ISO721-Q1、ISO722-Q1 3.3V および 5V 高速デジタル アイソレータ

1 特長

- 100Mbps の信号速度オプション
- 伝搬遅延は 12ns (標準値) です。
- パルス スキューは 0.5ns (標準値) です。
- 低消費電力スリープ モード
- 定格動作電圧で 28 年の標準寿命 (「絶縁特性曲線」を参照)
- フェイルセーフ出力
- 大半の光・磁気アイソレータに対しドロップイン代替可能
- 3.3V および 5V 電源で動作
- –40℃～+125℃の動作温度範囲
- 安全関連認証:
  - DIN EN IEC 60747-17 (VDE 0884-17)
  - UL 1577 部品認定プログラム
  - IEC 61010-1 認定、IEC 62368-1 認定

2 アプリケーション

- ファクトリ オートメーション
  - Modbus
  - Profibus™
  - DeviceNet™ データ バス
- コンピュータ ペリフェラル インターフェイス
- サーボ制御インターフェイス
- データ アクイジション

3 概要

ISO721-Q1 および ISO722-Q1 デバイスは、ロジック入力および出力バッファが二酸化ケイ素 (SiO_2) の絶縁膜によって分離されたデジタル アイソレータです。この絶縁膜は、VDE 0884-17 に準拠した、最大 $4000V_{PK}$ のガルバニック絶縁を提供します。これらのデバイスを絶縁型電源と組み合わせて使用すると、データ バスや他の回路上のノイズ電流がローカル グランドに入り込んでノイズに敏感な回路に干渉または損傷を与えることを防止できます。

バイナリ入力信号がコンディショニングされ、バランスされた信号に変換されてから、容量性絶縁バリアによって差動化されます。絶縁バリアを通過して、差動コンパレータがロジック変換情報を受け取り、それに応じてフリップフロップおよび出力回路を設定またはリセットします。バリアを通して周期的に更新パルスが送信され、適切な DC 出力レベルを実現します。

この DC 更新パルスが 4µs を超えて受信されない場合、入力に電力が供給されていない、または入力がアクティブに駆動されていないと見なされ、フェイルセーフ回路により出力が論理 HIGH 状態に駆動されます。

これらのデバイスは、3.3V、5V、または任意の組み合わせの 2 つの電源電圧を必要とします。3.3V 電源で動作するとき、すべての入力は 5V 許容で、すべての出力は 4mA CMOS です。

ISO722-Q1 デバイスは、アクティブ LOW の出力イネーブルを備えており、HIGH ロジック レベルに駆動すると出力が高インピーダンス状態になり、内部バイアス回路をオフにして消費電力を節約します。

ISO721-Q1 および ISO722-Q1 デバイスは、TTL 入力しきい値とノイズ フィルタが入力に存在し、パルス幅 2ns までの遷移パルスがデバイスの出力に渡されることを防止します。

ISO721-Q1 および ISO722-Q1 デバイスは、-40℃～+125℃の周囲温度範囲で動作が規定されています。

6 Specifications

6.1 Absolute Maximum Ratings

See (1)

Parameter		Value
V_{CC}	Supply voltage(2), V_{CC1}, V_{CC2}	–0.5 V to 6 V
V_I	Voltage at IN or OUT terminal	–0.5 V to 6 V
I_O	Output current	±15 mA
T_J	Maximum virtual-junction temperature	170°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) All voltage values except differential I/O bus voltages are with respect to network ground terminal and are peak voltage values. Vrms values are not listed in this publication.

6.2 Recommended Operating Conditions

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
(2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Apparent charge is electrical discharge caused by a partial discharge (pd).
(4) All pins on each side of the barrier tied together creating a two-terminal device

6.7 Safety Limiting Values

Safety limiting(1) intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{θJA}$ = 212°C/W, V_I = 5.5 V, T_J = 170°C, T_A = 25°C, see Thermal Information			124	mA
		$R_{θJA}$ = 212°C/W, V_I = 3.6 V, T_J = 170°C, T_A = 25°C, see Thermal Information			190	

Safety limiting(1) intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
T_S	Safety temperature				150	°C

(1) The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

8 Detailed Description

8.1 Overview

The ISO72x-Q1 family of devices transmit digital data across a silicon dioxide based isolation barrier. The digital input signal (IN) of the device is sampled by a transmitter and at every data edge the transmitter sends a corresponding differential signal across the isolation barrier. When the input signal is static, the refresh logic periodically sends the necessary differential signal from the transmitter. On the other side of the isolation barrier, the receiver converts the differential signal into a single-ended signal which is output on the OUT pin through a buffer. If the receiver does not receive a data or refresh signal, the timeout logic detects the loss of signal or power from the input side and drives the output to the default level.

