.1 System Interconnect Block Diagram

[Figure 4-1](#) displays the DM6431 system interconnect block diagram. The following is a list that helps in the interpretation of this diagram:

- The direction of the arrows indicates either a bus master or bus slave.
- The arrow originates at a bus master and terminates at a bus slave.
- The direction of the arrows **does not** indicate the direction of data flow. Data flow is typically bi-directional for each of the documented bus paths.
- The pattern of each arrow's line indicates the clock rate at which it is operating— i.e., either DSP/3, DSP/6, or MXI/CLKIN clock rate.
- A peripheral may have multiple instances shown in [Figure 4-1](#) for the following reason:
 - The peripheral/module has master port(s) for data transfers, as well as slave port(s) for register access, data access, and/or memory access. Examples of these peripherals are C64x+ Megamodule, EDMA3, VPSS, and EMAC.

Figure 4-1. System Interconnect Block Diagram

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Temperature Range (Unless Otherwise Noted)⁽¹⁾

| | | |
|---|---|-----------------|
| Supply voltage ranges: | Core (CV _{DD}) ⁽²⁾ | –0.5 V to 1.5 V |
| | I/O, 3.3V (DV _{DD33}) ⁽²⁾ | –0.5 V to 4.2 V |
| | I/O, 1.8V (DV _{DDR2} , DDR_VDDDLL, PLL_PWR18, MXV _{DD}) ⁽²⁾ | –0.5 to 2.5 V |
| Input voltage ranges: | V _I I/O, 3.3-V pins | –0.5 V to 4.2 V |
| | V _I I/O, 1.8 V | –0.5 V to 2.5 V |
| Output voltage ranges: | V _O I/O, 3.3-V pins | –0.5 V to 4.2 V |
| | V _O I/O, 1.8 V | –0.5 V to 2.5 V |
| Operating Junction temperature ranges, T _J : | Commercial | 0C to 90C |
| | Automotive (Q or S suffix) | –40C to 125C |
| Storage temperature range, T _{stg} | (default) | –65C to 150C |

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to V_{SS}.

5.2 Recommended Operating Conditions

| | | MIN | NOM | MAX | UNIT |
|---------------------|---|----------------------------|-----------------------|------------------------|------|
| CV _{DD} | Supply voltage, Core (CV _{DD}) ⁽¹⁾ (-3/-3Q/-3S devices) | 1.14 | 1.2 | 1.26 | V |
| DV _{DD} | Supply voltage, I/O, 3.3V (DV _{DD33}) | 2.97 | 3.3 | 3.63 | V |
| | Supply voltage, I/O, 1.8V (DV _{DDR2} , DDR_VDDDLL, PLL-PWR18, MXV _{DD}) ⁽²⁾ | 1.71 | 1.8 | 1.89 | V |
| V _{SS} | Supply ground (V _{SS} , DDR_VSSDLL, MXV _{SS}) ⁽³⁾ | 0 | 0 | 0 | V |
| DDR_VREF | DDR2 reference voltage ⁽⁴⁾ | 0.49DV _{DDR2} | 0.5DV _{DDR2} | 0.51DV _{DDR2} | V |
| DDR_ZP | DDR2 impedance control, connected via 200 Ω resistor to V _{SS} | | V _{SS} | | V |
| DDR_ZN | DDR2 impedance control, connected via 200 Ω resistor to DV _{DDR2} | | DV _{DDR2} | | V |
| V _{IH} | High-level input voltage, 3.3V (except I2C pins) | 2 | | | V |
| | High-level input voltage, MXI/ CLKIN | 0.65MXV | | | V |
| | High-level input voltage, I2C | 0.7DV _{DD33} | | | |
| V _{IL} | Low-level input voltage, 3.3V (except I2C pins) | | | 0.8 | V |
| | Low-level input voltage, MXI/ CLKIN | | | 0.35MXV ⁽⁵⁾ | V |
| | Low-level input voltage, I2C | 0 | | 0.3DV _{DD33} | V |
| T _J | Operating Junction temperature ⁽⁶⁾⁽⁷⁾ | Commercial | | 90 | C |
| | | Automotive (Q or S suffix) | -40 | | 125 |
| T _A | Operating Ambient Temperature ⁽⁷⁾ | Commercial | | 70 | C |
| | | Automotive (Q or S suffix) | -40 | | 85 |
| F _{SYCLK1} | DSP Operating Frequency (SYCLK1) (-3/-3Q/-3S devices) | | | 300 | MHz |

- (1) Future variants of TI SoC devices may operate at voltages ranging from 0.9 V to 1.4 V to provide a range of system power/performance options. TI highly recommends that users design-in a supply that can handle multiple voltages within this range (i.e., 1.0 V, 1.05 V, 1.1 V, 1.14 V, 1.2, 1.26 V with 3% tolerances) by implementing simple board changes such as reference resistor values or input pin configuration modifications. Not incorporating a flexible supply may limit the system's ability to easily adapt to future versions of TI SoC devices.
- (2) Oscillator 1.8 V power supply (MXV_{DD}) can be connected to the same 1.8 V power supply as DV_{DDR2}.
- (3) Oscillator ground (MXV_{SS}) must be kept separate from other grounds and connected directly to the crystal load capacitor ground.
- (4) DDR_VREF is expected to equal 0.5DV_{DDR2} of the transmitting device and to track variations in the DV_{DDR2}.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.
- (6) In the absence of a heat sink or direct thermal attachment on the top of the device, use the following formula to determine the device junction temperature: T_J = T_C + (Power x Psi_{JT}). Power and T_C can be measured by the user. [Section 7.1, Thermal Data for ZWT](#) and [Section 7.1.1, Thermal Data for ZDU](#) provide the junction-to-package top (Psi_{JT}) value based on airflow in the system. In the presence of a heat sink or direct thermal attachment on the top of the device, additional calculations and considerations **must** be taken into account. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).
- (7) Applications must meet **both** the Operating Junction Temperature and Operating Ambient Temperature requirements. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).

5.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)

| PARAMETER | | TEST CONDITIONS ⁽¹⁾ | MIN | TYP | MAX | UNIT |
|--------------------------------|--|---|------|------|-------|------|
| V _{OH} | High-level output voltage (3.3V I/O except I2C pins) | DV _{DD33} = MIN, I _{OH} = MAX | 2.4 | | | V |
| V _{OL} | Low-level output voltage (3.3V I/O except 2C pins) | DV _{DD33} = MIN, I _{OL} = MAX | | | 0.4 | V |
| | Low-level output voltage (3.3V I/O I2C pins) | I _O = 3 mA | 0 | | 0.4 | V |
| I _I ⁽²⁾ | Input current [DC] (except I2C capable pins) | V _I = V _{SS} to DV _{DD33} with internal pullup resistor ⁽³⁾ | 50 | 100 | 250 | μA |
| | | V _I = V _{SS} to DV _{DD33} with internal pulldown resistor ⁽³⁾ | -250 | -100 | -50 | μA |
| | Input current [DC] (I2C) | V _I = V _{SS} to DV _{DD33} | | | ±10 | μA |
| I _{OH} | High-level output current [DC] | CLK_OUT0/PWM2/GPIO[84] and GP[57] | | | -8 | mA |
| | | DDR2 | | | -13.4 | mA |
| | | All other peripherals | | | -4 | mA |
| I _{OL} | Low-level output current [DC] | CLK_OUT0/PWM2/GPIO[84] and GP[57] | | | 8 | mA |
| | | DDR2 | | | 13.4 | mA |
| | | All other peripherals | | | 4 | mA |
| I _{OZ} ⁽⁴⁾ | I/O Off-state output current | V _O = DV _{DD33} or V _{SS} ; internal pull disabled | | | 50 | μA |
| | | V _O = DV _{DD33} or V _{SS} ; internal pull enabled | | ±100 | | μA |
| I _{CDD} | Core (CV _{DD}) supply current ⁽⁵⁾ | CV _{DD} = 1.2 V, DSP clock = 300 MHz | | 325 | | mA |
| | | CV _{DD} = 1.05 V, DSP clock = 300 MHz | | 278 | | mA |
| I _{DDD} | 3.3V I/O (DV _{DD33}) supply current ⁽⁵⁾ | DV _{DD} = 3.3 V, DSP clock = 300 MHz | | 13 | | mA |
| I _{BDD} | 1.8V I/O (DV _{DDR2} , DDR_VDDDLL, PLLV _{PRW18} , MXV _{DD}) supply current ⁽⁵⁾ | DV _{DD} = 1.8 V, CV _{DD} = 1.2 V, DSP clock = 300 MHz | | 90 | | mA |
| | | DV _{DD} = 1.8 V, CV _{DD} = 1.05 V, DSP clock = 300 MHz | | 71 | | mA |
| C _I | Input capacitance | | | | 5 | pF |
| C _O | Output capacitance | | | | 5 | pF |

- (1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.
- (2) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (3) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (4) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
- (5) Measured under the following conditions: 60% DSP CPU utilization doing typical activity (peripheral configurations, other housekeeping activities); DDR2 Memory Controller at 50% utilization (135 MHz), 50% writes, 32 bits, 50% bit switching; 2 MHz McBSP0 at 100% utilization and 50% switching; Timer0 at 100% utilization. At room temperature (25 C) for typical process ZWT devices. The actual current draw varies across manufacturing processes and is highly application-dependent. For more details on core and I/O activity, as well as information relevant to board power supply design, see the *TMS320DM643x Power Consumption Summary* Application Report (literature number [SPRAAO6](#)).

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, $V_{ref} = 1.5$ V. For 1.8 V I/O, $V_{ref} = 0.9$ V.

Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL} MAX and V_{OH} MIN for output clocks.

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

6.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays.

TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number [SPRA839](#)). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For the DDR2 memory controller interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the DDR2 memory controller interface timings are met. See the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

For more information regarding TI's power management products and suggested devices to power TI DSPs, visit www.ti.com/dsppower.

6.3.1 Power-Supply Sequencing

The DM6431 includes one core supply (CV_{DD}), and two I/O supplies— DV_{DD33} and DV_{DDR2} . To ensure proper device operation, a specific power-up sequence **must** be followed. Some TI power-supply devices include features that facilitate power sequencing—for example, Auto-Track and Slow-Start/Enable features. For more information on TI power supplies and their features, visit www.ti.com/dsppower.

Here is a summary of the power sequencing requirements:

- The power ramp order **must** be DV_{DD33} before DV_{DDR2} , and DV_{DDR2} before CV_{DD} —meaning during power up, the voltage at the DV_{DDR2} rail should never exceed the voltage at the DV_{DD33} rail. Similarly, the voltage at the CV_{DD} rail should never exceed the voltage at the DV_{DDR2} rail.
- From the time that power ramp begins, all power supplies (DV_{DD33} , DV_{DDR2} , CV_{DD}) **must** be stable within 200 ms. The term "stable" means reaching the recommended operating condition (see [Section 5.2](#), *Recommended Operating Conditions* table).

6.3.2 Power-Supply Design Considerations

Core and I/O supply voltage regulators should be located close to the DSP to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the DM6431 device, the PC board should include separate power planes for core, I/O, and ground; all bypassed with high-quality low-ESL/ESR capacitors.

6.3.3 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value.

Larger caps for each supply can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away, but still as close as possible. Large caps for each supply should be placed outside of the BGA footprint.

As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

For more details on capacitor usage and placement, see the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

6.3.4 DM6431 Power and Clock Domains

The DM6431 includes one single power domain — the "Always On" power domain. The "Always On" power domain is always on when the chip is on. The "Always On" domain is powered by the CV_{DD} pins of the DM6431. All DM6431 modules lie within the "Always On" power domain. [Table 6-1](#) provides a listing of the DM6431 clock domains.

One primary reference clock is required for the DM6431 device. It can be either a crystal input or driven by external oscillators. A 27-MHz crystal is recommended for the PLLs, which generate the internal clocks for the digital media processor (DMP), peripherals, and EDMA3.

The DM6431 architecture is divided into the power and clock domains shown in [Table 6-1](#). [Table 6-2](#) and [Table 6-3](#) further discuss the clock domains and their ratios. [Figure 6-4](#) shows the Clock Domain block diagram.

