23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-65. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-65. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-65. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.4.24 TRIP12MUXENABLE Register (Offset = 2Eh) [Reset = 00000000h]

TRIP12MUXENABLE is shown in Figure 11-55 and described in Table 11-66.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-66. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-66. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-66. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-66. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.4.25 TRIPOUTINV Register (Offset = 38h) [Reset = 00000000h]

TRIPOUTINV is shown in Figure 11-56 and described in Table 11-67.

Return to the Summary Table.

Table 11-68. TRIPLOCK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	KEY	R-0/W	0h	Bit-0 of this register can be set only if KEY= 0x5a5a Reset type: CPU1.SYSRSn
15-1	RESERVED	R-0	0h	Reserved
0	LOCK	R/WSonce	0h	Locks the configuration for EPWM-XBAR. Once the configuration is locked, writes to the below registers for EPWM-XBAR is blocked. Registers Affected by the LOCK mechanism: EPWM-XBAROUTyMUX0TO15CFG EPWM-XBAROUTyMUX16TO31CFG EPWM-XBAROUTyMUXENABLE EPWM-XBAROUTLATEN EPWM-XBAROUTINV 0: Writes to the above registers are allowed 1: Writes to the above registers are blocked Note: [1] LOCK mechanism only apples to writes. Reads are never blocked. Reset type: CPU1.SYSRSn

11.4.5 CLB_XBAR_REGS Registers

Table 11-69 lists the memory-mapped registers for the CLB_XBAR_REGS registers. All register offset addresses not listed in Table 11-69 should be considered as reserved locations and the register contents should not be modified.

Table 11-69. CLB_XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	AUXSIG0MUX0TO15CFG	CLB XBAR Mux Configuration for Output-0	EALLOW	Go
2h	AUXSIG0MUX16TO31CFG	CLB XBAR Mux Configuration for Output-0	EALLOW	Go
4h	AUXSIG1MUX0TO15CFG	CLB XBAR Mux Configuration for Output-1	EALLOW	Go
6h	AUXSIG1MUX16TO31CFG	CLB XBAR Mux Configuration for Output-1	EALLOW	Go
8h	AUXSIG2MUX0TO15CFG	CLB XBAR Mux Configuration for Output-2	EALLOW	Go
Ah	AUXSIG2MUX16TO31CFG	CLB XBAR Mux Configuration for Output-2	EALLOW	Go
Ch	AUXSIG3MUX0TO15CFG	CLB XBAR Mux Configuration for Output-3	EALLOW	Go
Eh	AUXSIG3MUX16TO31CFG	CLB XBAR Mux Configuration for Output-3	EALLOW	Go
10h	AUXSIG4MUX0TO15CFG	CLB XBAR Mux Configuration for Output-4	EALLOW	Go
12h	AUXSIG4MUX16TO31CFG	CLB XBAR Mux Configuration for Output-4	EALLOW	Go
14h	AUXSIG5MUX0TO15CFG	CLB XBAR Mux Configuration for Output-5	EALLOW	Go
16h	AUXSIG5MUX16TO31CFG	CLB XBAR Mux Configuration for Output-5	EALLOW	Go
18h	AUXSIG6MUX0TO15CFG	CLB XBAR Mux Configuration for Output-6	EALLOW	Go
1Ah	AUXSIG6MUX16TO31CFG	CLB XBAR Mux Configuration for Output-6	EALLOW	Go
1Ch	AUXSIG7MUX0TO15CFG	CLB XBAR Mux Configuration for Output-7	EALLOW	Go
1Eh	AUXSIG7MUX16TO31CFG	CLB XBAR Mux Configuration for Output-7	EALLOW	Go

24h	AUXSIG2MUXENABLE	CLB XBAR Mux Enable Register for Output-2	EALLOW	Go
26h	AUXSIG3MUXENABLE	CLB XBAR Mux Enable Register for Output-3	EALLOW	Go
28h	AUXSIG4MUXENABLE	CLB XBAR Mux Enable Register for Output-4	EALLOW	Go
2Ah	AUXSIG5MUXENABLE	CLB XBAR Mux Enable Register for Output-5	EALLOW	Go
2Ch	AUXSIG6MUXENABLE	CLB XBAR Mux Enable Register for Output-6	EALLOW	Go
2Eh	AUXSIG7MUXENABLE	CLB XBAR Mux Enable Register for Output-7	EALLOW	Go
38h	AUXSIGOUTINV	CLB XBAR Output Inversion Register	EALLOW	Go
3Eh	AUXSIGLOCK	ClbXbar Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 11-70 shows the codes that are used for access types in this section.

Table 11-70. CLB_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

Table 11-70. CLB_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.4.5.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [Reset = 00000000h]

AUXSIG0MUX0TO15CFG is shown in Figure 11-58 and described in Table 11-71.

Return to the Summary Table.

Table 11-80. AUXSIG4MUX16TO31CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Group Select Bits for MUX31: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX31 01 : Select .1 input for MUX31 10 : Select .2 input for MUX31 11 : Select .3 input for MUX31 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Group Select Bits for MUX30: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX30 01 : Select .1 input for MUX30 10 : Select .2 input for MUX30 11 : Select .3 input for MUX30 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Group Select Bits for MUX29: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX29 01 : Select .1 input for MUX29 10 : Select .2 input for MUX29 11 : Select .3 input for MUX29 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Group Select Bits for MUX28: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX28 01 : Select .1 input for MUX28 10 : Select .2 input for MUX28 11 : Select .3 input for MUX28 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Group Select Bits for MUX27: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX27 01 : Select .1 input for MUX27 10 : Select .2 input for MUX27 11 : Select .3 input for MUX27 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-80. AUXSIG4MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-80. AUXSIG4MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.11 AUXSIG5MUX0TO15CFG Register (Offset = 14h) [Reset = 00000000h]

AUXSIG5MUX0TO15CFG is shown in Figure 11-68 and described in Table 11-81.

Return to the Summary Table.

Table 11-87. AUXSIG0MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.18 AUXSIG1MUXENABLE Register (Offset = 22h) [Reset = 00000000h]

AUXSIG1MUXENABLE is shown in Figure 11-75 and described in Table 11-88.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.19 AUXSIG2MUXENABLE Register (Offset = 24h) [Reset = 00000000h]

AUXSIG2MUXENABLE is shown in Figure 11-76 and described in Table 11-89.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-2

Table 11-89. AUXSIG2MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.20 AUXSIG3MUXENABLE Register (Offset = 26h) [Reset = 00000000h]

AUXSIG3MUXENABLE is shown in Figure 11-77 and described in Table 11-90.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-3

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.21 AUXSIG4MUXENABLE Register (Offset = 28h) [Reset = 00000000h]

AUXSIG4MUXENABLE is shown in Figure 11-78 and described in Table 11-91.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-4

Figure 11-78. AUXSIG4MUXENABLE Register

31	30	29	28	27	26	25	24
MUX31	MUX30	MUX29	MUX28	MUX27	MUX26	MUX25	MUX24
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h

Table 11-91. AUXSIG4MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-91. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-91. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-91. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-91. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.22 AUXSIG5MUXENABLE Register (Offset = 2Ah) [Reset = 00000000h]

AUXSIG5MUXENABLE is shown in Figure 11-79 and described in Table 11-92.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-5

Table 11-92. AUXSIG5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-92. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-92. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-92. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-92. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.23 AUXSIG6MUXENABLE Register (Offset = 2Ch) [Reset = 00000000h]

AUXSIG6MUXENABLE is shown in Figure 11-80 and described in Table 11-93.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-6

Table 11-93. AUXSIG6MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-93. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-93. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-93. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-93. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.24 AUXSIG7MUXENABLE Register (Offset = 2Eh) [Reset = 00000000h]

AUXSIG7MUXENABLE is shown in Figure 11-81 and described in Table 11-94.

Return to the Summary Table.

CLB XBAR Mux Enable Register for Output-7

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-94. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-94. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-94. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-94. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.5.25 AUXSIGOUTINV Register (Offset = 38h) [Reset = 00000000h]

AUXSIGOUTINV is shown in Figure 11-82 and described in Table 11-95.

Return to the Summary Table.

36h	OUTPUTLATCHENABLE	Output X-BAR Output Latch Enable	EALLOW	Go
38h	OUTPUTINV	Output X-BAR Output Inversion	EALLOW	Go
3Eh	OUTPUTLOCK	Output X-BAR Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 11-98 shows the codes that are used for access types in this section.

Table 11-98. OUTPUT_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write

Table 11-98. OUTPUT_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
W1S	W 1S	Write 1 to set
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.4.6.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [Reset = 00000000h]

OUTPUT1MUX0TO15CFG is shown in Figure 11-84 and described in Table 11-99.

Return to the Summary Table.

Output X-BAR Mux Configuration for Output 1

Table 11-115. OUTPUT1MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.18 OUTPUT2MUXENABLE Register (Offset = 22h) [Reset = 00000000h]

OUTPUT2MUXENABLE is shown in Figure 11-101 and described in Table 11-116.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 2

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.19 OUTPUT3MUXENABLE Register (Offset = 24h) [Reset = 00000000h]

OUTPUT3MUXENABLE is shown in Figure 11-102 and described in Table 11-117.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 3

Figure 11-102. OUTPUT3MUXENABLE Register

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.20 OUTPUT4MUXENABLE Register (Offset = 26h) [Reset = 00000000h]

OUTPUT4MUXENABLE is shown in Figure 11-103 and described in Table 11-118.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 4

Figure 11-103. OUTPUT4MUXENABLE Register

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.21 OUTPUT5MUXENABLE Register (Offset = 28h) [Reset = 00000000h]

OUTPUT5MUXENABLE is shown in Figure 11-104 and described in Table 11-119.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 5

Figure 11-104. OUTPUT5MUXENABLE Register

Table 11-119. OUTPUT5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-119. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-119. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-119. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-119. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.22 OUTPUT6MUXENABLE Register (Offset = 2Ah) [Reset = 00000000h]

OUTPUT6MUXENABLE is shown in Figure 11-105 and described in Table 11-120.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 6

Figure 11-105. OUTPUT6MUXENABLE Register

Table 11-120. OUTPUT6MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-120. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-120. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-120. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-120. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.23 OUTPUT7MUXENABLE Register (Offset = 2Ch) [Reset = 00000000h]

OUTPUT7MUXENABLE is shown in Figure 11-106 and described in Table 11-121.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 7

Figure 11-106. OUTPUT7MUXENABLE Register

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-121. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-121. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-121. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-121. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.6.24 OUTPUT8MUXENABLE Register (Offset = 2Eh) [Reset = 00000000h]

OUTPUT8MUXENABLE is shown in Figure 11-107 and described in Table 11-122.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 8

Figure 11-107. OUTPUT8MUXENABLE Register

Complex bit access types are encoded to fit into small table cells. Table 11-130 shows the codes that are used for access types in this section.

Table 11-130. OUTPUT_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		

Table 11-130. OUTPUT_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
W	W	Write
W1S	W 1S	Write 1 to set
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.4.7.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [Reset = 0h]

OUTPUT1MUX0TO15CFG is shown in Figure 11-114 and described in Table 11-131.

Return to the Summary Table.

Output X-BAR Mux Configuration for Output 1

Table 11-147. OUTPUT1MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-147. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-147. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-147. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-147. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.18 OUTPUT2MUXENABLE Register (Offset = 22h) [Reset = 0h]

OUTPUT2MUXENABLE is shown in Figure 11-131 and described in Table 11-148.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 2

25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-148. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-148. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-148. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.19 OUTPUT3MUXENABLE Register (Offset = 24h) [Reset = 0h]

OUTPUT3MUXENABLE is shown in Figure 11-132 and described in Table 11-149.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 3

Figure 11-132. OUTPUT3MUXENABLE Register

Table 11-149. OUTPUT3MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-149. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-149. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-149. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-149. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.20 OUTPUT4MUXENABLE Register (Offset = 26h) [Reset = 0h]

OUTPUT4MUXENABLE is shown in Figure 11-133 and described in Table 11-150.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 4

Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-150. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-150. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-150. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.21 OUTPUT5MUXENABLE Register (Offset = 28h) [Reset = 0h]

OUTPUT5MUXENABLE is shown in Figure 11-134 and described in Table 11-151.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 5

Table 11-151. OUTPUT5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-151. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-151. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-151. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-151. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.22 OUTPUT6MUXENABLE Register (Offset = 2Ah) [Reset = 0h]

OUTPUT6MUXENABLE is shown in Figure 11-135 and described in Table 11-152.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 6

27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-152. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-152. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-152. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.23 OUTPUT7MUXENABLE Register (Offset = 2Ch) [Reset = 0h]

OUTPUT7MUXENABLE is shown in Figure 11-136 and described in Table 11-153.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 7

Table 11-153. OUTPUT7MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-153. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-153. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-153. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-153. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.24 OUTPUT8MUXENABLE Register (Offset = 2Eh) [Reset = 0h]

OUTPUT8MUXENABLE is shown in Figure 11-137 and described in Table 11-154.

Return to the Summary Table.

Output X-BAR Mux Enable for Output 8

Figure 11-137. OUTPUT8MUXENABLE Register

Reset type: CPU1.SYSRSn

Table 11-154. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-154. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-154. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-154. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.4.7.25 OUTPUTLATCH Register (Offset = 30h) [Reset = 0h]

OUTPUTLATCH is shown in Figure 11-138 and described in Table 11-155.

Return to the Summary Table.

Output X-BAR Output Latch

Reads are never blocked. Reset type: CPU1.SYSRSn

Chapter 12

Direct Memory Access (DMA)

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and memory without intervention from the CPU; thereby, freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as the data is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for CPU processing.

12.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of the bandwidth moving data, whether moving data from off-chip memory to on-chip memory, from a peripheral such as an analog-to-digital converter (ADC) to RAM, or from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this chapter has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning the DMA module requires a peripheral or software trigger to start a DMA transfer. Although the DMA module can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module to start memory transfers periodically. The DMA module has six independent DMA channels that can be configured separately and each channel contains an independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. This address control logic allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features is discussed in detail in this chapter.

12.1.1 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

12.1.2 Block Diagram

Figure 12-1 shows a device-level block diagram of the DMA.

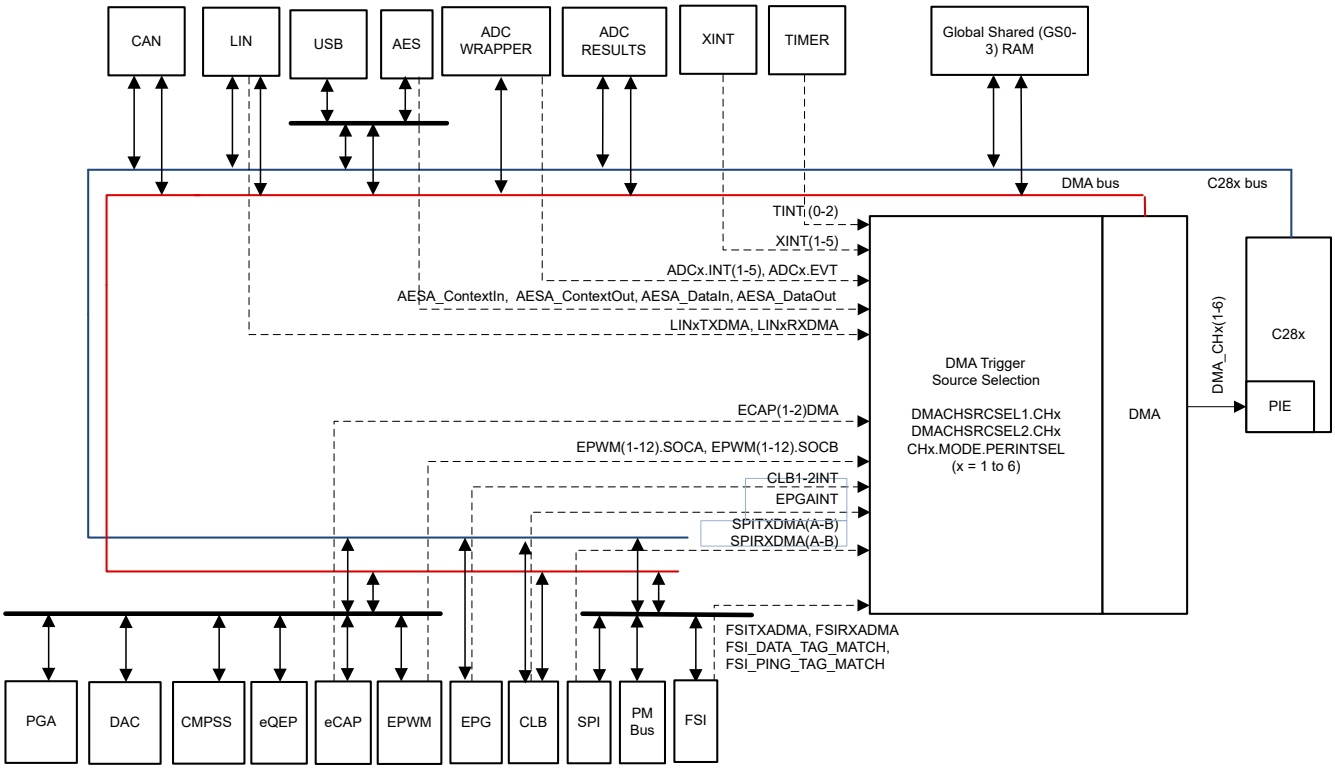

Figure 12-1. DMA Block Diagram

12.2 Architecture

12.2.1 Peripheral Interrupt Event Trigger Sources

Each DMA Channel can be configured to trigger by software and other peripheral triggers events. DMACHSRCSELx register can be used to configure DMA Trigger sources for each DMA channel. CHx.MODE.PERINTSEL register bit field can be set to channel number (CHx.MODE.PERINTSEL = x) as shown in Figure 12-2. Included in these DMA Trigger sources are five external interrupt signals that can be connected to most of the general-purpose input/output (GPIO) pins on the device. This adds significant flexibility to the event trigger capabilities. Upon receipt of a peripheral interrupt event signal, the DMA automatically sends a clear signal to the interrupt source so that subsequent interrupt events occur.

Note

To use the system-level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel can be done using the DMACHSRCSELx register and the CHx.MODE.PERINTSEL register. See Table 12-1 or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst completes before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG remains set.

Figure 12-3 shows a diagram of the trigger select circuit.

Table 12-1 shows the peripheral trigger source options that are available for each channel.

12.2.2 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus by way of interfaces that sometimes share resources with the CPU memory or peripheral bus.

12.3 Address Pointer and Transfer Control

The DMA state machine is, at the most basic level, two nested loops.

Burst (Inner) Loop:

The burst (inner) loop transfers a programmable number of words set by (BURST_SIZE + 1) register when a DMA channel trigger (Peripheral or Software trigger) is received. The BURST_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit or 32-bit word burst that can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC_ADDR_SHADOW) and the destination (DST_ADDR_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into the respective active (SRC_ADDR_ACTIVE or DST_ADDR_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST_STEP register is added to the active register:

SRC_ADDR_ACTIVE = SRC_ADDR_ACTIVE + SRC_BURST_STEP

DST_ADDR_ACTIVE = DST_ADDR_ACTIVE + DST_BURST_STEP

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral or Software trigger) is received.

Transfer (Outer) Loop:

The Transfer (outer) loop transfers a programmable number of bursts set by (TRANSFER_SIZE + 1) register for each channel. Since TRANSFER_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer:

Method 1 (Default): When address wrapping is disabled (SRC_WRAP_SIZE or DST_WRAP_SIZE is greater than TRANSFER_SIZE), active address pointer is updated as shown below

SRC_ADDR_ACTIVE = SRC_ADDR_ACTIVE + SRC_TRANSFER_STEP

DST_ADDR_ACTIVE = DST_ADDR_ACTIVE + DST_TRANSFER_STEP

Method 2: Address wrapping gets enabled when SRC_WRAP_SIZE or DST_WRAP_SIZE is less than TRANSFER_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST_WRAP_SIZE + 1) register, the state machine modifies the active address pointers as:

SRC_BEG_ADDR_ACTIVE = SRC_BEG_ADDR_ACTIVE + SRC_WRAP_STEP

DST_BEG_ADDR_ACTIVE = DST_BEG_ADDR_ACTIVE + DST_WRAP_STEP

SRC_ADDR_ACTIVE = SRC_BEG_ADDR_ACTIVE

DST_ADDR_ACTIVE = DST_BEG_ADDR_ACTIVE

At the end of DMA transfer, DMA can have transferred (BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words.

OneShot Mode:

OneShot mode is disabled by default.

When OneShot mode is disabled (MODE.CHx[ONESHOT] = 0), DMA transfers one burst [(BURST_SIZE + 1) words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled (MODE.CHx[ONESHOT] = 1), DMA transfers all the bursts [(BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

Continuous Mode:

Continuous mode is disabled by default.

When Continuous mode is disabled (MODE.CHx[CONTINUOUS] = 0), DMA state machine disables channel after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuous mode is enabled (MODE.CHx[CONTINUOUS] = 1), DMA state machine keep channel active even after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete.

Each DMA channel can trigger an EPIE interrupt for each DMA transfer either at start of DMA transfer or end of DMA transfer using MODE.CHx[CHINTMODE] bit.

Source/Destination Address Pointers (SRC/DST_ADDR)	The value written into the shadow register is the start address of the first location where data is read or written to. At the beginning of a transfer the shadow register (SRC/DST_ADDR_SHADOW) is copied into the active register (SRC/DST_ADDR_ACTIVE). The active register performs as the current address pointer.
Source/Destination Begin Address Pointers (SRC/DST_BEG_ADDR)	This is the wrap pointer. The value written into the shadow register (SRC/DST_BEG_ADDR_SHADOW) is loaded into the active register (SRC/DST_BEG_ADDR_ACTIVE) at the start of a transfer. On a wrap condition, the active register (SRC/DST_BEG_ADDR_ACTIVE) is incremented by the signed value in the appropriate SRC/DST_WRAP_STEP register prior to being loaded into the active register (SRC/DST_ADDR_ACTIVE).

