

## AM62Ax Sitara™ Processors

### 1 Features

#### Processor Cores:

- Up to Quad 64-bit Arm® Cortex®-A53 microprocessor subsystem at up to 1.4 GHz
  - Quad-core Cortex-A53 cluster with 512KB L2 shared cache with SECDED ECC
  - Each A53 core has 32KB L1 DCache with SECDED ECC and 32KB L1 ICache with Parity protection
- Single-core Arm® Cortex®-R5F at up to 800 MHz, integrated as part of MCU Channel with FFI
  - 32KB ICache, 32KB L1 DCache, and 64KB TCM with SECDED ECC on all memories
  - 512KB SRAM with SECDED ECC
- Single-core Arm® Cortex®-R5F at up to 800 MHz, integrated to support Device Management
  - 32KB ICache, 32KB L1 DCache, and 64KB TCM with SECDED ECC on all memories
- Deep Learning Accelerator based on Single-core C7x
  - C7x floating point, up to 40 GFLOPS, 256-bit Vector DSP at 1.0 GHz
  - Matrix Multiply Accelerator (MMA), up to 2 TOPS (8b) at 1.0 GHz
  - 32KB L1 DCache with SECDED ECC and 64KB L1 ICache with Parity protection
  - 1.25MB of L2 SRAM with SECDED ECC
- Vision Processing Accelerators (VPAC) with Image Signal Processor (ISP) and multiple vision assist accelerators:
  - 315 MPixel/s ISP; Up to 5MP @ 60 fps
  - Support for 12-bit RGB-IR
  - Support for up to 16-bit input RAW format
  - Line support up to 4096
  - Wide Dynamic Range (WDR), Lens Distortion Correction (LDC), Vision Imaging Subsystem (VISS), and Multi-Scalar (MSC) support
    - Output color format : 8-bits, 12-bits, and YUV 4:2:2, YUV 4:2:0, RGB, HSV/HSL

#### Multimedia:

- Display subsystem
  - Single display support
  - Up to 2048x1080 @ 60fps
  - Up to 165-MHz pixel clock support with independent PLL
  - DPI 24-bit RGB parallel interface
  - Supports safety features such as freeze frame detection and MISR data check

- One Camera Serial interface (CSI-2) Receiver with 4-Lane D-PHY
  - MIPI® CSI-2 v1.3 Compliant + MIPI D-PHY 1.2
  - Support for 1,2,3 or 4 data lane mode up to 1.5 Gbps per lane
  - ECC verification/correction with CRC check + ECC on RAM
  - Virtual Channel support (up to 16)
  - Ability to write stream data directly to DDR via DMA
- Video Encoder/Decoder
  - Support for HEVC (H.265) Main profiles at Level 5.1 High-tier
  - Support for H.264 BaseLine/Main/High Profiles at Level 5.2
  - Support for up to 4K UHD resolution (3840 × 2160)
    - Clocking options supporting 240 MPixels/s, 120 MPixels/s, or 60 MPixels/s
- Motion JPEG encode at 416 MPixels/s with resolutions up to 4K UHD (3840 × 2160)

#### Memory Subsystem:

- Up to 2.29MB of On-chip RAM
  - 64KB of On-Chip RAM (OCRAM) with SECDED ECC, can be divided into smaller banks in increments of 32KB for as many as 2 separate memory banks
  - 256KB of On-Chip RAM with SECDED ECC in SMS Subsystem
  - 176KB of On-Chip RAM with SECDED ECC in SMS Subsystem for TI security firmware
  - 512KB of On-chip RAM with SECDED ECC in Cortex-R5F MCU Subsystem
  - 64KB of On-chip RAM with SECDED ECC in Device/Power Manager Subsystem
  - 1.25MB of L2 SRAM with SECDED ECC in C7x Deep Learning Accelerator
- DDR Subsystem (DDRSS)
  - Supports LPDDR4
  - 32-bit data bus with inline ECC
  - Supports speeds up to 3733 MT/s
  - Max addressable range of 8GBytes

### Functional Safety:

- **Functional Safety-Compliant** targeted [Industrial]
  - Developed for functional safety applications
  - Documentation will be available to aid IEC 61508 functional safety system design
  - Systematic capability up to SIL 3 targeted
  - Hardware Integrity up to SIL 2 targeted
  - Safety-related certification
    - IEC 61508 by TÜV SÜD planned
- **Functional Safety-Compliant** targeted [Automotive]
  - Developed for functional safety applications
  - Documentation will be available to aid ISO 26262 functional safety system design
  - Systematic capability up to ASIL D targeted
  - Hardware integrity up to ASIL B targeted
  - Safety-related certification
    - ISO 26262 by TÜV SÜD planned
- AEC - Q100 qualified [Automotive]

### Security:

- Secure boot supported
  - Hardware-enforced Root-of-Trust (RoT)
  - Support to switch RoT via backup key
  - Support for takeover protection, IP protection, and anti-roll back protection
- Trusted Execution Environment (TEE) supported
  - Arm TrustZone® based TEE
  - Extensive firewall support for isolation
  - Secure watchdog/timer/IPC
  - Secure storage support
  - Replay Protected Memory Block (RPMB) support
- Dedicated Security Controller with user programmable HSM core and dedicated security DMA & IPC subsystem for isolated processing
- Cryptographic acceleration supported
  - Session-aware cryptographic engine with ability to auto-switch key-material based on incoming data stream
    - Supports cryptographic cores
    - AES – 128-/192-/256-Bit key sizes
    - SHA2 – 224-/256-/384-/512-Bit key sizes
    - DRBG with true random number generator
    - PKA (Public Key Accelerator) to Assist in RSA/ECC processing for secure boot
- Debugging security
  - Secure software controlled debug access
  - Security aware debugging

### High-Speed Interfaces:

- Integrated Ethernet switch supporting (total 2 external ports)
  - RMII(10/100) or RGMII (10/100/1000)
  - IEEE1588 (Annex D, Annex E, Annex F with 802.1AS PTP)
  - Clause 45 MDIO PHY management
  - Packet Classifier based on ALE engine with 512 classifiers
  - Priority based flow control
  - Time Sensitive Networking (TSN) support
  - Four CPU H/W interrupt Pacing
  - IP/UDP/TCP checksum offload in hardware
- Two USB2.0 Ports
  - Port configurable as USB host, USB peripheral, or USB Dual-Role Device (DRD mode)
  - Integrated USB VBUS detection

### General Connectivity:

- 9x Universal Asynchronous Receiver-Transmitters (UART)
- 5x Serial Peripheral Interface (SPI) controllers
- 6x Inter-Integrated Circuit (I<sup>2</sup>C) ports
- 3x Multichannel Audio Serial Ports (McASP)
  - Transmit and Receive Clocks up to 50 MHz
  - Up to 16/10/6 Serial Data Pins across 3x McASP with Independent TX and RX Clocks
  - Supports Time Division Multiplexing (TDM), Inter-IC Sound (I2S), and Similar Formats
  - Supports Digital Audio Interface Transmission (SPDIF, IEC60958-1, and AES-3 Formats)
  - FIFO Buffers for Transmit and Receive (256 Bytes)
  - Support for audio reference output clock
- 3x enhanced PWM modules (ePWM)
- 3x enhanced Quadrature Encoder Pulse modules (eQEP)
- 3x enhanced Capture modules (eCAP)
- General-Purpose I/O (GPIO), All LVCMOS I/O can be configured as GPIO
- 3x Controller Area Network (CAN) modules with CAN-FD support
  - Conforms w/ CAN Protocol 2.0 A, B and ISO 11898-1
  - Full CAN FD support (up to 64 data bytes)
  - Parity/ECC check for Message RAM
  - Speed up to 8 Mbps

**Media and Data Storage:**

- 3x Multi-Media Card/Secure Digital® (MMC/SD®/SDIO) interface
  - 1x 8-bit eMMC interface up to HS200 speed
  - 2x 4-bit SD/SDIO interface up to UHS-I
  - Compliant with eMMC 5.1, SD 3.0, and SDIO Version 3.0
- 1x General-Purpose Memory Controller (GPMC) up to 133 MHz
  - Flexible 8- and 16-bit Asynchronous Memory Interface with up to four Chip (22-bit address) Selects (NAND, NOR, Muxed-NOR, and SRAM)
  - Uses BCH code to support 4-, 8-, or 16-bit ECC
  - Uses Hamming code to support 1-bit ECC
  - Error Locator Module (ELM)
    - Used with the GPMC to locate addresses of data errors from syndrome polynomials generated using a BCH algorithm
    - Supports 4-, 8-, and 16-bit per 512-Byte block error location based on BCH algorithms
- OSPI/QSPI with DDR / SDR support
  - Support for Serial NAND and Serial NOR Flash devices
  - 4GBytes memory address support
  - XIP mode with optional on-the-fly encryption

**Power Management:**

- Low-power modes supported by Device/Power Manager
  - Partial IO support for CAN/GPIO/UART wakeup
  - DeepSleep : I/O + DDR (suspend to RAM)
  - DeepSleep
  - MCU Only
  - Standby
  - Dynamic frequency scaling for Cortex-A53

**Boot Options:**

- UART
- I<sup>2</sup>C EEPROM
- OSPI/QSPI Flash
- GPMC NOR/NAND Flash
- Serial NAND Flash
- SD Card
- eMMC
- USB (host) boot from Mass Storage device
- USB (device) boot from external host (DFU mode)
- Ethernet

**Technology / Package:**

- 16-nm FinFET technology
- 18 mm x 18 mm, 0.8-mm pitch full-array, 484-pin FCBGA (AMB)

## 2 Applications

- Driver Monitoring System (DMS) / Occupancy Monitoring System (OMS)
- eMirror/Camera Mirror System (CMS)
- Machine Vision Camera
- Barcode scanner
- Front camera system
- Stick up camera / Video doorbell
- Autonomous Mobile Robots (AMR)

## 3 Description

AM62Ax is an extension of the Sitara™ automotive-grade family of heterogeneous Arm® processors with embedded Deep Learning (DL), Video and Vision Processing acceleration, display interface and extensive automotive peripheral and networking options. AM62Ax is built for a set of cost-sensitive automotive applications including driver and in-cabin monitoring systems, next generation of eMirror system, as well as a broad set of industrial applications in Factory Automation, Building Automation, Robotics, and other markets. The cost optimized AM62Ax provides high-performance compute for both traditional and deep learning algorithms at industry leading power/performance ratios with a high level of system integration to enable scalability and lower costs for advanced automotive platforms supporting multiple sensor modalities in stand-alone Electronic Control Units (ECUs).

AM62Ax contains up to four Arm® Cortex®-A53 cores with 64-bit architecture, a Vision Processing Accelerator (VPAC) with Image Signal Processor (ISP) and multiple vision assist accelerators, Deep Learning (DL) and video accelerators, a Cortex®-R5F MCU Channel core and a Cortex®-R5F Device Management core. The Cortex-A53s provide the powerful computing elements necessary for Linux applications as well as the implementation of traditional vision computing based-algorithms such as driver monitoring. Building on the existing world-class ISP, TI's 7th generation ISP includes flexibility to process a broader sensor suite including RGB-InfraRed (RGB-IR), support for higher bit depth, and features targeting analytics applications. Key cores include the next generation C7000™ DSP from Texas Instruments ("C7x") with scalar and vector cores, dedicated "MMA" deep learning accelerator enabling performance up to 2 TOPS within the lowest power envelope in the industry when operating at the typical automotive worst case junction temperature of 125°C.

The 3-port Gigabit Ethernet switch has one internal port and two external ports with TSN support and can be used to enable industrial networking options. In addition, an extensive peripherals set is included in AM62Ax to enable system level connectivity such as USB, MMC/SD, Camera interface, OSPI, CAN-FD and GPMC for parallel host interface to an external ASIC/FPGA. AM62Ax supports secure boot for IP protection with the built-in HSM (Hardware Security Module) and also employs advanced power management support for portable and power-sensitive applications.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
AM62A7	AMB (FCBGA, 484)	18 mm × 18 mm
AM62A7-Q1	AMB (FCBGA, 484)	18 mm × 18 mm
AM62A3	AMB (FCBGA, 484)	18 mm × 18 mm
AM62A3-Q1	AMB (FCBGA, 484)	18 mm × 18 mm

(1) For more information, see [Mechanical, Packaging, and Orderable Information](#).

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

## 4 Revision History

### Changes from March 15, 2023 to August 4, 2023 (from Revision \* (MARCH 2023) to Revision A (AUGUST 2023))

	Page
• <b>Global:</b> Changed the document product status from "Advance Information" to "Production Data".....	1
• (Features): Included Multi-Media Card (MMC) in the first bullet describing MMC/SD features .....	1
• (Features): Added Serial NAND Flash to the list of Boot Options.....	1
• (Package Information): Updated the table to match the new content standard and added automotive "-Q1" devices.....	4
• (Functional Block Diagram): Removed "DDR4" from the "DDR4/LPDDR4 with inline EEC (32b)" block under the System Memory area.....	5
• (Functional Block Diagram): Added the Software Build Sheet note.....	5
• (Device Comparison): Added the Processor-SDK-AM62Ax URL to the Software Build Sheet note.....	9
• (Device Comparison): Corrected the name of the JTAG User ID register and added the register bit values by device "Features" code.....	9
• (Device Comparison): Changed "TBD" to "Yes" for Full CAN-FD Support.....	9
• (Device Comparison): Changed General-Purpose Memory Controller (GPMC) address range from 1GB to 128MB.....	9
• (Related Products): Additional content was added to the Related Products section.....	10
• (MMC0 Signal Descriptions): Removed the note associated with MMC0_CLK.....	64
• (MMC1 Signal Descriptions): Removed the note associated with MMC1_CLK.....	65
• (MMC2 Signal Descriptions): Changed the note associated with MMC2_CLK.....	65
• (Pin Connectivity Requirements): Updated the requirement for VMON_3P3_SOC to include another connectivity option.....	73
• (Pin Connectivity Requirements): Updated the second paragraph of the note following the Connectivity Requirements table. The update clarifies the operation of configurable device IOs and includes precautions that must be taken to prevent floating signals from damaging device input buffers.....	73
• (Power-On Hours): Removed commercial temperature range since it doesn't apply.....	79
• (Recommended Operating Conditions): Updated the notes associated with VDD_CANUART and VDDSHV_CANUART to clarify the requirements for these power rails.....	80
• (Power Consumption Summary): Added new section that references Power Estimation Tool application note.....	83
• (DDR Electrical Characteristics): Added a reference to the JEDEC standard.....	88
• (Power-Up Sequencing): Added Power-Up Sequencing – Supply / Signal Assignments table with waveform references and notes. Added a new waveform for VDD_CANUART to show its sequence requirements relative to VDD_CORE when powered from a separate always on power source.....	94
• (Power-Down Sequencing): Added Power-Down Sequencing – Supply / Signal Assignments table with waveform references and notes. Added a new waveform for VDD_CANUART to show its sequence requirements relative to VDD_CORE when powered from a separate always on power source.....	97
• (Partial IO Power Sequencing): Changed the section title to "Partial IO Power Sequencing" and included a description of sequencing requirements for entry into and exit from Partial IO low power mode.....	99
• (Reset Timing Conditions): Changed the Input slew rate minimum values for VDD = 1.8V and VDD = 3.3V (original values were swapped).....	100
• (MCU_RESETSTATz, and RESETSTATz Switching Characteristics): Changed the minimum value of parameter RST13 from "0" to "960".....	100
• (MCU_OSC0 Switching Characteristics - Crystal Mode): Defined values for all previously undefined TBD values.....	109
• (LFXOSC Modes of Operation): Changed the value of PD_C for BYPASS mode from "X" to "0".....	113
• (CPSW3G MDIO Timing): Changed the minimum setup time value (parameter MDIO1) from "90" to "45". Also changed the minimum and maximum output delay time values (parameter MDIO7) from "-150" and "150" to "-10" and "10" respectively.....	118