Table 6-1. DM6431 Power and Clock Domains

| Power Domain | Clock Domain | Peripheral/Module |
|--------------|--------------|-------------------|
| Always On | CLKIN | UART0 |
| Always On | CLKIN | HECC |
| Always On | CLKIN | I2C |
| Always On | CLKIN | Timer0 |
| Always On | CLKIN | Timer1 |
| Always On | CLKIN | Timer2 |
| Always On | CLKIN | PWM0 |
| Always On | CLKIN | PWM1 |
| Always On | CLKIN | PWM2 |
| Always On | CLKDIV3 | DDR2 |
| Always On | CLKDIV3 | VPSS |
| Always On | CLKDIV3 | EDMA |
| Always On | CLKDIV3 | SCR |
| Always On | CLKDIV6 | GPSC |
| Always On | CLKDIV6 | LPSCs |
| Always On | CLKDIV6 | PLL1 |
| Always On | CLKDIV6 | PLL2 |
| Always On | CLKDIV6 | Ice Pick |
| Always On | CLKDIV6 | EMIFA |
| Always On | CLKDIV6 | EMAC |
| Always On | CLKDIV6 | McASP0 |
| Always On | CLKDIV6 | McBSP0 |
| Always On | CLKDIV6 | GPIO |
| Always On | CLKDIV1 | C64x+ CPU |

Table 6-2. DM6431 Clock Domains

| SUBSYSTEM | CLOCK DOMAIN | DOMAIN CLOCK SOURCE | FIXED RATIO vs. SYSCLK1 FREQUENCY | EXAMPLE FREQUENCY (MHz) |
|------------------------------|--------------|----------------------------|-----------------------------------|-------------------------|
| Peripherals (CLKIN Domain) | CLKIN | PLL1 AUXCLK ⁽¹⁾ | – | 27 MHz |
| DSP Subsystem | CLKDIV1 | PLL1 SYSCLK1 | 1:1 | 594 MHz |
| EDMA3 | CLKDIV3 | PLL1 SYSCLK2 | 1:3 | 198 MHz |
| VPSS | CLKDIV3 | PLL1 SYSCLK2 | 1:3 | 198 MHz |
| Peripherals (CLKDIV3 Domain) | CLKDIV3 | PLL1 SYSCLK2 | 1:3 | 198 MHz |
| Peripherals (CLKDIV6 Domain) | CLKDIV6 | PLL1 SYSCLK3 | 1:6 | 99 MHz |

(1) PLL1 AUXCLK runs at exactly the same frequency as the device clock source from the MXI/CLKIN pin.

The CLKDIV1:CLKDIV3:CLKDIV6 ratio must be strictly followed by programming the PLL Controller 1 (PLL1) PLLDIV1, PLLDIV2, and PLLDIV3 registers appropriately (see [Table 6-3](#)).

Table 6-3. PLL1 Programming for CLKDIV1, CLKDIV3, CLKDIV6 Domains

| | CLKDIV1 DOMAIN (SYSCLK1) | | CLKDIV3 DOMAIN (SYSCLK2) | | CLKDIV6 DOMAIN (SYSCLK3) | |
|------|--------------------------|---------------|--------------------------|---------------|--------------------------|---------------|
| | PLL1 Divide-Down | PLLDIV1.RATIO | PLL1 Divide-Down | PLLDIV2.RATIO | PLL1 Divide-Down | PLLDIV3.RATIO |
| DIV1 | /1 | 0 | /3 | 2 | /6 | 5 |
| DIV2 | /2 | 1 | /6 | 5 | /12 | 11 |
| DIV3 | /3 | 2 | /9 | 8 | /18 | 17 |

Figure 6-4. PLL1 and PLL2 Clock Domain Block Diagram

For further detail on PLL1 and PLL2, see the structure block diagrams [Figure 6-5](#) and [Figure 6-6](#), respectively.

Figure 6-5. PLL1 Structure Block Diagram

Figure 6-6. PLL2 Structure Block Diagram

6.3.5 Power and Sleep Controller (PSC)

The Power and Sleep Controller (PSC) controls power by turning off unused power domains or by gating off clocks to individual peripherals/modules. The DM6431 device only utilizes the clock gating feature of the PSC for power savings. The PSC consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupt control, and a state machine for each peripheral/module. An LPSC is associated with each peripheral/module and provides clock and reset control. The LPSCs for DM6431 are shown in [Table 6-4](#). The PSC Register memory map is given in [Table 6-5](#). For more details on the PSC, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

Table 6-4. DM6431 LPSC Assignments

6.4 Enhanced Direct Memory Access (EDMA3) Controller

The EDMA controller handles all data transfers between memories and the device slave peripherals on the DM6431 device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses. These are summarized as follows:

- Transfer to/from on-chip memories
 - DSP L1D memory
 - DSP L2 memory
- Transfer to/from external storage
 - DDR2 SDRAM
 - NAND flash
 - Asynchronous EMIF (EMIFA)
- Transfer to/from peripherals/hosts
 - McBSP0
 - McASP0
 - PWM
 - UART0
 - HECC

The EDMA supports two addressing modes: constant addressing and increment addressing. On the DM6431, constant addressing mode is **not** supported by any peripheral or internal memory. For more information on these two addressing modes, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller User's Guide* (literature number [SPRU987](#)).

6.4.1 EDMA3 Channel Synchronization Events

The EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. [Table 6-6](#) lists the source of EDMA synchronization events associated with each of the programmable EDMA channels. For the DM6431 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ER, ERH) even if the events are disabled by the EDMA event enable registers (EER, EERH). For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller User's Guide* (literature number [SPRU987](#)).

Table 6-6. DM6431 EDMA Channel Synchronization Events⁽¹⁾

| EDMA CHANNEL | EVENT NAME | EVENT DESCRIPTION |
|--------------|------------|----------------------------|
| 0-1 | – | Reserved |
| 2 | XEVT0 | McBSP0 Transmit Event |
| 3 | REVT0 | McBSP0 Receive Event |
| 4 | – | Reserved |
| 5 | – | Reserved |
| 6 | – | Reserved |

6.5 Reset

The reset controller detects the different type of resets supported on the DM6431 device and manages the distribution of those resets throughout the device.

The DM6431 device has several types of device-level global resets - power-on reset, warm reset, and max reset. Table 6-10 explains further the types of reset, the reset initiator, and the effects of each reset on the chip. See Section 6.5.9, *Reset Electrical Data/Timing*, for more information on the effects of each reset on the PLL controllers and their clocks.

Table 6-10. Device-Level Global Reset Types

| TYPE | INITIATOR | EFFECT(s) |
|----------------------|-------------------------------|--|
| Power-on Reset (POR) | $\overline{\text{POR}}$ pin | Global chip reset (Cold reset). Activates the POR signal on chip, which resets the entire chip including the emulation logic. The power-on reset (POR) pin must be driven low during power ramp of the device. Device boot and configuration pin are latched. |
| Warm Reset | $\overline{\text{RESET}}$ pin | Resets everything except for the emulation logic. Emulator stays alive during Warm Reset. Device boot and configuration pin are latched. |
| Max Reset | Emulator, WD Timer (Timer 2) | Same as a Warm Reset, except the DM6431 device boot and configuration pins are not re-latched. |

In addition to device-level global resets, the PSC provides the capability to cause local resets to peripherals and/or the CPU.

6.5.1 Power-on Reset ($\overline{\text{POR}}$ Pin)

Power-on Reset (POR) is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. If an external 27-MHz oscillator is used on the MXI/CLKIN pin, the source clock should also be running at the correct frequency prior to de-asserting the $\overline{\text{POR}}$ pin. **Note:** A device power-up cycle is not required to initiate a Power-on Reset.

The following sequence **must** be followed during a Power-on Reset.

1. Wait for the power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low).
2. Wait for the input clock source to be stable while keeping the $\overline{\text{POR}}$ pin asserted (low).
3. Once the power supplies and the input clock source are stable, the $\overline{\text{POR}}$ pin **must** remain asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{POR}}$ pin, the following happens:

- The reset signals flow to the entire chip (including the emulation logic), resetting the modules on chip.
 - The PLL Controller clocks start at the frequency of the MXI clock. The clocks are propagated throughout the chip to reset the chip synchronously. By default, both PLL1 and PLL2 are in reset and **unlocked**. The PLL Controllers default to PLL Bypass Mode.
 - The RESETOUT pin stays asserted (low), indicating the device is in reset.
4. The $\overline{\text{POR}}$ pin may now be deasserted (driven high).

When the $\overline{\text{POR}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

5. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the RESETOUT pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8, Device Initialization Sequence After Reset](#).

6.5.1.1 Usage of $\overline{\text{POR}}$ versus $\overline{\text{RESET}}$ Pins

$\overline{\text{POR}}$ and $\overline{\text{RESET}}$ are independent resets.

If the device needs to go through a power-up cycle, $\overline{\text{POR}}$ (*not* $\overline{\text{RESET}}$) **must** be used to fully reset the device.

In functional end-system, emulation/debugger logic is typically *not* needed; therefore, the recommendation for functional end-system is to use the $\overline{\text{POR}}$ pin for full device reset. If $\overline{\text{RESET}}$ pin is *not* needed, it can be pulled inactive (high) via an external pullup resistor.

In a debug system, it is typically desirable to allow the reset of the device without crashing an emulation session. In this case, the user can use the $\overline{\text{POR}}$ pin to achieve full device reset and use the $\overline{\text{RESET}}$ pin to achieve a debug reset—which resets the entire device except emulation logic.

6.5.1.2 Latching Boot and Configuration Pins

Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together *only* for the purpose of latching device boot and configuration pins. The values on all device and boot configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

6.5.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset is activated by driving the $\overline{\text{RESET}}$ pin active low. This resets everything in the device except the emulation logic. An emulator session will stay alive during warm reset.

For more information on $\overline{\text{POR}}$ vs. $\overline{\text{RESET}}$ usage, see [Section 6.5.1.1, Usage of \$\overline{\text{POR}}\$ versus \$\overline{\text{RESET}}\$ Pins](#) and [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

The following sequence **must** be followed during a Warm Reset:

1. Power supplies and input clock source should already be stable.
2. The $\overline{\text{RESET}}$ pin **must** be asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip, except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
3. The $\overline{\text{RESET}}$ pin may now be deasserted (driven high).

When the $\overline{\text{RESET}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

4. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.3 Maximum Reset

A Maximum (Max) Reset is initiated by the emulator or the watchdog timer (Timer 2). The effects are the same as a warm reset, except the device boot and configuration pins are not re-latched. The emulator initiates a maximum reset via the ICEPICK module. This ICEPICK initiated reset is non-maskable. When the watchdog timer counter reaches zero, this will also initiate a maximum reset to recover from a runaway condition. The watchdog timeout reset condition is masked if the TIMERCTL.WDRST bit is cleared to "0".

To invoke the maximum reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Debug→Advanced Resets→System Reset

This is the Max Reset sequence:

1. Max Reset is initiated by the emulator or the watchdog timer.

During this time, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
2. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. Since the boot and configuration pins are *not* latched with a Max Reset, the previous values (as shown in the BOOTCFG register) are used to select the boot mode. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.4 CPU Local Reset

The C64x+ DSP CPU has an internal reset input that allows a host to control it. This reset is configured through a register bit (MDCTL[39].LRST) in the Power Sleep Controller (PSC) module. When in C64x+ local reset, the slave DMA port on C64x+ will remain active and the internal memory will be accessible. For procedures on asserting and de-asserting CPU local reset by the host, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

For information on peripheral selection at the rising edge of $\overline{\text{POR}}$ or $\overline{\text{RESET}}$, see [Section 3, Device Configurations](#) of this data manual.

6.5.5 Peripheral Local Reset

The user can configure the local reset and clock state of a peripheral through programming the PSC. [Table 6-4, DM6431 LPSC Assignments](#) identifies the LPSC numbers and the peripherals capable of being locally reset by the PSC. For more detailed information on the programming of these peripherals by the PSC, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.5.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLLC only processes the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on Reset
- Maximum Reset
- Warm Reset
- CPU Reset

6.5.7 Reset Controller Register

The Reset Type Status (RSTYPE) register (01C4 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers (see [Table 6-18](#) for the PLL1 Controller Registers (including Reset Controller)). For more details on the RSTYPE register, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.5.8 Pin Behaviors at Reset

During normal operations, pins are controlled by the respective peripheral selected in the PINMUX0 or PINMUX1 register. During device level global reset, the pin behaves as follows:

Multiplexed Boot and Configuration Pins

These pins are forced 3-stated when $\overline{\text{RESETOUT}}$ is asserted (low). This is to ensure the proper boot and configuration values can be latched on these multiplexed pins. This is particularly useful in the case where the boot and configuration values are driven by an external control device. After $\overline{\text{RESETOUT}}$ is deasserted (high), these pins are controlled by their respective default peripheral.

- **Boot and Configuration Pins Group:** GP[28], GP[27], GP[26]/(FASTBOOT), GP[25]/(BOOTMODE3), GP[24]/(BOOTMODE2), GP[23]/(BOOTMODE1), GP[22]/(BOOTMODE0), EM_A[4]/GP[10]/(AEAW2/PLLMS2), EM_A[1]/(ALE)/GP[9]/(AEAW1/PLLMS1), EM_A[2]/(CLE)/GP[8]/(AEAW0/PLLMS0), EM_A[0]/GP[7]/(AEM2), EM_BA[0]/GP[6]/(AEM1), and EM_BA[1]/GP[5]/(AEM0).

For information on whether external pullup/pulldown resistors should be used on the boot and configuration pins, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

Default Power Down Pins

As discussed in [Section 3.2, Power Considerations](#), the VDD3P3V_PWDN register controls power to the 3.3-V pins. The VDD3P3V_PWDN register defaults to powering down some 3.3-V pins to save power. For more details on the VDD3P3V_PWDN register and which 3.3-V pins default to powerup or powerdown, [Section 3.2, Power Considerations](#). The pins that default to powerdown, are both reset to powerdown and high-impedance. They remain in that state until configured otherwise by VDD3P3_PWDN and PINMUX0/PINMUX1 programming.