For each channel, the transfer process can be controlled with the following size values:

Source and Destination Burst Size (BURST_SIZE)

This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST_COUNT register at the beginning of each burst. The BURST_COUNT decrements each word that is transferred and when the register reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size can be all 16 registers (if all 16 registers are used). For RAM, the burst size can be up to the maximum allowed by the BURST_SIZE register, which is 32. See Table 12-2 to understand how BURST_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

Table 12-2. BURSTSIZE versus DATASIZE Behavior

BURSTSIZE	Number of 16-bit words transferred in	
	DataSize = 16-bit data	DataSize = 32-bit data
0	1	2
1	2	2
2	3	4
3	4	4

6	7	8
7	8	8
8	9	10
9	10	10
10	11	12
11	12	12
*	*	*
*	*	*
*	*	*
30	31	32
31	32	32

Source and Destination Transfer Size (TRANSFER_SIZE)

This specifies the number of bursts to be transferred per CPU interrupt (if enabled).

Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER_SIZE register is loaded into the TRANSFER_COUNT register at the beginning of each transfer. The TRANSFER_COUNT register keeps track of how many bursts of data the channel has transferred and when the register reaches zero, the DMA transfer is complete.

Source/Destination Wrap Size (SRC/DST_WRAP_SIZE)

This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning.

This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST_WRAP_COUNT register at the beginning of each transfer. The SRC/DST_WRAP_COUNT registers keep track of how many bursts of data the channel has transferred and when the registers reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To disable the wrap function, assign the value of these registers to be larger than the TRANSFER_SIZE.

Note

The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 can be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 can be placed in the SIZE register.

For each source/destination pointer, the address changes can be controlled with the following step values:

Source/Destination Burst Step (SRC/DST_BURST_STEP)

Within each burst transfer, the address source and destination step sizes are specified by these registers.

This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers can be set to zero.

Source/Destination Transfer Step (SRC/DST_TRANSFER_STEP)

This specifies the address offset to start the next burst transfer after completing the current burst transfer.

This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

Source/Destination Wrap Step (SRC/DST_WRAP_STEP)

When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST_BEG_ADDR pointer and hence sets the new start address.

This implements a circular type of addressing mode, useful in many applications. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

Note

Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 can be placed in these registers.

Channel Interrupt Mode (CHINTMODE)

This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer.

If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt can be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.

All of the previous features and modes are shown in Figure 12-4. The following items are in reference to Figure 12-4.

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST_ADDR_ACTIVE registers are not affected by SRC/DST_BEG_ADDR_ACTIVE at the start of a transfer. SRC/DST_BEG_ADDR_ACTIVE only affects the SRC/DST_ADDR_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
  - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
  - SRC/DST_ADDR_SHADOW remains unchanged.
  - SRC/DST_BEG_ADDR_ACTIVE = SRC/DST_BEG_ADDR_SHADOW
  - SRC/DST_ADDR_ACTIVE = SRC/DST_ADDR_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
  - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
  - SRC/DST_ADDR_SHADOW remains unchanged.
  - SRC/DST_BEG_ADDR_ACTIVE += SRC/DST_WRAP_STEP
  - SRC/DST_ADDR_ACTIVE = SRC/DST_BEG_ADDR_ACTIVE
- The best way to remember this is:
  - The shadow registers never change except by software.
  - The active registers never change except by hardware, and a shadow register is only copied into the active register, never an active register by another name.

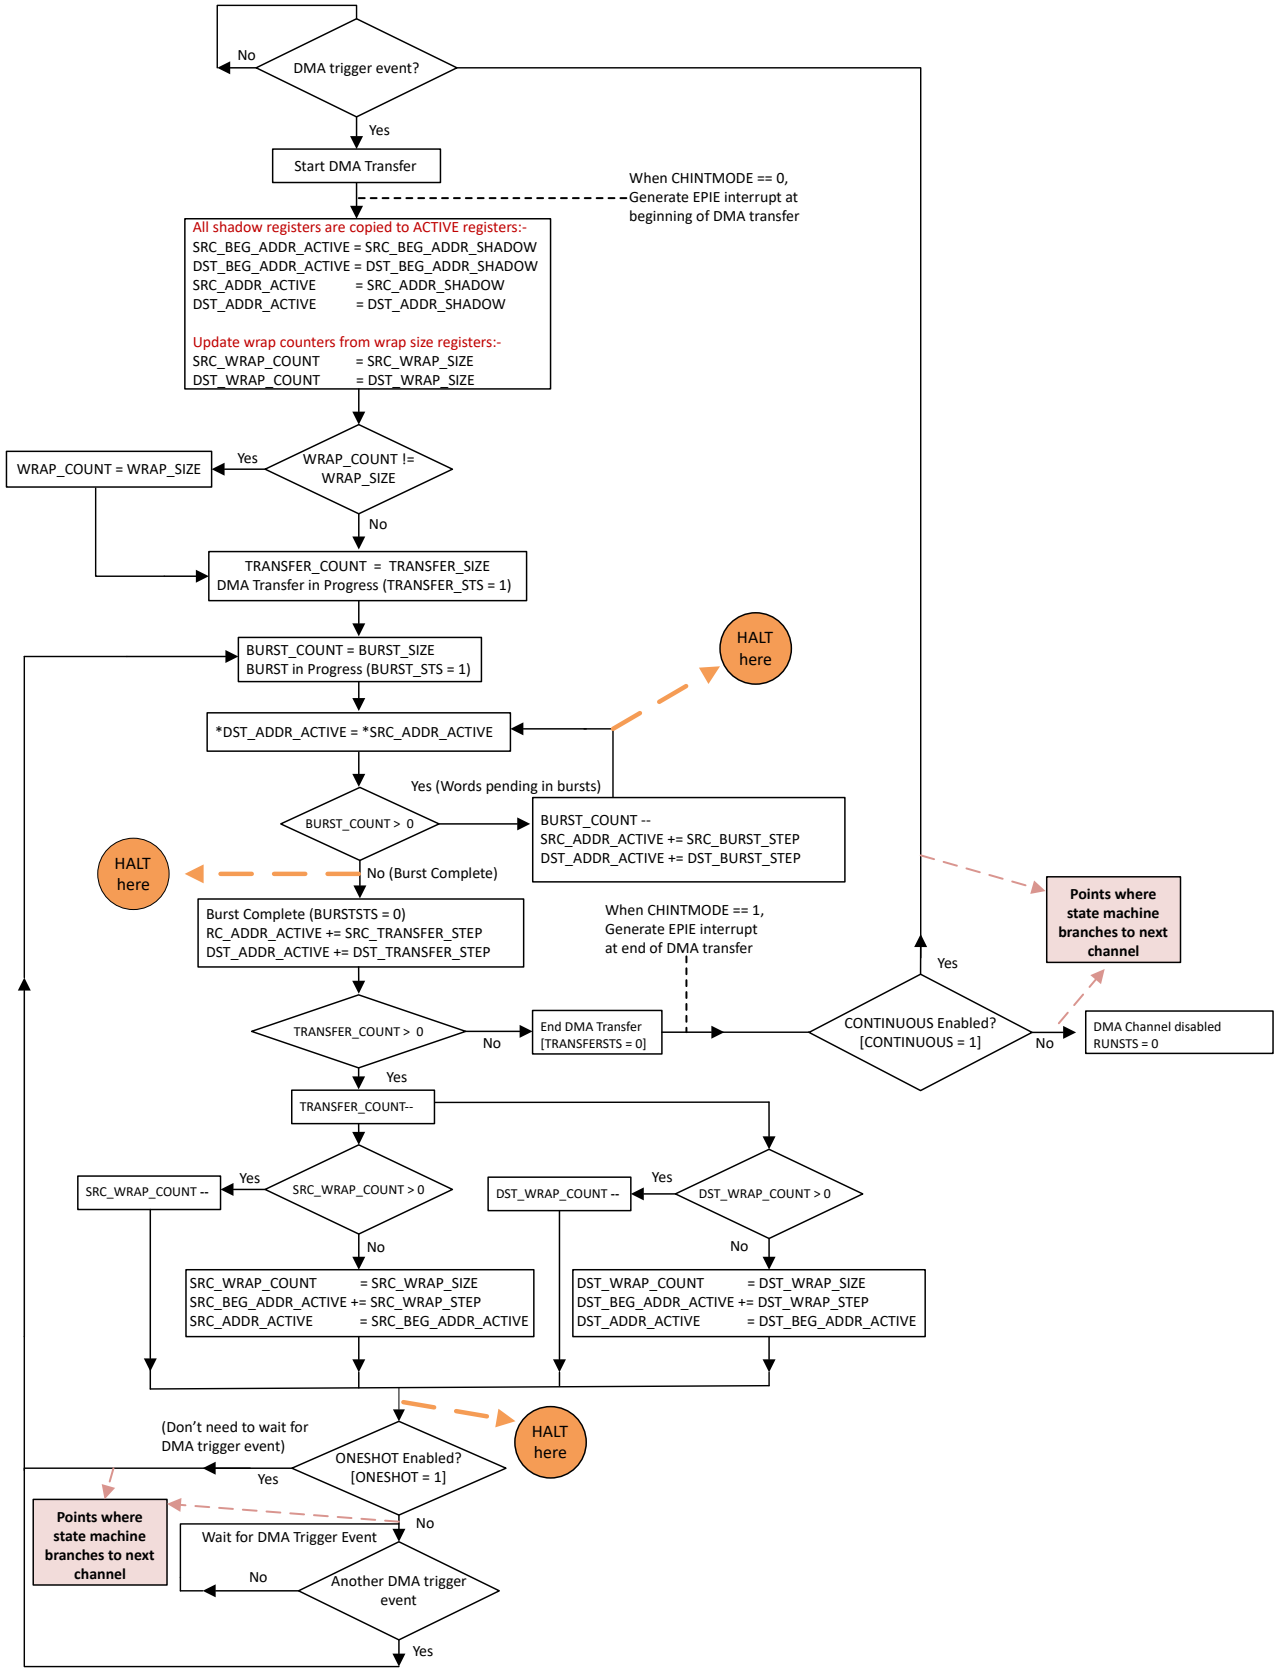

Figure 12-4. DMA State Diagram

12.4 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect the total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high-priority interrupt
- Collisions with the CPU can add delay slots
- 32-bit transfers run at double the speed of a 16-bit transfer (takes the same amount of time to transfer a 32-bit word as to transfer a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This gives:

8 bursts * [(3 cycles/word * 16 words/burst) + 1] = 392 cycles

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits), the transfer can take:

8 bursts * [(3 cycles/word * 8 words/burst) + 1] = 200 cycles

The DMA module consists of a 3-stage pipeline as shown in Figure 12-5 and Figure 12-6.

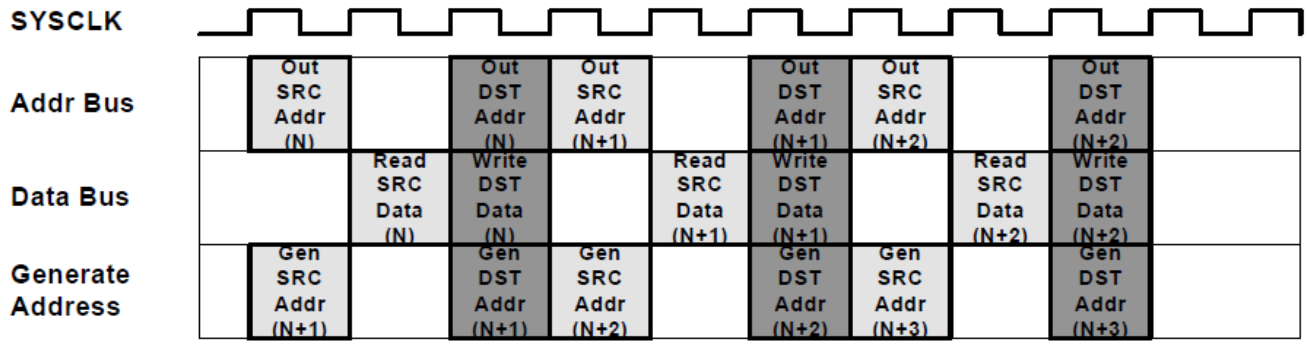

Figure 12-5. 3-Stage Pipeline DMA Transfer

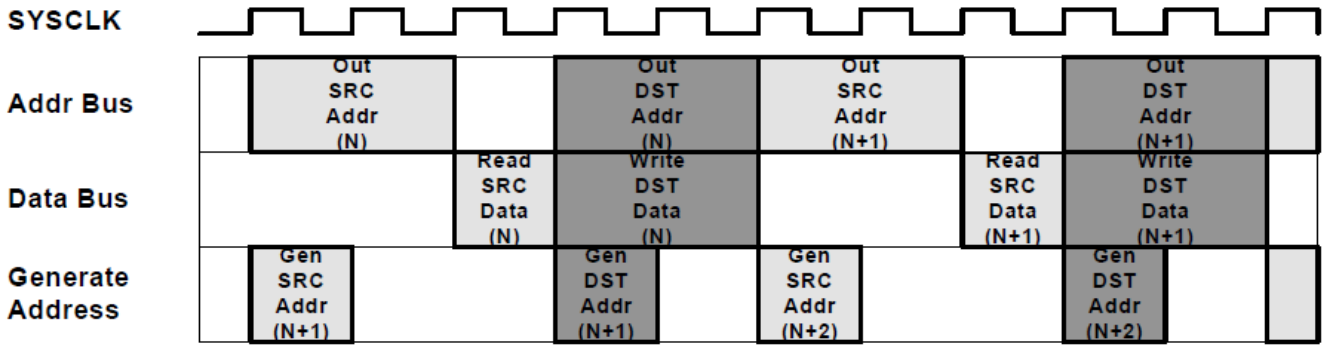

Figure 12-6. 3-stage Pipeline with One Read Stall

12.5 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict. Accesses to global shared RAM, across different instances, do not have this conflict. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, CMPSS, DAC , PGA
- Peripheral frame 2: PMBus, SPI , FSI

Conflict Example: The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

Conflict Example: The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

Non-conflict Example: The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

Non-conflict Example: The CPU is accessing GS0 while the DMA is accessing GS1

The exception to all this is the ADC result registers, which are duplicated for each bus controller. The CPU, DMA, and CLA can all simultaneously read these result registers with no stalls or arbitration needed for any controller.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see Section 12.4). Suppose CPU accesses a peripheral/memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device:

- The arbitration follows a fixed arbitration scheme with highest priority first:
  - DMA WRITE
  - DMA READ
  - CLA WRITE
  - CLA READ
  - CPU WRITE
  - CPU READ
- The priority scheme for GSx RAM accesses is round-robin.
- The ADC results are duplicated for CPU, CLA, and DMA so that no arbitration is needed when reading the result registers. This allows all controllers to access the ADC result registers simultaneously without delay.

Note

If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write can be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

Arbitration within DMA channels is based on a round-robin priority or Channel 1 high-priority scheme described in Section 12.6.

12.6 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

12.6.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as:

CH1 → CH2 → CH3 → CH4 → CH5 → CH6 → CH1 → CH2 → …

In the case above, after each channel has transferred a burst of words, the next channel is serviced. The user can specify the size of the burst for each channel. Once CH2 CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel x, all other pending channels between x and the end of the round are serviced before CH1. All the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes the *burst*, CH5 is serviced next. Only after CH5 completes a *burst* is CH1 serviced. Upon completion of the CH1 *burst*, if there are no more channels pending, the round-robin state machine enters an idle state.

A more complicated example is:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 is serviced since this channel is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst is serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 starts after the completion of the CH5 burst, since this channel is the next channel after CH5 in the round-robin scheme.
- This is followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine enters an idle state.

The round-robin state machine can be reset to the idle state using the DMACTRL[PRIORITYRESET] bit.

12.6.2 Channel 1 High-Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channels 2 to 6 have equal priority and each enabled channel is serviced in a round-robin fashion.

Higher priority:	CH1
Lower priority:	CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → …

Given an example where CH1, CH4, and CH5 are enabled in Channel 1 high-priority mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 *word transfer* is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution is suspended and CH1 is serviced. After the CH1 burst completes, CH4 resumes execution.

Upon completion of CH4, CH5 is serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine enters an idle state.

Typically Channel 1 is used in this mode for the ADC, since the data rate is so high. However, Channel 1 high-priority mode can be used in conjunction with any peripheral.

Note

High-priority mode and ONESHOT mode cannot be used at the same time on Channel 1. Other channels can use ONESHOT mode when Channel 1 is in high-priority mode.

12.7 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger is lost. This condition sets the OVRFLG bit in the CONTROL register as in Figure 12-7. If the overrun interrupt is enabled, the channel interrupt is generated to the PIE module.

12.8.2 DMA Examples

NOTE: These examples are located in the C2000Ware installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dma

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

12.8.2.1 DMA GSRAM Transfer (dma_ex1_gsram_transfer)

FILE: dma_ex1_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

: This example project has support for migration across our C2000 device families. If you are wanting to build this project from launchpad or controlCARD, please specify in the .syscfg file the board you're using. At any time you can select another device to migrate this example. *Watch Variables*

- *rData* - Received data

12.8.2.2 DMA GSRAM Transfer (dma_ex2_gsram_transfer)

FILE: dma_ex2_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

12.9 DMA Registers

This Section describes the DMA Registers.

12.9.1 DMA Base Address Table

Table 12-4. DMA Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
DmaRegs	DMA_REGS	DMA_BASE	0x0000_1000	YES	-	-	-
Dmach1Regs	DMA_CH_REGS	DMA_CH1_BASE	0x0000_1020	YES	-	-	-
Dmach2Regs	DMA_CH_REGS	DMA_CH2_BASE	0x0000_1040	YES	-	-	-
Dmach3Regs	DMA_CH_REGS	DMA_CH3_BASE	0x0000_1060	YES	-	-	-
Dmach4Regs	DMA_CH_REGS	DMA_CH4_BASE	0x0000_1080	YES	-	-	-
Dmach5Regs	DMA_CH_REGS	DMA_CH5_BASE	0x0000_10A0	YES	-	-	-
Dmach6Regs	DMA_CH_REGS	DMA_CH6_BASE	0x0000_10C0	YES	-	-	-

12.9.2 DMA_REGS Registers

Table 12-5 lists the memory-mapped registers for the DMA_REGS registers. All register offset addresses not listed in Table 12-5 should be considered as reserved locations and the register contents should not be modified.

Table 12-5. DMA_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DMACTRL	DMA Control Register	EALLOW	Go
1h	DEBUGCTRL	Debug Control Register	EALLOW	Go
4h	PRIORITYCTRL1	Priority Control 1 Register	EALLOW	Go
6h	PRIORITYSTAT	Priority Status Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 12-6 shows the codes that are used for access types in this section.

Table 12-6. DMA_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

12.9.2.1 DMACTRL Register (Offset = 0h) [Reset = 0000h]

DMACTRL is shown in Figure 12-8 and described in Table 12-7.

Return to the Summary Table.

DMA Control Register

Figure 12-8. DMACTRL Register

15	14	13	12	11	10	9	8
RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED						PRIORITYRESET	HARDRESET
R-0h						R-0/W1S-0h	R-0/W1S-0h

Table 12-7. DMACTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	PRIORITYRESET	R-0/W1S	0h	The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0. When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset. If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel). Reset type: SYSRSn
0	HARDRESET	R-0/W1S	0h	Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0. For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers. When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn

12.9.2.2 DEBUGCTRL Register (Offset = 1h) [Reset = 0000h]

DEBUGCTRL is shown in Figure 12-9 and described in Table 12-8.

Return to the Summary Table.

Debug Control Register

Figure 12-9. DEBUGCTRL Register

15	14	13	12	11	10	9	8

RESERVED							
R-0h							

Table 12-8. DEBUGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	FREE	R/W	0h	Emulation Control This bit specifies the action when an emulation halt event occurs. Reset type: SYSRSn 0h (R/W) = The DMA completes the current read-write operation, then halts. 1h (R/W) = The DMA continues running during an emulation halt.
14-0	RESERVED	R	0h	Reserved

12.9.2.3 PRIORITYCTRL1 Register (Offset = 4h) [Reset = 0000h]

PRIORITYCTRL1 is shown in Figure 12-10 and described in Table 12-9.

Return to the Summary Table.

Priority Control 1 Register

Figure 12-10. PRIORITYCTRL1 Register

15	14	13	12	11	10	9	8
RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED							CH1PRIORITY
R-0h							R/W-0h

Table 12-9. PRIORITYCTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-1	RESERVED	R	0h	Reserved
0	CH1PRIORITY	R/W	0h	DMA Channel 1 Priority This bit selects whether CH1 has high priority or not. The priority can only be changed when all channels are disabled. A priority reset should be performed before restarting channels after changing priority Reset type: SYSRSn 0h (R/W) = CH1 has the same priority as the other channels 1h (R/W) = CH1 has a higher priority than the other channels

12.9.2.4 PRIORITYSTAT Register (Offset = 6h) [Reset = 0000h]

PRIORITYSTAT is shown in Figure 12-11 and described in Table 12-10.

Return to the Summary Table.

Priority Status Register

Figure 12-11. PRIORITYSTAT Register

15	14	13	12	11	10	9	8
RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED	ACTIVESTS_SHADOW			RESERVED	ACTIVESTS		
R-0h	R-0h			R-0h	R-0h		

Table 12-10. PRIORITYSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
15-7	RESERVED	R	0h	Reserved
6-4	ACTIVESTS_SHADOW	R	0h	Active Channel Status Shadow These bits are only meaningful when CH1 is in high-priority mode. When CH1 is serviced, the ACTIVESTS bits are copied to the shadow bits and indicate which channel was interrupted by CH1. When CH1 service is completed, the shadow bits are copied back to the ACTIVESTS bits. If this bit field is zero or the same as the ACTIVESTS bit field, then no channel is pending due to a CH1 interrupt. When CH1 is not a higher priority channel, these bits should be ignored. Reset type: SYSRSn 0h (R/W) = No channel is active 1h (R/W) = CH 1 2h (R/W) = CH 2 3h (R/W) = CH 3 4h (R/W) = CH 4 5h (R/W) = CH 5 6h (R/W) = CH 6 7h (R/W) = Reserved
3	RESERVED	R	0h	Reserved
2-0	ACTIVESTS	R	0h	Active Channel Status These bits indicate which channel (if any) is currently active or performing a transfer. Reset type: SYSRSn 0h (R/W) = No channel is active 1h (R/W) = CH 1 2h (R/W) = CH 2 3h (R/W) = CH 3 4h (R/W) = CH 4 5h (R/W) = CH 5 6h (R/W) = CH 6 7h (R/W) = Reserved

12.9.3 DMA_CH_REGS Registers

Table 12-11 lists the memory-mapped registers for the DMA_CH_REGS registers. All register offset addresses not listed in Table 12-11 should be considered as reserved locations and the register contents should not be modified.