- (DSS Switching Characteristics): Added external pixel clock mode "EXTPCLKIN" to parameters D2, D3, D4, and D5. Also changed the "Internal PLL" mode min value for parameters D2 and D3 from "0.0475P" to "0.0475P - 0.3"..... 127
- (MCASP): Updated each AHCLKR/X table note to include a TRM reference for clock source options. Also corrected a typographical error on the signal name associated with the first waveform in each timing diagram by changing "MCASP[x]\_ACLKR/X" to "MCASP[x]\_AHCLKR/X"..... 159
- (MCSPi Switching Characteristics - Controller Mode): Replaced previous table notes 2 and 3 with new table notes 2, 3, 4, and 5..... 164
- (MMC0 DLL Delay Mapping): Changed the OTAPDLYENA and OTAPDLYSEL values for Legacy SDR and High Speed SDR modes..... 170
- (MMC1/MMC2 DLL Delay Mapping for all Timing Modes): Changed the "UHS-I DR50" mode name to "UHS-I DDR50" to correct a typographical error..... 182
- (OSPI0 Timing Requirements – PHY Data Training): Added three new timing parameters. Two that define timing parameters associated with SDR with External Board Loopback, and one that defines the minimum input data valid window for each mode. Also updated Note 1 to clarify the purpose of the new data valid window parameter..... 192
- (OSPI0 Timing Requirements – PHY Data Training, SDR with External Board Loopback): Added a new timing requirements diagram for SDR with External Board Loopback..... 192
- (OSPI Switching Characteristics – PHY Data Training): Added seven new timing parameters. Six that define timing parameters associated with SDR with External Board Loopback, and one that defines the maximum output data valid window for each mode..... 192
- (OSPI Switching Characteristics – PHY Data Training): Added maximum values to the OSPI0\_CLK Cycle Time parameters (O1) and (O7) to define a minimum operating frequency of 100MHz. Updated Note 1 and Note 4, where "in ns" was added to the OSPI\_CLK cycle time reference in Note 1 and "refclk" was changed to "reference clock" in Note 4 so it matches the clock name used in the TRM. Also updated Note 6 to clarify the purpose of the new data invalid window parameter..... 192
- (OSPI0 Switching Characteristics – PHY SDR Data Training): Added a new switching characteristics diagram for SDR with External Board Loopback..... 192
- (OSPI0 Switching Characteristics – PHY SDR Mode): Updated Note 1 and Note 4, where "in ns" was added to the OSPI\_CLK cycle time reference in Note 1 and "refclk" was changed to "reference clock" in Note 4 so it matches the clock name used in the TRM..... 196
- (OSPI0 Switching Characteristics – PHY DDR Mode): Updated Note 1 and Note 4, where "in ns" was added to the OSPI\_CLK cycle time reference in Note 1 and "refclk" was changed to "reference clock" in Note 4 so it matches the clock name used in the TRM..... 198
- (OSPI0 Timing Requirements – Tap SDR Mode): Updated the constant values associated with the minimum setup and minimum hold formulas in parameters O19 and O20. Note 2 was also updated to change "refclk" to "reference clock" so it matches the clock name used in the TRM..... 200
- (OSPI0 Switching Characteristics – Tap SDR Mode): Updated Note 1 and Note 4, where "in ns" was added to the OSPI\_CLK cycle time reference in Note 1 and "refclk" was changed to "reference clock" in Note 4 so it matches the clock name used in the TRM..... 200
- (OSPI0 Timing Requirements – Tap DDR Mode): Updated the constant values associated with the minimum setup and minimum hold formulas in parameters O13 and O14. Note 2 was also updated to change "refclk" to "reference clock" so it matches the clock name used in the TRM..... 202
- (OSPI0 Switching Characteristics – Tap DDR Mode): Updated the minimum data output delay and maximum data output delay formulas in parameter O6. Also updated Note 1 and Note 5, where "in ns" was added to the OSPI\_CLK cycle time reference in Note 1 and "refclk" was changed to "reference clock" in Note 5 so it matches the clock name used in the TRM..... 202
- (Detailed Description): Added content to "Detailed Description" section and associated subsections..... 207
- (Power Supply Designs): Added new section with link to PMIC application note..... 216
- (Clock Routing Guidelines): Added new section..... 224
- (Standard Package Symbolization): Updated image to match updates applied to the Nomenclature Description table in the Device Naming Convention section..... 226
- (Device Naming Convention): Changed "Q" to "Q1" and "ppp" to "PPP" in the FIELD PARAMETER column so they match the Standard Package Symbolization figure..... 227

## 5 Device Comparison

Table 5-1 shows a comparison between devices, highlighting the differences.

### Note

Availability of features listed in this table are a function of shared IO pins, where IO signals associated with many of the features are multiplexed to a limited number of pins. The SysConfig tool should be used to assign signal functions to pins. This will provide a better understanding of limitations associated with pin multiplexing.

### Note

To understand what device features are currently supported by TI Software Development Kits (SDKs), search for the *AM62Ax Software Build Sheet* located in the Downloads tab option provided at [Processor-SDK-AM62Ax](#).

## 5.1 Related Products

**Sitara™ processors** Broad family of scalable processors based on Arm® Cortex®-A cores with flexible accelerators, peripherals, connectivity, and unified software support – perfect for sensors to servers. Sitara processors have the reliability and functional safety support required for use in industrial and automotive applications.

**Sitara™ microcontrollers** Best-in-class Arm®-based 32-bit microcontrollers (MCUs) offer you a scalable portfolio of high-performance and power-efficient devices to help meet your system needs. Bring capabilities such as functional safety, power efficiency, real-time control, advanced networking, analytics, and security to your designs.

**AM64x Sitara™** processors target industrial applications such as Factory Automation and Control (FAC), and motor control that utilize Linux application processing cores (Cortex®-A53), real-time processing cores (Cortex®-R5F), and Industrial Communication Subsystems (PRU\_ICSSGs) to support protocols such as EtherCAT, Profinet, or EtherNet/IP. AM64x implements one CPSW3G and two PRU\_ICSSGs for supporting up to five gigabit Ethernet ports. The device also supports an extensive set of peripherals including a single lane of PCIe Gen2 or USB SuperSpeed Gen1, functional safety options, secure boot, and run-time security.

**AM623 Sitara™** processors Internet of Things (IoT) and gateway SoC with Arm® Cortex®-A53-based object and gesture recognition. The low-cost AM623 Sitara™ MPU family of application processors are built for Linux® application development. With scalable Arm® Cortex®-A53 performance, embedded features such as dual-display support, and an extensive set of peripherals make the AM623 device well-suited for a broad range of industrial and automotive applications.

**AM625 Sitara™** processors human-machine-interaction SoC with Arm® Cortex®-A53-and full-HD dual display. The low-cost AM625 Sitara™ MPU family of application processors are built for Linux® application development. With scalable Arm® Cortex®-A53 performance, embedded features such as dual-display support, 3D graphics acceleration, and an extensive set of peripherals make the AM625 device well-suited for a broad range of industrial and automotive applications.

## 6 Terminal Configuration and Functions

### 6.1 Pin Diagrams

#### Note

The terms "ball", "pin", and "terminal" are used interchangeably throughout the document. An attempt is made to use "ball" only when referring to the physical package.

Figure 6-1 shows the ball locations for the 484-ball flip chip ball grid array (FCBGA) package to quickly locate signal names and ball grid numbering. This figure is used in conjunction with Section 6.2.1 through Section 6.4 (Pin Attributes table and all Signal Descriptions tables, including the Pin Connectivity Requirements table).

Figure 6-1. AMB FCBGA-N484 Pin Diagram (Bottom View)

## 6.2 Pin Attributes

The following list describes the contents of each column in the [Table 6-1, Pin Attributes \(AMB Package\)](#) table:

1. **BALL NUMBER:** Ball numbers assigned to each terminal of the Ball Grid Array package.
2. **BALL NAME:** Ball name assigned to each terminal of the Ball Grid Array package (this name is typically taken from the primary MUXMODE 0 signal function).
3. **SIGNAL NAME:** Signal name(s) of all dedicated and pin multiplexed signal functions associated with a ball.

---

### Note

Many device pins support multiple signal functions. Some signal functions are selected via a single layer of multiplexers associated with pins. Other signal functions are selected via two or more layers of multiplexers, where one layer is associated with the pins and other layers are associated with peripheral logic functions.

The [Table 6-1, Pin Attributes \(AMB Package\)](#) table only defines signal multiplexing at the pins. For more information, related to signal multiplexing at the pins, see *Pad Configuration Registers* section in *Device Configuration* chapter of the device TRM. Refer to the respective peripheral chapter in the device TRM for information associated with peripheral signal multiplexing.

---

4. **MUX MODE:** The MUXMODE value associated with each pin multiplexed signal function:
  - a. MUXMODE 0 is the primary pin multiplexed signal function. However, the primary pin multiplexed signal function is not necessarily the default pin multiplexed signal function.

---

### Note

The value found in the MUX MODE AFTER RESET column defines the default pin multiplexed signal function selected when MCU\_PORz is deasserted.

---

- a. MUXMODE values 1 through 15 are possible for pin multiplexed signal functions. However, not all MUXMODE values have been implemented. The only valid MUXMODE values are those defined as pin multiplexed signal functions within the Pin Attributes table. Only valid values of MUXMODE should be used.
- b. Bootstrap defines SOC configuration pins, where the logic state applied to each pin is latched on the rising edge of PORz\_OUT. These input signal functions are fixed to their respective pins and are not programable via MUXMODE.
- c. An empty box means Not Applicable.

---

### Note

The following configurations of MUXMODE must be avoided for proper device operation.

- Configuring multiple pins operating as inputs to the same pin multiplexed signal function is not supported as it can yield unexpected results.
  - Configuring a pin to an undefined pin multiplexing mode will cause the pin behavior to be undefined.
-

5. **TYPE:** Signal type and direction:
  - I = Input
  - O = Output
  - OD = Output, with open-drain output function
  - IO = Input, Output, or simultaneously Input and Output
  - IOD = Input, Output, or simultaneously Input and Output, with open-drain output function
  - IOZ = Input, Output, or simultaneously Input and Output, with three-state output function
  - OZ = Output with three-state output function
  - A = Analog
  - PWR = Power
  - GND = Ground
  - CAP = LDO Capacitor.
6. **DSIS:** The deselected input state (DSIS) indicates the state driven to the subsystem input (logic "0", logic "1", or "pad" level) when the pin multiplexed signal function is not selected by MUXMODE.
  - 0: Logic 0 driven to the subsystem input.
  - 1: Logic 1 driven to the subsystem input.
  - pad: Logic state of the pad is driven to the subsystem input.
  - An empty box means Not Applicable.
7. **BALL STATE DURING RESET RX/TX/PULL:** State of the terminal while MCU\_PORz is asserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
  - RX (Input buffer)
    - Off: The input buffer is disabled.
    - On: The input buffer is enabled.
  - TX (Output buffer)
    - Off: The output buffer is disabled.
    - Low: The output buffer is enabled and drives  $V_{OL}$ .
  - PULL (Internal pull resistors)
    - Off: Internal pull resistors are turned off.
    - Up: Internal pull-up resistor is turned on.
    - Down: Internal pull-down resistor is turned on.
    - NA: Not Applicable.
  - An empty box means Not Applicable.
8. **BALL STATE AFTER RESET RX/TX/PULL:** State of the terminal after MCU\_PORz is deasserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
  - RX (Input buffer)
    - Off: The input buffer is disabled.
    - On: The input buffer is enabled.
  - TX (Output buffer)
    - Off: The output buffer is disabled.
    - SS: The subsystem selected with MUXMODE determines the output buffer state.
  - PULL (Internal pull resistors)
    - Off: Internal pull resistors are turned off.
    - Up: Internal pull-up resistor is turned on.
    - Down: Internal pull-down resistor is turned on.
    - NA: Not Applicable.
  - An empty box means Not Applicable.
9. **MUX MODE AFTER RESET:** The value found in this column defines the default pin multiplexed signal function after MCU\_PORz is deasserted.

An empty box means Not Applicable.

10. **I/O VOLTAGE VALUE:** This column describes I/O operating voltage options of the respective power supply, when applicable.  

An empty box means Not Applicable.

For more information, see valid operating voltage range(s) defined for each power supply in [Section 7.4, Recommended Operating Conditions](#).
11. **POWER:** The power supply of the associated I/O, when applicable.  

An empty box means Not Applicable.
12. **HYS:** Indicates if the input buffer associated with this I/O has hysteresis:
  - Yes: With hysteresis
  - No: Without hysteresis
  - An empty box means Not Applicable.

For more information, see the hysteresis values in [Section 7.7, Electrical Characteristics](#).
13. **BUFFER TYPE:** This column defines the buffer type associated with a terminal. This information can be used to determine which Electrical Characteristics table is applicable.  

An empty box means Not Applicable.

For electrical characteristics, refer to the appropriate buffer type table in [Section 7.7, Electrical Characteristics](#).
14. **PULL UP/DOWN TYPE:** Indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
  - PU: Internal pull-up
  - PD: Internal pull-down
  - PU/PD: Internal pull-up and pull-down
  - An empty box means No internal pull.
15. **PADCONFIG Register:** Name of the IO pad configuration register associated with Ball.
16. **PADCONFIG Address:** Physical address of the IO pad configuration register associated with Ball.

## 6.3 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

The following list describes the column headers:

1. **SIGNAL NAME:** The name of the signal passing through the pin.

---

### Note

Signal names and descriptions provided in each Signal Descriptions table, represent the pin multiplexed signal function which is implemented at the pin and selected via PADCONFIG registers. Device subsystems may provide secondary multiplexing of signal functions, which are not described in these tables. For more information on secondary multiplexed signal functions, see the respective peripheral chapter of the device TRM.