- **Default Power Down Pin Group:** GP[4]/PWM1, ACLKR0/CLKX0/GP[99], AFSR0/DR0/GP[100], AHCLKR0/CLKR0/GP[101], AXR0[3]/FSR0/GP[102], AXR0[2]/FSX0/GP[103], AXR0[1]/DX0/GP[104], AXR0/GP[105], ACLKX0/GP[106], AFSX0/GP[107], AHCLKX0/GP[108], AMUTEIN0/GP[109], AMUTE0/GP[110], HECC_TX/TOUT1L/GP[55], HECC_RX/TINP1L/GP[56], CLKS0/TOUT0L/GP[97], TINP0L/GP[98], URXD0/GP[85], UTXD0/GP[86], UCTS0/GP[87], and URTS0/PWM0/GP[88].

All Other Pins

During $\overline{\text{RESETOUT}}$ assertion (low), all other pins are controlled by the default peripheral. The default peripheral is determined by the default settings of the PINMUX0 or PINMUX1 registers.

Some of the PINMUX0/PINMUX1 settings are determined by configuration pins latched at reset. To determine the reset behavior of these pins, see [Section 3.7, Multiplexed Pin Configurations](#) and read the rest of this subsection to understand how that default peripheral controls the pin.

The reset behaviors for all these other pins are categorized as follows (also see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#)):

- **Z+/Low Group (Z Longer-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic low.
- **Z+/High Group (Z Longer-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic high.
- **Z+/Invalid Group (Z Longer-to-Invalid Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive an invalid value until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z Group:** These pins are 3-stated by default, and these pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins remain 3-stated until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Low Group:** These pins are low by default, and remain low until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **High Group:** These pins are high by default, and remain high until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z/Low Group (Z-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. When the reset source is deasserted, these pins drive a logic low.
- **Z/High Group (Z-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. When reset source is deasserted, these pins drive a logic high.
- **Clock Group:** These clock pins are toggling by default. They paused momentarily before $\overline{\text{RESETOUT}}$ is deasserted (high). The *only* pin in the Clock Group is CLKOUT0.

This is a list of possible default peripherals and how they control the pins during reset:

- **GPIO:** All GPIO pins behave according to Z Group.
Note: The following EMIFA list *only* includes pins that can default to function as EMIFA signals.
- **EMIFA:** These EMIFA signals are multiplexed with boot and configuration pins: EM_A[4], EM_A[2:0],

EM_BA[0], EM_BA[1]; therefore, they are forced 3-stated throughout $\overline{\text{RESETOUT}}$.

- **Z+/Low Group:** EM_A[4], EM_A[2:0]
- **Z+/High Group:** EM_BA[0], EM_BA[1], $\overline{\text{EM_OE}}$, $\overline{\text{EM_WE}}$
- **Z+/Invalid Group:** EM_D[7:0]
- **Z/Low Group:** EM_A[21:5], EM_A[3], EM_R $\overline{\text{W}}$
- **Z/High Group:** $\overline{\text{EM_CS2}}$
- **Z Group:** EM_WAIT/(RDY $\overline{\text{BSY}}$)
- **DDR2 Memory Controller:**
 - **Clock Group:** DDR_CLK, $\overline{\text{DDR_CLK}}$
 - **DDR2 Z Group:** DDR_DQM[1:0], DDR_DQS[1:0], DDR_D[15:0]
 - **DDR2 Low Group:** DDR_CKE, DDR_BA[2:0], DDR_A[12:0]
 - **DDR2 High Group:** $\overline{\text{DDR_CS}}$, $\overline{\text{DDR_WE}}$, $\overline{\text{DDR_RAS}}$, $\overline{\text{DDR_CAS}}$
- **I2C:** All I2C pins behave according to Z Group.
- **JTAG:** TDO, EMU0, and EMU1 pins behave according to Z Group. TCK, TDI, TMS, and $\overline{\text{TRST}}$ are input-only pins.
- **Clock:** CLKOUT0

For more information on the pin behaviors during device-level global reset, see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#).

6.5.9 Reset Electrical Data/Timing

Note: If a configuration pin *must* be routed out from the device, the internal pullup/pulldown (IPU/IPD) resistor should *not* be relied upon; TI recommends the use of an external pullup/pulldown resistor.

Table 6-11. Timing Requirements for Reset (see [Figure 6-7](#) and [Figure 6-8](#))

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|-------------------------|--|--------------------|-----|------|
| | | | MIN | MAX | |
| 1 | $t_{w(\text{RESET})}$ | Pulse duration, $\overline{\text{POR}}$ low or $\overline{\text{RESET}}$ low | 12C ⁽¹⁾ | | ns |
| 4 | $t_{su(\text{CONFIG})}$ | Setup time, boot and configuration pins valid before $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high ⁽²⁾ | 12C ⁽¹⁾ | | ns |
| 5 | $t_{h(\text{CONFIG})}$ | Hold time, boot and configuration pins valid after $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high ⁽²⁾ | 0 | | ns |

(1) C = 1/MX1 clock frequency in ns. The device clock source *must* be stable and at a valid frequency prior to meeting the $t_{w(\text{RESET})}$ requirement.

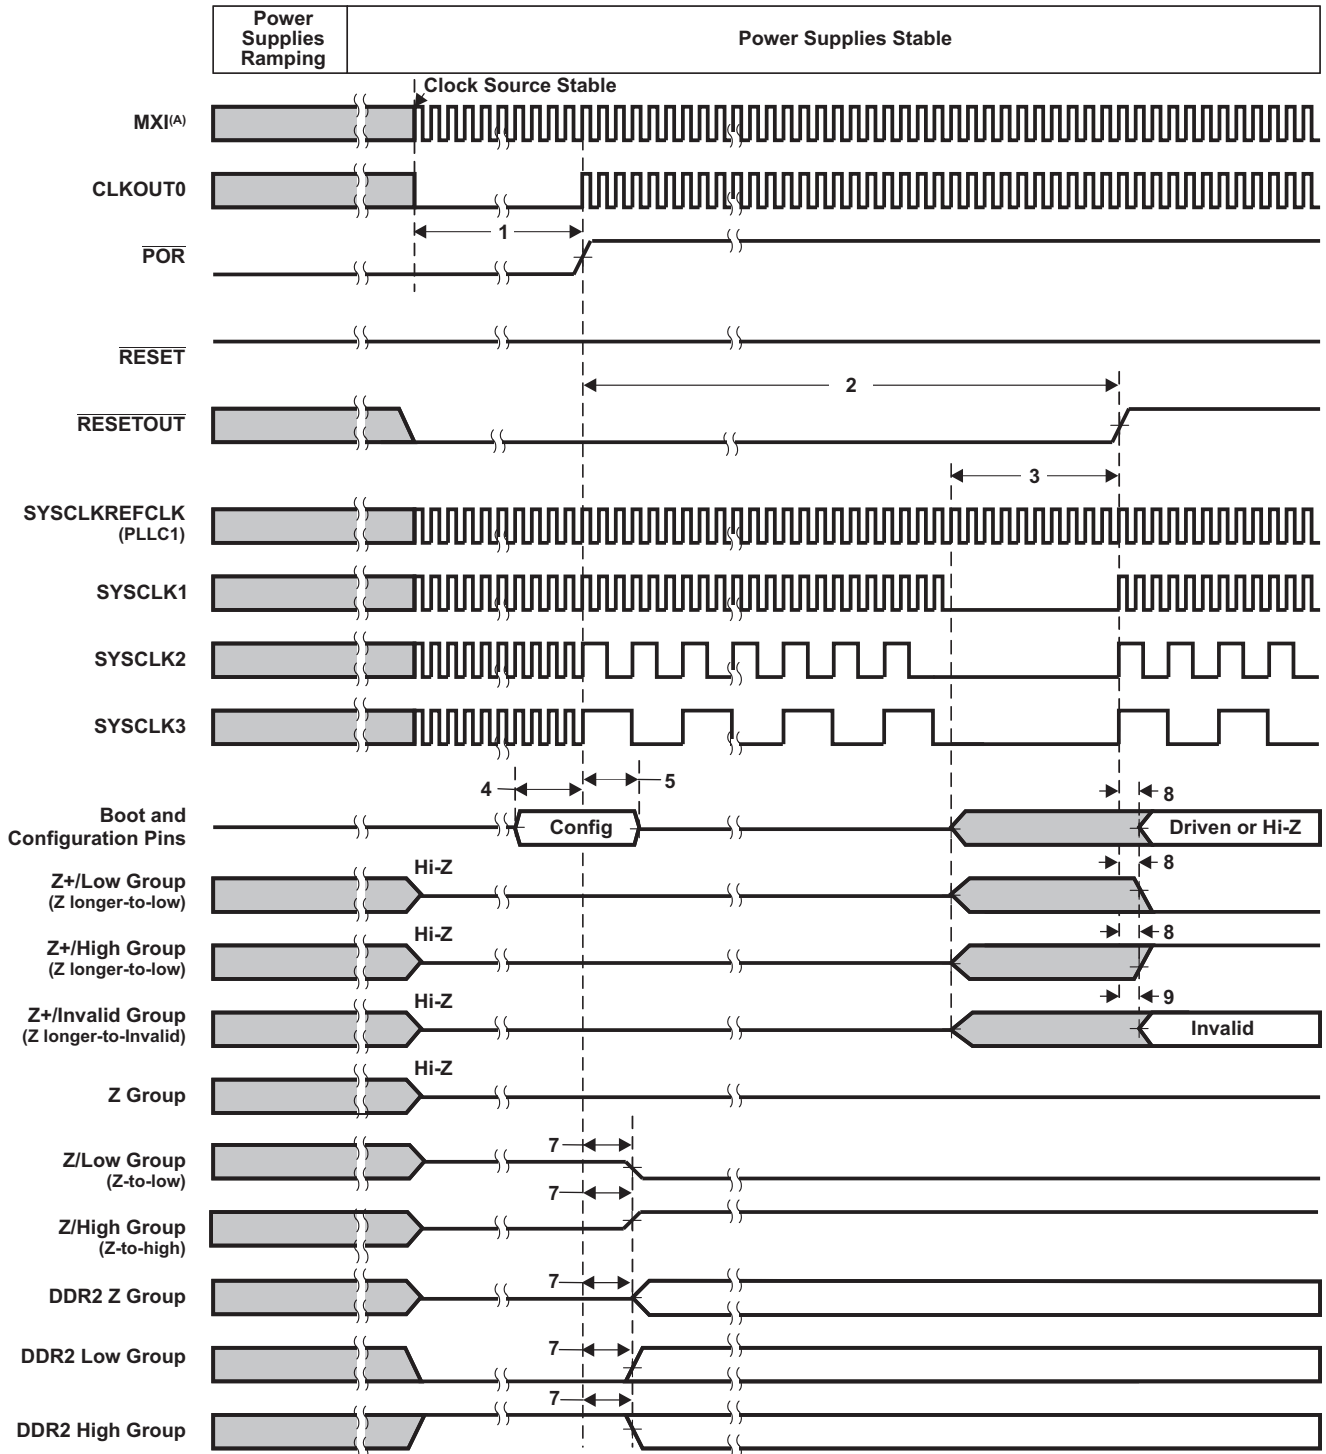

(2) For the list of boot and configuration pins, see [Table 2-5, Boot Terminal Functions](#).

Table 6-12. Switching Characteristics Over Recommended Operating Conditions During Reset⁽¹⁾ (see [Figure 6-8](#))

| NO. | PARAMETER | | -3/-3Q/-3S | | UNIT |
|-----|------------------------------|---|------------|-----|------|
| | | | MIN | MAX | |
| 2 | $t_{d(\text{RSTH-RSTOUTH})}$ | Delay time, $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high to $\overline{\text{RESETOUT}}$ high | 1900C | | ns |
| 3 | $t_{w(\text{PAUSE})}$ | Pulse duration, SYSCLKs paused (low) before $\overline{\text{RESETOUT}}$ high | 10C | 10C | ns |
| 6 | $t_{d(\text{RSTL-IV})}$ | Delay time, $\overline{\text{POR}}$ low or $\overline{\text{RESET}}$ low to pins invalid | 20 | | ns |
| 7 | $t_{d(\text{RSTH-V})}$ | Delay time, $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high to pins valid | 20 | | ns |
| 8 | $t_{d(\text{RSTOUTH-V})}$ | Delay time, $\overline{\text{RESETOUT}}$ high to pins valid | 0 | | ns |
| 9 | $t_{d(\text{RSTOUTH-IV})}$ | Delay time, $\overline{\text{RESETOUT}}$ high to pins invalid | 12C | | ns |

(1) C = 1/CLKIN1 clock frequency in ns.