9 Application and Implementation

注

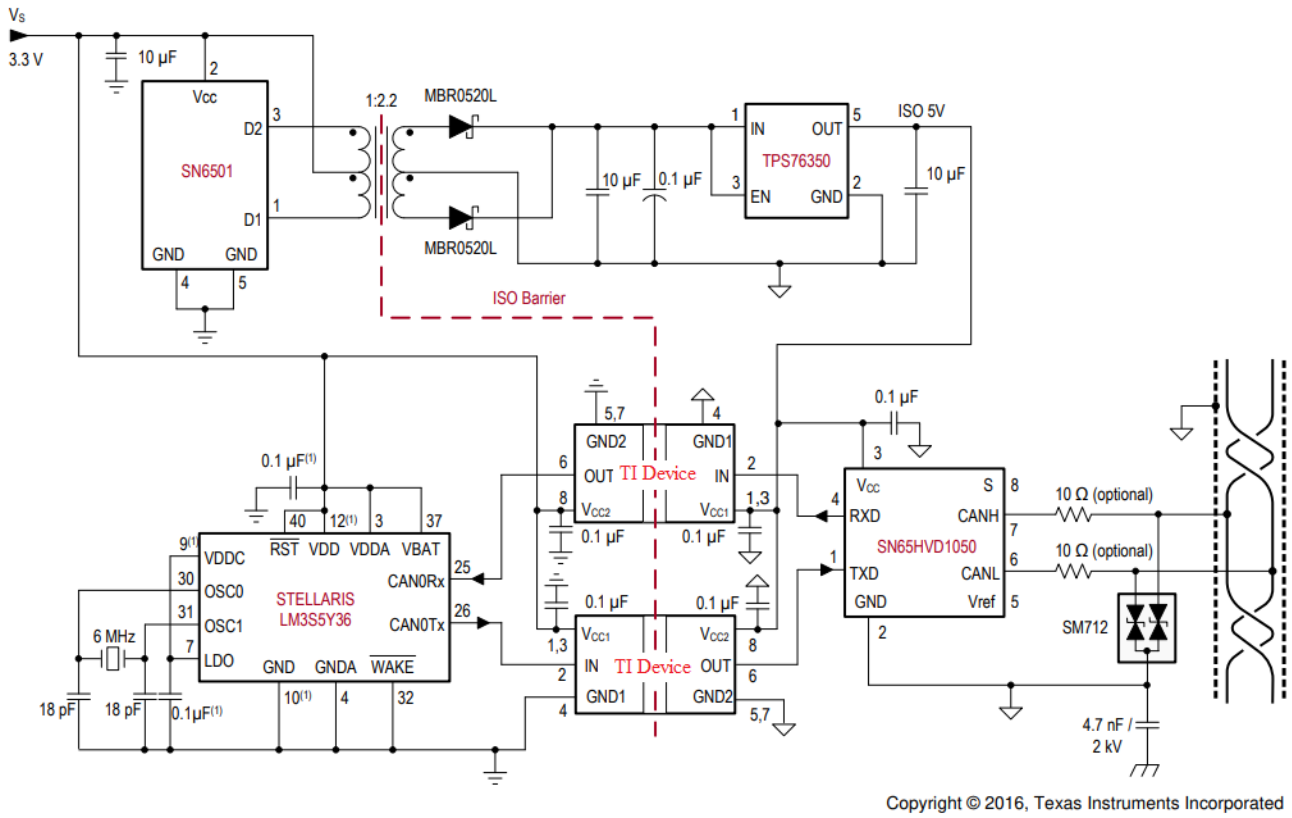
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The ISO72x-Q1 devices use single-ended TTL or CMOS-logic-switching technology. The supply voltage range of the devices is from 3 V to 5.5 V for both supplies, V_{CC1} and V_{CC2}. When designing with digital isolators, because the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (µC or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

9.2 Typical Application

The ISO721 device can be used with Texas Instruments' microcontroller, CAN transceiver, transformer driver, and low-dropout voltage regulator to create an Isolated CAN Interface as shown in 図 9-1.



A. Multiple pins and capacitors omitted for clarity purpose.

図 9-1. Isolated CAN Interface

9.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO72x-Q1 devices only require two external bypass capacitors to operate.

9.2.2 Detailed Design Procedure

図 9-2 shows a typical circuit hook-up for the ISO721-Q1 device.