---

2. **PIN TYPE:** Signal direction and type:

- I = Input
- O = Output
- OD = Output, with open-drain output function
- IO = Input, Output, or simultaneously Input and Output
- IOD = Input, Output, or simultaneously Input and Output with open-drain output function
- IOZ = Input, Output, or simultaneously Input and Output with three-state output function
- OZ = Output with three-state output function
- A = Analog
- PWR = Power
- GND = Ground
- CAP = LDO Capacitor

3. **DESCRIPTION:** Description of the signal

4. **BALL:** Ball number(s) associated with signal

### 6.3.2 CPTS

#### Note

Some CPTS signals are connected directly to CPTS modules within the device. Other CPTS signals are connected to the Time Sync Router and fanned out to peripherals linked to the router. Input signals are sent to the peripherals while output signals are sourced from the peripherals. For more information, see the Time Sync and Compare Events section in the Time Sync chapter in the device TRM.

- (1) DDRSS implements different signal functions on these signals based on the attached memory device type. The signals function as Column Address Strobe, Row Address Strobe, Chip Select 0, and Chip Select 1 when DDRSS is configured to operate with DDR4 memory devices. The signals function as Chip Select 1B, Chip Select 0B, Chip Select 0A, and Chip Select 1A respectively when DDRSS is configured to operate with LPDDR4 memory devices. For more information, refer to [Section 9.2.1, DDR Board Design and Layout Guidelines](#).
- (2) An external 240 Ω ±1% resistor must be connected between this pin and VSS. No external voltage should be applied to this pin.

## 6.4 Pin Connectivity Requirements

This section describes connectivity requirements for package balls that have specific connectivity requirements and unused package balls.

### Note

All power pins must be supplied with the voltages specified in [Section 7.4, Recommended Operating Conditions](#), unless otherwise specified.

### Note

For additional clarification, "leave unconnected" or "no connect" (NC) means **no** signal traces can be connected to these device ball numbers.

**Table 6-71. Connectivity Requirements**

AMB BALL NUMBER	BALL NAME	CONNECTION REQUIREMENTS

F12	VMON_1P8_SOC	If VMON_1P8_SOC is not used to monitor the SOC power rail, this ball must remain connected to a 1.8-V power rail.
F9	VMON_3P3_SOC	If VMON_3P3_SOC is not used to monitor the SOC power rail, this ball must remain connected to a 3.3-V power rail or connected directly to VSS.

(1) To determine which power supply is associated with any IO, see the POWER column of the *Pin Attributes* table.

---

### Note

Internal pull resistors are weak and may not source enough current to maintain a valid logic level for some operating conditions. This can be the case when connected to components with leakage to the opposite logic level, or when external noise sources couple to signal traces attached to balls which are only pulled to a valid logic level by the internal resistor. Therefore, external pull resistors are recommended to hold a valid logic level on balls with external connections.

Many of the device IOs are turned off by default and external pull resistors may be required to hold inputs of any attached device in a valid logic state until software initializes the respective IOs. The state of configurable device IOs are defined in the BALL STATE DURING RESET RX/TX/PULL and BALL STATE AFTER RESET RX/TX/PULL columns of the *Pin Attributes* table. Any IO with its input buffer (RX) turned off is allowed to float without damaging the device. However, any IO with its input buffer (RX) turned on shall never be allowed to float to any potential between  $V_{ILSS}$  and  $V_{IHSS}$ . The input buffer can enter a high-current state which could damage the IO cell if allowed to float between these levels.

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the [Section 7.4, Recommended Operating Conditions](#) but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to VSS, unless otherwise noted.
- (3) The absolute maximum ratings for these fail-safe pins depends on their IO supply operating voltage. Therefore, this value is also defined by the maximum V<sub>IH</sub> value found in the *I2C Open-Drain, and Fail-Safe (I2C OD FS) Electrical Characteristics* section, where the electrical characteristics table has separate parameter values for 1.8-V mode and 3.3-V mode.
- (4) The VMON\_VSYS pin provides a way to monitor the system power supply. For more information, see [Section 9.2.4, System Power Supply Monitor Design Guidelines](#).
- (5) This parameter applies to all IO pins which are not fail-safe and the requirement applies to all values of IO supply voltage. For example, if the voltage applied to a specific IO supply is 0 volts the valid input voltage range for any IO powered by that supply will be -0.3 to +0.3 volts. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.
- (6) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 9.2.3, USB Design Guidelines](#).
- (7) VDD is the voltage on the corresponding power-supply pin(s) for the IO.
- (8) For current pulse injection (I-Test):
  - Pins stressed per JEDEC JESD78 (Class II) and passed with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.

For over-voltage performance (Over-Voltage (OV) Test):

- Supplies stressed per JEDEC JESD78 (Class II) and passed specified voltage injection.

Fail-safe IO terminals are designed such they do not have dependencies on the respective IO power supply voltage. This allows external voltage sources to be connected to these IO terminals when the respective IO power supplies are turned off. The MCU\_I2C0\_SCL, MCU\_I2C0\_SDA, WKUP\_I2C0\_SCL, WKUP\_I2C0\_SDA, EXTINTn, VMON\_1P8\_SOC, VMON\_3P3\_SOC, and MCU\_PORz are the only fail-safe IO terminals. All other IO terminals are not fail-safe and the voltage applied to them should be limited to the value defined by the Steady State Max. Voltage at all IO pins parameter in [Section 7.1](#).

(1) AEC - Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## 7.3 Power-On Hours (POH)

POWER ON HOURS (POH) <sup>(1)</sup> (2) (3)		
JUNCTION TEMPERATURE RANGE ( $T_J$ )		LIFETIME (POH)
EXTENDED	-40°C to 105°C	100000
AUTOMOTIVE	-40°C to 125°C	20000 <sup>(4)</sup>

- (1) This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.
- (2) Unless specified in the table above, all voltage domains and operating conditions are supported in the device at the noted temperatures.
- (3) POH is a function of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH.
- (4) Automotive profile is defined as 20000 power on hours with a junction temperature as follows: 5%@-40°C, 65%@70°C, 20%@110°C, and 10%@125°C.

- (1) The voltage at the device ball must never drop below the MIN voltage or rise above the MAX voltage for any amount of time during normal device operation.
- (2) VDD\_CORE, VDDA\_CORE\_CSIRX0, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 shall be sourced from the same power source. Care should be taken to ensure that voltage differential between VDD\_CORE and VDDA\_CORE\_USB is within +/- 1%.
- (3) VDD\_CANUART shall be connected to an always on power source when using Partial IO low power mode. VDD\_CANUART shall be connected to the same power source as VDD\_CORE, VDDA\_CORE\_CSI\_DSI, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 when not using Partial IO low power mode.
- (4) VDDS\_DDR and VDDS\_DDR\_C shall be sourced from the same power source.
- (5) Refer to the [Recommended Operating Conditions for OTP eFuse Programming](#) table for VPP supply voltages based on eFuse usage.
- (6) The VMON\_VSYS pin provides a way to monitor the system power supply. For more information, see [Section 9.2.4, System Power Supply Monitor Design Guidelines](#).
- (7) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 9.2.3, USB Design Guidelines](#).
- (8) VDDSHV\_CANUART shall be connected to an always on power source when using Partial IO low power mode. VDDSHV\_CANUART shall be connected to any valid IO power source when not using Partial IO low power mode.

## 7.5 Operating Performance Points

- (1) Default operating frequency, set by software at boot. Supports Dynamic Frequency Scaling after boot.
- (2) Fixed operating frequency, set by software at boot.
- (3) Maximum DDR Frequency will be limited based on the specific memory type (vendor) used in a system and by PCB implementation. Refer to [DDR Board Design and Layout Guidelines](#) for the proper PCB implementation to achieve maximum DDR frequency.
- (4) The DDR PLL output, which sources DDR0\_CK0 and DDR0\_CK0\_n, is typically defined in units of frequency. So the "DDR PLL Bypass" transaction rate is equal to 2x the DDR PLL output frequency when operating in bypass mode.

## 7.6 Power Consumption Summary

For information on the device power consumption, see the [AM62Ax Power Estimation Tool](#) application note.

## 7.7 Electrical Characteristics

### Note

The interfaces or signals described in [Section 7.7](#) correspond to the interfaces or signals available in multiplexing mode 0 (Primary Signal Function).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY and GPIO combination, in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

- (1) VDD stands for corresponding power supply. For more information on the power supply name and the corresponding ball(s), see POWER column of the *Pin Attributes* table.
- (2) This value also defines the Absolute Maximum Ratings value the IO.
- (3) The I<sub>OL</sub> parameter defines the minimum Low Level Output Current for which the device is able to maintain the specified V<sub>OL</sub> value. The value defined by this parameter should be considered the maximum current available to a system implementation which needs to maintain the specified V<sub>OL</sub> value for attached components.
- (4) f = toggle frequency of the input signal in Hz.
- (5) This MIN parameter only applies to input signal functions which are not defined in their respective *Timing and Switching Characteristics* sections. Select the MIN parameter which results in the largest value.
- (6) I2C Hs-mode is not supported when operating the IO in 3.3 V mode.

### 7.7.2 Fail-Safe Reset (FS RESET) Electrical Characteristics

## 7.8 VPP Specifications for One-Time Programmable (OTP) eFuses

This section specifies the operating conditions required for programming the OTP eFuses .

### 7.8.1 Recommended Operating Conditions for OTP eFuse Programming

over operating junction temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
VDD_CORE	Supply voltage range for the core domain during OTP operation; OPP NOM (BOOT)	See <a href="#">Section 7.4</a>			V
VPP	Supply voltage range for the eFuse ROM domain during normal operation without hardware support to program eFuse ROM	NC <sup>(1)</sup>			V
	Supply voltage range for the eFuse ROM domain during normal operation with hardware support to program eFuse ROM	0			V
	Supply voltage range for the eFuse ROM domain during OTP programming <sup>(2)</sup>	1.71	1.8	1.89	V
I <sub>(VPP)</sub>	VPP current	400			mA
SR <sub>(VPP)</sub>	VPP Slew Rate	6E + 4			V/s
T <sub>j</sub>	Operating junction temperature range while programming eFuse ROM.	0	25	85	°C

(1) NC indicates No Connect.

(2) Supply voltage range includes DC errors and peak-to-peak noise.

### 7.8.2 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The VPP power supply must be disabled when not programming OTP registers.
- The VPP power supply must be ramped up after the proper device power-up sequence (for more details, see [Section 7.10.2.2, Power Supply Sequencing](#)).

### 7.8.3 Programming Sequence

Programming sequence for OTP eFuses:

- Power on the board per the power-up sequencing. No voltage should be applied on the VPP terminal during power up and normal operation.
- Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
- Apply the voltage on the VPP terminal according to the specification in [Section 7.8.1](#).
- Run the software that programs the OTP registers.
- After validating the content of the OTP registers, remove the voltage from the VPP terminal.

### 7.8.4 Impact to Your Hardware Warranty

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse. CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

## 7.9 Thermal Resistance Characteristics

This section provides the thermal resistance characteristics used on this device.

For reliability and operability concerns, the maximum junction temperature of the device has to be at or below the  $T_J$  value identified in [Section 7.4, Recommended Operating Conditions](#).

### 7.9.1 Thermal Resistance Characteristics for AMB Package

It is recommended to perform thermal simulations at the system level with the worst case device power consumption.

## 7.10 Timing and Switching Characteristics

### Note

The Timing Requirements and Switching Characteristics values may change following the silicon characterization result.

### Note

The default SLEWRATE settings in each pad configuration register must be used to ensure timings, unless specific instructions are given otherwise.

### 7.10.1 Timing Parameters and Information

The timing parameter symbols used in [Section 7.10, Timing and Switching Characteristics](#) are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies have been abbreviated in [Table 7-3](#):

**Table 7-3. Timing Parameters Subscripts**

SYMBOL	PARAMETER
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

## 7.10.2 Power Supply Requirements

This section describes the power supply requirements to ensure proper device operation.

### Note

All power balls must be supplied with the voltages specified in the *Recommended Operating Conditions* section, unless otherwise specified in *Signal Descriptions* and *Pin Connectivity Requirements*.

### 7.10.2.1 Power Supply Slew Rate Requirement

To maintain the safe operating range of the internal ESD protection devices, TI recommends limiting the maximum slew rate of supplies to be less than 18 mV/ $\mu$ s. For instance, as shown in [Figure 7-2](#), TI recommends having the supply ramp slew for a 1.8-V supply of more than 100  $\mu$ s.

[Figure 7-2](#) describes the Power Supply Slew Rate Requirement in the device.

**Figure 7-2. Power Supply Slew and Slew Rate**

### 7.10.2.2 Power Supply Sequencing

This section describes power sequence requirements using power sequence diagrams and associated notes. Each power sequence diagram demonstrates the sequential order expected for each device power rail. This is done by assigning each device power rail to one or more waveform. A dual-voltage power rail may be associated with more than one waveform and the associated note will describe which waveform is applicable. Each waveform defines a transition region for the associated power rails and shows its sequential relationship to the transition regions of other power rails. The notes associated with the power sequence diagram provides further detail of these requirements. See the *Power-up Sequence* section for details on power-up requirements, and the *Power-down Sequence* section for details on power-down requirements.

Two types of power supply transition regions are used to simplify the power supply sequencing diagrams. The legends shown in [Figure 7-3](#) and [Figure 7-4](#) along with their descriptions are provided to clarify what each transition regions represents.

[Figure 7-3](#) defines a transition region with multiple power rails which may be sourced from multiple power supplies or a single power supply. Transitions shown within the transition region represent a use case where multiple power supplies are used to source power rails associated with this waveform, and these power supplies are allowed to ramp at different times within the region since they do not have any specific sequence requirement relative to each other.

**Figure 7-3. Multiple Power Supply Transition Legend**

[Figure 7-4](#) defines a transition region with one or more power rails which must be sourced from a single common power supply. No transitions are shown within the region to represent a single ramp within the transition region.

**Figure 7-4. Single Common Power Supply Transition Legend**

### 7.10.2.2.1 Power-Up Sequencing

Table 7-4 and Figure 7-5 describes the device power-up sequencing.

#### Note

The power supply sequencing requirements defined in this section does not include entry or exit from low power modes. See Section 7.10.2.2.3, *Partial IO Power Sequencing* for more information on power supply sequence requirements when entering or exiting low power modes.

- (1) VSYS represents the name of a supply which sources power to the entire system. This supply is expected to be a pre-regulated supply that sources power management devices which source all other supplies.
- (2) VMON\_VSYS input is used to monitor VSYS via an external resistor divider circuit. For more information, see the *System Power Supply Monitor Design Guidelines*.
- (3) VDDSHV\_CANUART, VDDSHV\_MCU, and VDDSHVx [x=0-3] are dual voltage IO supplies which can be operated at 1.8V or 3.3V depending on the application requirements.  
  