Figure 6-7 shows the Power-Up Timing. Figure 6-8 shows the Warm Reset ($\overline{\text{RESET}}$) Timing. Max Reset Timing is identical to Warm Reset Timing, except the boot and configuration pins are *not* relatched and the BOOTCFG register retains its previous value latched before the Max Reset was initiated.

- A. Power supplies and MXI must be stable before the start of $t_{W(RESSET)}$.
- B. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-7. Power-Up Timing^(B)

A. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-8. Warm Reset ($\overline{\text{RESET}}$) Timing^(A)

6.6 External Clock Input From MXI/CLKIN Pin

The DM6431 device includes two options to provide an external clock input:

- Use an on-chip oscillator with external crystal.
- Use an external 1.8-V LVCMOS-compatible clock input.

The optimal external clock input frequency is 27 MHz. Section 6.6.1 provides more details on Option 1, using an on-chip oscillator with external crystal. Section 6.6.2 provides details on Option 2, using an external 1.8-V LVCMOS-compatible clock input.

6.6.1 Clock Input Option 1—Crystal

In this option, a crystal is used as the external clock input to the DM6431.

The 27-MHz oscillator provides the reference clock for all DM6431 subsystems and peripherals. The on-chip oscillator requires an external 27-MHz crystal connected across the MXI and MXO pins, along with two load capacitors, as shown in Figure 6-9. The external crystal load capacitors **must** be connected only to the 27-MHz oscillator ground pin (MXV_{SS}). **Do not** connect to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8 V power supply as DV_{DDR2}.

Figure 6-9. 27-MHz System Oscillator

The load capacitors, C1 and C2, should be chosen such that the equation is satisfied (typical values are C1 = C2 = 10 pF). C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator pins (MXI and MXO) and to the MXV_{SS} pin.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 6-13. Input Requirements for Crystal

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| Start-up time (from power up until oscillating at stable frequency of 27 MHz) | | | 4 | ms |
| Oscillation frequency | | 27 | | MHz |
| ESR | | | 60 | Ω |

6.6.2 Clock Input Option 2—1.8-V LVCMOS-Compatible Clock Input

In this option, a 1.8-V LVCMOS-Compatible Clock Input is used as the external clock input to the DM6431. The external connections are shown in Figure 6-10. The MXI/CLKIN pin is connected to the 1.8-V LVCMOS-Compatible clock source. The MXO pin is left unconnected. The MXV_{SS} pin is connected to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8-V power supply as DV_{DDR2}.

Figure 6-10. 1.8-V LVCMOS-Compatible Clock Input

The clock source **must** meet the MXI/CLKIN timing requirements in [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

6.7 Clock PLLs

There are two independently controlled PLLs on DM6431. PLL1 generates the frequencies required for the DSP, DMA, VPFE, and other peripherals. PLL2 generates the frequencies required for the DDR2 interface. The recommended reference clock for both PLLs is the 27-MHz crystal input.

6.7.1 PLL1 and PLL2

Both PLL1 and PLL2 power is supplied externally via the 1.8 V PLL power-supply pin (PLL_{PWR18}). An external EMI filter circuit **must** be added to PLL_{PWR18}, as shown in Figure 6-11. The 1.8-V supply of the EMI filter must be from the same 1.8-V power plane supplying the device's 1.8-V I/O power-supply pins (DV_{DDR2}). TI recommends EMI filter manufacturer Murata, part number NFM18CC222R1C3.

All PLL external components (C1, C2, and the EMI Filter) **must** be placed as close to the device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown in Figure 6-11. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).

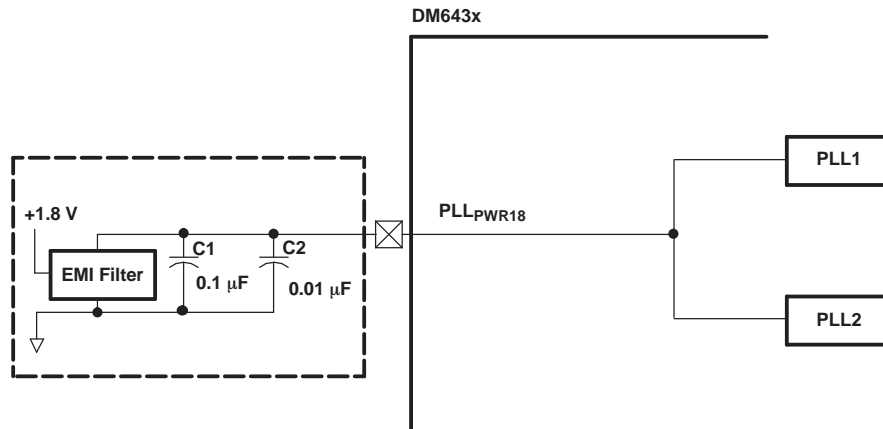

Figure 6-11. PLL1 and PLL2 External Connection

The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

There is an allowable range for PLL multiplier (PLLM). There is a minimum and maximum operating frequency for MXI/CLKIN, PLLOUT, and the device clocks (SYSCLKs). The PLL Controllers **must** be configured not to exceed any of these constraints documented in this section (certain combinations of external clock inputs, internal dividers, and PLL multiply ratios might not be supported). For these constraints (ranges), see Table 6-14 through Table 6-16.

Table 6-14. PLL1 and PLL2 Multiplier Ranges

| PLL MULTIPLIER (PLLM) | MIN | MAX |
|-----------------------|-----|-----|
| PLL1 Multiplier | x14 | x30 |
| PLL2 Multiplier | x14 | x32 |

Table 6-15. PLLC1 Clock Frequency Ranges

| CLOCK SIGNAL NAME | | MIN | MAX | UNIT |
|--------------------------|---------------------------|-----|-----|------|
| MXI/CLKIN ⁽¹⁾ | | 20 | 30 | MHz |
| PLLOUT | At 1.2-V CV _{DD} | 300 | 600 | MHz |
| SYSCLK1 (CLKDIV1 Domain) | -3/-3Q/-3S devices | | 300 | MHz |

(1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).

Table 6-16. PLLC2 Clock Frequency Ranges

| CLOCK SIGNAL NAME | | MIN | MAX | UNIT |
|----------------------------|---------------------------|-----|-----|------|
| MXI/CLKIN ⁽¹⁾ | | 20 | 30 | MHz |
| PLLOUT | At 1.2-V CV _{DD} | 300 | 900 | MHz |
| PLL2_SYSCLK1 (to DDR2 PHY) | | | 266 | MHz |

(1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).

Both PLL1 and PLL2 have stabilization, lock, and reset timing requirements that **must** be followed.

The PLL stabilization time is the amount of time that **must** be allotted for the internal PLL regulators to become stable after the PLL is powered up (after PLLCTL.PLLPWRDN bit goes through a 1-to-0 transition). The PLL should *not* be operated until this stabilization time has expired. This stabilization step **must** be applied after these resets—a Power-on Reset, a Warm Reset, or a Max Reset, as the PLLCTL.PLLPWRDN bit resets to a "1". For the PLL stabilization time value, see [Table 6-17](#).

The PLL reset time is the amount of wait time needed for the PLL to properly reset (writing PLLRST = 0) before bringing the PLL out of reset (writing PLLRST = 1). For the PLL reset time value, see [Table 6-17](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLEN = 0) to when to when the PLL controller can be switched to PLL mode (PLEN = 1). For the PLL lock time value, see [Table 6-17](#).

Table 6-17. PLL1 and PLL2 Stabilization, Lock, and Reset Times

| PLL STABILIZATION/LOCK/RESET TIME | MIN | TYP | MAX | UNIT |
|-----------------------------------|---------------------|-----|----------------------|------|
| PLL Stabilization Time | 150 | | | μs |
| PLL Lock Time | | | 2000C ⁽¹⁾ | ns |
| PLL Reset Time | 128C ⁽¹⁾ | | | ns |

(1) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use C = 37.037 ns.

For details on the PLL initialization software sequence, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

For more information on the clock domains and their clock ratio restrictions, see [Section 6.3.4, DM6431 Power and Clock Domains](#).

6.7.2 PLL Controller Register Description(s)

A summary of the PLL controller registers is shown in [Table 6-18](#). For more details, see the *TMS320C642x DSP Phase-Locked Loop Controller (PLL) User's Guide* (literature number [SPRUES0](#)).

Table 6-18. PLL and Reset Controller Registers Memory Map

| HEX ADDRESS RANGE | REGISTER ACRONYM | DESCRIPTION |
|----------------------------------|------------------|--|
| PLL1 Controller Registers | | |
| 0x01C4 0800 | PID | Peripheral ID Register |

6.7.3 Clock PLL Considerations with External Clock Sources

If the internal oscillator is bypassed, to minimize the clock jitter a single clean power supply should power both the DM6431 device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the device requirements in this data manual (see [Section 5.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature](#) and [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#)).

6.7.4 Clock PLL Electrical Data/Timing (Input and Output Clocks)

Table 6-19. Timing Requirements for MXI/CLKIN (-3/-3Q/-3S) Devices⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾ (see Figure 6-12)

| NO. | | -3/-3Q/-3S | | UNIT |
|-----|---|------------|-------|------|
| | | MIN | MAX | |
| 1 | $t_{c(MXI)}$ Cycle time, MXI/CLKIN | 33.3 | 50 | ns |
| 2 | $t_{w(MXH)}$ Pulse duration, MXI/CLKIN high | 0.45C | 0.55C | ns |
| 3 | $t_{w(MXL)}$ Pulse duration, MXI/CLKIN low | 0.45C | 0.55C | ns |
| 4 | $t_t(MXI)$ Transition time, MXI/CLKIN | | 0.05C | ns |
| 5 | $t_J(MXI)$ Period jitter, MXI/CLKIN | | 0.02C | ns |

- (1) The MXI/CLKIN frequency and PLL multiply factor should be chosen such that the resulting clock frequency is within the specific range for CPU operating frequency. The resulting clock frequency should also meet the PLL requirements discussed in Section 6.7.1, PLL1 and PLL2. For example, for a -3/-3Q/-3S speed device with a 27 MHz CLKIN frequency, the PLL multiply factor should be ≤ 22 . To get a ≤ 600 MHz PLL output frequency, SYSCLK1 should be set to a PLL output frequency of divide-by-2 to get ≤ 300 MHz device speed.
- (2) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
- (3) For more details on the PLL multiplier factors, see the TMS320DM63x DMP DSP Subsystem Reference Guide (literature number SPRU978).
- (4) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $C = 37.037$ ns.

Figure 6-12. MXI/CLKIN Timing

Table 6-20. Switching Characteristics Over Recommended Operating Conditions for CLKOUT0⁽¹⁾⁽²⁾ (see Figure 6-13)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT |
|-----|--|------------|-------|------|
| | | MIN | MAX | |
| 1 | t_c Cycle time, CLKOUT0 | 33.3 | 50 | ns |
| 2 | $t_{w(CLKOUT0H)}$ Pulse duration, CLKOUT0 high | 0.45P | 0.55P | ns |
| 3 | $t_{w(CLKOUT0L)}$ Pulse duration, CLKOUT0 low | 0.45P | 0.55P | ns |
| 4 | $t_t(CLKOUT0)$ Transition time, CLKOUT0 | | 0.05P | ns |

- (1) The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.
- (2) P = 1/CLKOUT0 clock frequency in nanoseconds (ns). For example, when CLKOUT0 frequency is 27 MHz, use $P = 37.04$ ns.

Figure 6-13. CLKOUT0 Timing

6.8 Interrupts

The C64x+ DSP interrupt controller combines device events into 12 prioritized interrupts. The source for each of the 12 CPU interrupts is user programmable and is listed in [Table 6-21](#). Also, the interrupt controller controls the generation of the CPU exception and emulation interrupts. The NMI input to the C64x+ DSP interrupt controller is not connected internally; therefore, the NMI interrupt is not available. [Table 6-22](#) summarizes the C64x+ interrupt controller registers and memory locations. For more details on DSP interrupt controller, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.9 External Memory Interface (EMIF)

DM6431 supports several memory and external device interfaces, including:

- Asynchronous EMIF (EMIFA) for interfacing to NOR Flash, SRAM, etc.
- NAND Flash

6.9.1 Asynchronous EMIF (EMIFA)

The DM6431 Asynchronous EMIF (EMIFA) provides an 8-bit data bus, an address bus width up to 24-bits, and 4 chip selects, along with memory control signals. These signals are multiplexed between these peripherals:

- EMIFA and NAND interfaces
- VPFE (CCDC)
- GPIO

6.9.2 NAND (NAND, SmartMedia, xD)

The EMIFA interface provides both the asynchronous EMIF and NAND interfaces. Four chip selects are provided and each are individually configurable to provide either EMIFA or NAND support. The NAND features supported are as follows.

- NAND flash on up to 4 asynchronous chip selects.
- 8-bit data bus width
- Programmable cycle timings.
- Performs ECC calculation.
- NAND Mode also supports SmartMedia and xD memory cards
- Boot ROM supports booting of the DM6431 from NAND flash located at CS2

The memory map for EMIFA and NAND registers is shown in [Table 6-23](#). For more details on the EMIFA and NAND interfaces, see [Section 2.9, Documentation Support](#) for the link to the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#)) for the *TMS320DM643x Asynchronous External Memory Interface (EMIF) User's Guide* (literature number [SPRU984](#)).