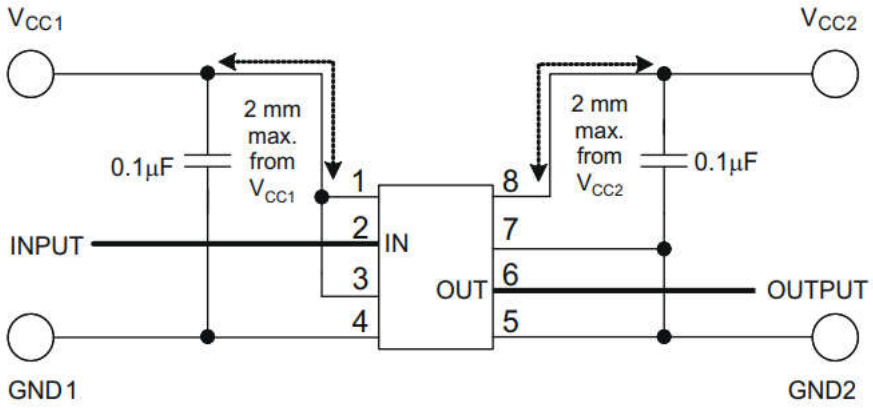


図 9-2. Typical ISO721-Q1 Circuit Hook-up

The ISO72x-Q1 isolators have the same functional pinout as those of most other vendors as shown in 図 9-3, and are often pin-for-pin drop-in replacements. The notable differences in the products are propagation delay, signaling rate, power consumption, and transient protection rating. 表 9-1 is used as a guide for replacing other isolators with the ISO72x-Q1 family of single-channel isolators.

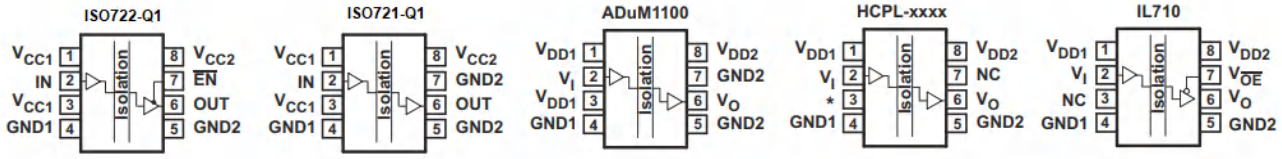

図 9-3. Pin Cross Reference

表 9-1. Cross Reference

ISOLATOR	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7		PIN 8
							ISO721-Q1 OR ISO721M-Q1	ISO722-Q1 OR ISO722M-Q1	
ISO721(1) (2)	V_{CC1}	IN	V_{CC1}	GND1	GND2	OUT	GND2	$\overline{EN}$	V_{CC2}
ADuM1100(1) (2)	V_{DD1}	V_I	V_{DD1}	GND1	GND2	V_O	GND2		V_{DD2}
HCPL-xxxx	V_{DD1}	V_I	*Leave Open(3)	GND1	GND2	V_O	NC(5)		V_{DD2}
IL710	V_{DD1}	V_I	NC(4)	GND1	GND2	V_O	$V_{\overline{OE}}$		V_{DD2}

(1) Pin 1 must be used as V_{CC1}. Pin 3 can also be used as V_{CC1} or left open, as long as pin 1 is connected to V_{CC1}.
(2) Pin 5 must be used as GND2. Pin 7 can also be used as GND2 or left open, as long as pin 5 is connected to GND2.
(3) Pin 3 of the HCPL devices must be left open. This is not a problem when substituting an ISO72x-Q1 device, because the extra V_{CC1} on pin 3 can be left an open circuit as well.
(4) Pin 3 of the IL710 must not be tied to ground on the circuit board because this shorts the ISO72x-Q1 V_{CC1} to ground. The IL710 pin 3 can only be tied to V_{CC} or left open to drop in an ISO72x-Q1 device.

(5) An HCPL device pin 7 must be left floating (open) or grounded when an ISO722-Q1 or ISO722M-Q1 device is to be used as a drop-in replacement. If pin 7 of the ISO722-Q1 or ISO722M-Q1 device is placed in a high logic state, the output of the device is disabled.

9.3 Power Supply Recommendations

To help provide reliable operation at data rates and supply voltages, a 0.1-µF bypass capacitor must be placed at input and output supply pins (V_{CC1} and V_{CC2}). The capacitors must be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments SN6501 device. For such applications, detailed power supply design and transformer selection recommendations are available in the *SN6501 Transformer Driver for Isolated Power Supplies* data sheet.

9.4 Layout

9.4.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see 図 9-4). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of the inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in^2.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links typically have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the *Digital Isolator Design Guide*.

9.4.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