VDDSHV\_CANUART shall be connected to an always-on power source when using Partial IO low power mode, or connected to any valid IO power source when not using Partial IO low power mode. When VDDSHV\_CANUART is not connected to an always-on power source and is operating at 3.3V, it shall be ramped up with other 3.3V supplies during the 3.3V ramp period defined by this waveform.  
  
When any of the VDDSHV\_MCU and VDDSHVx [x=0-3] IO supplies are operating at 3.3V, they shall be ramped up with other 3.3V supplies during the 3.3V ramp period defined by this waveform.
- (4) The VMON\_3P3\_SOC input is used to monitor supply voltage and shall be connected to the respective 3.3V supply source.
- (5) VDDSHV\_CANUART, VDDSHV\_MCU, and VDDSHVx [x=0-3] are dual voltage IO supplies which can be operated at 1.8V or 3.3V depending on the application requirements.  
  
VDDSHV\_CANUART shall be connected to an always-on power source when using Partial IO low power mode, or connected to any valid IO power source when not using Partial IO low power mode. When VDDSHV\_CANUART is not connected to an always-on power source and is operating at 1.8V, it shall be ramped up with other 1.8V supplies during the 1.8V ramp period defined by this waveform.  
  
When any of the VDDSHV\_MCU and VDDSHVx [x=0-3] IO supplies are operating at 1.8V, they shall be ramped up with other 1.8V supplies during the 1.8V ramp period defined by this waveform.
- (6) The VMON\_1P8\_SOC input is used to monitor supply voltage and shall be connected to the respective 1.8V supply source.
- (7) VDDSHV4, VDDSHV5, and VDDSHV6 were designed to support power-up, power-down, or dynamic voltage change without any dependency on other power rails. This capability is required to support UHS-I SD Cards.
- (8) VDDS\_DDR and VDDS\_DDR\_C are expected to be powered by the same source such that they ramp together.
- (9) VDD\_CANUART shall be connected to an always-on power source when using Partial IO low power mode.  
  
When VDD\_CANUART is connected to an always-on power source, the potential applied to VDD\_CORE must never be greater than the potential applied to VDD\_CANUART + 0.18V during power-up or power-down. This requires VDD\_CANUART to ramp up before and ramp down after VDD\_CORE. VDD\_CANUART does not have any ramp requirements beyond the one defined for VDD\_CORE.

- (10) VDD\_CANUART shall be connected to the same power source as VDD\_CORE, VDDA\_CORE\_CSIRX0, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 when not using Partial IO low power mode.
- VDD\_CANUART, VDD\_CORE, VDDA\_CORE\_CSIRX0, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 can be operated at 0.75V or 0.85V. When these supplies are operating at 0.75V, they shall be ramped up prior to VDDR\_CORE as defined by this waveform.
- (11) VDD\_CANUART shall be connected to the same power source as VDD\_CORE, VDD\_CORE, VDDA\_CORE\_CSIRX0, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 when not using Partial IO low power mode.
- VDD\_CANUART, VDD\_CORE, VDDA\_CORE\_CSIRX0, VDDA\_CORE\_USB, and VDDA\_DDR\_PLL0 can be operated at 0.75V or 0.85V. When these supplies are operating at 0.85V, they shall be powered from the same source as VDDR\_CORE and ramped during the 0.85V ramp period defined by this waveform.
- (12) The potential applied to VDDR\_CORE must never be greater than the potential applied to VDD\_CORE + 0.18V during power-up or power-down. This requires VDD\_CORE to ramp up before and ramp down after VDDR\_CORE when VDD\_CORE is operating at 0.75V. VDD\_CORE does not have any ramp requirements beyond the one defined for VDDR\_CORE.
- VDD\_CORE and VDDR\_CORE are expected to be powered by the same source so they ramp together when VDD\_CORE is operating at 0.85V.
- (13) VPP is the 1.8V eFuse programming supply, which shall be left floating (HiZ) or grounded during power-up/down sequences and during normal device operation. This supply shall only be sourced while programming eFuse.

### 7.10.2.2.2 Power-Down Sequencing

Table 7-5 and Figure 7-6 describes the device power-down sequencing.

#### Note

The power supply sequencing requirements defined in this section does not include entry or exit from low power modes. See Section 7.10.2.2.3, *Partial IO Power Sequencing* for more information on power supply sequence requirements when entering or exiting low power modes.

### 7.10.2.2.3 Partial IO Power Sequencing

This section describes power supply sequence requirements when entering or exiting low power modes.

For more information on low power modes supported by this device and the names assigned to each low power mode, see the Power Modes section in the Device Configuration chapter of the Technical Reference Manual.

Partial IO is the only low power mode that requires power supply changes to the device power rails. All power supply rails except VDD\_CANUART and VDDSHV\_CANUART are turned off when operating in Partial IO mode. The power sequence required to enter Partial IO is the same sequence defined in [Section 7.10.2.2.2, Power-Down Sequencing](#) with the exception of VDD\_CANUART and VDDSHV\_CANUART, which remain powered. The power sequence required to exit Partial IO is the same sequence defined in [Section 7.10.2.2.1, Power-Up Sequencing](#) with the exception of VDD\_CANUART and VDDSHV\_CANUART, which are already powered.

### 7.10.3 System Timing

For more details about features and additional description information on the subsystem multiplexing signals, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

#### 7.10.3.1 Reset Timing

Tables and figures provided in this section define timing conditions, timing requirements, and switching characteristics for reset related signals.

**Table 7-6. Reset Timing Conditions**

PARAMETER		MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>				
SR <sub>I</sub>	Input slew rate	VDD <sup>(1)</sup> = 1.8V	0.0018	V/ns
		VDD <sup>(1)</sup> = 3.3V	0.0033	V/ns
<b>OUTPUT CONDITIONS</b>				
C <sub>L</sub>	Output load capacitance		30	pF

(1) VDD stands for corresponding power supply. For more information on the power supply name and the corresponding ball(s), see POWER column of the *Pin Attributes* table.

**Table 7-7. MCU\_PORz Timing Requirements**

## 7.10.4 Clock Specifications

### 7.10.4.1 Input Clocks / Oscillators

Various external clock inputs/outputs are needed to drive the device. Summary of these input clock signals is as follows:

- MCU\_OSC0\_XO/MCU\_OSC0\_XI — external main crystal interface pins connected to the internal high-frequency oscillator (MCU\_HFOSC0), which is the default clock source for internal reference clock HFOSC0\_CLKOUT.
- WKUP\_LFOSC0\_XO/WKUP\_LFOSC0\_XI — external crystal interface pins connected to internal low-frequency oscillator (WKUP\_LFOSC0), which sources optional 32768 Hz reference clock.
- General purpose clock inputs
  - MCU\_EXT\_REFCLK0 — optional external system clock.
  - EXT\_REFCLK1 — optional external system clock.
- External CPTS reference clock input
  - CP\_GEMAC\_CPTS0\_RFT\_CLK — optional reference clock input for CPTS\_RFT\_CLK.
- External audio reference clock inputs/outputs
  - AUDIO\_EXT\_REFCLK[1:0] — optional McASP high-frequency input clocks when configured to operate as an input.

For more information about Input clock interfaces, see *Clocking* section in *Device Configuration* chapter in the device TRM.

### 7.10.4.1.1 MCU\_OSC0 Internal Oscillator Clock Source

Figure 7-16 shows the recommended crystal circuit. All discrete components used to implement the oscillator circuit must be placed as close as possible to the MCU\_OSC0\_XI and MCU\_OSC0\_XO pins.

**Figure 7-16. MCU\_OSC0 Crystal Implementation**

The crystal must be in the fundamental mode of operation and parallel resonant. Table 7-21 summarizes the required electrical constraints.

**Table 7-21. MCU\_OSC0 Crystal Circuit Requirements**

PARAMETER		MIN	TYP	MAX	UNIT	
F <sub>x<sub>tal</sub></sub>	Crystal Parallel Resonance Frequency	25			MHz

C <sub>L2+PCBXO</sub>	Capacitance of C <sub>L2</sub> + C <sub>PCBXO</sub>	12			24	pF
C <sub>L</sub>	Crystal Load Capacitance	6			12	pF
C <sub>shunt</sub>	Crystal Circuit Shunt Capacitance	ESR <sub>x<sub>tal</sub></sub> = 30 Ω	25 MHz		7	pF
		ESR <sub>x<sub>tal</sub></sub> = 40 Ω	25 MHz		5	pF
		ESR <sub>x<sub>tal</sub></sub> = 50 Ω	25 MHz		5	pF
ESR <sub>x<sub>tal</sub></sub>	Crystal Effective Series Resistance				(1)	Ω

(1) The maximum ESR of the crystal is a function of the crystal frequency and shunt capacitance. See the C<sub>shunt</sub> parameter.

When selecting a crystal, the system design must consider temperature and aging characteristics of the crystal based on worst case environment and expected life expectancy of the system.

Table 7-22 details the switching characteristics of the oscillator.

**Table 7-22. MCU\_OSC0 Switching Characteristics - Crystal Mode**

PARAMETER		MIN	TYP	MAX	UNIT	
C <sub>XI</sub>	XI Capacitance				2.04	pF
C <sub>XO</sub>	XO Capacitance				1.91	pF
C <sub>XIXO</sub>	XI to XO Mutual Capacitance				0.01	pF

**Table 7-22. MCU\_OSC0 Switching Characteristics - Crystal Mode (continued)**

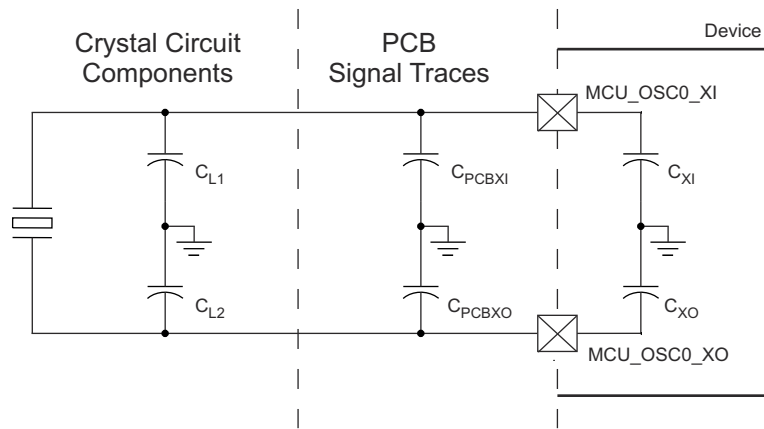

PARAMETER		MIN	TYP	MAX	UNIT
$t_s$	Start-up Time		4		ms

**Figure 7-17. MCU\_OSC0 Start-up Time**

**7.10.4.1.1.1 Load Capacitance**

The crystal circuit must be designed such that it applies the appropriate capacitive load to the crystal, as defined by the crystal manufacturer. The capacitive load,  $C_L$ , of this circuit is a combination of discrete capacitors  $C_{L1}$ ,  $C_{L2}$ , and several parasitic contributions. PCB signal traces which connect crystal circuit components to MCU\_OSC0\_XI and MCU\_OSC0\_XO have parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where the PCB designer should be able to extract parasitic capacitance for each signal trace. The MCU\_OSC0 circuits and device package have combined parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where these parasitic capacitance values are defined in [Table 7-22](#).

**Figure 7-18. Load Capacitance**

Load capacitors,  $C_{L1}$  and  $C_{L2}$  in [Figure 7-16](#), should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer.

$$C_L = [(C_{L1} + C_{PCBXI} + C_{XI}) \times (C_{L2} + C_{PCBXO} + C_{XO})] / [(C_{L1} + C_{PCBXI} + C_{XI}) + (C_{L2} + C_{PCBXO} + C_{XO})]$$

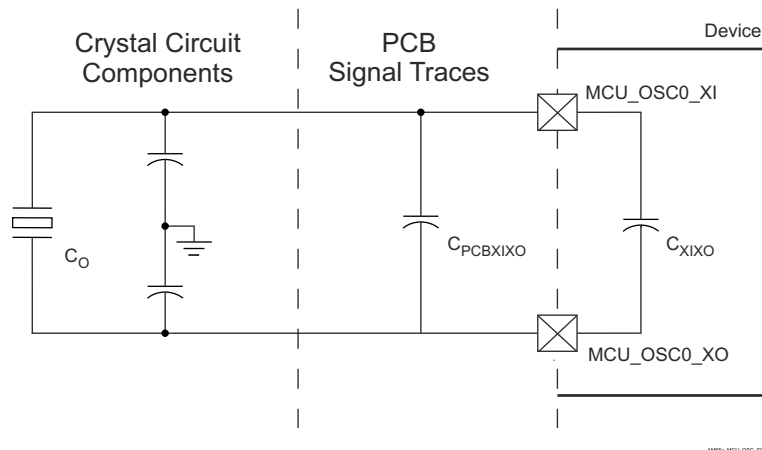

To determine the value of  $C_{L1}$  and  $C_{L2}$ , multiply the capacitive load value  $C_L$  by 2. Using this result, subtract the combined values of  $C_{PCBXI} + C_{XI}$  to determine the value of  $C_{L1}$  and the combined values of  $C_{PCBXO} + C_{XO}$  to

determine the value of  $C_{L2}$ . For example, if  $C_L = 10$  pF,  $C_{PCBXI} = 2.9$  pF,  $C_{XI} = 0.5$  pF,  $C_{PCBXO} = 3.7$  pF,  $C_{XO} = 0.5$  pF, the value of  $C_{L1} = [(2C_L) - (C_{PCBXI} + C_{XI})] = [(2 \times 10 \text{ pF}) - 2.9 \text{ pF} - 0.5 \text{ pF}] = 16.6$  pF and  $C_{L2} = [(2C_L) - (C_{PCBXO} + C_{XO})] = [(2 \times 10 \text{ pF}) - 3.7 \text{ pF} - 0.5 \text{ pF}] = 15.8$  pF

#### 7.10.4.1.1.2 Shunt Capacitance

The crystal circuit must also be designed such that it does not exceed the maximum shunt capacitance for MCU\_OSC0 operating conditions defined in Table 7-21. Shunt capacitance,  $C_{shunt}$ , of the crystal circuit is a combination of crystal shunt capacitance and parasitic contributions. PCB signal traces which connect crystal circuit components to MCU\_OSC0 have mutual parasitic capacitance to each other,  $C_{PCBXIXO}$ , where the PCB designer should be able to extract mutual parasitic capacitance between these signal traces. The device package also has mutual parasitic capacitance,  $C_{XIXO}$ , where this mutual parasitic capacitance value is defined in Table 7-22.

PCB routing should be designed to minimize mutual capacitance between XI and XO signal traces. This is typically done by keeping signal traces short and not routing them in close proximity. Mutual capacitance can also be minimized by placing a ground trace between these signals when the layout requires them to be routed in close proximity. It is important to minimize the mutual capacitance on the PCB to provide as much margin as possible when selecting a crystal.