6.9.3 EMIFA Electrical Data/Timing

Table 6-24. Timing Requirements for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾
(see [Figure 6-14](#) and [Figure 6-15](#))

| NO. | | | -3/-3Q/-3S | | | UNIT |
|-------------------------|-------------------------------|--|------------|-----|-----|------|
| | | | MIN | NOM | MAX | |
| READS and WRITES | | | | | | |
| 2 | $t_w(\text{EM_WAIT})$ | Pulse duration, EM_WAIT assertion and deassertion | 2E | | | ns |
| READS | | | | | | |
| 12 | $t_{su}(\text{EMDV-EMOEH})$ | Setup time, EM_D[7:0] valid before $\overline{\text{EM_OE}}$ high | 5 | | | ns |
| 13 | $t_h(\text{EMOEH-EMDIV})$ | Hold time, EM_D[7:0] valid after $\overline{\text{EM_OE}}$ high | 0 | | | ns |
| 14 | $t_{su}(\text{EMWAIT-EMOEH})$ | Setup time, EM_WAIT asserted before $\overline{\text{EM_OE}}$ high ⁽²⁾ | 4E + 5 | | | ns |
| WRITES | | | | | | |
| 28 | $t_{su}(\text{EMWAIT-EMWEH})$ | Setup time, EM_WAIT asserted before $\overline{\text{EM_WE}}$ high ⁽²⁾ | 4E + 5 | | | ns |

- (1) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 300 MHz, use E = 20 ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. [Figure 6-16](#) and [Figure 6-17](#) describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾⁽²⁾ (see Figure 6-14 and Figure 6-15)

| 9 | $t_{h(EMOEHEMBAIV)}$ | Output hold time, $\overline{EM_OE}$ high to $\overline{EM_A}[21:0]$ invalid | $(RH + 1) * E - 4$ | | $(RH + 1) * E + 4$ ns |
| 10 | $t_{w(EMOEL)}$ | $\overline{EM_OE}$ active low width | | $(RST + 1) * E^{(3)}$ | ns |
| 11 | $t_{d(EMWAITH-EMOEHE)}$ | Delay time from EM_WAIT deasserted to $\overline{EM_OE}$ high | | | $4E + 4$ ns |
| WRITES | | | | | |
| 15 | $t_{c(EMWVCYCLE)}$ EMIF write cycle time | | $(WS + WST + WH + TA + 4) * E^{(3)}$ | | ns |
| 16 | $t_{su(EMCSL-EMWEL)}$ | Output setup time, $\overline{EM_CS}[5:2]$ low to $\overline{EM_WE}$ low (SS = 0) | $(WS + 1) * E - 4$ | | $(WS + 1) * E + 4$ ns |
| | | Output setup time, $\overline{EM_CS}[5:2]$ low to $\overline{EM_WE}$ low (SS = 1) | -4 | | 4 ns |
| 17 | $t_{h(EMWEHEMCSH)}$ | Output hold time, $\overline{EM_WE}$ high to $\overline{EM_CS}[5:2]$ high (SS = 0) | $(WH + 1) * E - 4$ | | $(WH + 1) * E + 4$ ns |
| | | Output hold time, $\overline{EM_WE}$ high to $\overline{EM_CS}[5:2]$ high (SS = 1) | -4 | | 4 ns |
| 18 | $t_{su(EMRNW-EMWEL)}$ | Output setup time, $\overline{EM_R/W}$ valid to $\overline{EM_WE}$ low | $(WS + 1) * E - 4$ | | $(WS + 1) * E + 4$ ns |
| 19 | $t_{h(EMWEHEMRNW)}$ | Output hold time, $\overline{EM_WE}$ high to $\overline{EM_R/W}$ invalid | $(WH + 1) * E - 4$ | | $(WH + 1) * E + 4$ ns |
| 20 | $t_{su(EMBAV-EMWEL)}$ | Output setup time, $\overline{EM_BA}[1:0]$ valid to $\overline{EM_WE}$ low | $(WS + 1) * E - 4$ | | $(WS + 1) * E + 4$ ns |
| 21 | $t_{h(EMWEHEMBAIV)}$ | Output hold time, $\overline{EM_WE}$ high to $\overline{EM_BA}[1:0]$ invalid | $(WH + 1) * E - 4$ | | $(WH + 1) * E + 4$ ns |
| 22 | $t_{su(EMAV-EMWEL)}$ | Output setup time, $\overline{EM_A}[21:0]$ valid to $\overline{EM_WE}$ low | $(WS + 1) * E - 4$ | | $(WS + 1) * E + 4$ ns |
| 23 | $t_{h(EMWEHEMAIV)}$ | Output hold time, $\overline{EM_WE}$ high to $\overline{EM_A}[21:0]$ invalid | $(WH + 1) * E - 4$ | | $(WH + 1) * E + 4$ ns |

(1) RS = Read setup, RST = Read STrobe, RH = Read Hold, WS = Write Setup, WST = Write STrobe, WH = Write Hold, TA = Turn Around, EW = Extend Wait mode, SS = Select Strobe mode. These parameters are programmed via the Asynchronous n Configuration and Asynchronous Wait Cycle Configuration Registers.
(2) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 300 MHz, use E = 20 ns.
(3) When EW = 1, the EMIF will extend the strobe period up to 4,096 additional cycles when the EM_WAIT pin is asserted by the external device.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module (see Figure 6-14 and Figure 6-15) (continued)

| NO | PARAMETER | -3/-3Q/-3S | | | UNIT |

6.9.4 DDR2 Memory Controller

The DDR2 Memory Controller is a dedicated interface to DDR2 SDRAM. It supports JESD79D-2A standard compliant DDR2 SDRAM Devices and can interface to 16-bit DDR2 SDRAM devices. For details on the DDR2 Memory Controller, see the *TMS320DM643x DMP DDR2 Memory Controller User's Guide* (literature number [SPRU986](#)).

DDR2 SDRAM plays a key role in a DaVinci-based system. Such a system is expected to require a significant amount of high-speed external memory for:

- Buffering of input image data from sensors or video sources
- Intermediate buffering for large raw Bayer data image files while performing image processing functions
- Buffering for intermediate data while performing video encode and decode functions
- Storage of executable code for the DSP

A memory map of the DDR2 Memory Controller registers is shown in [Table 6-26](#).

Table 6-26. DDR2 Memory Controller Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|---------------------------|----------|--|
| 0x01C4 004C | DDRVTPER | DDR2 VTP Enable Register |

6.9.4.1 DDR2 Memory Controller Electrical Data/Timing

The *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)) specifies a complete DDR2 interface solution for the DM6431 as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met.

TI only supports board designs that follow the guidelines outlined in the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

Table 6-27. Switching Characteristics Over Recommended Operating Conditions for DDR2 Memory Controller⁽¹⁾⁽²⁾(see Figure 6-18)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT |
|-----|---------------------------------------|------------|-----|------|
| | | MIN | MAX | |
| 1 | $t_{c(DDR_CLK)}$ Cycle time, DDR_CLK | 7.5 | 8 | ns |

- (1) DDR_CLK cycle time = 2 x PLL2 _SYSCLK1 cycle time.
- (2) The PLL2 Controller **must** be programmed such that the resulting DDR_CLK clock frequency is within the specified range.

Figure 6-18. DDR2 Memory Controller Clock Timing

6.10 Video Processing Sub-System (VPSS) Overview

The DM6431 Video Processing Sub-System (VPSS) provides a Video Processing Front End (VPFE) input interface for external imaging peripherals (i.e., image sensors, video decoders, etc.).

The VPSS register memory mapping is shown in [Table 6-28](#).

Table 6-28. VPSS Register Descriptions

| HEX ADDRESS RANGE | REGISTER ACRONYM | Description |
|------------------------------|------------------|---|
| 0x01C7 3400 | PID | Peripheral Revision and Class Information |
| 0x01C7 3404 | PCR | VPSS Control Register |
| 0x01C7 3408 | - | Reserved |
| 0x01C7 3508 | SDR_REG_EXP | SDRAM Non Real-Time Read Request Expand |
| 0x01C7 350C - 0x01C7 3FFF | - | Reserved |

6.10.1 Video Processing Front-End (VPFE)

The Video Processing Front-End (VPFE) consists of the CCD Controller (CCDC). Together, these modules provide DM6431 with a powerful and flexible front-end interface. This module is briefly described below:

- The CCDC provides an interface to image sensors and digital video sources.

The VPFE register memory mapping is shown in [Table 6-29](#).

Table 6-29. VPFE Register Address Range Descriptions

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|---------------------------|---------|------------------------------------|
| 0x01C7 0400 – 0x01C7 07FF | CCDC | VPFE – CCD Controller |
| 0x01C7 3400 – 0x01C7 3FFF | VPSS | VPSS Shared Buffer Logic Registers |

6.10.1.1 CCD Controller (CCDC)

The CCDC receives raw image/video data from sensors (CMOS or CCD) or YUV video data in numerous formats from video decoder devices. The following features are supported by the CCDC module.

- Conventional Bayer pattern format (either 8- or 10-bit).
- Generates HD/VD timing signals and field ID to an external timing generator or can synchronize to an external timing generator.
- Interface to progressive and interlaced sensors.
- REC656/CCIR-656 standard (YCbCr 4:2:2 format, either 8- or 10-bit).
- 8-bit YCbCr 4:2:2 format with discrete H and VSYNC signals.
- Optical black clamping signal generation.
- Shutter signal control.
- Digital clamping and black level compensation.
- 10-bit to 8-bit A-law compression.
- Low-pass filter prior to writing to SDRAM. If this filter is enabled, 2 pixels each in the left and right edges of each line are cropped from the output.
- Output range from 10-bits to 8-bits wide (8-bits wide allows for 50% saving in storage area).
- Downsampling via programmable culling patterns.
- Control output to the DDR2 via an external write enable signal.
- Up to 16K pixels (image size) in both the horizontal and vertical direction.

The CCDC register memory mapping is shown in [Table 6-30](#).

Table 6-30. CCDC Register Descriptions

| HEX ADDRESS RANGE | REGISTER ACRONYM | DESCRIPTION |
|-------------------|------------------|--|
| 0x01C7 0400 | PID | Peripheral Revision and Class Information |

6.11 Universal Asynchronous Receiver/Transmitter (UART)

The DM6431 device has one UART peripheral (UART0). UART0 has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
 - 5, 6, 7, or 8-bit characters
 - Even, odd, or no parity bit generation and detection
 - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
 - Loopback controls for communications link fault isolation
 - Break, parity, overrun, and framing error simulation
- Modem control functions (CTS, RTS)

The UART0 registers are listed in [Table 6-35](#).

6.11.1 UART Peripheral Register Description(s)

Table 6-35. UART0 Register Descriptions

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|---------------------------|-------------|---|
| 0x01C2 0000 | RBR | UART0 Receiver Buffer Register (Read Only) |
| 0x01C2 0000 | THR | UART0 Transmitter Holding Register (Write Only) |

6.11.2 UART Electrical Data/Timing

Table 6-36. Timing Requirements for UARTx Receive⁽¹⁾ (see Figure 6-23)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|---------------------|---|------------|-------|------|
| | | | MIN | MAX | |
| 4 | $t_w(\text{URXDB})$ | Pulse duration, receive data bit (URXDx) [15/30/100 pF] | 0.96U | 1.05U | ns |
| 5 | $t_w(\text{URXSB})$ | Pulse duration, receive start bit [15/30/100 pF] | 0.96U | 1.05U | ns |

(1) U = UART baud time = 1/programmed baud rate.

Table 6-37. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit⁽¹⁾ (see Figure 6-23)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT |
|-----|---------------------|--------------------------------|-------|---------|
| | | MIN | MAX | |
| 1 | $f_{(\text{baud})}$ | Maximum programmable baud rate | | 128 kHz |
| 2 | $t_w(\text{UTXDB})$ | U - 2 | U + 2 | ns |
| 3 | $t_w(\text{UTXSB})$ | U - 2 | U + 2 | ns |

(1) U = UART baud time = 1/programmed baud rate.