Table 12-11. DMA_CH_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	MODE	Mode Register	EALLOW	Go
1h	CONTROL	Control Register	EALLOW	Go
2h	BURST_SIZE	Burst Size Register	EALLOW	Go
3h	BURST_COUNT	Burst Count Register	EALLOW	Go
4h	SRC_BURST_STEP	Source Burst Step Register	EALLOW	Go
5h	DST_BURST_STEP	Destination Burst Step Register	EALLOW	Go
6h	TRANSFER_SIZE	Transfer Size Register	EALLOW	Go
7h	TRANSFER_COUNT	Transfer Count Register	EALLOW	Go
8h	SRC_TRANSFER_STEP	Source Transfer Step Register	EALLOW	Go
9h	DST_TRANSFER_STEP	Destination Transfer Step Register	EALLOW	Go
Ah	SRC_WRAP_SIZE	Source Wrap Size Register	EALLOW	Go
Bh	SRC_WRAP_COUNT	Source Wrap Count Register	EALLOW	Go
Ch	SRC_WRAP_STEP	Source Wrap Step Register	EALLOW	Go
Dh	DST_WRAP_SIZE	Destination Wrap Size Register	EALLOW	Go
Eh	DST_WRAP_COUNT	Destination Wrap Count Register	EALLOW	Go
Fh	DST_WRAP_STEP	Destination Wrap Step Register	EALLOW	Go
10h	SRC_BEG_ADDR_SHADOW	Source Begin Address Shadow Register	EALLOW	Go
12h	SRC_ADDR_SHADOW	Source Address Shadow Register	EALLOW	Go
14h	SRC_BEG_ADDR_ACTIVE	Source Begin Address Active Register	EALLOW	Go
16h	SRC_ADDR_ACTIVE	Source Address Active Register	EALLOW	Go
18h	DST_BEG_ADDR_SHADOW	Destination Begin Address Shadow Register	EALLOW	Go
1Ah	DST_ADDR_SHADOW	Destination Address Shadow Register	EALLOW	Go
1Ch	DST_BEG_ADDR_ACTIVE	Destination Begin Address Active Register	EALLOW	Go
1Eh	DST_ADDR_ACTIVE	Destination Address Active Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 12-12 shows the codes that are used for access types in this section.

Table 12-12. DMA_CH_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

12.9.3.1 MODE Register (Offset = 0h) [Reset = 0000h]

MODE is shown in Figure 12-12 and described in Table 12-13.

Return to the Summary Table.

Mode Register

Figure 12-12. MODE Register

15	14	13	12	11	10	9	8
CHINTE	DATASIZE	RESERVED	RESERVED	CONTINUOUS	ONESHOT	CHINTMODE	PERINTE
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h
7	6	5	4	3	2	1	0
OVRINTE	RESERVED		PERINTSEL				
R/W-0h	R-0h		R/W-0h				

Table 12-13. MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CHINTE	R/W	0h	Channel Interrupt Enable Bit This bit enables the DMA channel's CPU interrupt. Reset type: SYSRSn 0h (R/W) = Interrupt disabled 1h (R/W) = Interrupt enabled
14	DATASIZE	R/W	0h	Data Size Mode Bit This bit determines whether the DMA channel transfers 16 bits or 32 bits of data per read/write operation. Regardless of this setting, all data lengths and offsets in other DMA registers refer to 16- bit words. The pointer step increments must be configured to accomodate 32-bit words. Reset type: SYSRSn 0h (R/W) = 16-bit data transfer size 1h (R/W) = 32-bit data transfer size
13	RESERVED	R/W	0h	Reserved
12	RESERVED	R/W	0h	Reserved
11	CONTINUOUS	R/W	0h	Continuous Mode Bit If this bit is set to 1, then the channel re-initializes when TRANSFER_COUNT is zero and waits for the next event trigger. Otherwise, the DMA stops and clears the RUNSTS bit. Reset type: SYSRSn
10	ONESHOT	R/W	0h	One Shot Mode If this bit is set to 1, each peripheral event trigger causes the channel to perform an entire transfer. Otherwise, the channel only performs one burst per trigger. Reset type: SYSRSn
9	CHINTMODE	R/W	0h	Channel Interrupt Generation Mode This bit specifies when the DMA channel generates a CPU interrupt for a transfer. Reset type: SYSRSn 0h (R/W) = Generate interrupt at beginning of new transfer 1h (R/W) = Generate interrupt at end of transfer.
8	PERINTE	R/W	0h	Peripheral Event Trigger Enable This bit enables peripheral event triggers on the DMA channel. Reset type: SYSRSn 0h (R/W) = Peripheral event trigger disabled. Neither the selected peripheral nor software can start a DMA burst. 1h (R/W) = Peripheral event trigger enabled.

Table 12-13. MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	OVRINTE	R/W	0h	Overflow Interrupt Enable The bit determines whether the DMA module generates a CPU interrupt when it detects an overflow event. Reset type: SYSRSn 0h (R/W) = Overflow interrupt disabled 1h (R/W) = Overflow interrupt enabled
6-5	RESERVED	R	0h	Reserved
4-0	PERINTSEL	R/W	0h	Peripheral Event Trigger Source Select These are legacy bits and should be set to the channel number. The actual source selection is done via the DMACHSRCSELn registers, which are part of the DMA_CLA_SRC_SEL_REGS group. Reset type: SYSRSn

12.9.3.2 CONTROL Register (Offset = 1h) [Reset = 0000h]

CONTROL is shown in Figure 12-13 and described in Table 12-14.

Return to the Summary Table.

Control Register

Figure 12-13. CONTROL Register

15	14	13	12	11	10	9	8
RESERVED	OVRFLG	RUNSTS	BURSTSTS	TRANSFERSTS	RESERVED	RESERVED	PERINTFLG

R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h

Table 12-14. CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	OVRFLG	R	0h	Overflow Flag This bit indicates that a peripheral event trigger was received while PERINTFLG was already set. It can be cleared by writing to the ERRCLR bit. Reset type: SYSRSn 0h (R/W) = No overflow detected 1h (R/W) = Overflow detected
13	RUNSTS	R	0h	Run Status Flag This bit indicates that the DMA channel is ready to respond to peripheral event triggers. This bit is set when a 1 is written to the RUN bit. It is cleared when a transfer completes (TRANSFER_COUNT = 0) and continuous mode is disabled, or when the HARDRESET, SOFTRESET, or HALT bit is set. Reset type: SYSRSn 0h (R/W) = The channel is disabled 1h (R/W) = The channel is enabled
12	BURSTSTS	R	0h	Burst Status Flag This bit is set when a DMA burst begins. The BURST_COUNT is set to the BURST_SIZE. This bit is cleared when BURST_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set. Reset type: SYSRSn 0h (R/W) = No burst activity 1h (R/W) = The DMA is currently servicing or suspending a burst transfer from this channel
11	TRANSFERSTS	R	0h	Transfer Status Flag This bit is set when a DMA transfer begins. The address registers are copied to the shadow set and the TRANSFER_COUNT is set to the TRANSFER_SIZE. This bit is cleared when TRANSFER_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set. Reset type: SYSRSn 0h (R/W) = No transfer activity 1h (R/W) = The channel is currently in the middle of a transfer regardless of whether a burst of data is actively being transferred or not
10	RESERVED	R	0h	Reserved
9	RESERVED	R	0h	Reserved

Table 12-14. CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PERINTFLG	R	0h	Peripheral Event Trigger Flag This bit indicates whether a peripheral event trigger has arrived. This bit is automatically cleared when the first burst transfer begins. Reset type: SYSRSn 0h (R/W) = Waiting for event trigger 1h (R/W) = Event trigger pending
7	ERRCLR	R-0/W1S	0h	Clear Error Writing a 1 to this bit will clear the OVRFLG bit. This is normally done when initializing the DMA module or if an overflow condition is detected. If an overflow event occurs at the same time this bit is set, the overrun has priority and the OVRFLG bit is set. Reset type: SYSRSn
6	RESERVED	R-0/W1S	0h	Reserved
5	RESERVED	R-0/W1S	0h	Reserved
4	PERINTCLR	R-0/W1S	0h	Clear Peripheral Event Trigger Writing a 1 to this bit clears PERINTFLG, which cancels a pending event trigger. This is normally done when initializing the DMA module. If an event trigger arrives at the same time this bit is set, the trigger has priority and PERINTFLG is set. Reset type: SYSRSn
3	PERINTFRC	R-0/W1S	0h	Force Peripheral Event Trigger If the PERINTE bit of the MODE register is set, writing a 1 to this bit sets PERINTFLG, which triggers a DMA burst. This bit can be used to start a DMA transfer in software. Reset type: SYSRSn
2	SOFTRESET	R-0/W1S	0h	Channel Soft Reset Writing a 1 to this bit places the channel into its default state after the current read/write access has completed: RUNSTS = 0 TRANSFERSTS = 0 BURSTSTS = 0 BURST_COUNT = 0 TRANSFER_COUNT = 0 SRC_WRAP_COUNT = 0 DST_WRAP_COUNT = 0 When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn
1	HALT	R-0/W1S	0h	Halt Channel Writing a 1 to this bit halts the DMA channel in its current state after any ongoing read/write access has completed. Reset type: SYSRSn
0	RUN	R-0/W1S	0h	Run Channel Writing a 1 to this bit enables the DMA channel and sets the RUNSTS bit to 1. This bit is also used to resume after a channel halt. The RUN bit is typically used to start the DMA channel after configuration. The channel will then wait for the first peripheral event trigger (PERINTFLG == 1) to start a burst. Reset type: SYSRSn

12.9.3.3 BURST_SIZE Register (Offset = 2h) [Reset = 0000h]

BURST_SIZE is shown in Figure 12-14 and described in Table 12-15.

Return to the Summary Table.

Chapter 13

Embedded Real-time Analysis and Diagnostic (ERAD)

This chapter describes the features and operation of the embedded real-time analysis and diagnostic (ERAD) module. The ERAD module enhances the debug and system analysis capabilities of the device. The debug and system analysis enhancements provided by the ERAD module are implemented external to the CPU. The ERAD module consists of the enhanced bus comparator (EBC) units, the system event counter (SEC) units, and the cyclic redundancy check (CRC) units. The EBC units are used to generate hardware breakpoints, hardware watch points, and other output events. The SEC units are used to analyze and profile the system. The CRC units monitor CPU buses and compute the CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with the Software Test Library (STL). The ERAD module is accessible both by the debugger and the application software, which significantly increases the debug capabilities of many real-time systems, especially in situations where the debugger is not connected.

13.1 Introduction

The ERAD module is shown in Figure 13-1.

The ERAD enhances the debug and system analysis capabilities of the device external to the CPU. The CPU has two analysis resources; Analysis Unit 1 (AU1) and Analysis Unit 2 (AU2). The first analysis unit counts events or monitors address buses. The second analysis unit monitors address and data buses. The two analysis units can be configured for hardware breakpoints or hardware watch points, and additionally the first analysis unit can be configured as a benchmark counter or event counter. The ERAD module further expands this capability to provide additional hardware breakpoints, hardware watch points, and counters for profiling, as well as other advanced features. The ERAD module can be utilized by the debugger, and also by the application software. For many real-time systems, it is not always possible to connect a debugger and perform an intrusive debug. Under these situations, the user's code has the ability to set up and control the ERAD module to debug and profile the system without disturbing the end application.

The ERAD module consists of eight enhanced bus comparator (EBC) units and four system event counter (SEC) units. The EBC units monitor buses and generate output events. The SEC units can be used with EBC units to profile and analyze the system. These units are described in detail in the following sections.

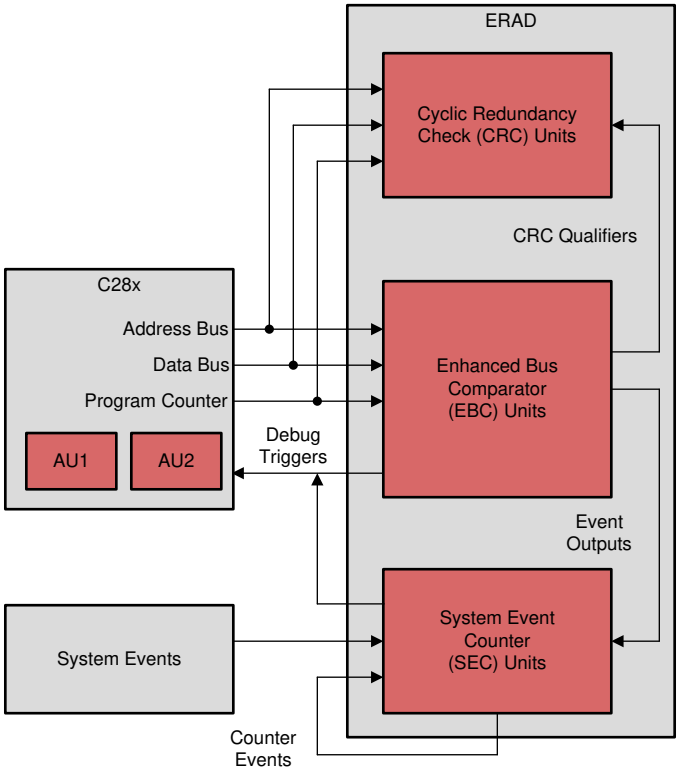

Figure 13-1. ERAD Overview

13.2 Enhanced Bus Comparator Unit

The Enhanced Bus Comparator (EBC) units connect to the CPU using a direct memory interface. This includes the program address and data buses, the data address, write and read data buses, debug qualifiers for memory access, and the ability to set breakpoints, watch points, and trace points on the CPU. Typically, the EBC is owned and controlled by the debugger application (for example, Code Composer Studio™ IDE). A user application running on the CPU can also configure and use the EBC units to generate events and interrupts for real-time diagnostic purposes. Note that ownership is exclusive—the debugger and application software cannot simultaneously control an EBC unit. For more information on EBC unit ownership, see Section 13.4.

The EBC units have the following capabilities:

- Generate hardware breakpoints
- Generate hardware watch points
- Generate trace tags for instruction fetch matches and generate real-time interrupts (RTOSINT)
- Monitor data address and read and write buses and generate real-time interrupts (RTOSINT)
- Generate event outputs that can be used by other modules.

The following features are not supported by the EBC units:

- Chained breakpoints
- Ability to monitor DMA transfers
- Ability to monitor CLA buses

Each EBC unit has the capability to monitor a range of addresses by defining masks and generating outputs based on greater than, less than, or equal events.

The EBC units can also be used with the System Event Counter (SEC) units for system or code profiling and analysis purposes.

13.2.1 Enhanced Bus Comparator Unit Operations

The following operations are supported by each EBC unit:

- Hardware Breakpoints: The EBC unit generates a breakpoint tag when the specified instruction address is accessed on the program address bus. When the instruction reaches the DECODE-2 (D2) stage of the pipeline, the CPU is halted.
- Watch Points: A watch point detects a read or write to specified locations in data memory, and halts the CPU. Unlike hardware breakpoints, watch points do not have precise timing for halting the CPU—this is entirely dependent on the current state of the CPU pipeline. The CPU halts at the next interruptible boundary.
- Program Trace: Program traces are very similar to hardware breakpoints. The difference here is that instead of halting the CPU, a program trace generates a real-time interrupt (RTOSINT) when the instruction reaches the D2 stage of the pipeline. If the instruction is discarded in the fetch buffer due to discontinuity, no RTOSINT is generated.
- Data Trace: A data trace is similar to a watch point, except that a data trace generates a real-time interrupt (RTOSINT) instead of halting the CPU on an access to the specified data memory.

Note that hardware breakpoints only halt the CPU if a debugger is connected.

13.2.2 Event Masking and Exporting

The events generated by different EBC units can be combined using OR and AND logic to generate new events as required. There are four AND and four OR combinations that can be exported using masks to suppress undesired events. These events can be configured to generate an RTOSINT. In addition, the AND and OR events can also be used to qualify CRC computation using the cyclic redundancy check unit. The AND and OR events are also available as inputs to the system event counter unit for event counting and system profiling.

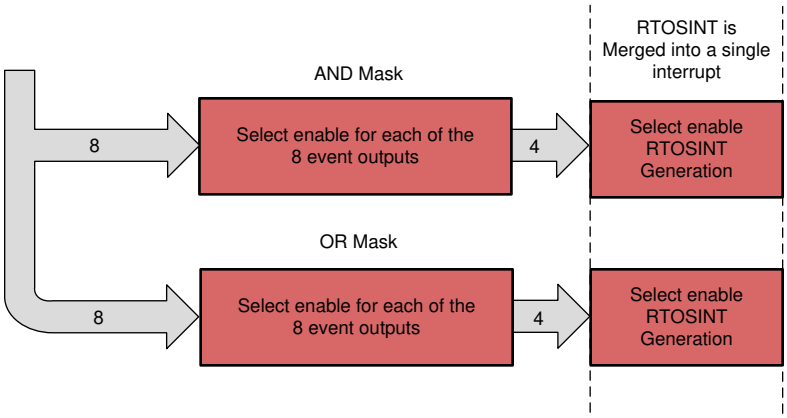

Figure 13-2. EBC Units Event Masking

To use the AND and OR masks:

1. Configure the GLBL_EVENT_AND_MASK and GLBL_OR_EVENT_MASK registers to select the desired EBC unit outputs for any of the available four masks.
2. To enable an RTOSINT for the configured mask, write 1 to the corresponding bit in the GLBL_AND_EVENT_INT_MASK or GLBL_OR_EVNT_INT_MASK register.
3. To use the mask output as an input to the system event counter unit, configure the CTM_INPUT_SEL register with the mux value for the desired mask. The input mux values are listed in Section 13.3.1.4.
4. To use the mask output as a qualifier to the CRC unit, configure the CRC_QUALIFIER register.

For example, to generate a real-time interrupt on MASK1 when EBC units 2, 3, AND 6 events are triggered, write 0x46 to GLBL_EVENT_AND_MASK, and then write 0x1 to GLBL_AND_EVENT_INT_MSK.

13.3 System Event Counter Unit

The SEC units provide system profiling, analysis, and debug capability. The SEC units contain counters that can enhance the debug and profiling process in various types of system scenarios such as:

- Profiling code segments
- Counting duration between specified memory reads and writes
- Counting system events (such as interrupts)
- Counting duration between system events
- System timer
- Measuring the number of wait states in code segments
- Measuring the maximum amount of time spent in between a pair of events, measured over multiple iterations
- Chaining counters to link events or create larger counters

Furthermore, the SEC unit has the capability to:

- Function as a counter capable of counting:
  - Any of the match events generated by the EBC units.
  - Events generated by the EBC units. These events can be used to start and stop the counting.
  - System events including the interrupts to the interrupt controller, and timer interrupts. These system events can be used to start and stop the counting.
  - More information on the input sources for the SEC units can be found in Section 13.3.1.4.
- Generate an interrupt or a watch point if the count reaches a reference value.
- Perform counter operation in one of the following two modes:
  - Duration mode: The counter counts the CPU cycles as long as the event is active.
  - Event mode: The counter counts only the positive edge of the event signal. This is effectively counting the number of times the event transitions from inactive to active.

13.3.1 System Event Counter Modes

The following are the operating modes of the SEC unit. The counters are initialized to zero when the SEC module receives a reset input signal, and always count up.

- Continuous Count: In this mode, the counter continues to count as specified by the input selector. The counter can count the CPU cycles without any events selected. In this mode, the module can be used as a software-controlled SYSCLK counter. Continuous mode is active when CTM_CNTL.START_STOP_MODE and CTM_REF are both set to 0.
- Timer Mode Count: In this mode, the counter counts up to a set reference value, defined in the CTM_REF register. Upon reaching the reference value, the counter generates an event that can send an interrupt to the CPU or generate a watch point. The RST_ON_MATCH bit in the CTM_CNTL register configures the counter to either continue incrementing or reset when a match event occurs.
- Start-Stop Count: In this mode, two events are configured to act as start and stop indicators to the counter. The counter commences counting only when the defined start event occurs. The counter then continues to count up until the stop event occurs. Once the first start event has occurred, further start events are ignored until the stop event occurs.

In any of the counter modes of operation, there is a possibility that the 32-bit counter value overflows. If an overflow occurs, the counter value resets to zero and continues to count up, and the OVERFLOW bit in the CTM_STATUS register is set high. The OVERFLOW bit remains high until either the counter is reset, or the application writes 1 to the OVERFLOW_CLEAR bit of the CTM_CLEAR register.

13.3.1.1 Counting Active Levels Versus Edges

The SEC units can be configured to either count active levels or edges of the selected inputs.

Each SEC unit has eight inputs from the EBC units and many inputs from other events in the device. Each SEC unit can be configured to count any of the input events or just count up on every cycle. For example, if an input event occurs and is active for 25 cycles, the SEC unit counter increments only by 1 in event mode; whereas in the duration mode, the counter increments by 25.

13.3.1.2 Max Mode

Max mode is also supported by the SEC units. This mode allows the user to detect the maximum count that has occurred during various count iterations in start-stop mode. For example, a user can set up the counter in the start-stop count mode to count the duration of a critical code loop. Every time the stop event occurs and the counter stops, the counter value is checked against the current MAX_COUNT present in the register. If the new value is greater, then the MAX_COUNT register is updated. The counter always resets to zero at the stop event and is ready to start counting on the next start event. Therefore, the MAX_COUNT contains the maximum number of cycles that occurred between the start and stop condition over many iterations.

13.3.1.3 Cumulative Mode

The SEC units can be used to yield the cumulative count over several start and stop events. In this mode, unlike Max mode, the counter does not reset due to a stop event. Instead, the counter stops counting and resumes counting when a start event occurs. In cumulative count mode, the MAX_COUNT is not valid.

13.3.1.4 Input Signal Selection

The SEC inputs can be selected from various signals from in the system to enable debug and system analysis. Figure 13-3 shows the SEC inputs. Each event selector MUX can select from various signals on in the system. These signals are shown in Table 13-1.