**Figure 7-19. Shunt Capacitance**

A crystal should be chosen such that the below equation is satisfied.  $C_0$  in the equation is the maximum shunt capacitance specified by the crystal manufacturer.

$$C_{shunt} \geq C_0 + C_{PCBXIXO} + C_{XIXO}$$

For example, the equation would be satisfied when the crystal being used is 25 MHz with an ESR = 30  $\Omega$ ,  $C_{PCBXIXO} = 0.04$  pF,  $C_{XIXO} = 0.01$  pF, and shunt capacitance of the crystal is less than or equal to 6.95 pF.

#### 7.10.4.1.2 MCU\_OSC0 LVCMOS Digital Clock Source

Figure 7-20 shows the recommended oscillator connections when MCU\_OSC0\_XI is connected to a 1.8-V LVCMOS square-wave digital clock source.

#### Note

A DC steady-state condition is not allowed on MCU\_OSC0\_XI when the oscillator is powered up. This is not allowed because MCU\_OSC0\_XI is internally AC coupled to a comparator that can enter an unknown state when DC is applied to the input. Therefore, application software must power down MCU\_OSC0 any time MCU\_OSC0\_XI is not toggling between logic states.

Figure 7-20. 1.8-V LVCMOS-Compatible Clock Input

### 7.10.4.1.3 WKUP\_LFOSC0 Internal Oscillator Clock Source

Figure 7-21 shows the recommended crystal circuit. It is recommended that preproduction printed-circuit board (PCB) designs include the two optional resistors  $R_{bias}$  and  $R_d$  in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases,  $R_{bias}$  is not required and  $R_d$  is a 0- $\Omega$  resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on preproduction PCBs.

**Figure 7-21. WKUP\_LFOSC0 Crystal Implementation**

Table 7-23 presents LFXOSC modes of operation.

**Table 7-23. LFXOSC Modes of Operation**

MODE	BP_C	PD_C	XI	XO	CLK_OUT	DESCRIPTION
ACTIVE	0	0	XTAL	XTAL	CLK_OUT	Active oscillator mode providing 32kHz
PWRDN	0	1	X	PD	LOW	Output will be pulled down to LOW. PAD to be tri-stated. Active mode disabled
BYPASS	1	0	CLK	PD	CLK	XI is driven by external clock source. XO is pulled down to LOW. Due to ESD diode to supply, XI should not be driven unless oscillator supply is present.

#### Note

User should set CTRLMMR\_WKUP\_LFXOSC\_TRIM[18:16]  $i\_mult = 3b'001$  for CL in the range 6pf to 9.5pf. CTRLMMR\_WKUP\_LFXOSC\_TRIM [18:16]  $i\_mult = 3b'010$  for CL in the range 8.5pf to 12pf. Default setting is 3b'010.

#### Note

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in Figure 7-22, should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator WKUP\_LFOSC0\_XI, WKUP\_LFOSC0\_XO, and VSS pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

#### 7.10.4.2 Output Clocks

The device provides several system clock outputs. Summary of these output clocks are as follows:

- **MCU\_SYCLKOUT0**
  - MCU\_PLL0\_HSDIV0\_CLKOUT (MCU\_SYCLKOUT0) divided by 4 and sent out of the device as MCU\_SYCLKOUT0. This clock output is provided for test and debug purposes only.
- **MCU\_OBSCLK0**
  - Observation clock output for test and debug purposes only.
- **WKUP\_CLKOUT0**
  - WKUP domain CLKOUT0 output.
- **SYCLKOUT0**
  - MAIN\_PLL0\_HSDIV0\_CLKOUT (SYCLKOUT0) divided by 4 and then sent out of the device as SYCLKOUT0. This clock output is provided for test and debug purposes only.
- **CLKOUT0**
  - CLKOUT0 is the Ethernet subsystem clock (MAIN\_PLL2\_HSDIV1\_CLKOUT) divided-by-5 or divided-by-10. This clock output was provided as an optional source to the external PHY. When configured to operate as the RMII Clock source (50 MHz) the signal must also be routed back to the respective RMII[x]\_REF\_CLK pin for proper device operation.
- **OBSCLK[1:0]**
  - Observation clock outputs for test and debug purposes only.
- **AUDIO\_EXT\_REFCLK[1:0]**
  - Option of sourcing one of six McASP high-frequency audio reference clocks, MAIN\_PLL1\_HSDIV6\_CLKOUT, or MAIN\_PLL2\_HSDIV8\_CLKOUT when configured to operate as an output.

#### 7.10.4.3 PLLs

Power is supplied to the Phase-Locked Loop circuits (PLLs) by internal regulators that derive their power from off-chip power-sources.

There is one PLL in the MCU domain:

- MCU PLL

There are nine PLLs in the MAIN domain:

- MAIN PLL
- PER0 PLL
- PER1 PLL
- VIDEO PLL
- C7x PLL
- ARM0 PLL
- DDR PLL
- SMS PLL
- DSS PLL

The system designer should consider the reference clock source start-up time and the PLL lock requirements before configuring and using any of the PLL outputs as clock sources. The device reference clock input requirements are defined in [Section 7.10.4.1, Input Clocks / Oscillators](#). PLL configuration details are described in the device TRM.

For more information on PLLs, see the *PLL* subsection in the *Clocking* subsection of the *Device Configuration* section in the device TRM.

#### **7.10.4.4 Recommended System Precautions for Clock and Control Signal Transitions**

All clock and strobe signals must transition between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner.

Monotonic transitions are more likely to occur with fast signal transitions. It is easy for noise to create non-monotonic events on a signal with slow transitions. Therefore, avoid slow signal transitions on all clock and control signals since they are more likely to generate glitches inside the device.

- A. RGMII[x]\_RXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGMII[x]\_RD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]\_RXC and data bits 7-4 on the falling edge of RGMII[x]\_RXC. Similarly, RGMII[x]\_RX\_CTL carries RXDV on rising edge of RGMII[x]\_RXC and RXERR on falling edge of RGMII[x]\_RXC.

- (1) Output setup/hold times are defining a delay relationship of the transmit data and control outputs relative to the transmit clock output, but this output relationship is being presented as the minimum setup/hold times provided to the attached receiver. This approach matches how the output timing relationships are defined in the RGMII specification.

- A. TXC is delayed internally before being driven to the RGMII[x]\_TXC pin. This internal delay is always enabled.  
 B. Data and control information is received using both edges of the clocks. RGMII[x]\_TD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]\_TXC and data bits 7-4 on the falling edge of RGMII[x]\_TXC. Similarly, RGMII[x]\_TX\_CTL carries TXEN on rising edge of RGMII[x]\_TXC and TXERR on falling edge of RGMII[x]\_TXC.

### 7.10.5.3 CSI-2

#### Note

For more information, see the *Camera Serial Interface Receiver (CSI\_RX\_IF)* section in the device TRM.

The CSI\_RX\_IF deals with the processing of the pixel data coming from an external image sensor. It is a key component for the following multimedia applications: camera viewfinder, video record, and still image capture.

The CSI\_RX\_IF has a primary serial interface CSI-2 port (CSIRX0) compliant with the MIPI D-PHY RX specification v1.2 and the MIPI CSI-2 specification v1.3, with 4 differential data lanes plus 1 differential clock lane in synchronous mode, double data rate. Refer to the MIPI specifications for timing details.

- Support for 1,2,3 or 4 data lane mode up to 1.5Gbps

### 7.10.5.4 DDRSS

For more details about features and additional description information on the device LPDDR4 Memory Interface, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

Table 7-41 and Figure 7-34 present switching characteristics for DDRSS.

**Table 7-41. DDRSS Switching Characteristics**

see Figure 7-34

NO.	PARAMETER	DDR TYPE	MIN	MAX	UNIT
1	$t_{c(DDR\_CKP/DDR\_CKN)}$ Cycle time, DDR_CKP and DDR_CKN	LPDDR4	0.5358 <sup>(1)</sup>	20	ns

- (1) Minimum DDR clock Cycle time will be limited based on the specific memory type (vendor) used in a system and by PCB implementation. Refer to *AM62Ax DDR Board Design and Layout Guidelines* for the proper PCB implementation to achieve maximum DDR frequency.

**Figure 7-34. DDRSS Switching Characteristics**

For more information, see *DDR Subsystem (DDRSS)* section in *Memory Controllers* chapter in the device TRM.

### 7.10.5.5 DSS

Table 7-42, Table 7-43, Figure 7-35, Table 7-44 and Figure 7-36 present timing conditions, requirements, and switching characteristics for DSS.

**Table 7-50. JTAG Timing Conditions**

PARAMETER		MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>				
SR <sub>I</sub>	Input slew rate	0.5	2.0	V/ns
<b>OUTPUT CONDITIONS</b>				
C <sub>L</sub>	Output load capacitance	5	15	pF
<b>PCB CONNECTIVITY REQUIREMENTS</b>				
t <sub>d</sub> (Trace Delay)	Propagation delay of each trace	83.5	1000 <sup>(1)</sup>	ps
t <sub>d</sub> (Trace Mismatch Delay)	Propagation delay mismatch across all traces		100	ps

(1) Maximum propagation delay associated with the JTAG signal traces has a significant impact on maximum TCK operating frequency. It may be possible to increase the trace delay beyond this value, but the operating frequency of TCK must be reduced to account for the additional trace delay.

**Table 7-51. JTAG Timing Requirements**

see [Figure 7-40](#)

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
J1	t <sub>c</sub> (TCK)	Cycle time minimum, TCK	40 <sup>(1)</sup>		ns
J2	t <sub>w</sub> (TCKH)	Pulse width minimum, TCK high	0.4P <sup>(2)</sup>		ns
J3	t <sub>w</sub> (TCKL)	Pulse width minimum, TCK low	0.4P <sup>(2)</sup>		ns
J4	t <sub>su</sub> (TDI-TCK)	Input setup time minimum, TDI valid to TCK high	2		ns
	t <sub>su</sub> (TMS-TCK)	Input setup time minimum, TMS valid to TCK high	2		ns
J5	t <sub>h</sub> (TCK-TDI)	Input hold time minimum, TDI valid from TCK high	3		ns
	t <sub>h</sub> (TCK-TMS)	Input hold time minimum, TMS valid from TCK high	3		ns

(1) The maximum TCK operating frequency assumes the following timing requirements and switching characteristics for the attached debugger. The operating frequency of TCK must be reduced to provide appropriate timing margin if the debugger exceeds any of these assumptions.

- Minimum TDO setup time of 2 ns relative to the rising edge of TCK
- TDI and TMS output delay in the range of -12.9 ns to 13.9 ns relative to the falling edge of TCK

(2) P = TCK cycle time in ns

### 7.10.5.10 GPIO

Table 7-59, Table 7-60, and Table 7-61 present timing conditions, requirements, and switching characteristics for GPIO.

The device has three instances of the GPIO module.

- MCU\_GPIO0
- GPIO0
- GPIO1

#### Note

GPIO<sub>n\_x</sub> is generic name used to describe a GPIO signal, where n represents the specific GPIO module and x represents one of the input/output signals associated with the module.

For additional description information on the device GPIO, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

**Table 7-59. GPIO Timing Conditions**

PARAMETER		BUFFER TYPE	MIN	MAX	UNIT

(10) First transfer only for CLK DIV 1 mode.

(11) Half cycle; for all data after initial transfer for CLK DIV 1 mode.

(12) Half cycle of GPMC\_CLKOUT; for all data for modes other than CLK DIV 1 mode. GPMC\_CLKOUT divide down from GPMC\_FCLK.

(13) In GPMC\_CS*n*[*j*], *i* is equal to 0, 1, 2 or 3. In GPMC\_WAIT[*j*], *j* is equal to 0 or 1.

(14)  $P = \text{GPMC\_CLK}$  period in ns

(15) Related to the GPMC\_CLK output clock maximum and minimum frequencies programmable in the GPMC module by setting the GPMC\_CONFIG1\_*i* configuration register bit field GPMCFCLKDIVIDER.

(16) For div\_by\_1\_mode:

- GPMC\_CONFIG1\_*i* register: GPMCFCLKDIVIDER = 0h:
  - GPMC\_CLK frequency = GPMC\_FCLK frequency

For GPMC\_FCLK\_MUX:

- CTRLMMR\_GPMC\_CLKSEL[1-0] CLK\_SEL = 01 = PER1\_PLL\_CLKOUT / 3 = 300 / 3 = 100MHz

For TIMEPARAGRANULARITY\_X1:

- (1) The FA5 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.
- (2) The FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.
- (3)  $P = \text{PageBurstAccessTime} \times (\text{TimeParaGranularity} + 1) \times \text{GPMC\_FCLK}^{(5)}$
- (4)  $H = \text{AccessTime} \times (\text{TimeParaGranularity} + 1) \times \text{GPMC\_FCLK}^{(5)}$
- (5) GPMC\_FCLK is general-purpose memory controller internal functional clock period in ns.

### 7.10.5.12 I2C

The device contains six multicontroller Inter-Integrated Circuit (I2C) controllers. Each I2C controller was designed to be compliant to the Philips I<sup>2</sup>C-bus™ specification version 2.1. However, the device IOs are not fully compliant to the I2C electrical specification. The speeds supported and exceptions are described per port below:

- I2C0, I2C1, I2C2, and I2C3
  - Speeds:
    - Standard-mode (up to 100 Kbits/s)
      - 1.8 V
      - 3.3 V
    - Fast-mode (up to 400 Kbits/s)
      - 1.8 V
      - 3.3 V
  - Exceptions:
    - The IOs associated with these ports are not compliant to the fall time requirements defined in the I2C specification because they are implemented with higher performance LVCMOS push-pull IOs that were designed to support other signal functions that could not be implemented with I2C compatible IOs. The LVCMOS IOs being used on these ports are connected such they emulate open-drain outputs. This emulation is achieved by forcing a constant low output and disabling the output buffer to enter the Hi-Z state.
    - The I2C specification defines a maximum input voltage  $V_{IH}$  of  $(V_{DD_{max}} + 0.5 V)$ , which exceeds the absolute maximum ratings for the device IOs. The system must be designed to ensure the I2C signals never exceed the limits defined in the *Absolute Maximum Ratings* section of this datasheet.
- MCU\_I2C0 and WKUP\_I2C0
  - Speeds:
    - Standard-mode (up to 100 Kbits/s)
      - 1.8 V
      - 3.3 V
    - Fast-mode (up to 400 Kbits/s)
      - 1.8 V
      - 3.3 V
    - Hs-mode (up to 3.4 Mbits/s)
      - 1.8 V
  - Exceptions:
    - The IOs associated with these ports were not design to support Hs-mode while operating at 3.3 V. So Hs-mode is limited to 1.8-V operation.
    - The rise and fall times of the I2C signals connected to these ports must not exceed a slew rate of 0.8 V/ns (or 8E+7 V/s). This limit is more restrictive than the minimum fall time limits defined in the I2C specification. Therefore, it may be necessary to add additional capacitance to the I2C signals to slow the rise and fall times such that they do not exceed a slew rate of 0.8 V/ns.
    - The I2C specification defines a maximum input voltage  $V_{IH}$  of  $(V_{DD_{max}} + 0.5 V)$ , which exceeds the absolute maximum ratings for the device IOs. The system must be designed to ensure the I2C signals never exceed the limits defined in the *Absolute Maximum Ratings* section of this datasheet.