Figure 6-23. UART Transmit/Receive Timing

6.12 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module provides an interface between DM6431 and other devices compliant with Philips Semiconductors Inter-IC bus (I²C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

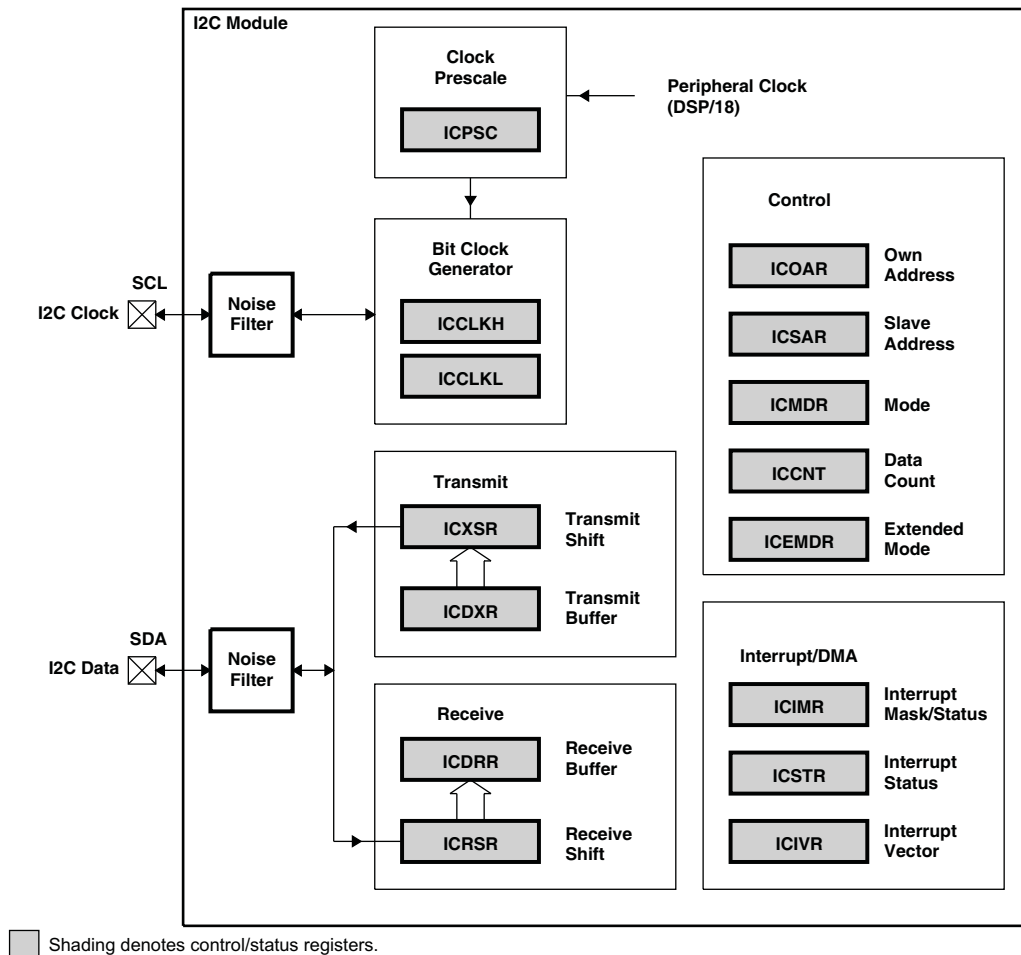

Figure 6-24. I2C Module Block Diagram

For more detailed information on the I2C peripheral, see [Section 2.9, Documentation Support](#) section of this document for the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number SPRU983).

6.12.1 I2C Peripheral Register Description(s)

Table 6-38. I2C Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|-------------------|---------|--|
| 0x1C2 1000 | ICOAR | I2C Own Address Register |
| 0x1C2 1004 | ICIMR | I2C Interrupt Mask Register |
| 0x1C2 1008 | ICSTR | I2C Interrupt Status Register |

6.12.2 I2C Electrical Data/Timing

6.12.2.1 Inter-Integrated Circuits (I2C) Timing

Table 6-39. Timing Requirements for I2C Timings⁽¹⁾ (see Figure 6-25)

| NO. | | | -3/-3Q/-3S | | | | UNIT |
|-----|----------------------|---|------------------|------|------------------------------|--------------------|---------------|
| | | | STANDARD MODE | | FAST MODE | | |
| | | | MIN | MAX | MIN | MAX | |
| 1 | $t_{c(SCL)}$ | Cycle time, SCL | 10 | | 2.5 | | μs |
| 2 | $t_{su(SCLH-SDAL)}$ | Setup time, SCL high before SDA low (for a repeated START condition) | 4.7 | | 0.6 | | μs |
| 3 | $t_h(SCLL-SDAL)$ | Hold time, SCL low after SDA low (for a START and a repeated START condition) | 4 | | 0.6 | | μs |
| 4 | $t_w(SCLL)$ | Pulse duration, SCL low | 4.7 | | 1.3 | | μs |
| 5 | $t_w(SCLH)$ | Pulse duration, SCL high | 4 | | 0.6 | | μs |
| 6 | $t_{su(SDAV-SCLH)}$ | Setup time, SDA valid before SCL high | 250 | | 100 ⁽²⁾ | | ns |
| 7 | $t_h(SDA-SCLL)$ | Hold time, SDA valid after SCL low | 0 ⁽³⁾ | | 0 ⁽³⁾ | 0.9 ⁽⁴⁾ | μs |
| 8 | $t_w(SDAH)$ | Pulse duration, SDA high between STOP and START conditions | 4.7 | | 1.3 | | μs |
| 9 | $t_r(SDA)$ | Rise time, SDA | | 1000 | $20 + 0.1C_b$ ⁽⁵⁾ | 300 | ns |
| 10 | $t_r(SCL)$ | Rise time, SCL | | 1000 | $20 + 0.1C_b$ ⁽⁵⁾ | 300 | ns |
| 11 | $t_f(SDA)$ | Fall time, SDA | | 300 | $20 + 0.1C_b$ ⁽⁵⁾ | 300 | ns |
| 12 | $t_f(SCL)$ | Fall time, SCL | | 300 | $20 + 0.1C_b$ ⁽⁵⁾ | 300 | ns |
| 13 | $t_{su(SCLH-SDAH)}$ | Setup time, SCL high before SDA high (for STOP condition) | 4 | | 0.6 | | μs |
| 14 | $t_w(SP)$ | Pulse duration, spike (must be suppressed) | | | 0 | 50 | ns |
| 15 | C_b ⁽⁵⁾ | Capacitive load for each bus line | | 400 | | 400 | pF |

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_h(SDA-SCLL)$ has only to be met if the device does not stretch the low period [$t_w(SCLL)$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 6-25. I2C Receive Timings

Table 6-40. Switching Characteristics for I2C Timings⁽¹⁾ (see Figure 6-26)

| NO. | PARAMETER | -3/-3Q/-3S | | | | UNIT |
|-----|--------------------|---|-----|-----------|---------------------|---------------|
| | | STANDARD MODE | | FAST MODE | | |
| | | MIN | MAX | MIN | MAX | |
| 16 | $t_{c(SCL)}$ | Cycle time, SCL | | 10 | 2.5 | μs |
| 17 | $t_{d(SCLH-SDAL)}$ | Delay time, SCL high to SDA low (for a repeated START condition) | | 4.7 | 0.6 | μs |
| 18 | $t_{d(SDAL-SCLL)}$ | Delay time, SDA low to SCL low (for a START and a repeated START condition) | | 4 | 0.6 | μs |
| 19 | $t_{w(SCLL)}$ | Pulse duration, SCL low | | 4.7 | 1.3 | μs |
| 20 | $t_{w(SCLH)}$ | Pulse duration, SCL high | | 4 | 0.6 | μs |
| 21 | $t_{d(SDAV-SCLH)}$ | Delay time, SDA valid to SCL high | | 250 | 100 | ns |
| 22 | $t_{v(SCLL-SDAV)}$ | Valid time, SDA valid after SCL low | | 0 | 0 0.9 | μs |
| 23 | $t_{w(SDAH)}$ | Pulse duration, SDA high between STOP and START conditions | | 4.7 | 1.3 | μs |
| 24 | $t_{r(SDA)}$ | Rise time, SDA | | 1000 | $20 + 0.1C_b^{(1)}$ | 300 ns |
| 25 | $t_{r(SCL)}$ | Rise time, SCL | | 1000 | $20 + 0.1C_b^{(1)}$ | 300 ns |
| 26 | $t_{f(SDA)}$ | Fall time, SDA | | 300 | $20 + 0.1C_b^{(1)}$ | 300 ns |
| 27 | $t_{f(SCL)}$ | Fall time, SCL | | 300 | $20 + 0.1C_b^{(1)}$ | 300 ns |
| 28 | $t_{d(SCLH-SDAH)}$ | Delay time, SCL high to SDA high (for STOP condition) | | 4 | 0.6 | μs |
| 29 | C_p | Capacitance for each I2C pin | | 10 | 10 | pF |

(1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

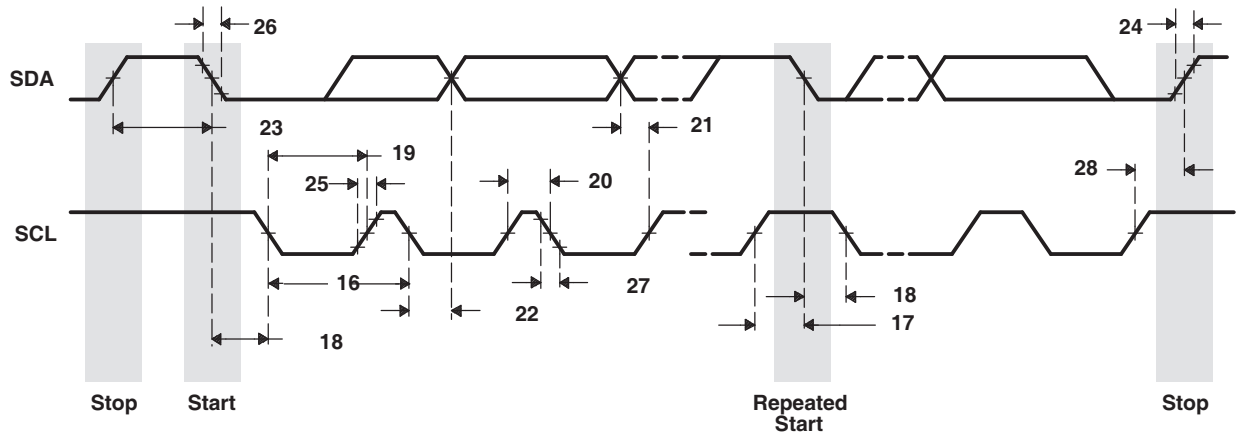

Figure 6-26. I2C Transmit Timings

6.13 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer

If internal clock source is used, the CLKGDV field of the Sample Rate Generator Register (SRGR) must always be set to a value of 1 or greater.

For more detailed information on the McBSP peripheral, see the *TMS320DM643x DMP Multichannel Buffered Serial Port (McBSP) User's Guide* (literature number [SPRU943](#)).

6.13.1 McBSP Peripheral Register Description(s)

Table 6-41. McBSP 0 Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME | COMMENTS |
|-----------------------|---------|--|--|

6.13.2 McBSP Electrical Data/Timing

6.13.2.1 Multichannel Buffered Serial Port (McBSP) Timing

Table 6-42. Timing Requirements for McBSP⁽¹⁾ (see Figure 6-27)