13.3.2 Reset on Event

Resetting the counters on external events is also possible. Additionally all the counter event outputs are applied back to each of counter input MUX, which selects the event that can be used as a reset input. When enabled, an active high on the reset input causes the counter to reset. This gives a powerful feature that allows setting up threshold monitors. This can be used to flag an interrupt or a watch point, if the distance between two events crosses a certain threshold.

13.3.3 Operation Conditions

The SEC units count accurately only when the CPU is operating in normal conditions. If the counters are running and capturing the CPU cycles while the CPU is controlled through the debugger to single-step through the code, then the result can differ from when the CPU was executing the code in normal conditions.

13.4 ERAD Ownership, Initialization and Reset

Although the features of the ERAD module are typically used by the debugger, user applications can also take advantage of the capabilities to monitor buses and generate interrupts and events. There are three possible ownership scenarios:

1. The user elects to give ownership of the ERAD module to the application software or the debugger.
2. Both the application code and the debugger share use of the ERAD module. Only the current owner of the module (application code or debugger) is allowed to use the module at a given time. When ownership is shared between application and debugger, the user application has the responsibility of resolving any ownership conflicts.
3. There is no ERAD owner. In this mode, both application code and debugger can access the module at any given time. The software, both on the application side and the debugger side, to resolve any potential conflicts is critical. An example scenario in this mode can be for the debugger to use some of the EBC and SEC units, while the application software uses the remaining units.

The ERAD module initializes the internal states and all registers to the initial/reset states under the following conditions:

- At power-on-reset (POR)
- With DCON and SYSRSN
  - Debug logic disconnected when the debugger owns the module
  - Functional reset when application owns the module

13.5 ERAD Programming Sequence

The ERAD module can be used to set hardware breakpoints and hardware watch points. The programming sequences to set hardware breakpoints, hardware watch points, or to use the timers to profile and analyze the system are described in this section. The same sequences can be used by both the debugger software and user application code.

Refer to the Driverlib example projects in C2000Ware for JavaScript files to configure the ERAD module. Example projects are also available to showcase the usage of these script files. These examples can be found in the driverlib\~f28p55x~\examples\erad directory under the C2000Ware installation directory.

13.5.1 Hardware Breakpoint and Hardware Watch Point Programming Sequence

The programming sequence is identical when using the EBC units, regardless of whether the debug software or the application is programing the units. A typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected; if not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the address reference, mask, bus select and stop bits.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the EVENT_FIRED sticky bit. This takes the module back to the enabled state.

The example programming sequences for hardware breakpoints and hardware watch points are:

Set a hardware breakpoint on address 0x201000:

- Read GLBL_OWNER to confirm ownership.
- Read HWBP_STATUS to confirm the module is in IDLE state.
- Write 0x0 to HWBP_MASK.
- Write 0x201000 to HWBP_REF.
- Set HWBP_CNTL.STOP = 1 and HWBP_CNTL.BUS_SEL = 0000 (PAB). If a trace is to be generated instead of a breakpoint, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on read of addresses from 0x121010 to 0x12101F:

- Read GLBL_OWNER to confirm ownership.
- Read HWBP_STATUS to confirm the module is in IDLE state.
- Write 0xF to HWBP_MASK.
- Write 0x121010 to HWBP_REF.
- Write HWBP_CNTL.STOP = 1 and HWBP_CNTL.BUS_SEL = 0011 (DRAB). If an RTOSINTn is to be generated instead of a watch point, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on write to address 0xFF10101A:

- Read GLBL_OWNER to confirm ownership
- Read HWBP_STATUS to confirm the module is in IDLE state
- Write 0x0 to HWBP_MASK
- Write 0xFF10101A to HWBP_REF
- Write HWBP_CNTL.STOP = 1, HWBP_CNTL.BUS_SEL = 0010 (DWAB). If an RTOSINTn is to be generated instead of a watch point, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

13.5.2 Timer and Counter Programming Sequence

The programming sequence is identical when using the SEC units, regardless of whether the debug software or the application is programing the units. Typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the counter reference, counter registers (clear/reset if a clean start is required) and CTM_CNTL.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the EVENT_FIRED sticky bit. This takes the module back to the enabled state.

Set up a free running counter:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Write 0x0 to CTM_INPUT_SEL.
- Write 0x0 to CTM_CNTL.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the duration spent between addresses 0x1000 and 0x1210:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x1000.
- Set up the EBC unit 2 to generate an event for VPC = 0x1210.
- Set up the start and stop input selects to use comparator event 1 and 2, respectively. This is achieved by writing CTM_INPUT_SEL.STA_INP_SEL = 0x0 and CTM_INPUT_SEL_2.STO_INP_SEL = 0x1.
- Enable the counter in the START_STOP_MODE of operation. This is achieved by writing CTM_CNTL. START_STOP_MODE = 1.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the number of times a function at address 0x2010 is called and fire an RTOSINT if this count reaches 0x300:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x2010.
- Setup the counter to select comparator event 1 as the event to count. This is achieved by writing CTM_INPUT_SEL.CNT_INP_SEL= 0 and CTM_CNTL.CNT_INP_SEL_EN = 1.
- Write 0x300 CTM_REF.
- Enable the counter in the EVENT_MODE, and also allow the counter to generate an RTOSINT when the count matches the reference. This is achieved by writing 0x88 to CTM_CNTL (bit 3 = 1 and bit 7 = 1).
- Enable the module in the GLBL_ENABLE register.

13.6 Cyclic Redundancy Check Unit

The cyclic redundancy check (CRC) units monitor CPU buses and compute CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with Software Test Library (STL). Each CRC unit is used to monitor a different CPU interface. For example, CRC unit 1 is used to monitor the Program Counter, while CRC unit 2 is used to monitor the data read address bus. Table 13-2 identifies the CPU interface monitored by each of the CRC units.

Table 13-2. CPU Interfaces Monitored by CRC Units

CRC Unit	CPU Interface
CRC Unit 1	Program Counter Register
CRC Unit 2	Data Read Address Bus
CRC Unit 3	Data Read Data Bus
CRC Unit 4	Data Write Address Bus
CRC Unit 5	Data Write Data Bus
CRC Unit 6	Instruction Register Value (Unsecured)
CRC Unit 7	Instruction Register Value (Secure-Zone 1)
CRC Unit 8	Instruction Register Value (Secure-Zone 2)

The main purpose of the CRC units is to make sure that the CPU functionally remains intact when the CRC unit is executing the same software test library over multiple iterations. This is done by comparing the computed CRC values after each iteration, with a pre-computed golden value.

CRC units 7 and 8 are intended to compute the instruction register values for secure-zone 1 and secure-zone 2 instruction execution. Computed CRC values for the a given secure-zone is available only for accesses originating from that zone.

13.6.1 CRC Unit Qualifier

By default, all the valid events on a given interface enables a CRC unit for computation. However there are optional qualifiers that can be used to gate the CRC computation when valid events occur. If required, these qualifiers can be generated by masking the EBC units events. The AND/OR masks discussed in Section 13.2.2 are used to generate these qualifiers. Refer to the CRC_QUALIFIER register for a full list of available qualifiers. Figure 13-4 shows the connection between EBC event masking and exporting with the CRC qualifiers.

EBC units have the capability to monitor the Program Counter, data writes and data reads. CRC units can use the EBC units to decide when the check values can be calculated. For example, if required to calculate the check values only when the CPU is executing a specific function, the user can set up an EBC unit to monitor the PC and generate a CRC qualifier when that function is executed. This allows the CRC unit to calculated the check value only when desired.

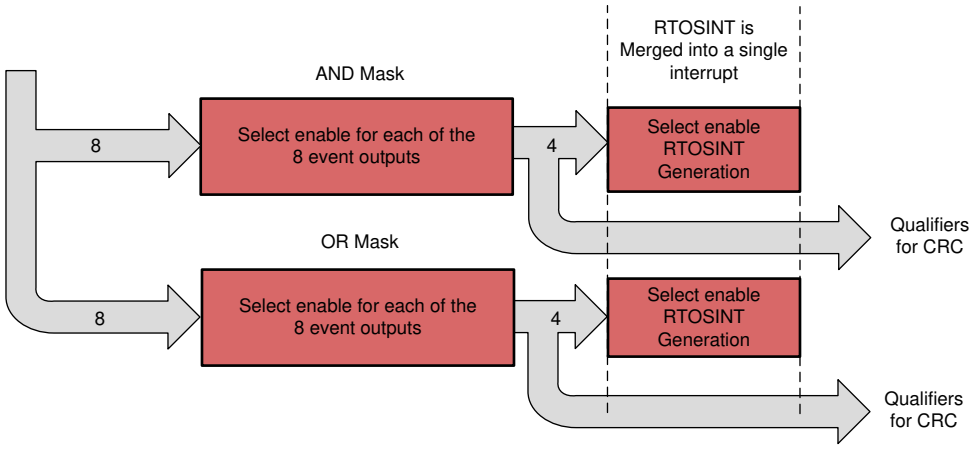

Figure 13-4. Event Masking and Exporting for CRC Qualifiers

13.6.2 CRC Unit Programming Sequence

The following sequence can be used to initialize a CRC unit to calculate the check value for the corresponding CPU interface.

1. Initialize the CRC unit by writing a 1 to the corresponding CRC_INIT field in the CRC_GLOBAL_CTRL register.
2. Configure the seed value (if required) using CRC_SEED register (CRC_EN can be 0 for when modifying the CRC_SEED register).
3. Configure the CRC_QUALIFIER register if additional qualification from EBC units is required; If not additional qualification is not required, set the CRC_QUALIFIER register to 0.
4. Enable the CRC unit by setting the CRC_EN to 1 at the beginning of the software for which the CRC calculation is done.
5. Disable the CRC unit by setting the CRC_EN to 0 at the end of the software for which the CRC calculation is done.
6. Read the CRC_CURRENT register to record the computed CRC. This check value can be compared with previous check values to make sure no changes have occurred.
7. Repeat steps 1-7 periodically as needed.

Note

Sufficient NOP's must be added immediately after the CRC submodule is enabled to make sure the pipeline contains predictable code as soon as the CRC is enabled. Similarly, sufficient NOP's must be added before the CRC submodule is disabled. Disabling the CRC write access takes a few cycles, therefore there must be predictable code in the pipeline stages until the write takes place.

13.7 Program Counter Trace

The Program Counter (PC) Trace module can be used to keep track of PC discontinuities or jumps, as a means to trace an entire program execution sequence over a period of time. When trace is completed or stopped, trace data can be read out using a debugger and analyzed to reconstruct the code execution sequence. The PC Trace module provides multiple modes and controls to govern when to trace and when not to trace. The trace module is tightly coupled with the Enhanced Bus Comparator, the System Event Counter Unit, and certain critical system level event signals.

Trace data is stored in an addressable memory buffer that can be read by software or a debugger. The trace data stored in this buffer includes additional status information on trace validity that can be used to correctly reconstruct the code execution system. For each discontinuity, two PC values are stored: the source of the discontinuity, and the destination. Figure 13-5 illustrates the operation of the PC trace module. The trace buffer is a circular buffer with overflow: when the buffer becomes full, new trace data is written starting from the top of the buffer, and an overflow status bit is set.

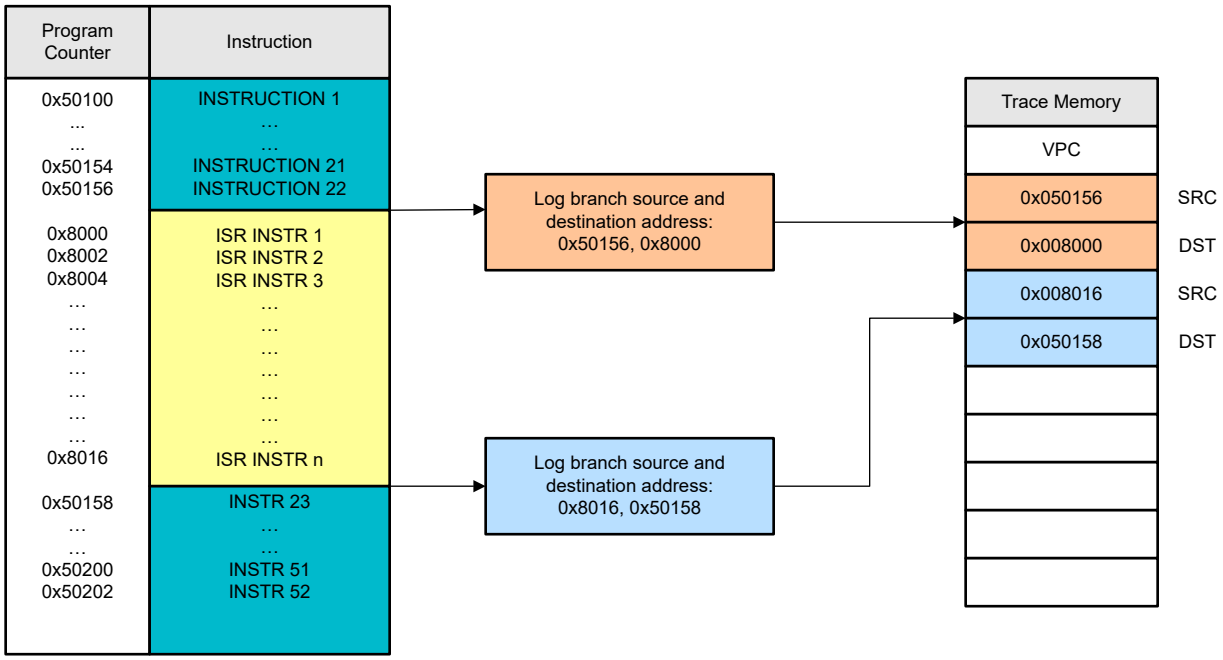

Figure 13-5. PC Trace Operation

13.7.1 Functional Block Diagram

Figure 13-6 describes the device PC trace architecture. The trace module is tightly coupled with the CPU, and receives the current program counter (VPC), program address (PAB), and various qualifying signals from the CPU interface. The Trace core captures these values whenever a PC discontinuity (for example, branch operation) is detected. The PC Trace module interfaces with the Enhanced Bus Comparator Unit and System Event Counter Unit, providing the ability to select events from these units as triggers to start a trace, stop a trace, or determine the bounding conditions for a windowed trace operation.

The Trace Core qualifies trace source and destination addresses, and stores these addresses sequentially in the trace memory buffer. Additionally, the Trace Core can generate hit events every time a new trace is stored in the memory buffer; this event signal is connected to the ERAD counter block so that the number of entries in the buffer can be tracked. This counter value can in turn be used to create a STOP event at a predefined threshold.

Note

Discontinuities that arise due to block repeats (RPTB instruction blocks) are not captured by the PC trace module.

Debugger accesses are always treated as unsecure accesses. Unlike other ERAD components, there is no concept of debug or application ownership in the PC Trace module.

The Trace Core generates a trace hit event for a discontinuity arising from a speculative instruction fetch, even if the fetched instruction does not reach the execution phase in the CPU pipeline. As a result, the BUFFER_FULL signal can be set prematurely due to a speculative prefetch. The user can always safely discard the oldest discontinuity pair present in the memory buffer when a full buffer is detected, to mitigate this scenario.

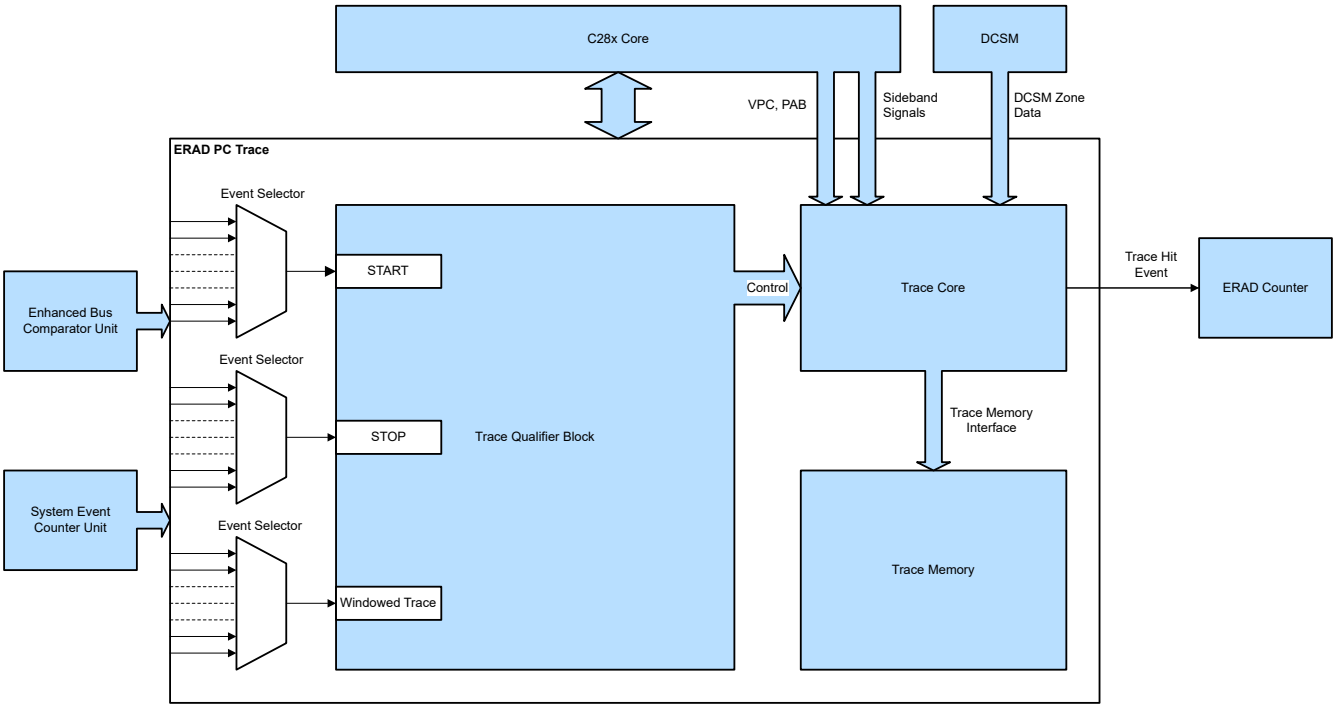

Figure 13-6. PC Trace Block Diagram

13.7.2 Trace Qualification Modes

There are three modes of trace qualification available:

1. Normal mode: In this mode, trace is enabled without any qualifiers. Trace control happens purely through software writing to the PCTRACE_GLOBAL register. When operating PC Trace in normal mode, The PCTRACE_LOGPC_SOFTENABLE captures the program counter value at the point when PCTRACE_GLOBAL.EN is set to 1, and the PCTRACE_LOGPC_SOFTDISABLE register captures the program counter value at the point PCTRACE_GLOBAL.EN is set to 0.
2. Windowed Trace mode: In windowed mode, PC Trace can be activated or stopped based on the value of a signal coming from the Event Bus Comparator, System Event Counter, or other system events. The WINDOWED_INP_SEL field in the PCTRACE_QUAL1 register specifies the input signal used to qualify PC Trace operation in windowed mode. By default trace is active when the input signal is high and inactive when the input signal is low; this behavior can be reversed by setting the PCTRACE_QUAL1.WINDOWED_INP_INV bit high.
3. Start-Stop mode: In this mode, one input signal starts the PC trace operation, and a different input signal stops the trace operation. Event Bus Comparator signals, System Event Counter signals and other system event signals can be used as inputs to start or stop the PC Trace. The START_INP_SEL and STOP_INP_SEL fields in the PCTRACE_QUAL2 register specify the input signals used to qualify PC Trace operation in start-stop mode. Once a start event arrives and PC trace operation begins, the PC Trace module ignores all further start events until a stop event is received. Trace start and stop operations are triggered on the rising edge of the input event; this behavior can be reversed by setting the START_INP_INV and STOP_INP_INV bits in the PCTRACE_QUAL1 register.

To set the PC Trace operation mode, write to the TRACE_MODE bit in the PCTRACE_QUAL1 register.

13.7.2.1 Trace Qualifier Input Signals

Table 13-3 describes the various input signals that can be used to qualify PC Trace operation in Windowed or Start-Stop modes.

Table 13-3. Event Selector Mux Signals

13.7.3 Trace Memory

PC Trace memory is a 32-bit-wide read-only memory buffer that holds each 22-bit PC value, together with a security BLOCKED status bit. The memory-map section of the device data sheet specifies the size of the PC Trace memory buffer. Trace memory entries are stored in pairs: the discontinuity source and destination addresses. Table 13-4 describes the bit field structure of each trace memory entry.

Table 13-4. Trace Memory Entry Bit Fields

Bits	Field Name	Description
21:0	PROGRAM_COUNTER	Program counter source or destination address value where discontinuity occurred
22	BLOCKED	1 = PROGRAM_COUNTER[21:0] is invalid due to security permissions 0 = PROGRAM_COUNTER[21:0] is valid
31:23	RESERVED	Reserved

Note

For addresses that are blocked due to security zone restrictions, the PROGRAM_COUNTER value is set to 0.

Trace memory is intended solely for debug purposes and does not have parity or Error Correction Code (ECC) support.

13.7.4 Trace Input Signal Conditioning

The PC Trace module provides input conditioning options for signals that are used to qualify operation in Start-Stop or Windowed modes. For each of these (START, STOP, WINDOWED), there is a two-stage synchronizer for asynchronous input signals, and an inverter. The PC Trace input conditioning options are controllable using the PCTRACE_QUAL1 register with the following bits:

- WINDOWED_INP_INV: This bit inverts the input signal for Windowed trace mode selected in WINDOWED_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input, and stops the rising edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input, and stops on the falling edge of the input.
- WINDOWED_INP_SYNCH: This bit passes the input signal selected in WINDOWED_INP_SEL through a two-stage synchronizer.
- START_INP_INV: This bit inverts the input signal for trace START operation selected in PCTRACE_QUAL2.START_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input.
- START_INP_SYNCH: This bit passes the input signal selected in PCTRACE_QUAL2.START_INP_SEL through a two-stage synchronizer.
- STOP_INP_INV: This bit inverts the input signal for trace STOP operation selected in PCTRACE_QUAL2.STOP_INP_SEL. When set to 1, the trace operation stops on the falling edge of the input. When this bit is set to 0, the trace operation stops on the rising edge of the input.
- STOP_INP_SYNCH: This bit passes the input signal selected in PCTRACE_QUAL2.STOP_INP_SEL through a two-stage synchronizer.