#### Note

I2C3 has one or more signals which can be multiplexed to more than one pin. Timing is only valid for specific pin combinations known as IOSETs. Valid pin combinations or IOSETs for this interface are defined in the [SysConfig-PinMux Tool](#).

---

Refer to the Philips I2C-bus specification version 2.1 for timing details.

For more details about features and additional description information on the device Inter-Integrated Circuit, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

### 7.10.5.13 MCAN

Table 7-69 and Table 7-70 presents timing conditions and switching characteristics for MCAN.

For more details about features and additional description information on the device Controller Area Network Interface, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

#### Note

The device has multiple MCAN modules. MCANn is a generic prefix applied to MCAN signal names, where n represents the specific MCAN module.

For more information, see *Controller Area Network (MCAN)* section in *Peripherals* chapter in the device TRM.

### 7.10.5.14 MCASP

#### Note

McASP has one or more signals which can be multiplexed to more than one pin. Timing requirements and switching characteristics defined in this section are only valid for specific pin combinations known as IOSETs. Valid pin combinations or IOSETs for this interface are defined in the [SysConfig-PinMux Tool](#).

Table 7-71, Table 7-72, Figure 7-61, Table 7-73, and Figure 7-62 present timing conditions, requirements, and switching characteristics for MCASP.

### 7.10.5.15 MCSPI

#### Note

McSPI has one or more signals which can be multiplexed to more than one pin. Timing requirements and switching characteristics defined in this section are only valid for specific pin combinations known as IOSETs. Valid pin combinations or IOSETs for this interface are defined in the [SysConfig-PinMux Tool](#).

For more details about features and additional description information on the device Serial Port Interface, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

[Table 7-74](#) presents timing conditions for MCSPI.

### 7.10.5.16 MMCSDB

The MMCSDB Host Controller provides an interface to embedded Multi-Media Card (MMC), Secure Digital (SD), and Secure Digital IO (SDIO) devices. The MMCSDB Host Controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness.

For more details about MMCSDB interfaces, see the corresponding MMC0, MMC1, and MMC2 subsections within *Signal Descriptions* and *Detailed Description* sections.

---

#### Note

Some operating modes require software configuration of the MMC DLL delay settings, as shown in [Table 7-79](#) and [Table 7-97](#).

The modes which show a value of "Tuning" in the ITAPDLYSEL column of [Table 7-79](#) and [Table 7-97](#) require a tuning algorithm to be used for optimizing input timing. Refer to the MMCSDB Programming Guide in the device TRM for more information on the tuning algorithm and configuration of input delays required to optimize input timing.

---

For more information, see *Multi-Media Card/Secure Digital (MMCSDB) Interface* section in *Peripherals* chapter in the device TRM.

### 7.10.5.16.1 MMC0 - eMMC/SD/SDIO Interface

MMC0 interface is compliant with the JEDEC eMMC electrical standard v5.1 (JESD84-B51) and it supports the following eMMC applications:

- Legacy SDR
- High Speed SDR
- HS200

MMC0 interface is also compliant with the SD Host Controller Standard Specification 4.10 and SD Physical Layer Specification v3.01 as well as SDIO Specification v3.00 and it supports the following SD Card applications:

- Default Speed
- High Speed
- UHS-I SDR12
- UHS-I SDR25
- UHS-I SDR50
- UHS-I DDR50
- UHS-I SDR104

Table 7-79 presents the required DLL software configuration settings for MMC0 timing modes.

### 7.10.5.16.2 MMC1/MMC2 - SD/SDIO Interface

MMC1/MMC2 interface is compliant with the SD Host Controller Standard Specification 4.10 and SD Physical Layer Specification v3.01 as well as SDIO Specification v3.00 and it supports the following SD Card applications:

- Default speed
- High speed
- UHS-I SDR12
- UHS-I SDR25
- UHS-I SDR50
- UHS-I DDR50
- UHS-I SDR104

### 7.10.5.17 OSPI

OSPI0 offers two data capture modes, PHY mode and Tap mode.

PHY mode uses an internal reference clock to transmit and receive data via a DLL based PHY, where each reference clock cycle produces a single cycle of OSPI0\_CLK for Single Data Rate (SDR) transfers or a half cycle of OSPI0\_CLK for Double Data Rate (DDR) transfers. PHY mode supports four clocking topologies for the receive data capture clock. Internal PHY Loopback - uses the internal reference clock as the PHY receive data capture clock. Internal Pad Loopback - uses OSPI0\_LBCLKO looped back into the PHY from the OSPI0\_LBCLKO pin as the PHY receive data capture clock. External Board Loopback - uses OSPI0\_LBCLKO looped back into the PHY from the OSPI0\_DQS pin as the PHY receive data capture clock. DQS - uses the DQS output from the attached device as the PHY receive data capture clock. SDR transfers are not supported when using the Internal Pad Loopback and DQS clocking topologies. DDR transfers are not supported when using the Internal PHY Loopback or Internal Pad Loopback clocking topologies.

Tap mode uses an internal reference clock with selectable taps to adjusted data transmit and receive capture delays relative to OSPI0\_CLK, which is a divide by 4 of the internal reference clock for SDR transfers or a divide by 8 of the internal reference clock for DDR transfers. Tap mode only supports one clocking topology for the receive data capture clock. No Loopback - uses the internal reference clock as the Tap receive data capture clock. This clocking topology supports a maximum internal reference clock rate of 200 MHz, which produces an OSPI0\_CLK rate up to 50 MHz for SDR mode or 25 MHz for DDR mode.

For more information, see *Octal Serial Peripheral Interface (OSPI)* section in *Peripherals* chapter in the device TRM.

For more details about features and additional description information on the device Octal Serial Peripheral Interface, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

[Section 7.10.5.17.1](#) defines timing requirements and switching characteristics associated with PHY mode and [Section 7.10.5.17.2](#) defines timing requirements and switching characteristics associated with Tap mode.

[Table 7-110](#) presents timing conditions for OSPI0.

### 7.10.5.17.1 OSPI0 PHY Mode

#### 7.10.5.17.1.1 OSPI0 With PHY Data Training

Read and write data valid windows will shift due to variation in process, voltage, temperature, and operating frequency. A data training method may be implemented to dynamically configure optimal read and write timing. Implementing data training enables proper operation across temperature with a specific process, voltage, and frequency operating condition, while achieving a higher operating frequency.

Data transmit and receive timing parameters are not defined for the data training use case since they are dynamically adjusted based on the operating condition.

Table 7-111 defines DLL delays required for OSPI0 with Data Training. Table 7-112, Figure 7-94, Figure 7-95, Table 7-113, Figure 7-96, and Figure 7-97 present timing requirements and switching characteristics for OSPI0 with Data Training.

- (1) Minimum setup and hold time requirements for OSPI0\_D[7:0] inputs are not defined when Data Training is used to find the optimum data valid window. The  $t_{DWW}$  parameter defines the minimum data invalid window required. This parameter is provided in lieu of minimum setup and minimum hold times, where it must be used to check compatibility with the data valid window provided by an attached device.

- (1) This Hold time requirement is larger than the Hold time provided by a typical OSPI/QSPI/SPI device. Therefore, the trace length between the SoC and attached OSPI/QSPI/SPI device must be sufficiently long enough to ensure that the Hold time is met at the SoC. The length of the SoC's external loopback clock (OSPI0\_LBCLKO to OSPI0\_DQS) may need to be shortened to compensate.

### 7.10.5.19 UART

For more details about features and additional description information on the device Universal Asynchronous Receiver Transmitter, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

**Table 7-127. UART Timing Conditions**

PARAMETER		MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>				
SR <sub>I</sub>	Input slew rate	0.5	5	V/ns
<b>OUTPUT CONDITIONS</b>				
C <sub>L</sub>	Output load capacitance	1	30 <sup>(1)</sup>	pF

- (1) This value represents an absolute maximum load capacitance. As the UART baud rate increases, it may be necessary to reduce the load capacitance to a value less than this maximum limit to provide enough timing margin for the attached device. The output rise/fall times increase as capacitive load increases, which decreases the time data is valid for the receiver of the attached devices. Therefore, it is important to understand the minimum data valid time required by the attached device at the operating baud rate. Then use the device IBIS models to verify the actual load capacitance on the UART signals does not increase the rise/fall times beyond the point where the minimum data valid time of the attached device is violated.

## 8 Detailed Description

### 8.1 Overview

AM62Ax is an extension of the Sitara™ automotive-grade family of heterogeneous Arm® processors with embedded Deep Learning (DL), Video and Vision Processing acceleration, display interface and extensive automotive peripheral and networking options. AM62Ax is built for a set of cost-sensitive automotive applications including driver and in-cabin monitoring systems, next generation of eMirror system, as well as a broad set of industrial applications in Factory Automation, Building Automation, Robotics, and other markets. The cost optimized AM62Ax provides high-performance compute for both traditional and deep learning algorithms at industry leading power/performance ratios with a high level of system integration to enable scalability and lower costs for advanced automotive platforms supporting multiple sensor modalities in stand-alone Electronic Control Units (ECUs).

AM62Ax contains up to four Arm® Cortex®-A53 cores with 64-bit architecture, a Vision Processing Accelerator (VPAC) with Image Signal Processor (ISP) and multiple vision assist accelerators, Deep Learning (DL) and video accelerators, a Cortex®-R5F MCU Channel core and a Cortex®-R5F Device Management core. The Cortex-A53s provide the powerful computing elements necessary for Linux applications as well as the implementation of traditional vision computing based-algorithms such as driver monitoring. Building on the existing world-class ISP, TI's 7th generation ISP includes flexibility to process a broader sensor suite including RGB-InfraRed (RGB-IR), support for higher bit depth, and features targeting analytics applications. Key cores include the next generation C7000™ DSP from Texas Instruments ("C7x") with scalar and vector cores, dedicated "MMA" deep learning accelerator enabling performance up to 2 TOPS within the lowest power envelope in the industry when operating at the typical automotive worst case junction temperature of 125°C.

The 3-port Gigabit Ethernet switch has one internal port and two external ports with TSN support and can be used to enable industrial networking options. In addition, an extensive peripherals set is included in AM62Ax to enable system level connectivity such as USB, MMC/SD, Camera interface, OSPI, CAN-FD and GPMC for parallel host interface to an external ASIC/FPGA. AM62Ax supports secure boot for IP protection with the built-in HSM (Hardware Security Module) and also employs advanced power management support for portable and power-sensitive applications.

## 8.2 Processor Subsystems

### 8.2.1 Arm Cortex-A53 Subsystem

The SoC implements one cluster of quad-core Arm® Cortex®-A53 MPCore™, with 32KB L1 instruction, 32KB L1 data, per core and 512KB L2 shared cache.

The Cortex®-A53 cores are general-purpose processors that can be used for running customer applications.

The A53SS is built around the Cortex®-A53 MPCore™ (Arm®-A53 Cluster), which is provided by Arm and configured by TI. It is based on the symmetric multiprocessor (SMP) architecture, and thus, it delivers high performance and optimal power management, debug and emulation capabilities.

The A53 processor is a multi-issue out-of-order superscalar execution engine with integrated L1 Instruction and Data Caches, compatible with Arm®v8-A architecture. It delivers significantly more performance than its predecessors at a higher level of power efficiency.

The Arm®v8-A architecture brings a number of new features. These include 64-bit data processing, extended virtual addressing and 64-bit general purpose registers. The A53 processor is Arm's first Arm®v8-A processor aimed at providing power-efficient 64-bit processing. It features an in-order, 8-stage, dual-issue pipeline, and improved integer, Arm® Neon™, Floating-Point Unit (FPU) and memory performance.

The A53 CPU supports two execution states: AArch32 and AArch64. The AArch64 state gives the A53 CPU its ability to execute 64-bit applications, while the AArch32 state allows the processor to execute existing Arm®v7-A applications.

For more information, see *Arm Cortex-A53 Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

### 8.2.2 Device/Power Manager

The WKUP\_R5FSS is a single-core implementation of the Arm® Cortex®-R5F processor that acts as the Device Manager responsible for boot, resource management, and power management functions. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™™ debug and trace architecture, integrated vectored interrupt manager (VIM), ECC aggregators, and various other modules for protocol conversion and address translation for easy integration into the SoC.

For more information, see *Device Manager Cortex R5F Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

### 8.2.3 MCU Arm Cortex-R5F Subsystem

The MCU\_R5FSS is an Arm® Cortex®-R5F based subsystem that can run safety processing or be used as a general purpose MCU. The processor includes 32KB instruction Cache, 32KB data cache, and 64KB Tightly Coupled Memory.

For more information, see *Cortex R5F Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

## 8.3 Accelerators and Coprocessors

### 8.3.1 C7xV-256 Deep Learning Accelerator

Single Core C7x/MMA subsystem with 32KB Instruction cache and 64KB data cache

### 8.3.2 Vision Pre-processing Accelerator

The Vision Pre-processing Accelerator (VPAC) subsystem is a set of common vision primitive functions, performing pixel data processing tasks, such as: color processing and enhancement, noise filtering, wide dynamic range (WDR) processing, lens distortion correction, pixel remap for de-warping, on-the-fly scale generation, on-the-fly pyramid generation. The VPAC offloads these common tasks from the main SoC processors (ARM, DSP, etc.), so these CPUs can be utilized for differentiated high-level algorithms. The VPAC is designed to support multiple cameras by working in time-multiplexing mode. The VPAC also includes an imaging pipe, which can be integrated on-the-fly with external camera sensor, as well as does memory-to-memory (M2M) processing on pixel data

The VPAC subsystem provides 4 processing blocks: Vision Imaging Sub-System (VISS), Lens Distortion Correction (LDC), Multi-Scalar (MSC) and Noise Filter (NF), along with Hardware Thread Scheduler (HTS), Load Store Engin (LSE), and 512 KB of internal L2 memory.

For more information, see *Vision Pre-processing Accelerator (VPAC)* section in *Processors and Accelerators* chapter in the device TRM.

### 8.3.3 JPEG Encoder

The JPEG Encoder is a scalable performance still image encoder. It supports the JPEG baseline still image encode. The source is raw picture data and the output is the fully constructed compressed image. The JPEG Encoder receives the image source through the memory interface (via MMU). It supports 4:2:2 and 4:2:0 YCbCr picture formats. As a coprocessor, the host processor needs only to manage the higher level control code functions such as providing the image to encode and choosing compression settings.

For more information, see *JPEG Encoder* section in *Processors and Accelerators* chapter in the device TRM.