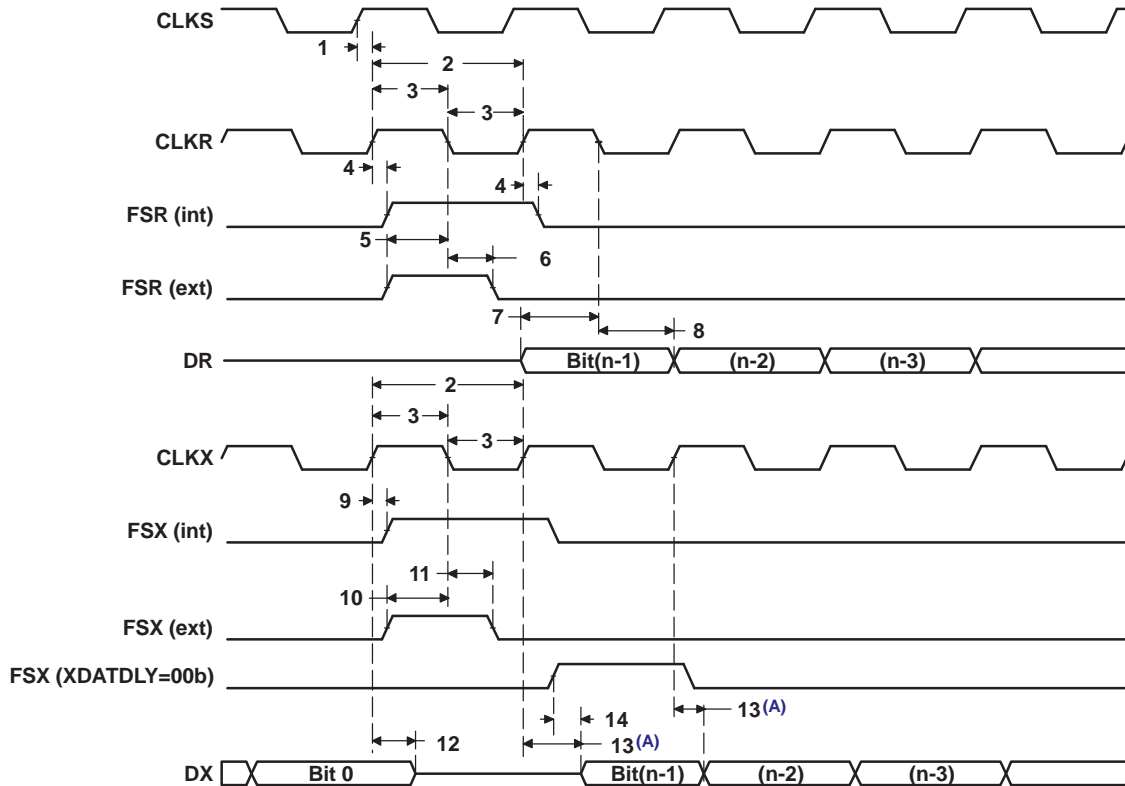

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|--------------------|---|------------|----------------------|------|
| | | | MIN | MAX | |
| 2 | $t_{c(CKRX)}$ | Cycle time, CLKR/X | CLKR/X ext | 2P ⁽²⁾⁽³⁾ | ns |
| 3 | $t_{w(CKRX)}$ | Pulse duration, CLKR/X high or CLKR/X low | CLKR/X ext | P - 1 ⁽⁴⁾ | ns |
| 5 | $t_{su(FRH-CKRL)}$ | Setup time, external FSR high before CLKR low | CLKR int | 14 | ns |
| | | | CLKR ext | 4 | |
| 6 | $t_{h(CKRL-FRH)}$ | Hold time, external FSR high after CLKR low | CLKR int | 6 | ns |
| | | | CLKR ext | 4 | |
| 7 | $t_{su(DRV-CKRL)}$ | Setup time, DR valid before CLKR low | CLKR int | 14 | ns |
| | | | CLKR ext | 4 | |
| 8 | $t_{h(CKRL-DRV)}$ | Hold time, DR valid after CLKR low | CLKR int | 3 | ns |
| | | | CLKR ext | 3.5 | |
| 10 | $t_{su(FXH-CKXL)}$ | Setup time, external FSX high before CLKX low | CLKX int | 14 | ns |
| | | | CLKX ext | 4 | |
| 11 | $t_{h(CKXL-FXH)}$ | Hold time, external FSX high after CLKX low | CLKX int | 6 | ns |
| | | | CLKX ext | 3 | |

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) P = SYSCLK3 period in ns. For example, when running parts at 300 MHz, use P = 20 ns.
- (3) Use whichever value is greater. Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

Table 6-43. Switching Characteristics Over Recommended Operating Conditions for McBSP⁽¹⁾⁽²⁾
(see [Figure 6-27](#))

| NO. | PARAMETER | | -3/-3Q/-3S | | UNIT |
|-----|----------------------|--|-------------------|------------------|------|
| | | | MIN | MAX | |
| 1 | $t_{d(CKSH-CKRXH)}$ | Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input | 3 | 10 | ns |
| 2 | $t_c(CKRX)$ | Cycle time, CLKR/X | $2P^{(3)(4)(5)}$ | | ns |
| 3 | $t_w(CKRX)$ | Pulse duration, CLKR/X high or CLKR/X low | $C - 2^{(6)}$ | $C + 2^{(6)}$ | ns |
| 4 | $t_{d(CKRH-FRV)}$ | Delay time, CLKR high to internal FSR valid | -4 | 5.5 | ns |
| 9 | $t_{d(CKXH-FXV)}$ | Delay time, CLKX high to internal FSX valid | -4 | 5.5 | ns |
| | | | CLKX int | 2.5 | |
| 12 | $t_{dis(CKXH-DXHZ)}$ | Disable time, DX high impedance following last data bit from CLKX high | -5.5 | 7.5 | ns |
| | | | CLKX ext | -2.1 | |
| 13 | $t_{d(CKXH-DXV)}$ | Delay time, CLKX high to DX valid | $-4 + D1^{(7)}$ | $5.5 + D2^{(7)}$ | ns |
| | | | CLKX int | $2.5 + D1^{(7)}$ | |
| 14 | $t_{d(FXH-DXV)}$ | Delay time, FSX high to DX valid | -4 ⁽⁸⁾ | 5 ⁽⁸⁾ | ns |
| | | ONLY applies when in data delay 0 (XDATDLY = 00b) mode | FSX int | 1 ⁽⁸⁾ | |

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) Minimum delay times also represent minimum output hold times.
- (3) Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) P = SYSCLK3 period in ns. For example, when running parts at 300 MHz, use P = 20 ns.
- (5) Use whichever value is greater.
- (6) C = H or L
S = sample rate generator input clock = P if CLKSM = 1 (P = SYSCLK3 period)
S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)
H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even
H = (CLKGDV + 1)/2 * S if CLKGDV is odd
L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even
L = (CLKGDV + 1)/2 * S if CLKGDV is odd
CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see (4) above).
- (7) Extra delay from CLKX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P
- (8) Extra delay from FSX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P

A. Parameter No. 13 applies to the first data bit *only* when XDATDLY \neq 0.

Figure 6-27. McBSP Timing^(B)

Figure 6-32. McBSP Timing as SPI Master or Slave: CLKSTP = 11b, CLKXP = 1

6.14 Multichannel Audio Serial Port (McASP0) Peripheral

The McASP functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

6.14.1 McASP0 Device-Specific Information

The DM6431 device includes one multichannel audio serial port (McASP) interface peripheral (McASP0). The McASP0 is a serial port optimized for the needs of multichannel audio applications.

The McASP0 consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or alternatively, the transmit and receive sections may be synchronized. The McASP module also includes a pool of 16 shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP supports the TDM synchronous serial format.

The McASP can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format. However, the transmit and receive formats need not be the same.

Both the transmit and receive sections of the McASP also support burst mode which is useful for non-audio data (for example, passing control information between two DSPs).

The McASP peripheral has additional capability for flexible clock generation, and error detection/handling, as well as error management.

For more detailed information on and the functionality of the McASP0 peripheral, see the *TMS320DM643x DMP Multichannel Audio Serial Port (McASP) User's Guide* (literature number SPRU980).

6.14.1.1 McASP Block Diagram

Figure 6-33 illustrates the major blocks along with external signals of the McASP0 peripheral; and shows the 4 serial data [AXR] pins.

| | | | ACLKX ext input | 0 12.5 | ns |
| | | | ACLKX ext output | 0 14 | ns |
| 15 | $t_{dis(CKRX-AXRHZ)}$ | Disable time, AXR high impedance following last data bit from ACLKR/X transmit edge | ACLKR/X int | -4.5 8 | ns |
| | | | ACLKR/X ext | -4.5 12.5 | ns |

(1) A = (ACLKR/X period)/2 in ns. For example, when ACLKR/X period is 25 ns, use A = 12.5 ns.

(2) AH = (AHCLKR/X period)/2 in ns. For example, when AHCLKR/X period is 25 ns, use AH = 12.5 ns.

(3) ACLKX internal: ACLKXCTL.CLKXM=1, PDIR.ACLKX = 1
 ACLKX external input: ACLKXCTL.CLKXM=0, PDIR.ACLKX=0
 ACLKX external output: ACLKXCTL.CLKXM=0, PDIR.ACLKX=1
 ACLKR internal: ACLKRCTL.CLKRM=1, PDIR.ACLKR = 1
 ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0
 ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1

- A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).
- B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 6-34. McASP Input Timings

- A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 6-35. McASP Output Timings

6.15 High-End Controller Area Network Controller (HECC)

The DM6431 device has a High-End Controller Area Network Controllers (HECC). The HECC uses established protocol to communicate serially with other controllers in harsh environments. The HECC is fully compliant with the Controller Area Network (CAN) protocol, version 2.0B.

Key features of the HECC include the following:

- CAN, version 2.0B compliant
- 32 RX/TX message objects
- 32 receive identifier masks
- Programmable wake-up on bus activity
- Programmable interrupt scheme
- Automatic reply to a remote request
- Automatic re-transmission in case of error or loss of arbitration
- Protection against reception of a new message
- 32-bit time stamp
- Local network time counter
- Programmable priority register for each message
- Programmable transmission and reception time-out
- HECC/SCC mode of operation
- Standard-Extended Identifier
- Self-test mode

For more details on the HECC, see the *TMS320DM643x High-End CAN Controller (HECC) User's Guide* (literature number SPRU981).

6.15.1 HECC Device-Specific Information

Software **must not** access "Reserved" locations of the HECC. Access to HECC "Reserved" locations may hang the device.

6.15.2 HECC Peripheral Register Description(s)

Table 6-57 through Table 6-60 show the High-End CAN Controller (HECC) registers. For more detailed information, see the *TMS320DM643x DMP High-End CAN Controller User's Guide* (literature number [SPRU981](#)).

Table 6-57. HECC Control and Status Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|-----------------------|---------|--|
| 01C2 3000 | CANME | Mailbox Enable Register |
| 01C2 3004 | CANMD | Mailbox Direction Register |

Table 6-59. HECC Message Mailbox RAM⁽¹⁾⁽²⁾

| HEX ADDRESS RANGE | DESCRIPTION |
|-----------------------|---------------------------------|
| 01C2 4000 – 01C2 400F | Mailbox 0 (4 32-bit Registers) |
| 01C2 4010 – 01C2 401F | Mailbox 1 (4 32-bit Registers) |
| 01C2 4020 – 01C2 402F | Mailbox 2 (4 32-bit Registers) |
| 01C2 4030 – 01C2 403F | Mailbox 3 (4 32-bit Registers) |
| 01C2 4040 – 01C2 404F | Mailbox 4 (4 32-bit Registers) |
| ... | ... |
| 01C2 41E0 – 01C2 41EF | Mailbox 30 (4 32-bit Registers) |
| 01C2 41F0 – 01C2 41FF | Mailbox 31 (4 32-bit Registers) |

- (1) This table summarizes the address ranges for the Message Mailboxes 0 to 31. For the contents within each Message Mailbox RAM, see [Table 6-60, Message Mailbox n RAM Entries](#).
- (2) For SCC mode, *only* Mailboxes 0 to 15 are supported.

Table 6-60. HECC Message Mailbox n RAM Entries⁽¹⁾

| HEX ADDRESS OFFSET (within RAM) | ACRONYM ⁽²⁾ | MAILBOX REGISTER NAME |
|---------------------------------|------------------------|---|
| 0 | MIDn | Message Identifier Register for Mailbox n |
| 4 | MCFn | Message Control Field Register for Mailbox n |
| 8 | MDLn | Message Data Low-Word Register for Mailbox n |
| C | MDHn | Message Data High-Word Register for Mailbox n |

- (1) For the hex address range of Mailbox n, see [Table 6-59, Message Mailbox RAM](#). For example, Message Mailbox 0 occupies hex address range 0x01C2 4000 – 0x01C2 400F.
- (2) The suffix "n" indicates the Message Mailbox number. For example, Message Mailbox 0 has the following Message Mailbox Registers: MID0, MCF0, MDL0, and MDH0.

6.15.3 HECC Electrical Data/Timing

Table 6-61. Timing Requirements for HECC Receive⁽¹⁾ (see Figure 6-36)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|------------------------|----------------------------------|------------|-------|------|
| | | | MIN | MAX | |
| 1 | $f_{(\text{baud})}$ | Maximum programmable baud rate | | 1 | Mbps |
| 2 | $t_w(\text{HECC_RX})$ | Pulse duration, receive data bit | H - 2 | H + 2 | ns |

(1) H = HECC baud time = 1/programmed baud rate.

Table 6-62. Switching Characteristics Over Recommended Operating Conditions for HECC Transmit⁽¹⁾ (see Figure 6-36)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT | |
|-----|------------------------|-----------------------------------|-------|-------|------|
| | | MIN | MAX | | |
| 3 | $f_{(\text{baud})}$ | Maximum programmable baud rate | | 1 | Mbps |
| 4 | $t_w(\text{HECC_TX})$ | Pulse duration, transmit data bit | H - 2 | H + 2 | ns |

(1) H = HECC baud time = 1/programmed baud rate.

Figure 6-36. HECC Transmit/Receive Timing

6.16 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between DM6431 and the network. The DM6431 EMAC supports both 10Base-T (10 Mbits/second [Mbps]) and 100Base-TX (100 Mbps) in either half- or full-duplex mode. The EMAC module also supports hardware flow control and quality of service (QoS) support.

The EMAC controls the flow of packet data from the DM6431 device to the PHY. The MDIO module controls PHY configuration and status monitoring.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

Both the EMAC and the MDIO modules interface to the DM6431 device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

For the *DM6431 Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRU941) which describes the DM6431 EMAC peripheral in detail, see [Section 2.9, Documentation Support](#) section . For a list of supported registers and register fields, see [Table 6-63](#) [Ethernet MAC (EMAC) Control Registers] and [Table 6-64](#) [EMAC Statistics Registers] in this data manual.