Figure 13-7 describes the signal conditioning circuit available for each input qualifier signal.

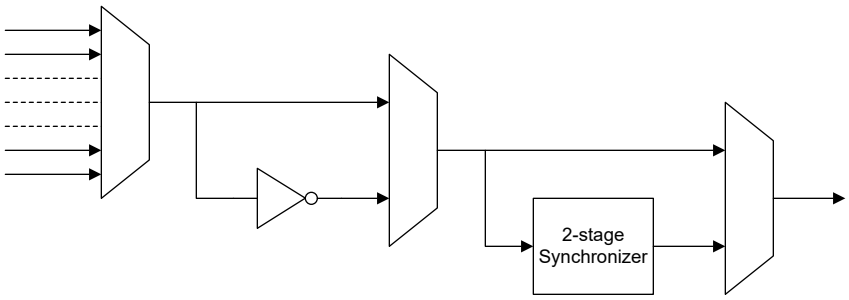

Figure 13-7. Trace Qualifier Input Conditioning Circuit

13.7.5 PC Trace Software Operation

An example software sequence to perform PC Trace operation is as follows:

1. Initialize the PC Trace module by writing 1 to PCTRACE_GLOBAL.INIT. The trace initialize operation resets the buffer pointer and overflow flags, and clears the values of the PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers.
2. Start the PC Trace operation by writing 1 to PCTRACE|_GLOBAL.EN.
3. Execute the desired code sequence to be profiled.
4. Stop the PC Trace operation by writing 0 to PCTRACE_GLOBAL.EN. This step is optional, as the PC Trace buffer can be read while trace operation is active.
5. To determine if there are valid entries in the trace buffer and how many:
   a. Examine the buffer pointer by reading PCTRACE_BUFFER.PTR. If the pointer value is 0, then no discontinuities have been detected since PC Trace was initialized. A non-zero value indicates the number of locations in the buffer that contain valid entries. For instance, PTR = 4 indicates that locations 0, 1, 2, and 3 contain valid entries (SRC, DST, SRC, DST).
   b. Examine the BUFFER_FULL bit in the PCTRACE_BUFFER register. If BUFFER_FULL = 1, then the following possibilities apply:
      - If PTR = 0, then the buffer is simply full and contains the maximum number of entries possible.
      - If PTR > 0, then a buffer overflow has occurred. The value of PTR indicates by how many entries the buffer has overflowed: this is a circular buffer.
6. Read PCTRACE_LOGPC_SOFTENABLE (and optionally PCTRACE_LOGPC_SOFTDISABLE) if needed to determine the bounding addresses of the trace operation, in case the code sequence being traced does not begin or end at a discontinuity boundary (for example, partial function trace).
7. Trace discontinuities are recorded in the trace buffer in pairs (SRC, DST). Use this data to reconstruct the code execution sequence. While reading the trace buffer, be sure to examine the BLOCKED status bit to confirm the validity of each trace entry.

13.7.6 Trace Operation in Debug Mode

PC Trace is designed to capture data while the CPU is executing code. Debugger operations such as halt, step, and manual PC modification can compromise the reliability of PC trace data collection. Only use or interpret PC Trace data in the context of a continuous CPU run without debugger interruption or intervention.

CPU execution does not preclude debugger operation of the PC trace module if the debugger owns the PCTRACE module. While the CPU is running and executing code, the debugger can read and write PC Trace registers, read the trace buffer, and enable or disable PC trace operation. Debugger can update the PC Trace registers if debugger owns PCTRACE module. The PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers record the start and stop PC addresses to provide accurate trace window information during manual trace starts or stops triggered by writing to the PCTRACE_GLOBAL.EN bit.

13.8.2 ERAD Examples

NOTE: These examples are located in the C2000Ware installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/erad

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

13.8.2.1 ERAD Profiling Interrupts

FILE: erad_ex1_profileinterrupts.c

This example configures CPU Timer0, 1, and 2 to be profiled using the ERAD module. Included is a JavaScript file, profile_interrupts.js, which is used with the scripting console to program ERAD registers and view profiling data.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex1_profileinterrupts"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\\erad_debugger_ex1_profileinterrupts\\erad_ex1_profile_interrupts.js", 0);

The included JavaScript file, erad_ex1_profile_interrupts.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: *http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html*

Note that the script must be run after loading and running the .out on the C28x core. Only CPU timer 2 ISR is profiled in this example.

This example uses 2 HW breakpoints and 4 counters:

- HWBP_1 : PC = start address of cpuTimer2ISR
- HWBP_2 : PC = end address of cpuTimer2ISR
- CTM_1 : Used to count the cpuTimer2ISR execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the number of times the system event TIMER2_TINT2 has occurred. Configured in rising-edge count mode with counting input as system event TIMER2_TINT2 (INP_SEL[25])
- CTM_3 : Used to count the number of times cputTimer2ISR executes. Configured in rising-edge count mode with counting input as HWBP_1 (INP_SEL[0])
- CTM_4 : Used to count the latency from the system event TIMER2_TINT2 to cpuTimer2ISR entry. Configured in start-stop mode with start event as TIMER2_TINT2 and stop event as HWBP_1

External Connections

- None

Watch Variables

- cpuTimer0IntCount
- cpuTimer1IntCount
- cpuTimer2IntCount

Profiling Script Output

- Current ISR cycle count (CTM_1)
- Max ISR cycle count (maximum value of CTM_1)
- Interrupt occurrence count (CTM_2)
- ISR execution count (CTM_3)
- ISR entry delay cycle count (maximum value of CTM_4)

Note that the large difference between Interrupt occurrence count (CTM_2) and ISR execution count (CTM_3) is because the ISR takes more number of cycles than the actual interrupt period. ISR entry delay cycle count will also be higher due to the same reason.

13.8.2.2 ERAD Profile Function

FILE: erad_ex1_profile_function.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections
None

13.8.2.3 ERAD Profile Function

FILE: erad_ex1_profile_function_syscfg.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections
None

13.8.2.4 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

13.8.2.5 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor_syscfg.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

13.8.2.6 ERAD Profile Function

FILE: erad_ex2_profilefunction.c

This example contains a basic FIR calculation and sorting algorithm to help demonstrate the function profiling capability of the ERAD peripheral. A number of FIR sums are calculated within a loop and are then sorted using the insertion sort algorithm. Cycle counts of both the FIR calculations and the sorting algorithm are output to the screen through the scripting console. In this example, it can be seen that sorting the data takes up a majority of the CPU cycles executed in this program.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex2_profilefunction"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\\erad_debugger_ex2_profilefunction\\erad_ex2_profile_function.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex2_profile_function.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: *http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html*

This example uses 4 HW breakpoints and 2 counters:

- HWBP_1 : PC = start address of performFIR
- HWBP_2 : PC = end address of performFIR
- HWBP_3 : PC = start address of sortMax
- HWBP_4 : PC = end address of sortMax
- CTM_1 : Used to count the performFIR execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the sortMax execution cycles. Configured in start-stop mode with start event as HWBP_3 and stop event as HWBP_4

External Connections

- None.

Watch Variables

- FIR_iterationCounter - A counter for the number of times FIR calculation and sorting was performed

Profiling Script Output

- Current FIR cycle count (CTM_1)
- Max FIR cycle count (maximum value of CTM_1)
- Current sorting function cycle count (CTM_2)
- Max sorting function cycle count (maximum value of CTM_2)

Note that the the counters are reset after the stop event. The counter value remains 0 till the next start event occurs. The javascript continuously reads the counter value in a while(1) and hence the current counter may return 0.

13.8.2.7 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections
None

13.8.2.8 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect_syscfg.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections
None

13.8.2.9 ERAD Stack Overflow

FILE: erad_ex3_stackoverflow.c

This example shows the basic setup of CAN in order to transmit and receive messages on the CAN bus. The CAN peripheral is configured to transmit messages with a specific CAN ID. A message is then transmitted once per second, using a simple delay loop for timing. The message that is sent is a 2 byte message that contains an incrementing pattern.

This example sets up the CAN controller in External Loopback test mode. Data transmitted is visible on the CANTXA pin and is received internally back to the CAN Core.

A buffer is created to store message history up to 50 messages for the duration of the program. A logic error is intentionally made to allow the buffer to overflow, eventually causing a stack overflow. The included JavaScript file, stack_overflow.js, programs ERAD registers in order to detect the stack overflow and halt the CPU once the illegal write is made. The illegal write is made after 507 messages are received.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex3_stackoverflow"
- var PROJ_WKSPC_LOC = <proj_workspace_path>

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\\erad_debugger_ex3_stackoverflow\\erad_ex3_stack_overflow.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex3_stack_overflow.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: *http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html*

This example uses 1 HW watchpoint :

- HWBP_1 : Data Write Address Bus = Stack end address + 1

External Connections

- None.

Watch Variables

- msgCount - A counter for the number of successful messages received
- txMsgData - An array with the data being sent
- rxMsgData - An array with the data that was received
- msgHistoryBuff - An array meant to store the last 50 messages received

Profiling Script Output

- "STACK OVERFLOW detected. Halting CPU." will be printed in the scripting console when a stack overflow occurs (that is, when the watchpoint is hit)

13.8.2.10 ERAD Profile Interrupts CLA

FILE: erad_ex4_profileinterrupts_cla.c

This example configures EPWM1A to run at 1 KHz (period = 1 ms) to trigger a start-of-conversion on ADC channel A0. This channel will, in turn, sample EPWM4A which is set to run at 100Hz. At the end-of-conversion the ADC interrupt is fired. The interrupt signal will be used to trigger a CLA task that runs an FIR filter. The filter is designed to be low pass with a cutoff frequency of 100Hz; it will remove the odd harmonics in the input signal smoothing the square wave to a sinusoidal shape. The CLA background task will continuously buffer the filtered output in a circular buffer.

This example also utilizes the ERAD peripheral to profile the Interrupt Service Routine (ISR) cla1ISR1 (on the C28x core). The ISR contains a loop that simulates storing a random amount of data to a location in order to introduce variability into the cycle measurements. The ERAD peripheral is also configured to count the number of times the system event CLA_INTERRUPT1 occurs.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex4_profileinterrupts_cla"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"

- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\\erad_debugger_ex4_profileinterrupts_cla\ \erad_ex4_profile_interrupts_cla.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex4_profile_interrupts_cla.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: *http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html*

This example uses 4 HW breakpoints and 2 counters:
- HWBP_1 : PC = start address of cla1Isr1
- HWBP_2 : PC = end address of cla1Isr1
- CTM_1 : Used to count the cla1Isr1 execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the number of times the system event CLA_INTERRUPT1 event has occurred. Configured in rising-edge count mode with counting input as system event CLA_INTERRUPT1 (INP_SEL[26])

External Connections
- connect A0 to EPWM4A

Watch Variables
- ISR_count - A counter that signifies how many times cla1ISR1 executes

Profiling Script Output
- Current ISR cycle count (CTM_1)
- Max ISR cycle count (maximum value of CTM_1)
- Interrupt occurrence count (CTM_2)

13.8.2.11 ERAD Profiling Interrupts

FILE: erad_ex4_profile_interrupt.c

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:
- BUSCOMP_1 : PC = start address of cpuTimer1ISR
- BUSCOMP_2 : PC = address of cpuTimer1IntCount variable access. This specifies the end address of the code of interest.
- COUNTER_1 : Used to count the cpuTimer1ISR execution cycles. Configured in start-stop mode with start event as BUSCOMP_1 and stop event as BUSCOMP_2
- COUNTER_2 : Used to count the number of times the system event TIMER1_TINT1 has occurred. Configured in rising-edge count mode with counting input as system event TIMER1_TINT1
- COUNTER_3 : Used to count the number of times cputTimer2ISR executes. Configured in rising-edge count mode with counting input as BUSCOMP_1
- COUNTER_4 : Used to count the latency from the system event TIMER1_TINT1 to cpuTimer1ISR entry. Configured in start-stop mode with start event as TIMER1_TINT1 and stop event as BUSCOMP_1

We configure the COUNTER1 to generate an interrupt once it reaches a threshold value.

External Connections
- None

Profiling Output

- Current ISR cycle count (COUNTER_1)
- Interrupt occurrence count (COUNTER_2)
- ISR execution count (COUNTER_3)
- ISR entry delay cycle count (maximum value of COUNTER_4)
- x - To show that the ISR executed

13.8.2.12 ERAD Profiling Interrupts

FILE: erad_ex4_profile_interrupt_syscfg.c

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:
- BUSCOMP_1 : PC = start address of cpuTimer1ISR
- BUSCOMP_2 : PC = address of cpuTimer1IntCount variable access. This specifies the end address of the code of interest.
- COUNTER_1 : Used to count the cpuTimer1ISR execution cycles. Configured in start-stop mode with start event as BUSCOMP_1 and stop event as BUSCOMP_2
- COUNTER_2 : Used to count the number of times the system event TIMER1_TINT1 has occurred. Configured in rising-edge count mode with counting input as system event TIMER1_TINT1
- COUNTER_3 : Used to count the number of times cputTimer2ISR executes. Configured in rising-edge count mode with counting input as BUSCOMP_1
- COUNTER_4 : Used to count the latency from the system event TIMER1_TINT1 to cpuTimer1ISR entry. Configured in start-stop mode with start event as TIMER1_TINT1 and stop event as BUSCOMP_1

We configure the COUNTER1 to generate an interrupt once it reaches a threshold value.

External Connections
- None

Profiling Output
- Current ISR cycle count (COUNTER_1)
- Interrupt occurrence count (COUNTER_2)
- ISR execution count (COUNTER_3)
- ISR entry delay cycle count (maximum value of COUNTER_4)
- x - To show that the ISR executed

13.8.2.13 ERAD MEMORY ACCESS RESTRICT

FILE: erad_ex5_restricted_write_detect.c

This example uses BUSCOMP1 to monitor the Data Write Address Bus. It monitors the bus and generates an RTOS interrupt if a certain region of memory is accessed by the PC. The user may disable the Bus Comparator to access that region.

Use the COM port (Baud=9600) to try to write to the restricted area.

Watch Variables
- x : stores the number of times the region of memory is accessed

External Connections
- None

13.8.2.14 ERAD INTERRUPT ORDER

FILE: erad_ex6_interrupt_order.c

This example uses a COUNTER to monitor the sequence of ISRs executed. An interrupt is generated if the ISRs executed are not in the expected order. The expected order is CPUTimer0 ,then CPUTimer1 and then CPUTimer2

The counter is configured in Start-Stop Mode to count the number of times CPUTimer2 interrupt occurs between the CPUTimer0 interrupt and CPUTimer1 ISRs. Ideally, this count should be zero if the interrupts are occurring in the expected order. we configure a threshold value of 1 to generate an RTOS interrupt. This indicates that the CPUTimer2 interrupt has come out of order.

For demonstration purposes, this example disables CPUTimer1 to simulate this error.

Watch Variables

- cpuTimer0IntCount: Number of executions of ISR0
- cpuTimer1IntCount: Number of executions of ISR1
- cpuTimer2IntCount: Number of executions of ISR2

External Connections

- None

13.8.2.15 ERAD AND CLB

FILE: erad_ex7_reg_write_clb.c

This example uses 4 BUS COMPARATORS of ERAD along with the CLB. One bus comparator monitors a write to x, another one monitors a write to y. The other two monitor a write of 0x1 and 0x0. By using the LUTs in the CLB1 tile, we can monitor a write of 0x1 to x or 0x0 to x. These are used to change the state of FSM2 in the CLB1 tile. If y is accessed before writing a 0x1 to x, an interrupt is generated and y is changed to 0x0 again. The LED2 indicates when access to y is allowed(it is off at this point) The LED1 indicates if an invalid access is attempted. A COUNTER in ERAD is used to count the number of access attempts to y.

Watch Variables

- y
- x
- a - counts the number of access attempts to y

External Connections

None

13.8.2.16 ERAD PWM PROTECTION

FILE: erad_ex8_pwm_protection.c

This example uses a BUS COMPARATOR and the CLB to detect the event when the delay between the interrupt and the ISR execution is longer than expected. The PWM output is also tripped in this case.

Watch Variables

- adcAResults stores the results of the conversions from the ADC

External Connections

- Monitor the PWM output (GPIO0)

13.9 ERAD Registers

This Section describes the ERAD Registers.

13.9.1 ERAD Base Address Table

Table 13-6. ERAD Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected

13.9.2 ERAD_GLOBAL_REGS Registers

Table 13-7 lists the memory-mapped registers for the ERAD_GLOBAL_REGS registers. All register offset addresses not listed in Table 13-7 should be considered as reserved locations and the register contents should not be modified.

Table 13-7. ERAD_GLOBAL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GLBL_EVENT_STAT	Global Event Status Register		Go
4h	GLBL_HALT_STAT	Global Halt Status Register		Go
8h	GLBL_ENABLE	Global Enable Register	EALLOW	Go
Ch	GLBL_CTM_RESET	Global Counter Reset	EALLOW	Go
10h	GLBL_NMI_CTL	Global Debug NMI control	EALLOW	Go
14h	GLBL_OWNER	Global Ownership	EALLOW	Go
18h	GLBL_EVENT_AND_MASK	Global Bus Comparator Event AND Mask Register	EALLOW	Go
1Ch	GLBL_EVENT_OR_MASK	Global Bus Comparator Event OR Mask Register	EALLOW	Go
20h	GLBL_AND_EVENT_INT_MASK	Global AND Event Interrupt Mask Register	EALLOW	Go
24h	GLBL_OR_EVENT_INT_MASK	Global OR Event Interrupt Mask Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 13-8 shows the codes that are used for access types in this section.

Table 13-8. ERAD_GLOBAL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

13.9.2.1 GLBL_EVENT_STAT Register (Offset = 0h) [Reset = 0000h]

GLBL_EVENT_STAT is shown in Figure 13-8 and described in Table 13-9.

Return to the Summary Table.

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT_FIRED bit of the corresponding module. This facilitates software to just read one register and find out if any of the debug modules had fired.

13.9.2.2 GLBL_HALT_STAT Register (Offset = 4h) [Reset = 0000h]

GLBL_HALT_STAT is shown in Figure 13-9 and described in Table 13-10.

Return to the Summary Table.

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT_FIRED status bit. This facilitates software to just read one register and find out if any of the debug modules have fired.

13.9.2.3 GLBL_ENABLE Register (Offset = 8h) [Reset = 0000h]

GLBL_ENABLE is shown in Figure 13-10 and described in Table 13-11.

Return to the Summary Table.

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly acts as a global enable for the corresponding module. This bit has to be set to 1 for the module to be functional.

13.9.2.4 GLBL_CTM_RESET Register (Offset = Ch) [Reset = 0000h]

GLBL_CTM_RESET is shown in Figure 13-11 and described in Table 13-12.

Return to the Summary Table.

This register contains one bit for each of the counter modules that are present in a device. Each bit directly acts as a reset for the counters for the corresponding module.(It does not affect anything else except resetting the counter.
Example: If the counter was previously incrementing before reset, then on a reset event the counter gets reset and continues to increment again).

13.9.2.5 GLBL_NMI_CTL Register (Offset = 10h) [Reset = 0000h]

GLBL_NMI_CTL is shown in Figure 13-12 and described in Table 13-13.

Return to the Summary Table.

This register contains one bit for each of the bus comparator modules anf the counter modules that can cause an NMI to the CPU. When the corresponding bit of a unit is set to 1, then if an event occurs from that module, then an NMI will be generated.

Table 13-15. GLBL_EVENT_AND_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MASK4_HWBP8	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 8: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
30	MASK4_HWBP7	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 7: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
29	MASK4_HWBP6	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 6: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
28	MASK4_HWBP5	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 5: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET

Table 13-15. GLBL_EVENT_AND_MASK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MASK4_HWBP4	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 4: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
26	MASK4_HWBP3	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 3: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
25	MASK4_HWBP2	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 2: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
24	MASK4_HWBP1	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 1: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND4 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND4 output Reset type: ERAD_RESET
23	MASK3_HWBP8	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 8: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
22	MASK3_HWBP7	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 7: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
21	MASK3_HWBP6	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 6: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
20	MASK3_HWBP5	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 5: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
19	MASK3_HWBP4	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 4: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET

Table 13-15. GLBL_EVENT_AND_MASK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	MASK3_HWBP3	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 3: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
17	MASK3_HWBP2	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 2: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
16	MASK3_HWBP1	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 1: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND3 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND3 output Reset type: ERAD_RESET
15	MASK2_HWBP8	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 8: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
14	MASK2_HWBP7	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 7: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
13	MASK2_HWBP6	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 6: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
12	MASK2_HWBP5	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 5: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
11	MASK2_HWBP4	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 4: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
10	MASK2_HWBP3	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 3: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET

Table 13-15. GLBL_EVENT_AND_MASK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	MASK2_HWBP2	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 2: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
8	MASK2_HWBP1	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 1: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND2 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND2 output Reset type: ERAD_RESET
7	MASK1_HWBP8	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 8: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
6	MASK1_HWBP7	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 7: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
5	MASK1_HWBP6	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 6: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
4	MASK1_HWBP5	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 5: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
3	MASK1_HWBP4	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 4: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
2	MASK1_HWBP3	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 3: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET
1	MASK1_HWBP2	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 2: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET

Table 13-15. GLBL_EVENT_AND_MASK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	MASK1_HWBP1	R/W	1h	AND event mask for Enhanced Bus Comparator (EBC) unit 1: 0 Corresponding HWBP_EVENT is enabled for HWBP_EVENT_AND1 output 1 Corresponding HWBP_EVENT is masked for HWBP_EVENT_AND1 output Reset type: ERAD_RESET

13.9.2.8 GLBL_EVENT_OR_MASK Register (Offset = 1Ch) [Reset = FFFFFFFFh]

GLBL_EVENT_OR_MASK is shown in Figure 13-15 and described in Table 13-16.

Return to the Summary Table.

13.9.3 ERAD_HWBP_REGS Registers

Table 13-19 lists the memory-mapped registers for the ERAD_HWBP_REGS registers. All register offset addresses not listed in Table 13-19 should be considered as reserved locations and the register contents should not be modified.