### 8.3.4 Video Accelerator

The Video Accelerator is a 4K codec that supports both HEVC and H.264/AVC video formats. It provides high performance encode and decode capability up to 8bit 4K@60fps with a single-core architecture.

The Video Accelerator can encode and/or decode any resolution up to 8192 x 4320. It guarantees real-time performance for encoding/decoding 4K 60fps based on its sophisticated, latency tolerant hardware architecture. The Video Accelerator is highly optimized for memory bandwidth loading and excellent power management.

The Video Accelerator contains a 32-bit processor called V-CPU, which is responsible for parsing bitstream syntax in decoder or encoding bitstream syntax in encoder from sequence to slice header unit, pre-scanning slice data, controlling the underlying video hardware blocks called V-CORE. The V-CPU also communicates with host CPU through host register interface. The V-CORE performs actual processing of coded slice data: entropy decoding, inverse scan, inverse transform/quantization, motion compensation, and loop filtering in decoder and motion estimation, intra prediction, RDO, and entropy coding in encoder. This software and hardware combined architecture can provide flexibility and high throughput at the same time.

For more information, see *Video Accelerator* section in *Processors and Accelerators* chapter in the device TRM.

## 8.4 Other Subsystems

### 8.4.1 Dual Clock Comparator (DCC)

The Dual Clock Comparator (DCC) is used to determine the accuracy of a clock signal during the time execution of an application. Specifically, the DCC is designed to detect drifts from the expected clock frequency. The desired accuracy can be programmed based on calculation for each application. The DCC measures the frequency of a selectable clock source using another input clock as a reference.

For more information, see *Dual Clock Comparator* section in *Peripherals* chapter in the device TRM.

### 8.4.2 Data Movement Subsystem (DMSS)

The DMSS module provides data movement (DMA) and bridges between the CBA switched interconnect and the packet streaming fabric (network on chip) on the device.

The Data Movement Subsystem (DMSS) consists of DMA/Queue Management components and Peripherals:

- Packet DMA
- Block Copy DMA
- Ring Accelerator
- Packet Streaming Interface (PSILSS)
- Infrastructure components such as CBASS, secure proxy, and an interrupt aggregator

### 8.4.3 Memory Cyclic Redundancy Check (MCRC)

VBUSM CRC controller is a module which is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of a memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into MCRC Controller. The responsibility of MCRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. MCRC controller provides four channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system.

For more information, see *Memory Cyclic Redundancy Check* section in *Peripherals* chapter in the device TRM.

### 8.4.4 Peripheral DMA Controller (PDMA)

The Peripheral DMA is a simple DMA which has been architected to specifically meet the data transfer needs of peripherals, which perform data transfers using memory mapped registers (MMRs) accessed via a standard non-coherent bus fabric. The PDMA module is located close to one or more peripherals which require an external DMA for data movement and is architected to reduce cost by using VBUSP interfaces and supporting only statically configured transfer request (TR) operations.

The PDMA is only responsible for performing the data movement transactions which interact with the peripherals themselves. Data which is read from a given peripheral is packed by a PDMA source channel into a PSI-L data stream which is then sent to a remote peer DMSS destination channel which then performs the movement of the data into memory. Likewise, a remote DMSS source channel fetches data from memory and transfers it to a peer PDMA destination channel over PSI-L which then performs the writes to the peripheral.

The PDMA architecture is intentionally heterogeneous (DMSS + PDMA) to right size the data transfer complexity at each point in the system to match the requirements of whatever is being transferred to or from. Peripherals are typically FIFO based and do not require multi-dimensional transfers beyond their FIFO dimensioning requirements, so the PDMA transfer engines are kept simple with only a few dimensions (typically for sample size and FIFO depth), hardcoded address maps, and simple triggering capabilities.

Multiple source and destination channels are provided within the PDMA which allow multiple simultaneous transfer operations to be ongoing. The DMA controller maintains state information for each of the channels and employs round-robin scheduling between channels in order to share the underlying DMA hardware.

#### 8.4.5 Real-Time Clock (RTC)

The basic purpose for the RTC is to keep time of day. The other equally important purpose of RTC is for Digital Rights management. Some degree of tamper proofing is needed to ensure that simply stopping, resetting, or corrupting the RTC does not go unnoticed so that if this occurs, the application can re-acquire the time of day from a trusted source.

For more information, see *Real-Time Clock* section in *Peripherals* chapter in the device TRM.

## 8.5 Peripherals

### 8.5.1 Gigabit Ethernet Switch (CPSW3G)

The 3-port Gigabit Ethernet Switch (CPSW0) subsystem provides Ethernet packet communication for the device and can be configured as an Ethernet switch.

For more information, see *Gigabit Ethernet Switch* section in *Peripherals* chapter in the device TRM.

### 8.5.2 Camera Serial Interface Receiver (CSI\_RX\_IF)

The integration of the CSI\_RX\_IF module allows the device to stream video inputs from multiple cameras to internal memory.

For more information, see *Camera Serial Interface Receiver* section in *Peripherals* chapter in the device TRM.

### 8.5.3 Display Subsystem (DSS)

The Display Subsystem (DSS) is a flexible, multi-pipeline subsystem that supports high-resolution display outputs. DSS includes input pipelines providing multi-layer blending with transparency to enable on-the-fly composition. Various pixel processing capabilities are supported, such as color space conversion and scaling, among others. DSS includes a DMA engine, which allows direct access to the frame buffer (device system memory). Display outputs to the Display Parallel Interface (DPI).

For more information, see *Display Subsystem* section in *Peripherals* chapter in the device TRM.

### 8.5.4 Enhanced Capture (ECAP)

The ECAP module provides accurate timing of events. When not being used for event capture, its resources can be used to generate a single channel of asymmetrical PWM waveforms.

The Enhanced Capture (ECAP) module can be used for:

- Sample rate measurements of audio inputs
- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

For more information, see *Enhanced Capture* section in *Peripherals* chapter in the device TRM.

### 8.5.5 Error Location Module (ELM)

The ELM extracts error addresses from generated syndrome polynomials.

The ELM is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. A host processor can then correct the data block by flipping the bits to which the ELM error-location outputs point.

When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller. ELM can be also used to support parallel NOR flash or NAND flash.

For more information, see *Error Location Module* section in *Peripherals* chapter in the device TRM.

### 8.5.6 Enhanced Pulse Width Modulation (EPWM)

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The EPWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the EPWM is built up from smaller single channel modules with separate resources and that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

For more information, see *Enhanced Pulse Width Modulation* section in *Peripherals* chapter in the device TRM.

### 8.5.7 Error Signaling Module (ESM)

The Error Signaling Module (ESM) aggregates events and/or errors from throughout the device into one location. It can signal both low and high priority interrupts to a processor to deal with an event and/or manipulate an I/O error pin to signal an external hardware that an error has occurred. Therefore an external controller is able to reset the device or keep the system in a safe, known state.

For more information, see *Error Signaling Module* section in *Peripherals* chapter in the device TRM.

### 8.5.8 Enhanced Quadrature Encoder Pulse (EQEP)

The Enhanced Quadrature Encoder Pulse (EQEP) peripheral is used for direct interface with a linear or rotary incremental encoder to get position, direction and speed information from a rotating machine for use in high performance motion and position control system. The disk of an incremental encoder is patterned with a single track of slots patterns. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position and zero reference.

For more information, see *Enhanced Quadrature Encoder Pulse* section in *Peripherals* chapter in the device TRM.

### 8.5.9 General-Purpose Interface (GPIO)

The general-purpose input/output (GPIO) peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs. When configured as an output, user can write to an internal register to control the state driven on the output pin. When configured as an input, user can obtain the state of the input by reading the state of an internal register.

In addition, the GPIO peripheral can produce host CPU interrupts and DMA synchronization events in different interrupt/event generation modes.

For more information, see *General-Purpose Interface* section in *Peripherals* chapter in the device TRM.

### 8.5.10 General-Purpose Memory Controller (GPMC)

The General-Purpose Memory Controller is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in non-multiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

For more information, see *General-Purpose Memory Controller* section in *Peripherals* chapter in the device TRM.

### 8.5.11 Global Timebase Counter (GTC)

The GTC module provides a continuous running counter that can be used for time synchronization and debug trace time stamping.

For more information, see *Global Timebase Counter* section in *Peripherals* chapter in the device TRM.

### 8.5.12 Inter-Integrated Circuit (I2C)

The device contains multicontroller Inter-Integrated Circuit (I2C) controllers each of which provides an interface between a local host (LH), such as an Arm and any I<sup>2</sup>C-bus-compatible device that connects via the I<sup>2</sup>C serial bus. External components attached to the I<sup>2</sup>C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I<sup>2</sup>C interface.

Each multicontroller I<sup>2</sup>C module can be configured to act like a target or controller I<sup>2</sup>C-compatible device.

I<sup>2</sup>C instances may be implemented with dedicated, I<sup>2</sup>C compliant, open-drain I/O buffers, or with standard LVCMOS I/O buffers. The I<sup>2</sup>C instances associated with open-drain I/O buffers can support Hs-mode (up to 3.4 Mbps when the I/O buffers are operating at 1.8 V but limited to 400 kbps when the I/O buffers are operating at 3.3 V).

The I<sup>2</sup>C instances associated with standard LVCMOS I/O buffers can support Fast-mode (up to 400 kbps). The LVCMOS I/O buffers being used on these ports are connected such they emulate open-drain outputs. This emulation is achieved by forcing a constant low output and disabling the output buffer to enter the Hi-Z state.

For more information, see *Inter-Integrated Circuit* section in *Peripherals* chapter in the device TRM.

### 8.5.13 Modular Controller Area Network (MCAN)

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time control with a high level of security. CAN has high immunity to electrical interference and the ability to self-diagnose and repair data errors. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The MCAN module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

For more information, see *Modular Controller Area Network* section in *Peripherals* chapter in the device TRM.

### 8.5.14 Multichannel Audio Serial Port (MCASP)

This section introduces the Multichannel Audio Serial Port (MCASP) module and describes its main functions and connections in the device.

The MCASP functions as a general-purpose audio serial port are optimized to the requirements of various audio applications. The MCASP module can operate in both transmit and receive modes. The MCASP is useful for time-division multiplexed (TDM) stream, Inter-IC Sound (I2S) protocols reception and transmission as well as for an inter-component digital audio interface transmission (DIT). The MCASP has the flexibility to gluelessly connect to a Sony/Philips digital interface (S/PDIF) transmit physical layer component.

Although inter-component digital audio interface reception (DIR) mode (this is, S/PDIF stream receiving) is not natively supported by the MCASP module, a specific TDM mode implementation for the MCASP receivers allows an easy connection to external DIR components (for example, S/PDIF to I2S format converters).

For more information, see *Multichannel Audio Serial Port* section in *Peripherals* chapter in the device TRM.

### 8.5.15 Multichannel Serial Peripheral Interface (MCSPi)

The MCSPi module is a multichannel transmit/receive, controller/peripheral synchronous serial bus.

For more information, see *Multichannel Serial Peripheral Interface* section in *Peripherals* chapter in the device TRM.

### 8.5.16 Multi-Media Card Secure Digital (MMCSD)

The MMCSD Host Controller provides an interface to eMMC 5.1 (embedded Multi-Media Card), SD 4.10 (Secure Digital), and SDIO 4.0 (Secure Digital IO) devices. The MMCSD Host Controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness

For more information, see *Multi-Media Card Secure Digital* section in *Peripherals* chapter in the device TRM.

### 8.5.17 Octal Serial Peripheral Interface (OSPI)

The Octal Serial Peripheral Interface (OSPI) module is a Serial Peripheral Interface (SPI) module which allows single, dual, quad or octal read and write access to external flash devices. This module has a memory mapped register interface, which provides a direct memory interface for accessing data from external flash devices, simplifying software requirements.

The OSPI module is used to transfer data, either in a memory mapped direct mode (for example a processor wishing to execute code directly from external flash memory), or in an indirect mode where the module is set-up to silently perform some requested operation, signaling its completion via interrupts or status registers. For indirect operations, data is transferred between system memory and external flash memory via an internal SRAM which is loaded for writes and unloaded for reads by a device controller at low latency system speeds. Interrupts or status registers are used to identify the specific times at which this SRAM should be accessed using user programmable configuration registers.

For more information, see *Octal Serial Peripheral Interface (OSPI)* section in *Peripherals* chapter in the device TRM.

### 8.5.18 Timers

All timers include specific functions to generate accurate tick interrupts to the operating system.

For more information, see *Timers* section in *Peripherals* chapter in the device TRM.

### 8.5.19 Universal Asynchronous Receiver/Transmitter (UART)

The UART is a peripheral that utilizes the DMA for data transfer or interrupt polling via host CPU. All UART modules support IrDA and CIR modes when 48 MHz function clock is used. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices.

For more information, see *Universal Synchronous/Asynchronous Receiver/Transmitter* section in *Peripherals* chapter in the device TRM.

### 8.5.20 Universal Serial Bus Subsystem (USBSS)

USB (Universal Serial Bus) provides a low-cost connectivity solution for numerous consumer portable devices by implementing a mechanism for data transfer between USB devices.

The device instantiates two independent instances of a third-party USB subsystem (USB2SS) operating at up to USB2.0 speeds (480Mb/s), either of which can be independently configured to act as a USB Host or a USB Device.

For more information, see *Universal Serial Bus Subsystem* section in *Peripherals* chapter in the device TRM.

## 9 Applications, Implementation, and Layout

---

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

---

### 9.1 Device Connection and Layout Fundamentals

#### 9.1.1 Power Supply

##### 9.1.1.1 Power Supply Designs

The Power Management IC (PMIC) recommended for the AM62Ax processor and its principal peripherals, along with its operational details can be found in the [PMIC Solution for AM62Ax](#) application note.

List of benefits when using the recommended PMIC to power AM62Ax:

- Cost and space optimized solution specifically designed to power the AM62Ax processor
- Full device performance entitlement as validated on TI Evaluation boards
- Factory programmed configurations support power rail load steps, supply voltage accuracies, and maximum load currents with margins
- Factory programmed configuration to support LPDDR4 memory
- Meets all AM62Ax voltage and sequencing requirements, refer to [Section 7.4, Recommended Operating Conditions](#) and [Section 7.10.2.2, Power Supply Sequencing](#)

##### 9.1.1.2 Power Distribution Network Implementation Guidance

The [Sitara Processor Power Distribution Networks: Implementation and Analysis](#) provides guidance for successful implementation of the power distribution network. This includes PCB stackup guidance as well as guidance for optimizing the selection and placement of the decoupling capacitors. TI *only* supports designs that follow the board design guidelines contained in the application report.

#### 9.1.2 External Oscillator

For more information about External Oscillators, see the [Clock Specifications](#) section.

#### 9.1.3 JTAG, EMU, and TRACE

Texas Instruments supports a variety of eXtended Development System (XDS) JTAG controllers with various debug capabilities beyond only JTAG support. A summary of this information is available in the [XDS Target Connection Guide](#).