6.16.1 EMAC Peripheral Register Description(s)

Table 6-63. Ethernet MAC (EMAC) Control Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|-------------------|------------------|---|
| 01C8 0000 | TXIDVER | Transmit Identification and Version Register |
| 01C8 0004 | TXCONTROL | Transmit Control Register |
| 01C8 0008 | TXTEARDOWN | Transmit Teardown Register |
| 01C8 0010 | RXIDVER | Receive Identification and Version Register |
| 01C8 0014 | RXCONTROL | Receive Control Register |
| 01C8 0018 | RXTEARDOWN | Receive Teardown Register |

6.17 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time.

For more detailed information on the MDIO peripheral, see the *Documentation Support* section for the Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module Reference Guide. For a list of supported registers and register fields, see [Table 6-71](#) [MDIO Registers] in this data manual.

6.17.1 Peripheral Register Description(s)

6.18 Timers

The DM6431 device has 3 64-bit general-purpose timers which have the following features:

- 64-bit count-up counter
- Timer modes:
 - 64-bit general-purpose timer mode (Timer 0 and 1)
 - Dual 32-bit general-purpose timer mode (Timer 0 and 1)
 - Watchdog timer mode (Timer 2)
- 2 possible clock sources:
 - Internal clock

- External clock input via timer input pin TINPL (Timer 0 and 1 only)
- 2 operation modes:
 - One-time operation (timer runs for one period then stops)
 - Continuous operation (timer automatically resets after each period)
- Generates interrupts to the DSP
- Generates sync event to EDMA
- Causes device global reset upon watchdog timer timeout (Timer 2 only)

For more detailed information, see [Section 2.9, Documentation Support](#) for the *TMS320DM643x DMP 64-Bit Timer User's Guide* (literature number SPRU989).

6.18.2 Timer Electrical Data/Timing

Table 6-77. Timing Requirements for Timer Input⁽¹⁾⁽²⁾⁽³⁾ (see Figure 6-43)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|----------------|-----------------------------|--|-------|------|
| | | | MIN | MAX | |
| 1 | $t_{w(TINPH)}$ | Pulse duration, TINPxL high | TINP0L, if TIMERCTL.TINP0SEL = 0 [default] | 2P | ns |
| | | | TINP0L, if TIMERCTL.TINP0SEL = 1 | 0.33P | ns |
| | | | TINP1L | 2P | ns |
| 2 | $t_{w(TINPL)}$ | Pulse duration, TINPxL low | TINP0L, if TIMERCTL.TINP0SEL = 0 [default] | 2P | ns |
| | | | TINP0L, if TIMERCTL.TINP0SEL = 1 | 0.33P | ns |
| | | | TINP1L | 2P | ns |

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $P = 37.037$ ns.
- (2) The TIMERCTL.TINP0SEL field in the System Module determines if the TINP0L input directly goes to Timer 0 (TIMERCTL.TINP0SEL=0), or if the TINP0L input is first divided down by 6 before going to Timer 0 (TIMERCTL.TINP0SEL=1).
- (3) TINP1L input goes directly to Timer 1.

Table 6-78. Switching Characteristics Over Recommended Operating Conditions for Timer Output⁽¹⁾ (see Figure 6-43)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|----------------|-----------------------------|------------|-----|------|
| | | | MIN | MAX | |
| 3 | $t_{w(TOUTH)}$ | Pulse duration, TOUTxL high | P | | ns |
| 4 | $t_{w(TOURL)}$ | Pulse duration, TOUTxL low | P | | ns |

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $P = 37.037$ ns.

Figure 6-43. Timer Timing

6.19 Pulse Width Modulator (PWM)

The 3 DM6431 Pulse Width Modulator (PWM) peripherals support the following features:

- Period counter
- First-phase duration counter
- Repeat count for one-shot operation
- Configurable to operate in either one-shot or continuous mode
- Buffered period and first-phase duration registers
- One-shot operation triggerable by hardware events with programmable edge transitions. (low-to-high or high-to-low).
- One-shot operation generates N+1 periods of waveform, N being the repeat count register value
- Emulation support

The register memory maps for PWM0/1/2 are shown in [Table 6-79](#), [Table 6-80](#), and [Table 6-81](#).

| 3 | $t_t(\text{PWM})$ | Transition time, PWMx | | 5 | ns |
| 4 | $t_d(\text{CCDC-PWMV})$ | Delay time, CCDC(VD) trigger event to PWMx valid | 2 | 10 | ns |

Figure 6-44. PWM Output Timing

Figure 6-45. PWM Output Delay Timing

6.20 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GP[0:15]).

The DM6431 GPIO peripheral supports the following:

- Up to 111 3.3-V GPIO pins, GP[0:110]
- Interrupts:
 - Up to 8 unique GP[0:7] interrupts from Bank 0
 - 7 GPIO bank (aggregated) interrupt signals from each of the 7 banks of GPIOs
 - Interrupts can be triggered by rising and/or falling edge, specified for each interrupt capable GPIO signal
- DMA events:
 - Up to 8 unique GPIO DMA events from Bank 0
 - 7 GPIO bank (aggregated) DMA event signals from each of the 7 banks of GPIOs
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in [Table 6-83](#). For more detailed information on GPIOs, see the *TMS320DM643x DMP General-Purpose Input/Output (GPIO) User's Guide* (literature number [SPRU988](#)).

6.20.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-84. Timing Requirements for GPIO Inputs⁽¹⁾ (see Figure 6-46)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|---------------|----------------------------------|------------|-----|------|
| | | | MIN | MAX | |
| 1 | $t_{w(GPIH)}$ | Pulse duration, GP[x] input high | $2C^{(2)}$ | | ns |
| 2 | $t_{w(GPIL)}$ | Pulse duration, GP[x] input low | $2C^{(2)}$ | | ns |

- (1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have DM6431 recognize the GP[x] input changes through software polling of the GPIO register, the GP[x] input duration must be extended to allow DM6431 enough time to access the GPIO register through the internal bus.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 300 MHz, use C = 20 ns.

Table 6-85. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-46)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT |
|-----|---------------|---------------|-----|------|
| | | MIN | MAX | |
| 3 | $t_{w(GPOH)}$ | $2C^{(1)(2)}$ | | ns |
| 4 | $t_{w(GPOL)}$ | $2C^{(1)(2)}$ | | ns |

- (1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 300 MHz, use C = 20 ns.

Figure 6-46. GPIO Port Timing

6.21 IEEE 1149.1 JTAG

The JTAG⁽³⁾ interface is used for BSDL testing and emulation of the DM6431 device.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. **Note:** $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

For maximum reliability, DM6431 includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

6.21.1 JTAG ID (JTAGID) Register Description(s)

(3) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

Table 6-86. JTAG ID (JTAGID) Register

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME | COMMENTS |
|-------------------|---------|------------------------------|---|
| 0x01C4 0028 | JTAGID | JTAG Identification Register | Read-only. Provides 32-bit JTAG ID of the device. |

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the DM6431 device, the JTAG ID register resides at address location 0x01C4 0028. For the actual register bit names and their associated bit field descriptions, see [Figure 6-47](#) and [Table 6-87](#).

| 31-28 | 27-12 | 11-1 | 0 |
|-----------------|-----------------------|-----------------------|-----|
| VARIANT (4-Bit) | PART NUMBER (16-Bit) | MANUFACTURER (11-Bit) | LSB |
| R-n | R-1011 0111 0010 0001 | R-0000 0010 111 | R-1 |

LEGEND: R = Read, W = Write, n = value at reset

Figure 6-47. JTAG ID (JTAGID) Register—0x01C4 0028

Table 6-87. JTAG ID (JTAGID) Register Selection Bit Descriptions

| BIT | NAME | DESCRIPTION |
|-------|--------------|--|
| 31:28 | VARIANT | Variant (4-Bit) value. A read from this field always returns 0b0000. |
| 27:12 | PART NUMBER | Part Number (16-Bit) value. DM6431 value: 1011 0111 0010 0001. |
| 11-1 | MANUFACTURER | Manufacturer (11-Bit) value. DM6431 value: 0000 0010 111. |
| 0 | LSB | LSB. This bit is read as a "1" for DM6431. |

6.21.2 JTAG Electrical Data/Timing

Table 6-88. Timing Requirements for JTAG Test Port (see Figure 6-48)

| NO. | | | -3/-3Q/-3S | | UNIT |
|-----|----------------------------|---|------------|-----|------|
| | | | MIN | MAX | |
| 1 | $t_c(\text{TCK})$ | Cycle time, TCK | 33 | | ns |
| 3 | $t_{su}(\text{TDIV-TCKH})$ | Setup time, TDI/TMS/ $\overline{\text{TRST}}$ valid before TCK high | 2.5 | | ns |
| 4 | $t_h(\text{TCKH-TDIV})$ | Hold time, TDI/TMS/ $\overline{\text{TRST}}$ valid after TCK high | 16.5 | | ns |

Table 6-89. Switching Characteristics Over Recommended Operating Conditions for JTAG Test Port (see Figure 6-48)

| NO. | PARAMETER | -3/-3Q/-3S | | UNIT |
|-----|-------------------------|------------|-----|------|
| | | MIN | MAX | |
| 2 | $t_d(\text{TCKL-TDOV})$ | 0 | 14 | ns |

7 Mechanical Data

The following table(s) show the thermal resistance characteristics for the PBGA–ZWT and ZDU mechanical package(s). For more details, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).

7.1 Thermal Data for ZWT

Table 7-1. Thermal Resistance Characteristics (PBGA Package) [ZWT]

| NO. | | | °C/W ⁽¹⁾ | AIR FLOW (m/s) ⁽²⁾ |
|-----|-----------------|-------------------------|---------------------|-------------------------------|
| 1 | R θ_{JC} | Junction-to-case | 5.4 | N/A |
| 2 | R θ_{JB} | Junction-to-board | 16.0 | N/A |
| 3 | R θ_{JA} | Junction-to-free air | 26.6 | 0.00 |
| 4 | | | 21.9 | 1.0 |
| 5 | | | 20.4 | 2.00 |
| 7 | | | 0.0 | 0.00 |
| 8 | Psi $_{JT}$ | Junction-to-package top | 0.1 | 1.0 |
| 9 | | | 0.2 | 2.00 |
| 11 | Psi $_{JB}$ | Junction-to-board | 15.9 | 0.00 |
| 12 | | | 15.8 | 1.0 |
| 13 | | | 15.3 | 2.00 |

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.

For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.1 Thermal Data for ZDU

Table 7-2. Thermal Resistance Characteristics (PBGA Package) [ZDU]

| NO. | | | °C/W ⁽¹⁾ | AIR FLOW (m/s) ⁽²⁾ |
|-----|--------------------------|-------------------------|---------------------|-------------------------------|
| 1 | R θ _{JC} | Junction-to-case | 7.7 | N/A |
| 2 | R θ _{JB} | Junction-to-board | 10.5 | N/A |
| 3 | R θ _{JA} | Junction-to-free air | 19.7 | 0.00 |
| 4 | | | 15.5 | 1.0 |
| 5 | | | 14.3 | 2.00 |
| 7 | Psi _{JT} | Junction-to-package top | 4.9 | 0.00 |
| 8 | | | 5.1 | 1.0 |
| 9 | | | 5.2 | 2.00 |
| 11 | Psi _{JB} | Junction-to-board | 10.4 | 0.00 |
| 12 | | | 9.8 | 1.0 |
| 13 | | | 9.6 | 2.00 |

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.

For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.2 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|-------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|---------------------------------|-------------------------|
| TMS320DM6431ZWT3 | ACTIVE | NFBGA | ZWT | 361 | 90 | RoHS & Green | SNAGCU | Level-3-260C-168 HR | 0 to 90 | L2 DM6431ZWT TMS320 3 | Samples |
| TMS320DM6431ZWTQ3 | ACTIVE | NFBGA | ZWT | 361 | 90 | RoHS & Green | SNAGCU | Level-3-260C-168 HR | -40 to 125 | L1 DM6431ZWTQ TMS320 3 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TRAY

Chamfer on Tray corner indicates Pin 1 orientation of packed units.

*All dimensions are nominal

| Device | Package Name | Package Type | Pins | SPQ | Unit array matrix | Max temperature (°C) | L (mm) | W (mm) | K0 (µm) | P1 (mm) | CL (mm) | CW (mm) |
|-------------------|--------------|--------------|------|-----|-------------------|----------------------|--------|--------|---------|---------|---------|---------|
| TMS320DM6431ZWT3 | ZWT | NFBGA | 361 | 90 | 6 X 15 | 150 | 315 | 135.9 | 7620 | 20 | 17.5 | 15.45 |
| TMS320DM6431ZWTQ3 | ZWT | NFBGA | 361 | 90 | 6 X 15 | 150 | 315 | 135.9 | 7620 | 20 | 17.5 | 15.45 |

ZWT (S-PBGA-N361)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.
 - D. Falls within JEDEC MO-275.

ZDU (S-PBGA-N376)

PLASTIC BALL GRID ARRAY

4206752-4/E 11/06

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Falls within JEDEC MO-151
 - D. Thermally enhanced molded plastic package with heat slug (HSL).
 - E. This is a lead-free solder ball design.