Table 13-19. ERAD_HWBP_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	HWBP_MASK	HWBP (EBC) Mask Register	EALLOW	Go
4h	HWBP_REF	HWBP (EBC) Reference Register	EALLOW	Go
8h	HWBP_CLEAR	HWBP (EBC) Clear Register	EALLOW	Go
Ch	HWBP_CNTL	HWBP (EBC) Control Register	EALLOW	Go
Eh	HWBP_STATUS	HWBP (EBC) Status Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 13-20 shows the codes that are used for access types in this section.

Table 13-20. ERAD_HWBP_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

13.9.3.1 HWBP_MASK Register (Offset = 0h) [Reset = 00000000h]

HWBP_MASK is shown in Figure 13-18 and described in Table 13-21.

Return to the Summary Table.

7	6	5	4	3	2	1	0
RTOSINT	STOP	RESERVED	RST_ON_MATCH	EVENT_MODE	START_STOP_MODE	RESERVED	
R/W-0h	R/W-0h	R-0h	R/W-0h	R/W-0h	R/W-0h	R-0h	

Table 13-28. CTM_CNTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-12	RESERVED	R	0h	Reserved
11	CNT_INP_SEL_EN	R/W	0h	0 = Disable using the input_select register for the count input. The counter will always count CPU cycles. 1 = Enable using the input_select register for the count input. The counter will count the event selected by the count input register. Reset type: ERAD_RESET
10	RST_EN	R/W	0h	This bit decides if the reset input is enabled or not. Setting this to 1 will cause the counter to reset to zero whenever the selected reset input goes active high. No event will be generated when the counter is reset. Setting this bit to 0 will cause the counter to ignore the reset inputs. Reset type: ERAD_RESET
9	RESERVED	R	0h	Reserved
8	START_STOP_CUMULATIVE	R/W	0h	This bit decides whether the counter counts to give the cumulative cycle count for 'n' number of successive start stop events or clears the counter on very stop event to record the MAX_COUNT across successive start stop sequences. 0 When in START_STOP mode counter gets cleared on every stop event and MAX_COUNT records the max value 1 When in START_STOP mode counter keeps counting between successive start stop events to generate a cumulative count w/o clearing the counter on any stop events. MAX_COUNT register is invalid when this bit is set. Reset type: ERAD_RESET
7	RTOSINT	R/W	0h	This bit decides whether the counter module will generate RTOSINTn interrupt when count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not cause any action towards the CPU. 1 The counter unit will assert RTOSINTn when the count value matches the reference value. Reset type: ERAD_RESET

Table 13-28. CTM_CNTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	STOP	R/W	0h	This bit decides whether the counter module will generate a watchpoint to the CPU when the count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not generate a watchpoint. 1 The counter unit will assert ANASTOP when the count value matches the reference. Reset type: ERAD_RESET
5	RESERVED	R	0h	Reserved
4	RST_ON_MATCH	R/W	0h	This bit is used to decide whether the counter will reset to zero once it reaches the reference value. 0 Counter will stay at the reference value and the counter will go to COMPLETED state and further counting will be stopped. 1 The counter will reset to zero once it reaches the match value and will stay enabled. Reset type: ERAD_RESET
3	EVENT_MODE	R/W	0h	This bit is used to decide whether the counter will count the level of the event or the edge of the event. 0 Counter will increment the count as long as the count input is active high. 1 The counter will count only on the rising edge of the count input. Reset type: ERAD_RESET
2	START_STOP_MODE	R/W	0h	This bit is used to decide whether the counter will count in the START_STOP mode or not. 0 Normal count mode. The counter will not depend on the START and STOP events 1 This is the START-STOP mode of the counter. The counter will start counting only after the START input has been asserted. It will continue to count the selected event till the STOP event is seen. Reset type: ERAD_RESET
1-0	RESERVED	R	0h	Reserved

13.9.4.2 CTM_STATUS Register (Offset = 2h) [Reset = 0010h]

CTM_STATUS is shown in Figure 13-24 and described in Table 13-29.

Return to the Summary Table.

Table 13-48. PCTRACE_BUFFER Register Field Descriptions

Bit	Field	Type	Reset	Description
15	BUFFER_FULL	R	0h	0 = Trace Buffer Never became full/Overflowed after init 1 = Indicates Trace Buffer became full/Overflowed This bit also gets cleared when INIT is performed via PCTRACE_GLOBAL.INIT Reset type: SYSRSn
14-10	RESERVED	R	0h	Reserved
9-0	PTR	R	0h	Current Pointer to the Trace Buffer. If BUFFER_FULL=0 a. PTR=0 => there is no trace data in buffer) b. PTR=2,4,6. indicates there is fresh trace data in buffer Buffer pointer gets incremented by 2 for every new trace storage, since two 32-bit values get stored for every discontinuity. For ex : 2 => Locations 0,1 of trace buffer have valid data (SRC,DST) 4 => Locations 0,1,2,3 have valid data (SRC,DST,SRC,DST) and so on If BUFFER_FULL = 1 a. PTR = 0 => buffer is just full b. PTR = non-zero value, then the buffer had overflowed and PTR points to how much it has overflowed. Discontinuities start from PTR (oldest discontinuity trace) to the end of buffer and then follows back to 0 and then until PTR-1(most recent discontinuity trace). This acts more like a circular buffer. These bits also gets cleared when INIT is performed via PCTRACE_GLOBAL.INIT Reset type: SYSRSn

13.9.7.3 PCTRACE_QUAL1 Register (Offset = 4h) [Reset = 00000000h]

PCTRACE_QUAL1 is shown in Figure 13-38 and described in Table 13-49.

Chapter 14

Analog Subsystem

The analog subsystem module is described in this chapter.

14.1 Introduction

The analog modules on this device include the Analog-to-Digital Converter (ADC), Temperature Sensor, Buffered Digital-to-Analog Converter (DAC), Programmable Gain Amplifier (PGA), and Comparator Subsystem (CMPSS).

14.1.1 Features

The analog subsystem has the following features:

- Flexible voltage references:
  - The ADCs are referenced to VREFHI and VREFLO pins.
    - VREFHI pin voltage can be driven in externally or can be generated by an internal bandgap voltage reference.
    - The internal voltage reference range can be selected to be 0V to 3.3V or 0V to 2.5V.
  - The buffered DAC is referenced to VREFHI and VSSA
  - The comparator DACs are referenced to VDDA and VSSA
- Flexible pin usage
  - Buffered DAC outputs, comparator subsystem inputs, PGA functions, and digital inputs (AIOs)/outputs (AGPIOs) are multiplexed with ADC inputs
  - Internal connection to V_{REFLO} on all ADCs for offset self-calibration

14.1.2 Block Diagram

The following analog subsystem block diagrams show the connections between the different integrated analog modules to the device pins. These pins fall into two categories: analog module inputs/outputs and reference pins.

The reference pin, VREFHI can be used to supply an external voltage reference to all ADCs. An internal voltage reference is available and connects to VREFHI.

Some analog pins support digital functionality through muxed AIOs and AGPIOs. AIOs only support digital input functionality, while AGPIOs support full digital input and output functionality.

The following notes apply to all packages:

- Not all analog pins are available on all devices. See the device data sheet to determine which pins are available.
- See the device data sheet to determine the allowable voltage range for VREFHI and VREFLO.
- An external capacitor is required on the VREFHI pins. See the device data sheet for the specific value required.
- For CMPSS and buffered DAC modules, VSSA and VDDA are the low reference and the high reference, respectively.

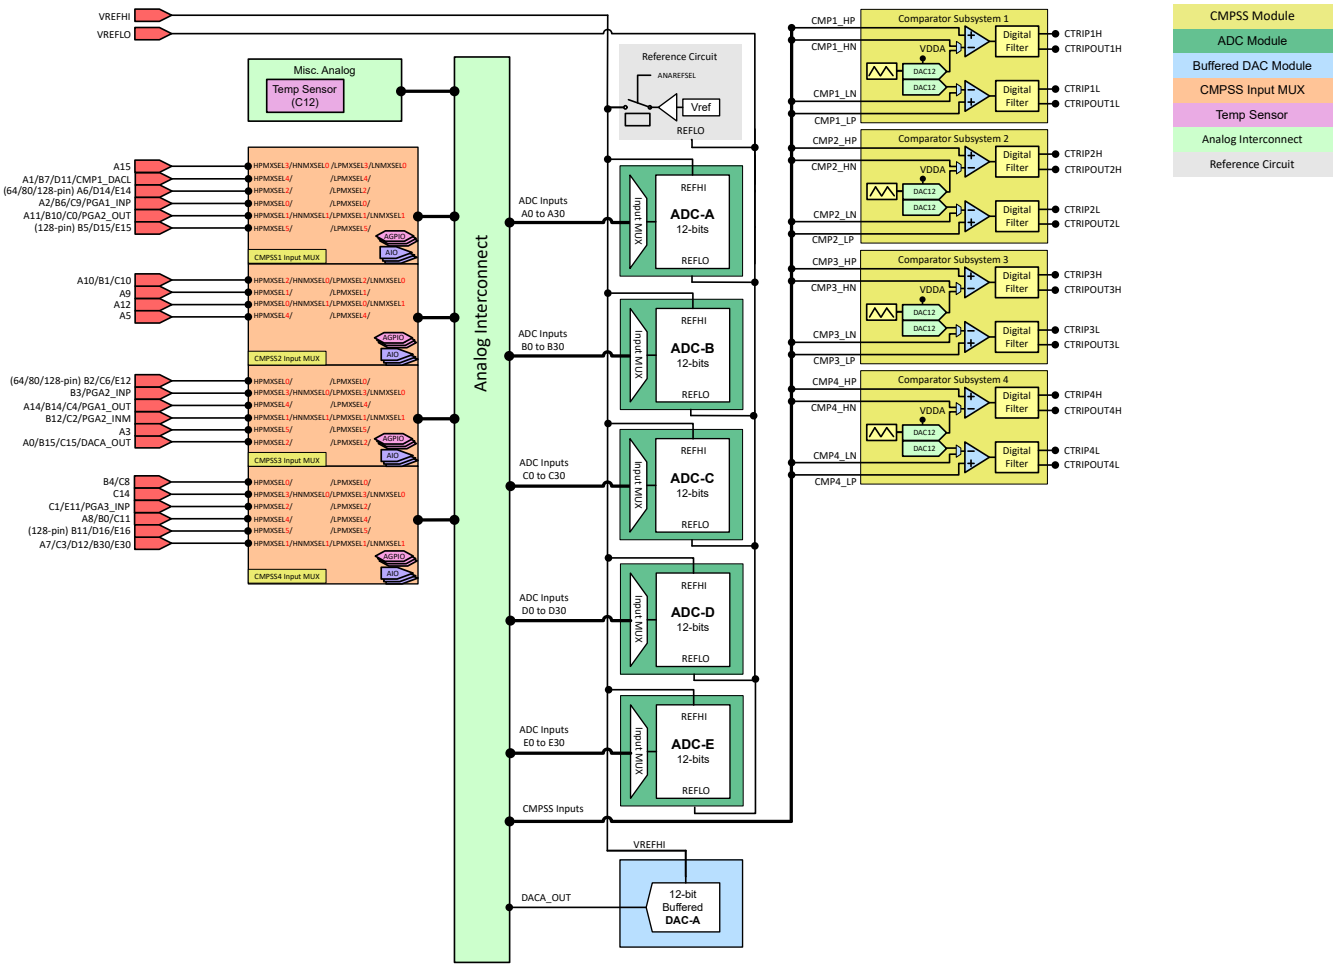

Figure 14-1. Analog Subsystem Block Diagram (128/80/64/56- Pins)

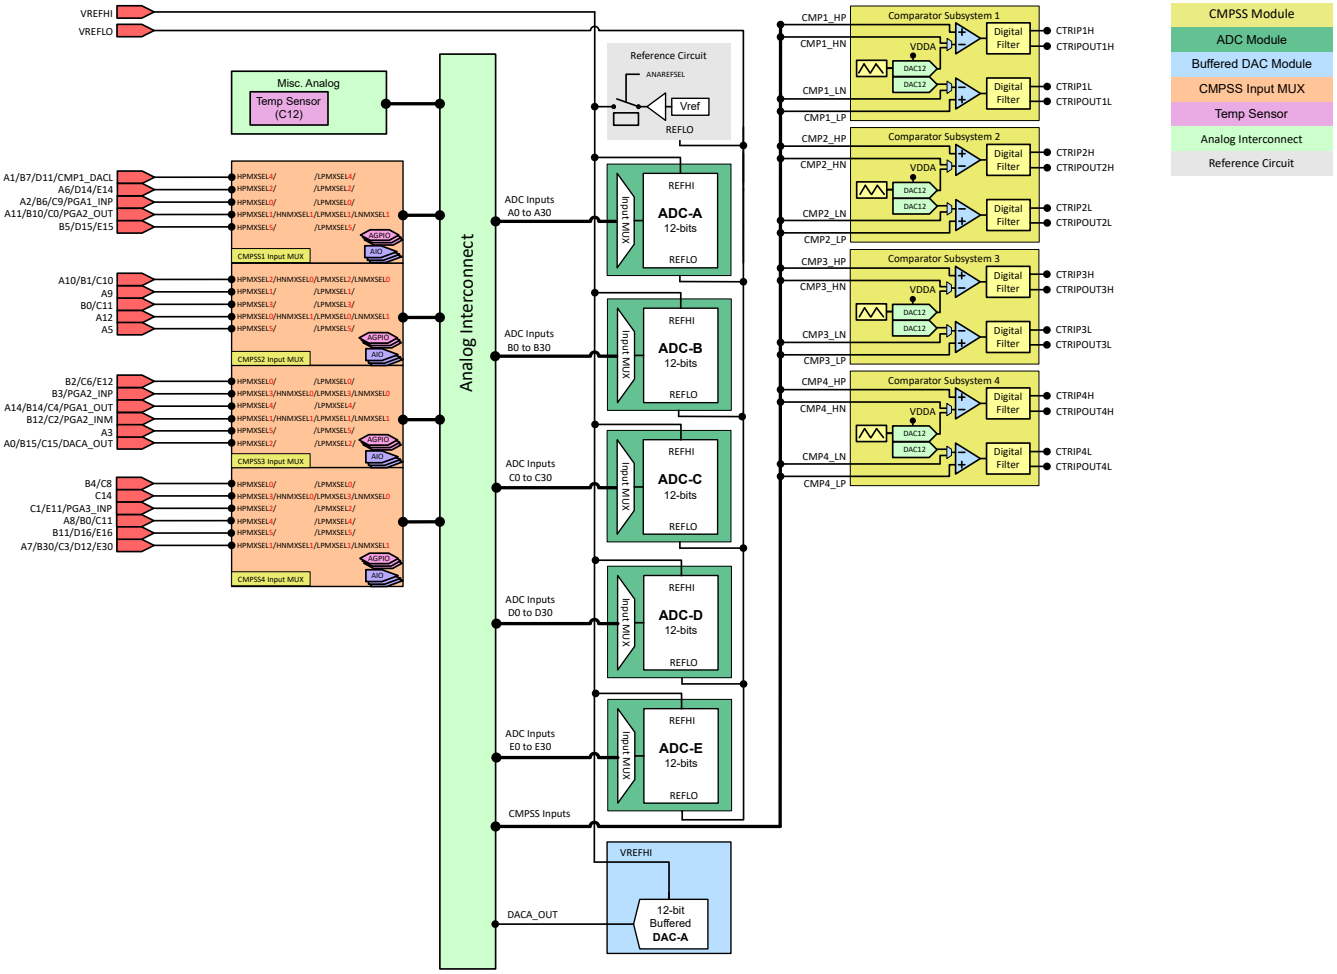

Figure 14-2. Analog Subsystem Block Diagram (100-Pin QFP)

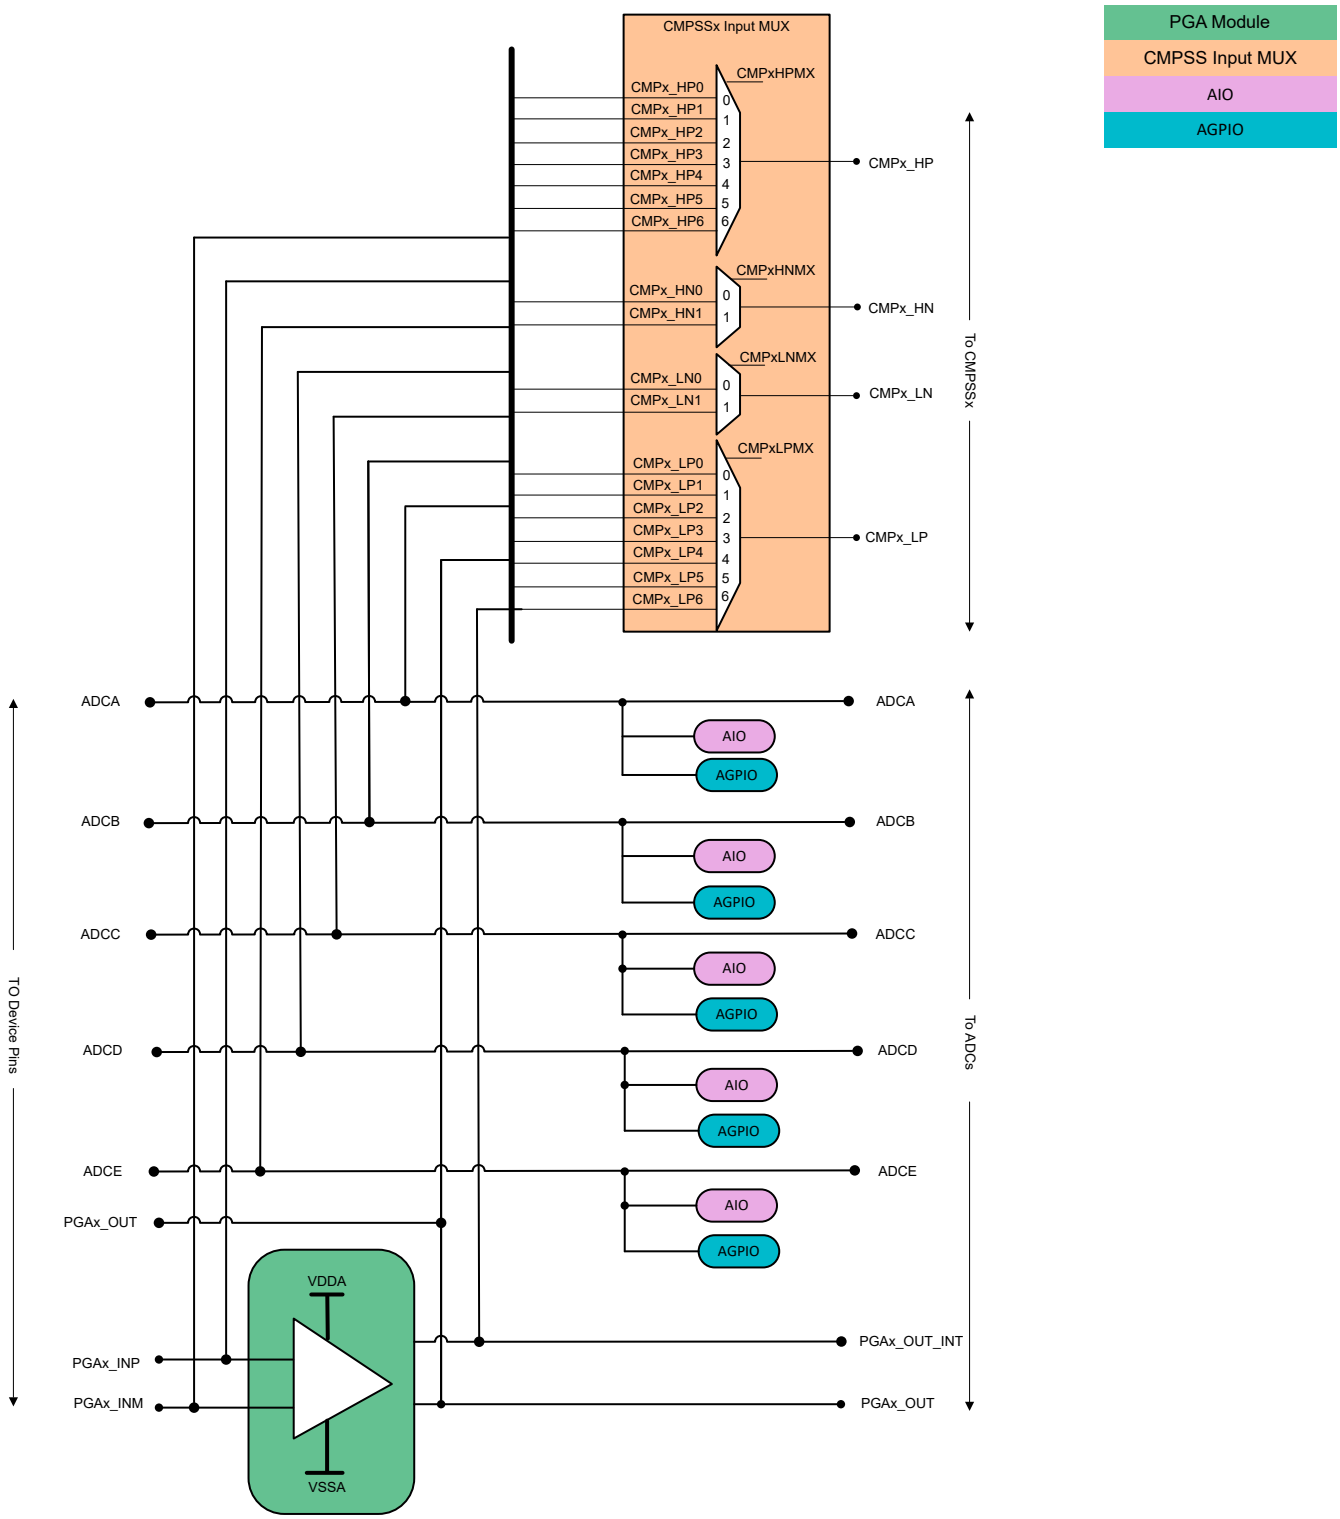

Figure 14-3. Analog Group Connections

Input connections to the CMPSS modules are selectable through a programmable input mux. Figure 14-3 demonstrates the connection between the input MUX of CMPSS modules, PGA modules, and ADC modules. Table 14-1 shows the mapping of ADC input signals and PGA input and output signals to CMPSS mux inputs.