For recommendations on JTAG, EMU, and TRACE routing, see the [Emulation and Trace Headers Technical Reference Manual](#)

#### 9.1.4 Unused Pins

For more information about Unused Pins, see [Section 6.4, Pin Connectivity Requirements](#)

## 9.2 Peripheral- and Interface-Specific Design Information

### 9.2.1 DDR Board Design and Layout Guidelines

The goal of the [AM62Ax DDR Board Design and Layout Guidelines](#) is to make the DDR system implementation straightforward for all designers. Requirements have been distilled down to a set of layout and routing rules that allow designers to successfully implement a robust design for the topologies that TI supports. TI only supports board designs using LPDDR4 memories that follow the guidelines in this document.

## 9.2.2 OSPI/QSPI/SPI Board Design and Layout Guidelines

The following section details the PCB routing guidelines that must be observed when connecting OSPI, QSPI, or SPI devices.

### 9.2.2.1 No Loopback, Internal PHY Loopback, and Internal Pad Loopback

- The OSPI[x]\_CLK output pin must be connected to the CLK input pin of the attached OSPI/QSPI/SPI device
- The signal propagation delay from the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B) must be  $\leq 450$  ps ( $\sim 7$ cm as stripline or  $\sim 8$ cm as microstrip)
- The signal propagation delay of each OSPI[x]\_D[y] and OSPI[x]\_CSn[z] pin to the corresponding attached OSPI/QSPI/SPI device data and control pin (E to F, or F to E) must be approximately equal to the signal propagation delay from the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B)
- 50  $\Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 9-1](#)
- Propagation delays and matching:
  - (A to B)  $\leq 450$  ps
  - (E to F, or F to E) = ((A to B)  $\pm 60$  ps)

\* 0  $\Omega$  resistor (R1), located as close as possible to the OSPI[x]\_CLK pin, is placeholder for fine tuning, if needed.

**Figure 9-1. OSPI Connectivity Schematic for No Loopback, Internal PHY Loopback, and Internal Pad Loopback**

### 9.2.2.2 External Board Loopback

- The OSPI[x]\_CLK output pin must be connected to the CLK input pin of the attached OSPI/QSPI/SPI device
- The OSPI[x]\_LBCLKO output pin must be looped back to the OSPI[x]\_DQS input pin
- The signal propagation delay of the OSPI[x]\_LBCLKO pin to the OSPI[x]\_DQS pin (C to D) must be approximately twice the propagation delay of the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B)
- The signal propagation delay of each OSPI[x]\_D[y] and OSPI[x]\_CSn[z] pin to the corresponding attached OSPI/QSPI/SPI device data and control pin (E to F, or F to E) must be approximately equal to the signal propagation delay from the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [Figure 9-2](#)
- Propagation delays and matching:
  - (C to D) = 2 x ((A to B) ± 30 ps), see the exception note below.
  - (E to F, or F to E) = ((A to B) ± 60 ps)

#### Note

The External Board Loopback hold time requirement (defined by parameter number O16 in [Table 7-118, OSPI0 Timing Requirements - PHY DDR Mode](#)) may be larger than the hold time provided by a typical OSPI/QSPI/SPI device. In this case, the propagation delay of OSPI[x]\_LBCLKO pin to the OSPI[x]\_DQS pin (C to D) can be reduced to provide additional hold time.

\* 0 Ω resistor (R1), located as close as possible to the OSPI[x]\_CLK and OSPI[x]\_LBCLKO pins, is a placeholder for fine tuning, if needed.

**Figure 9-2. OSPI Connectivity Schematic for External Board Loopback**

### 9.2.2.3 DQS (only available in Octal SPI devices)

- The OSPI[x]\_CLK output pin must be connected to the CLK input pin of the attached OSPI/QSPI/SPI device
- The DQS pin of the attached OSPI/QSPI/SPI device must be connected to OSPI[x]\_DQS pin
- The signal propagation delay from the attached OSPI/QSPI/SPI device DQS pin to the OSPI[x]\_DQS pin (D to C) must be approximately equal to the signal propagation delay from the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B)
- The signal propagation delay of each OSPI[x]\_D[y] and OSPI[x]\_CSn[z] pin to the corresponding attached OSPI/QSPI/SPI device data and control pin (E to F, or F to E) must be approximately equal to the signal propagation delay from the OSPI[x]\_CLK pin to the attached OSPI/QSPI/SPI device CLK pin (A to B)
- 50  $\Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 9-3](#)
- Propagation delays and matching:
  - (D to C) = ((A to B)  $\pm$  30 ps)
  - (E to F, or F to E) = ((A to B)  $\pm$  60 ps)

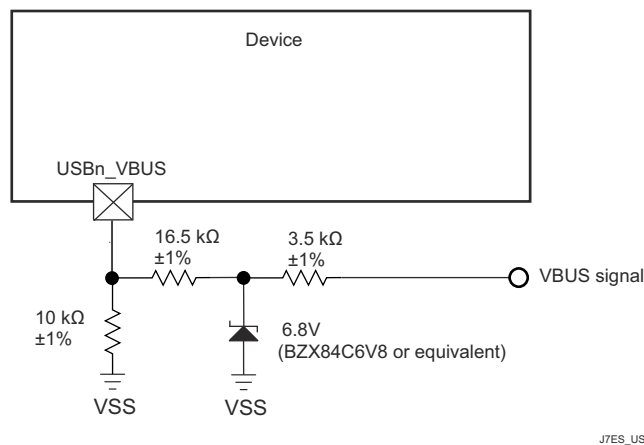

\* 0  $\Omega$  resistor (R1), located as close as possible to the OSPI[x]\_CLK pin, is a placeholder for fine tuning, if needed.

**Figure 9-3. OSPI Connectivity Schematic for DQS**

### 9.2.3 USB VBUS Design Guidelines

The USB 3.1 specification allows the VBUS voltage to be as high as 5.5 V for normal operation, and as high as 20 V when the Power Delivery addendum is supported. Some automotive applications require a max voltage to be 30 V.

The device requires the VBUS signal voltage be scaled down using an external resistor divider (as shown in the [Figure 9-4](#)), which limits the voltage applied to the actual device pin (USB0\_VBUS). The tolerance of these external resistors should be equal to or less than 1%, and the leakage current of Zener diode at 5 V should be less than 100 nA.

**Figure 9-4. USB VBUS Detect Voltage Divider / Clamp Circuit**

The USB0\_VBUS pin can be considered to be fail-safe because the external circuit in [Figure 9-4](#) limits the input current to the actual device pin in a case where VBUS is applied while the device is powered off.

### 9.2.4 System Power Supply Monitor Design Guidelines

The VMON\_VSYS pin provides a way to monitor a system power supply. This system power supply is typically a single pre-regulated power source for the entire system and can be connected to the VMON\_VSYS pin via an external resistor divider circuit. This system supply is monitored by comparing the external voltage divider output voltage to an internal voltage reference, where a power fail event is triggered when the voltage applied to VMON\_VSYS drops below the internal reference voltage. The actual system power supply voltage trip point is determined by the system designer when selecting component values used to implement the external resistor voltage divider circuit.

When designing the resistor divider circuit the designer must understand various factors which contribute to variability in the system power supply monitor trip point. The first thing to consider is the initial accuracy of the VMON\_VSYS input threshold which has a nominal value of 0.45 V, with a variation of  $\pm 3\%$ . Precision 1% resistors with similar thermal coefficient are recommended for implementing the resistor voltage divider. This minimizes variability contributed by resistor value tolerances. Input leakage current associated with VMON\_VSYS must also be considered since any current flowing into the pin creates a loading error on the voltage divider output. The VMON\_VSYS input leakage current can be in the range of 10 nA to 2.5  $\mu$ A when applying 0.45 V.

#### Note

The resistor voltage divider shall be designed such that the output voltage never exceeds the maximum value defined in the *Recommended Operating Conditions* section, during normal operating conditions.

[Figure 9-5](#) presents an example, where the system power supply is nominally 5 V and the maximum trigger threshold is 5 V - 10%, or 4.5 V.

For this example, the designer must understand which variables effect the maximum trigger threshold when selecting resistor values. A device which has a VMON\_VSYS input threshold of  $0.45\text{ V} + 3\%$  needs to be considered when trying to design a voltage divider that doesn't trip until the system supply drops 10%. The effect of resistor tolerance and input leakage also needs to be considered, but the contribution to the maximum trigger point is not obvious. When selecting component values which produce a maximum trigger voltage, the system designer must consider a condition where the value of R1 is 1% low and the value of R2 is 1% high combined with a condition where input leakage current for the VMON\_VSYS pin is  $2.5\ \mu\text{A}$ . When implementing a resistor divider where  $R1 = 4.81\ \text{k}\Omega$  and  $R2 = 40.2\ \text{k}\Omega$ , the result is a maximum trigger threshold of  $4.517\ \text{V}$ .

Once component values have been selected to satisfy the maximum trigger voltage as described above, the system designer can determine the minimum trigger voltage by calculating the applied voltage that produces an output voltage of  $0.45\ \text{V} - 3\%$  when the value of R1 is 1% high and the value of R2 is 1% low, and the input leakage current is  $10\ \text{nA}$ , or zero. Using an input leakage of zero with the resistor values given above, the result is a minimum trigger threshold of  $4.013\ \text{V}$ .

This example demonstrates a system power supply voltage trip point that ranges from  $4.013\ \text{V}$  to  $4.517\ \text{V}$ . Approximately  $250\ \text{mV}$  of this range is introduced by VMON\_VSYS input threshold accuracy of  $\pm 3\%$ , approximately  $150\ \text{mV}$  of this range is introduced by resistor tolerance of  $\pm 1\%$ , and approximately  $100\ \text{mV}$  of this range is introduced by loading error when VMON\_VSYS input leakage current is  $2.5\ \mu\text{A}$ .

The resistor values selected in this example produces approximately  $100\ \mu\text{A}$  of bias current through the resistor divider when the system supply is  $4.5\ \text{V}$ . The  $100\ \text{mV}$  of loading error mentioned above can be reduced to about  $10\ \text{mV}$  by increasing the bias current through the resistor divider to approximately  $1\ \text{mA}$ . So resistor divider bias current vs loading error is something the system designer needs to consider when selecting component values.

The system designer must also consider implementing a noise filter on the voltage divider output since VMON\_VSYS has minimum hysteresis and a high-bandwidth response to transients. This can be done by installing a capacitor across R1 as shown in Figure 9-5. However, the system designer must determine the response time of this filter based on system supply noise and expected response to transient events.

**Figure 9-5. System Supply Monitor Voltage Divider Circuit**

VMON\_1P8\_SOC pin provides a way to monitor external  $1.8\ \text{V}$  power supplies. This pin must be connected directly to their respective power source. An internal resistor divider with software control is implemented inside the SoC for each of these pins. Software can program each internal resistor divider to create appropriate under voltage and over voltage interrupts.

VMON\_3P3\_SOC pin provides a way to monitor external  $3.3\ \text{V}$  power supplies. This pin must be connected directly to their respective power source. An internal resistor divider with software control is implemented inside the SoC for each of these pins. Software can program each internal resistor divider to create appropriate under voltage and over voltage interrupts.

### 9.2.5 High Speed Differential Signal Routing Guidance

The [High Speed Interface Layout Guidelines](#) provides guidance for successful routing of the high speed differential signals. This includes PCB stackup and materials guidance as well as routing skew, length and spacing limits. TI supports *only* designs that follow the board design guidelines contained in the application note.

### 9.2.6 Thermal Solution Guidance

The [Thermal Design Guide for DSP and ARM Application Processors](#) provides guidance for successful implementation of a thermal solution for system designs containing this device. This document provides background information on common terms and methods related to thermal solutions. TI only supports designs that follow system design guidelines contained in the application note.

## 9.3 Clock Routing Guidelines

### 9.3.1 Oscillator Routing

When designing the printed-circuit board:

- Place all crystal circuit components as close as possible to the respective device pins.
- Route the crystal circuit traces on the outer layer of the PCB and minimize trace lengths to reduce parasitic capacitance and minimize crosstalk from other signals.
- Place a continuous ground plane on the adjacent layer of the PCB such that it is under all crystal circuit components and crystal circuit traces.
- Route a ground guard around the crystal circuit components to shield it from any adjacent signals routed on the same layer as the crystal circuit traces. Insert multiple vias to stitch down the ground guard such that it does not have any unterminated stubs.
- Route a ground guard between the MCU\_OSC0\_XI and MCU\_OSC0\_XO signals to shield the MCU\_OSC0\_XI signal from the MCU\_OSC0\_XO signal. Insert multiple vias to stitch down the ground guard such that it does not have any unterminated stubs.
- Connect all crystal circuit ground connections and ground guard connections directly to the adjacent layer ground plane, and the device VSS ground plane if they are implemented separately on different layers of the PCB.

#### Note

Implementing a ground guard between the MCU\_OSC0\_XI and MCU\_OSC0\_XO signals is critical to minimize shunt capacitance between the two signals. Routing these two signals adjacent to each other without a ground guard between them will effectively reduce the gain of the oscillator amplifier, which reduces its ability to start oscillation.

## 10 Device and Documentation Support

### 10.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, AM62AxAMB). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of AM62Ax devices in the AMB package type, see the Package Option Addendum of this document, the TI website ([ti.com](http://ti.com)), or contact your TI sales representative.

### 10.1.1 Standard Package Symbolization

#### Note

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

## 10.2 Tools and Software

The following Development Tools support development for TI's Embedded Processing platforms:

### Development Tools

**Code Composer Studio™ Integrated Development Environment** Code Composer Studio (CCS) Integrated Development Environment (IDE) is a development environment that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. The tool includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

**SysConfig-PinMux Tool** The SysConfig-PinMux Tool is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI Embedded Processor devices. The tool can be used to automatically calculate the optimal pinmux configuration to satisfy entered system requirements. The tool generates output C header/code files that can be imported into software development kits (SDKs) and used to configure customer's software to meet custom hardware requirements. The **Cloud-based SysConfig-PinMux Tool** is also available.

For a complete listing of development-support tools for the processor platform, visit the Texas Instruments website at [ti.com](http://ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

## 10.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents describe the AM62Ax devices.

### Technical Reference Manual

**AM62Ax Sitara Processors Technical Reference Manual:** Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the AM62Ax family of devices.

### Errata

**AM62Ax Sitara Processors Silicon Errata:** Describes the known exceptions to the functional specifications for the device.

## 10.4 Support Resources

**TI E2E™ support forums** are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

## 10.5 Trademarks

Sitara™, C7000™, Code Composer Studio™, and TI E2E™ are trademarks of Texas Instruments. MPCore™, Neon™, and CoreSight™ are trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

Arm®, Cortex®, and TrustZone® are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

MIPI® is a registered trademark of MIPI Alliance.

Secure Digital® and SD® are registered trademarks of SD Card Association.

All trademarks are the property of their respective owners.

## 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