- To configure the CMPx_HP input mux for CMPSSx, write to the CMPxHPMXSEL field in the CMPHPMXSEL analog subsystem register.
- To configure the CMPx_HN input mux for CMPSSx, write to the CMPxHNMXSEL field in the CMPHNMXSEL analog subsystem register.
- To configure the CMPx_LP input mux for CMPSSx, write to the CMPxLPMXSEL field in the CMPLPMXSEL analog subsystem register.
- To configure the CMPx_LN input mux for CMPSSx, write to the CMPxLNMXSEL field in the CMPLNMXSEL analog subsystem register.

Table 14-1. CMPSS Input Mux Options

(1) These MUX options are available only on 100 QFP package.
(2) This MUX option is available only on 56 QFN, 64 QFP, 80 QFP, and 128 QFP packages.
(3) This MUX option is available only on 64 QFP, 80 QFP, 100 QFP, and 128 QFP packages.
(4) This MUX option is available only on 100 QFP and 128 QFP packages.

14.2 Optimizing Power-Up Time

The analog-to-digital converters (ADC) and buffered digital-to-analog converters (DAC) share a common reference circuit. If needed, an application using one or more of these modules can optimize power-up time by taking advantage of the shared reference. Once one of the modules using the shared reference has been initialized in internal reference mode, the power-up time for subsequent modules can be optimized by subtracting the reference power-up time from the minimum power-up time requirement.

For instance, if ADCA requires $t_{ADCPUINT}$ to power up in internal reference mode, and $t_{ADCPUEXT}$ to power up in external reference mode, the application does not need to wait $t_{ADCPUINT}$ to power up a second ADC instance such as ADCC in internal reference mode. In this case, the application can simply wait for $t_{ADCPUEXT}$ after powering up ADCC, even though both ADCs are used in internal reference mode. In the same scenario, if the application wished to use DACA in internal reference mode, the required wait time after power-up is $t_{DACPUEXT}$, not the longer $t_{DACPUINT}$.

There is also a wait time associated with power-up in internal reference mode when switching between 2.5V and 3.3V range. See the device data sheet for wait time values.

14.3 Digital Inputs on ADC Pins (AIOs)

Some GPIOs are multiplexed with analog pins and only have digital input functionality. These are also referred to as AIOs. Pins with only an AIO option on this port can only function in input mode. See the device data sheet for list of AIO signals. By default, these pins function as analog pins and the GPIOs are in a high-impedance state. The GPyAMSEL register is used to configure these pins for digital or analog operation.

Note

If digital signals with sharp edges (high dv/dt) are connected to the AIOs, cross-talk can occur with adjacent analog signals. Therefore, limit the edge rate of signals connected to AIOs if adjacent channels are being used for analog functions.

14.4 Digital Inputs and Outputs on ADC Pins (AGPIOs)

Some GPIOs are multiplexed with analog pins and have digital input and output functionality. These are also referred to as AGPIOs. Unlike AIOs, AGPIOs have full input and output capability. By default, the AGPIOs are not connected and must be configured. Table 14-2 shows how to configure the AGPIOs. To enable the analog functionality, set the register AGPIOCTRLx from analog subsystem. To enable the digital functionality, set the register GPxAMSEL from the *General-Purpose Input/Output (GPIO)* chapter.

Table 14-2. AGPIO Configuration

AGPIOCTRLx.GPIOy (Default = 0)	GPxAMSEL.GPIOy (Default = 1)	Pin Connected To:	
		ADC	GPIOy
0	0	-	Yes

1	0	-	Yes
1	1	Yes	-

(1) By default there are no signals connected to AGPIO pins. One of the other rows in the table must be chosen for pin functionality.

Note

If digital signals with sharp edges (high dv/dt) are connected to the AGPIOs, cross-talk can occur with adjacent analog signals. The user must therefore limit the edge rate of signals connected to AGPIOs, if adjacent channels are being used for analog functions.

The general schematic of analog subsystem with AGPIO implementation is illustrated in Figure 14-4. The combinations of use cases for a specific analog input pin need special consideration are shown in Table 14-3. The AGPIO analog pin path contains an extra series switch of 53Ω. This creates a low capacitance isolated

node shared by the ADC and CMPSS Comparator as shown in Figure 14-4. This node can be disturbed when the ADC samples the channel (depending on the prior voltage stored on the ADC sample and hold capacitor), and this disturbance can cause a false CMPSS event of up to 50ns. As shown in Table 14-3, special considerations or workarounds need to be used for the combination of CMPSS Input, ADC Sampling, and AGPIO. To accommodate this potential disturbance the following workarounds can be implemented:

1. Use a different pin (that is AIO pin type) for analog channels which need both ADC and CMPSS together.
2. Use the CMPSS Digital Filter with a setting of 50ns or greater, which filters the temporary disturbance.
3. Precondition the sample and hold capacitor of the ADC so the disturbance does not cause a false trip. For example, perform a dummy read of a 3.3V connection from a different channel on the ADC immediately before the impacted channel is read so the disturbance is in the positive direction, away from the false trip. The opposite dummy read of a 0V signal can be used if the false trip is inverted in polarity.

Table 14-3. The Combinations of Use Cases for a Specific Analog Input Pin

Function Used on a Specific Analog Pin	Component Used				
CMPSS Comparator Input	Yes	-	Yes	-	Yes
ADC Sampling	Yes	Yes	-	Yes	Yes
AGPIO Analog Pin Type	Yes	Yes	Yes	-	-
AIO Analog Pin Type	-	-	-	Yes	Yes
Result	**Workaround needed**	**No special analysis or workaround needed**

(1) Signal is bonded together with another signal as a single pin on this package.
(2) Internal connection only; does not come to a device pin.
(3) The GPIOs on these analog pins support full digital input and output functionality and are referred to as AGPIOs. By default, the AGPIOs are unconnected; that is, the analog and digital functions are both disabled. For configuration details, see the *Digital Inputs and Outputs on ADC Pins (AGPIOs)* section.
(4) Only on 100 QFP package, AGPIO 247 is available.

Note

The GPIOs on the analog pins support full digital input and output functionality and are referred to as AGPIOs. By default, the AGPIOs are unconnected; that is, the analog and digital functions are both disabled. For configuration details, see the *Digital Inputs and Outputs on ADC Pins (AGPIOs)* section.

Table 14-5. Analog Signal Descriptions

Signal Name	Description
AIOx	Digital input on ADC pin
AGPIOx	Digital input/output pin with ADC functionality
ADCINAx, Ax	ADC A Input
ADCINBx, Bx	ADC B Input
ADCINCx, Cx	ADC C Input
ADCINDx, Dx	ADC D Input
ADCINEx, Ex	ADC E Input
CMPx_HP	Comparator subsystem high comparator positive input
CMPx_HN	Comparator subsystem high comparator negative input
CMPx_LP	Comparator subsystem low comparator positive input
CMPx_LN	Comparator subsystem low comparator negative input
CMP1_DACL	CMP1 DAC Output
DACA_OUT	Buffered DAC Output
PGAx_INP	PGA module non-inverting pin
PGAx_INM	PGA module inverting pin
PGAx_OUT	PGA module output
PGAx_OUT_INT	PGA module internal output connected to CMPSS and ADC modules
TEMP SENSOR, TS	Internal temperature sensor

Table 14-6. Reference Summary

Module	Reference Option	Configured Where?	Register	Driverlib Function	Notes
ADC	External or Internal	Analog Subsystem	AnalogSubsysRegs.ANAREFPCTL.bit.REFPMUXSELx	ASysCtl_setAnalogReferenceInternal, ASysCtl_setAnalogReferenceExternal	The voltage reference for all ADCs comes from one common buffer associated with all ADCs.
	Internal Reference 2.5V or 3.3V	Analog Subsystem	AnalogSubsysRegs.ANAREFPCTL.bit.ANAREFx1P65SEL.	ASysCtl_setAnalogReference2P5, ASysCtl_setAnalogReference1P65	When used with internal reference, sets the FSR range of the ADC to 2.5V or 3.3V. When used with external reference, use 2P5 mode for all VREFHI <2.97V, for FSR 3.3V use 1P65 with 1.65V applied to VREFHI.
	Analog Supply (VDDA/VSSA) as Reference	Analog Subsystem	AnalogSubsysRegs.ANAREFPCTL.bit.REFPMUXSELx		
Buffered DAC	Internal Reference 2.5V or 3.3V	DAC Module	DacxRegs.DACCTL.bit.MODE	DAC_setGainMode	Gain = 2 must be set when using 3.3V internal reference mode.
	External or Internal	Analog Subsystem	AnalogSubsysRegs.ANAREFPCTL.bit.REFPMUXSELx	ASysCtl_setAnalogReferenceInternal, ASysCtl_setAnalogReferenceExternal	
CMPSS DAC	VDDA	CMPSS Module	Not configurable

14.7 ASBSYS Registers

This section describes the ASBSYS Registers.

14.7.1 ASBSYS Base Address Table

Table 14-8. ASBSYS Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
AnalogSubsysRegs	ANALOG_SUBSYS_REGS	ANALOGSUBSYS_BASE	0x0005_D700	YES	-	-	YES

14.7.2 ANALOG_SUBSYS_REGS Registers

Table 14-9 lists the memory-mapped registers for the ANALOG_SUBSYS_REGS registers. All register offset addresses not listed in Table 14-9 should be considered as reserved locations and the register contents should not be modified.

Table 14-9. ANALOG_SUBSYS_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
26h	ADCOSDETECT	I2V Logic Control	EALLOW	Go
36h	REFCONFIGB	Config register for analog reference B.	EALLOW	Go
4Ah	INTERNALTESTCTL	INTERNALTEST Node Control Register	EALLOW	Go
5Eh	CONFIGLOCK	Lock Register for all the config registers.	EALLOW	Go
60h	TSNSCTL	Temperature Sensor Control Register	EALLOW	Go
68h	ANAREFPCTL	Analog Reference Control Register for VREFHI	EALLOW	Go
69h	ANAREFNCTL	Analog Reference Control Register for VREFLO	EALLOW	Go
70h	VMONCTL	Voltage Monitor Control Register	EALLOW	Go
82h	CMPHPMXSEL	Bits to select one of the many sources on CompHP inputs. Refer to Pimux diagram for details.	EALLOW	Go
84h	CMPLPMXSEL	Bits to select one of the many sources on CompLP inputs. Refer to Pimux diagram for details.	EALLOW	Go
86h	CMPHNMXSEL	Bits to select one of the many sources on CompHN inputs. Refer to Pimux diagram for details.	EALLOW	Go
87h	CMPLNMXSEL	Bits to select one of the many sources on CompLN inputs. Refer to Pimux diagram for details.	EALLOW	Go
88h	ADCDACLOOPBACK	Enabble loopback from DAC to ADCs		Go
8Bh	CMPSSCTL	CMPSS Control Register	EALLOW	Go
8Ch	CMPSSDACBUFCONFIG	Config bits for CMPSS DAC buffer	EALLOW	Go
8Eh	LOCK	Lock Register	EALLOW	Go
10Ah	AGPIOCTRLA	AGPIO Control Register	EALLOW	Go
10Ch	AGPIOCTRLB	AGPIO Control Register	EALLOW	Go
116h	AGPIOCTRLG	AGPIO Control Register	EALLOW	Go
118h	AGPIOCTRLH	AGPIO Control Register	EALLOW	Go
132h	GPIOINENACTRL	GPIOINENACTRL Control Register	EALLOW	Go
134h	IO_DRVSEL	IO Drive strength select register	EALLOW	Go
135h	IO_MODESEL	IO Mode select register	EALLOW	Go
136h	ADCSOCFRCGB	ADC Global SOC Force	EALLOW	Go
138h	ADCSOCFRCGBSEL	ADC Global SOC Force Select	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 14-10 shows the codes that are used for access types in this section.

Table 14-10. ANALOG_SUBSYS_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		

Table 14-10. ANALOG_SUBSYS_REGS Access Type Codes (continued)

Access Type	Code	Description
W	W	Write
W1S	W 1S	Write 1 to set
WOnce	W Once	Write Write once
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

14.7.2.1 ADCOSDETECT Register (Offset = 26h) [Reset = 0000h]

ADCOSDETECT is shown in Figure 14-5 and described in Table 14-11.

Return to the Summary Table.

Chapter 15

Analog-to-Digital Converter (ADC)

The analog-to-digital converter (ADC) module described in this chapter is a Type 6 ADC. See the *C2000 Real-Time Control Peripheral Reference Guide* for a list of all devices with modules of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

15.1 Introduction

The ADC module is a 12-bit successive approximation (SAR) style ADC . The ADC is composed of a core and a wrapper. The core is composed of the analog circuits which include the channel select MUX, the sample-and-hold (S/H) circuit, the successive approximation circuits, voltage reference circuits, and other analog support circuits. The wrapper is composed of the digital circuits that configure and control the ADC. These circuits include the logic for programmable conversions, result registers, interfaces to analog circuits, interfaces to the peripheral buses, post-processing circuits, and interfaces to other on-chip modules.

Each ADC module consists of a single sample-and-hold (S/H) circuit. The ADC module is designed to be duplicated multiple times on the same chip, allowing simultaneous sampling or independent operation of multiple ADCs. The ADC wrapper is start-of-conversion (SOC) based (see Section 15.3).

15.1.2 Features

Each ADC has the following features:

- 12-bit resolution
- Ratiometric external reference set by VREFHI and VREFLO pins
- Selectable internal reference of 2.5V or 3.3V
- Single-ended signal conversions (12-bit mode only)
- Input multiplexer with up to 32 channels
- External channel mux option to expand available ADC channels
- 16 configurable SOCs
- 16 individually addressable result registers
- Two trigger repeater modules, enabling customizable hardware oversampling and undersampling modes with little or no CPU overhead
- Multiple trigger sources
  - S/W (with available global synchronization for multiple ADCs) - software immediate start
  - All ePWMs - ADCSOC A or B
  - GPIO XINT2
  - CPU Timers 0/1/2
  - ADCINT1/2
  - ECAP events in capture mode (CEVT1, CEVT2, CEVT3, and CEVT4) and APWM mode (period match, compare match, or both)
- Four flexible PIE interrupts
- Configurable interrupt placement
- Burst mode
- Four post-processing blocks, each with:
  - Saturating offset calibration
  - Error from set-point calculation
  - High, low, and zero-crossing compare, with interrupt and ePWM trip capability
  - Trigger-to-sample delay capture
  - Aggregation functions: max, min, sum, and average (binary shift)
  - Configurable digital filter for high/low/zero-crossing compare
  - Absolute value function

Note

Not every channel is pinned out from all ADCs. Check the device data sheet to determine which channels are available.

15.1.3 Block Diagram

Figure 15-1 shows the block diagram for the ADC core and ADC wrapper.

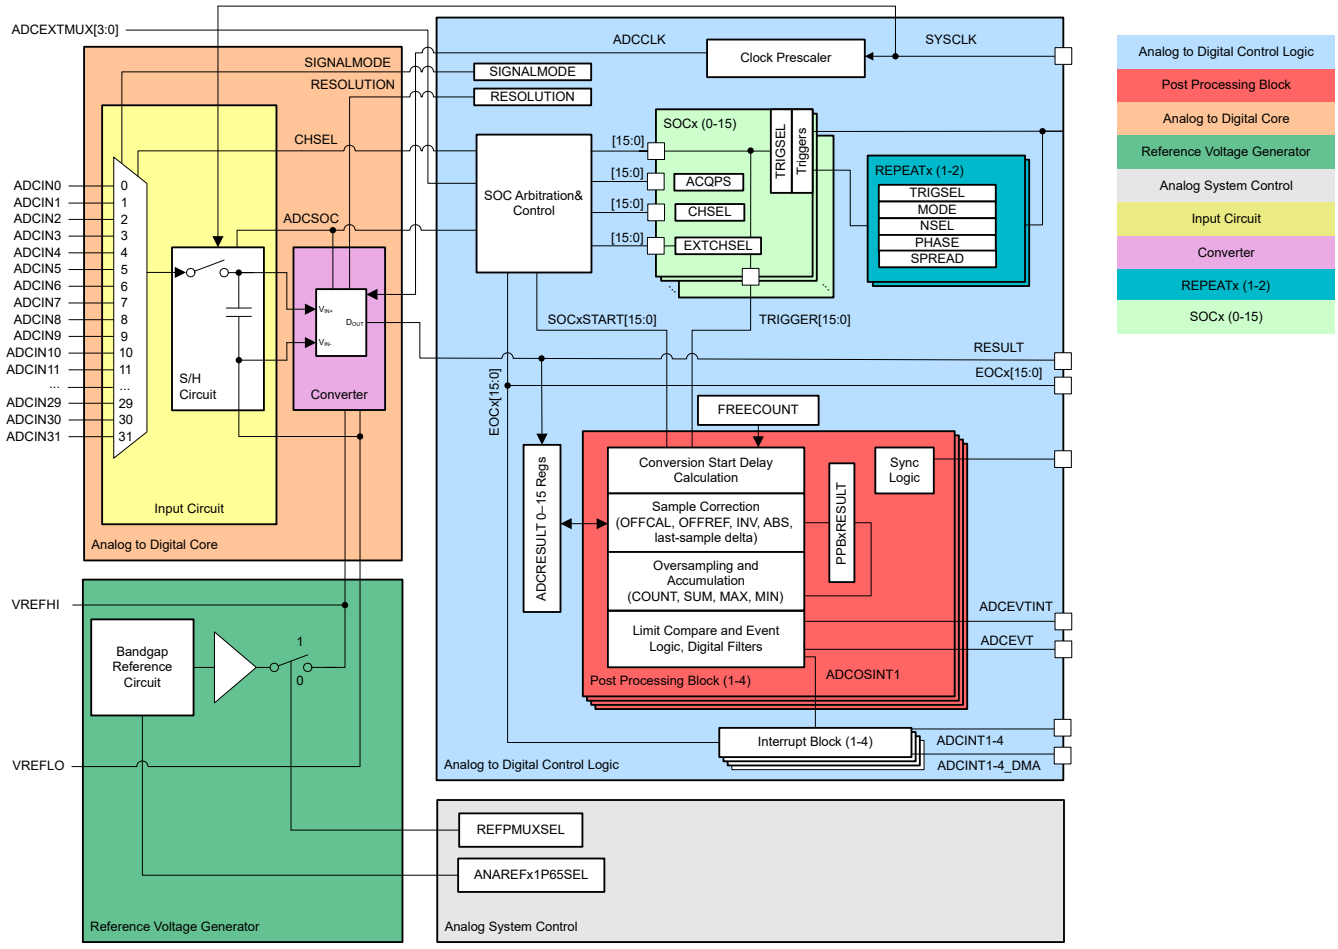

Figure 15-1. ADC Module Block Diagram

Note

- The ADC block diagram reflects the number of ADC channels internally configurable on the device. The actual number of available external ADC inputs varies depending on part and package.

15.2 ADC Configurability

Some ADC configurations are individually controlled by the SOCs, while others are globally controlled per ADC module. Table 15-1 summarizes the basic ADC options and the level of configurability. The subsequent sections discuss these configurations.

Table 15-1. ADC Options and Configuration Levels

Options	Configurability
Clock	Per module(1)
Resolution	Not configurable (12-bit only)
Signal mode	Not configurable (single-ended only)
Reference voltage source	Per module (external or internal)(2)
Trigger source	Per SOC(1)
Converted channel	Per SOC
Acquisition window duration	Per SOC(1)
EOC location	Per module
Burst Mode	Per module(1)
Sample capacitor reset	Per SOC(1)

(1) Writing these values differently to different ADC modules can cause the ADCs to operate asynchronously. See Section 15.13.1 for guidance on when the ADCs are operating synchronously or asynchronously.
(2) Lower pin count packages can share one VREFHI pin among multiple ADCs. In this case, the ADCs that share a reference pin must have the reference modes configured identically

15.2.1 Clock Configuration

The base ADC clock is provided directly by the system clock (SYSCLK). SYSCLK is used to generate the ADC acquisition window. The register ADCCTL2 has a PRESCALE field that determines the ADCCLK. ADCCLK is used to clock the converter, and is only active during the conversion phase. At all other times, including during the sample-and-hold window, the ADCCLK signal is gated off.

The core requires approximately 10.5 ADCCLK cycles to process a voltage into a conversion result. The user must determine the required duration of the acquisition window, see Section 15.13.2.

Note

To determine an appropriate value for ADCCTL2.PRESCALE, see the device data sheet to determine the maximum SYSCLK and ADCCLK frequency.

15.2.2 Resolution

The resolution of the ADC determines how finely the analog range is quantized into digital values. Each ADC module supports a fixed resolution of 12 bits.

15.2.3 Voltage Reference

15.2.3.1 External Reference Mode

The ADC modules share VREFHI and VREFLO inputs. In external reference mode, these pins are used as a ratiometric reference to determine the ADC conversion input range.

See Section 15.13.6 for information on how to supply the reference voltage.

Note

- On devices with no external VREFLO pin, VREFLO is internally connected to the device analog ground, VSSA.
- See the device data sheet to determine the allowable voltage range for VREFHI and VREFLO.
- The external reference mode requires an external capacitor on the VREFHI pin. See the device data sheet for the specific value required.

15.2.3.2 Internal Reference Mode

In internal reference mode, the device drives a voltage out onto the VREFHI pin. The VREFHI and VREFLO pins then set the ADC conversion range.

The internal reference voltage can be configured to be either 2.5V or 1.65V. When the 1.65V internal reference voltage is selected, the ADC input signal is internally divided by 2 before conversion, which effectively makes the ADC conversion range from VREFLO to 3.3V.

Note

The internal reference mode also requires an external capacitor on the VREFHI pin. See the device data sheet for the specific value required.

15.2.3.3 Ganged References

On some packages, the voltage reference pins for multiple ADCs can be combined. In this case, configure the ganged references identically when selecting external versus internal reference mode and for selecting an internal reference voltage range of 3.3V or 2.5V.

For example, if ADC A and ADC B reference pins are combined and the desired reference mode is 2.5V internal reference mode, the following reference configuration code can be run:

```
//ADCA VREFHI and ADCB VREFHI share a pin
//ADCA VREFLO and ADCB VREFLO share a pin
//Both references must be explicitly configured
//Both references must be configured identically
SetVREF(ADC_ADCA, ADC_INTERNAL, ADC_VREF2P5);
SetVREF(ADC_ADCB, ADC_INTERNAL, ADC_VREF2P5);
```

Internal device hardware makes sure multiple references do not drive conflicting voltages onto the same pin. Because of this, references can be configured in any order or over any amount of time.

15.2.3.4 Selecting Reference Mode

The voltage reference mode must be configured by using either the ADC_setVREF() or the SetVREF() functions, depending on the header files used, provided in C2000Ware. Using either of these functions makes sure that the correct trim is loaded in the ADC trim registers. This function must be called at least once after a device reset. Do not configure the voltage reference mode by directly writing to the ANAREFCTL register.

15.2.4 Signal Mode

The ADC supports single-ended signaling.

In single-ended mode, the input voltage to the converter is sampled through a single pin (ADCINx), referenced to VREFLO.

15.2.5 Expected Conversion Results

Based on a given analog input voltage, the expected digital conversion is given in Table 15-2. Fractional values are truncated.

Table 15-2. Analog to 12-bit Digital Formulas

Analog Input	Digital Result
when ADCINy ≤ VREFLO	ADCRESULTx = 0
when VREFLO < ADCINy < VREFHI	$\text{ADCRESULTx} = 4096 \left(\frac{\text{ADCINy - VREFLO}}{\text{VREFHI - VREFLO}} \right)$
when ADCINy ≥ VREFHI	ADCRESULTx = 4095

15.2.6 Interpreting Conversion Results

Based on a given ADC conversion result, the corresponding analog input is given in Table 15-3. This corresponds to the center of the possible range of analog voltages that can produce this conversion result.

Table 15-3. 12-Bit Digital-to-Analog Formulas

Digital Value	Analog Equivalent	
when ADCRESULTy = 0	$\text{ADCINx} \leq \text{VREFLO}$	(3)
when 0 < ADCRESULTy < 4095	$\text{ADCINx} = (\text{VREFHI} - \text{VREFLO})\left(\frac{\text{ADCRESULTy}}{4096}\right) + \text{VREFLO}$	(4)
when ADCRESULTy = 4095	$\text{ADCINx} \geq \text{VREFHI}$	(5)

15.3 SOC Principle of Operation

The ADC triggering and conversion sequencing is accomplished through configurable start-of-conversions (SOCs). Each SOC is a configuration set defining the single conversion of a single channel. In that set, there are three configurations: the trigger source that starts the conversion, the channel to convert, and the acquisition (sample) window duration. Upon receiving the trigger configured for a SOC, the wrapper makes sure that the specified channel is captured using the specified acquisition window duration.

Multiple SOCs can be configured for the same trigger, channel, and acquisition window as desired. Configuring multiple SOCs to use the same trigger allows the trigger to generate a sequence of conversions. Configuring multiple SOCs to use the same trigger and channel allows for oversampling. Oversampling can also be achieved using a single trigger source by configuring the trigger repeater module. See Section 15.3.2.2 for more information.

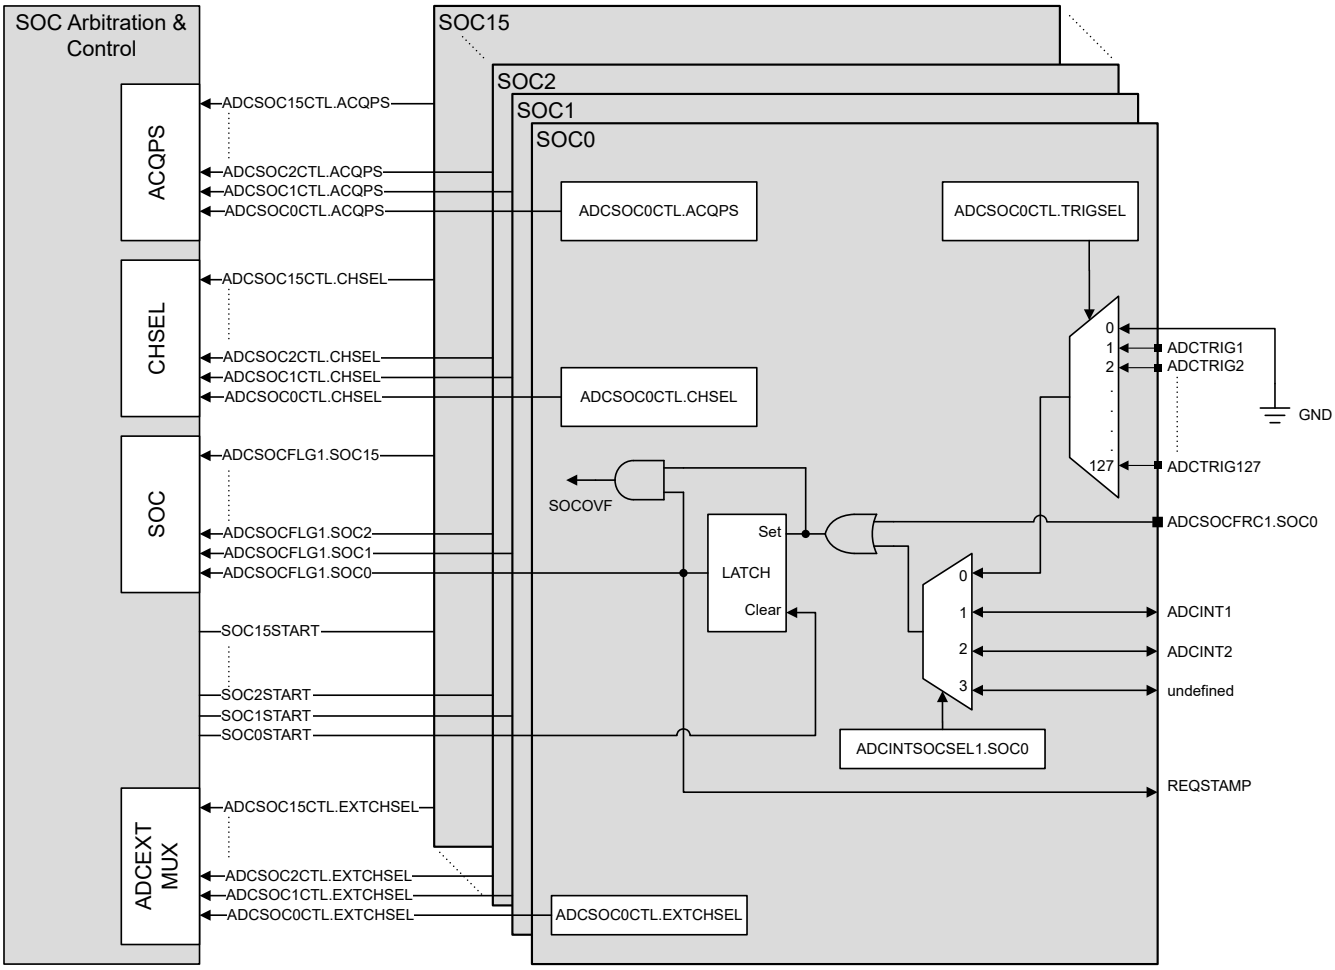

Figure 15-2. SOC Block Diagram

15.3.1 SOC Configuration

Each SOC has a configuration register, ADCSOCxCTL. Within this register, SOCx can be configured for trigger source, channel to convert, optional external channel mux selection, resolution, signal mode, and acquisition (sample) window duration.

15.3.2 Trigger Operation

Each SOC can be configured to start on one of many input triggers. The primary trigger select for SOCx is in the ADCSOCxCTL.TRIGSEL register, which can select between:

- Disabled (software only)
- CPU Timers 0/1/2
- GPIO: Input X-Bar INPUT5
- ADCSOCA or ADCSOCB from each ePWM module
- eCAP events
- Either of the two trigger repeater blocks. This can be used to achieve oversampling, undersampling, or to apply a trigger delay.
- A global synchronous software trigger. This is achieved by configuring the ADCSOCFRCGBSEL and ADCSOCFRCGB analog subsystem registers.

In addition, each SOC can also be triggered when the ADCINT1 flag or ADCINT2 flag is set. This is achieved by configuring the ADCINTSOCSEL1 register (for SOC0 to SOC15) or the ADCINTSOCSEL2 register (for SOC16 and higher where applicable). This is useful for creating continuous conversions.

15.3.2.1 Global Software Trigger

This ADC supports synchronous global software triggers. Synchronous global triggers allow the application to trigger SOCs on multiple ADC instances that are exactly simultaneous in time. To generate a global software trigger, configure the analog subsystem register ADCSOCFRCGBSEL to select the ADC instances to be triggered, then write to ADCSOCFRCGB to trigger the desired SOCs simultaneously on each ADC.

For example, to trigger SOC0, SOC1, and SOC2 on ADCA and ADCC:

1. Set ADCSOCFRCGBSEL.ADCA = 1 and ADCSOCFRCGBSEL.ADCC = 1 by writing 0x5 to the ADCSOCFRCGBSEL register.
2. Trigger SOCs 0, 1, and 2 by writing 0x7 to the ADCSOCFRCGB register.

15.3.2.2 Trigger Repeaters

Each ADC instance contains two trigger repeater modules. These modules can select any of the regular ADC triggers that are selectable by the ADCSOCxCTL.TRIGGER register, and generate a number of repeat pulses as configured in the REPxN.NSEL register. Figure 15-3 shows a functional block diagram of the ADC trigger repeater module.

Each repeater module can apply four types of trigger modifications:

- Oversampling mode
- Undersampling mode
- Phase delay
- Re-trigger spread

Each of these trigger modification features is explained in detail in the following sections.

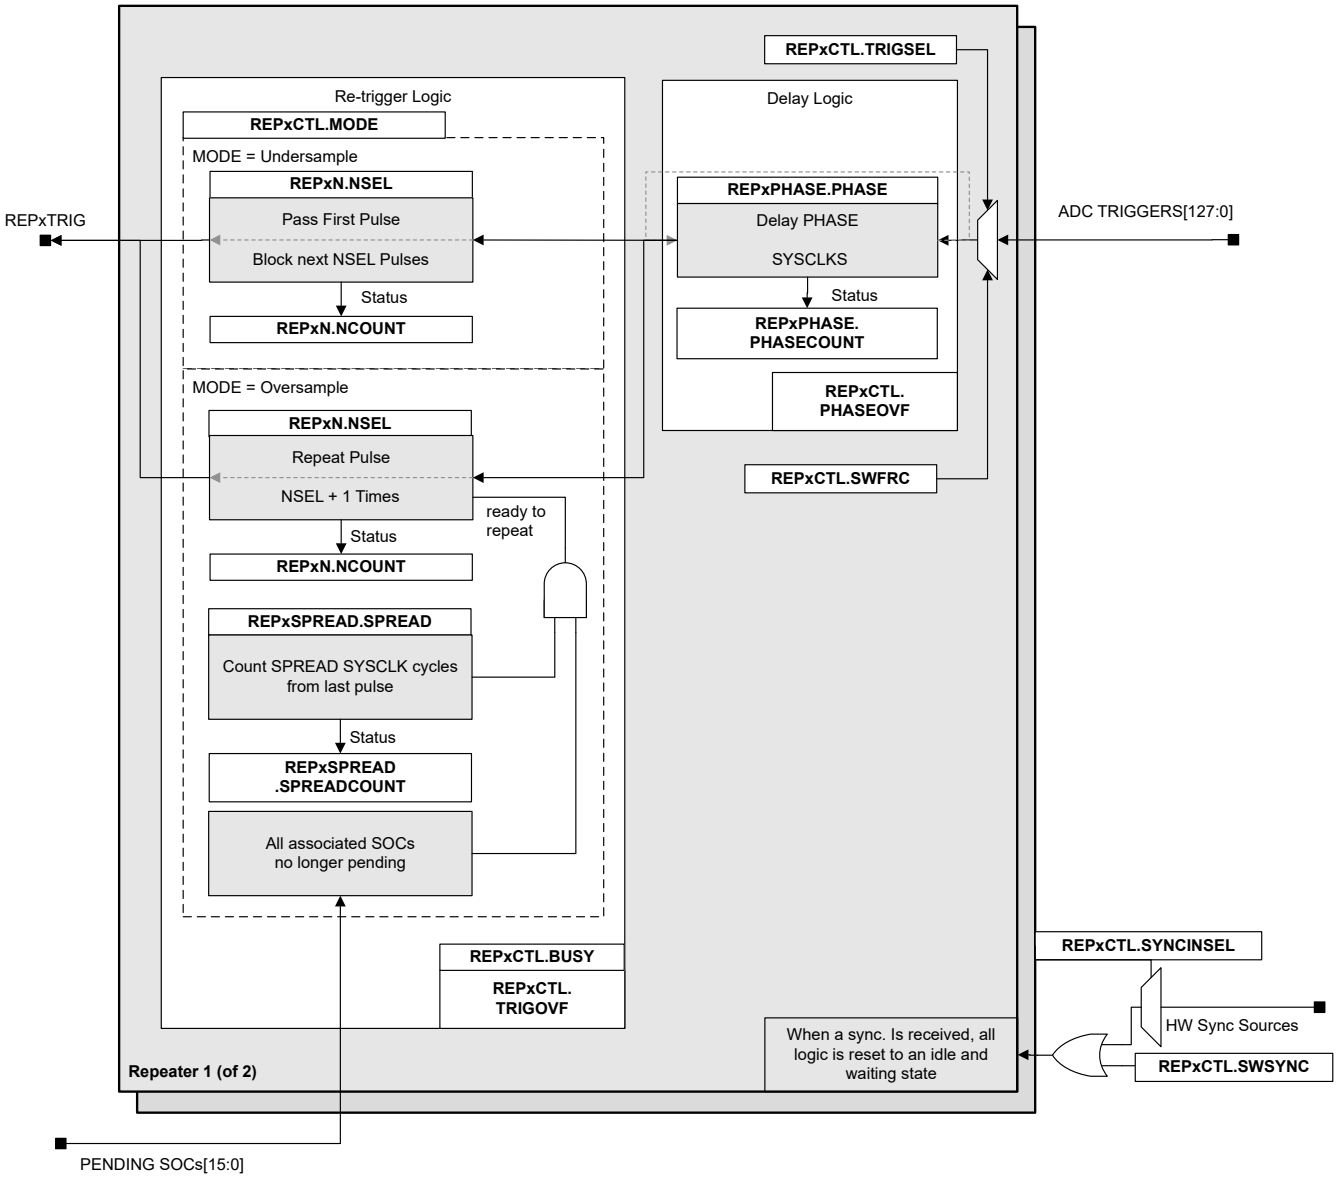

Figure 15-3. ADC Trigger Repeater Block Diagram

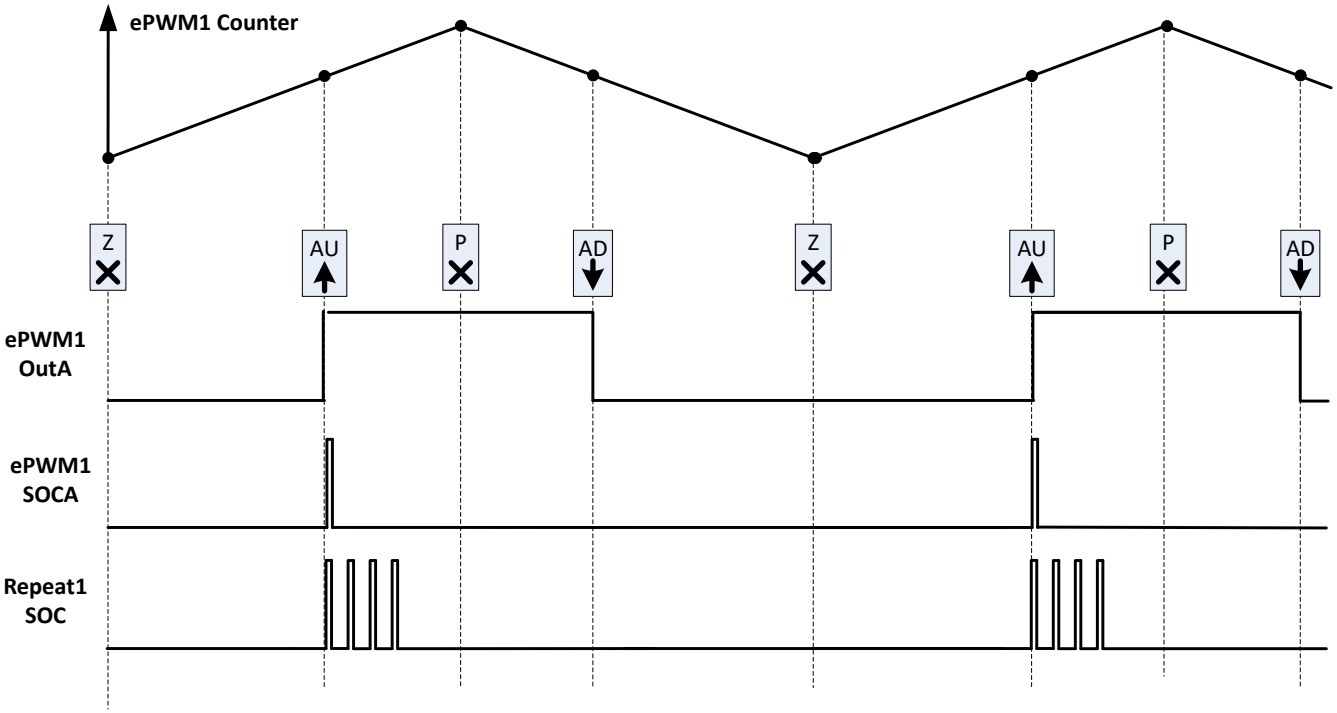
15.3.2.2.1 Oversampling Mode

In this mode, the repeater module passes the initial trigger through to the output. As soon as all SOCs configured to receive the trigger are in progress or completed, the repeater issues the trigger again. The process repeats until the configured number of trigger pulses (NSEL + 1) have been issued.

This mode allows the application to easily perform multiple back-to-back samples from a single trigger pulse. When used in conjunction with the aggregation options in the post-processing block, this mode enables oversampling, averaging, or peak detection. Figure 15-4 shows an example of oversampling SOCs generated from a single ePWM trigger.



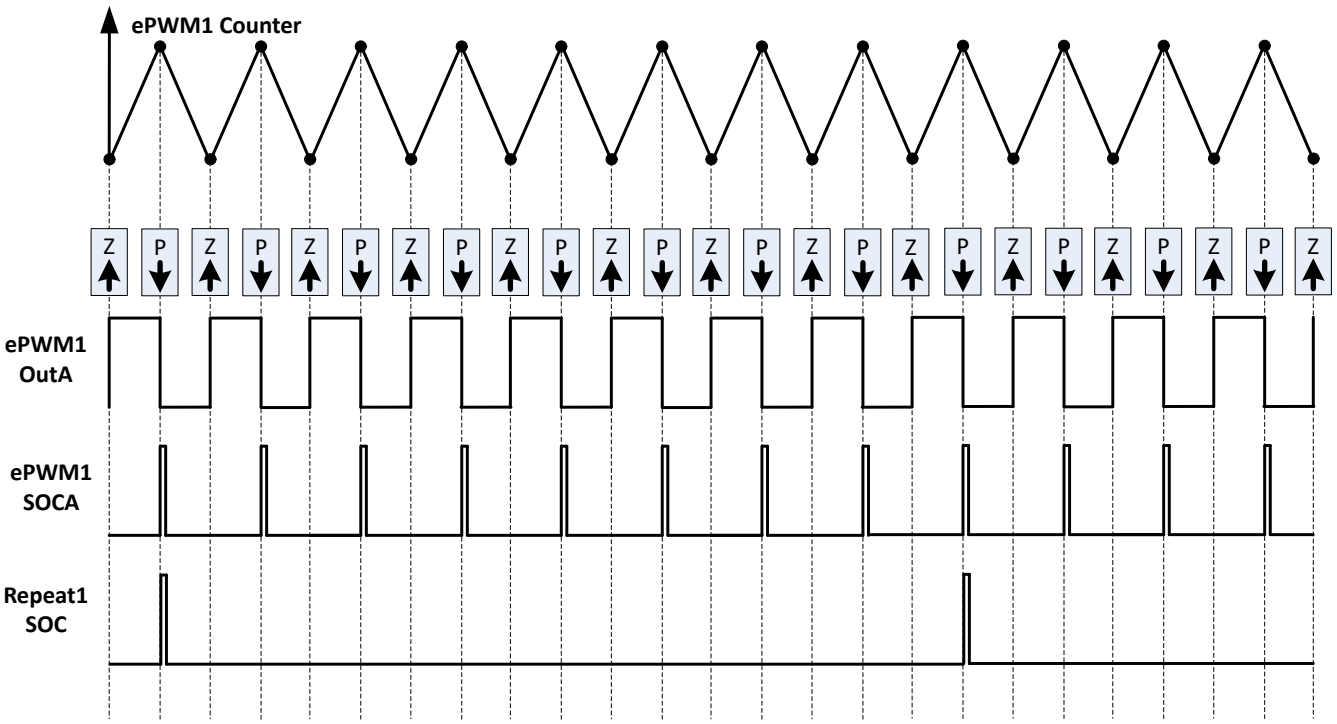
TRIGGER = ePWM SOCA, NSEL = 3, PHASE = 0, MODE = Oversampling, SPREAD = 0

Figure 15-4. Oversampled ADC Trigger Example

15.3.2.2.2 Undersampling Mode

In this mode, the repeater module passes the initial trigger through to the output, and then blocks subsequent triggers until the configured number of trigger pulses (NSEL + 1) arrive. The result is that only 1 in every (NSEL + 1) pulses passes through to the output. Figure 15-5 shows an example of undersampled SOCs from multiple ePWM triggers.

This mode enables the application to scale down the trigger frequency for one or more SOCs. This is useful for charge-sharing input drivers which have increased error with higher sampling frequencies.



TRIGGER = ePWM SOCA, NSEL = 7, PHASE = 0, MODE = Undersampling, SPREAD = (don't care)

Figure 15-5. Undersampled ADC Trigger Example

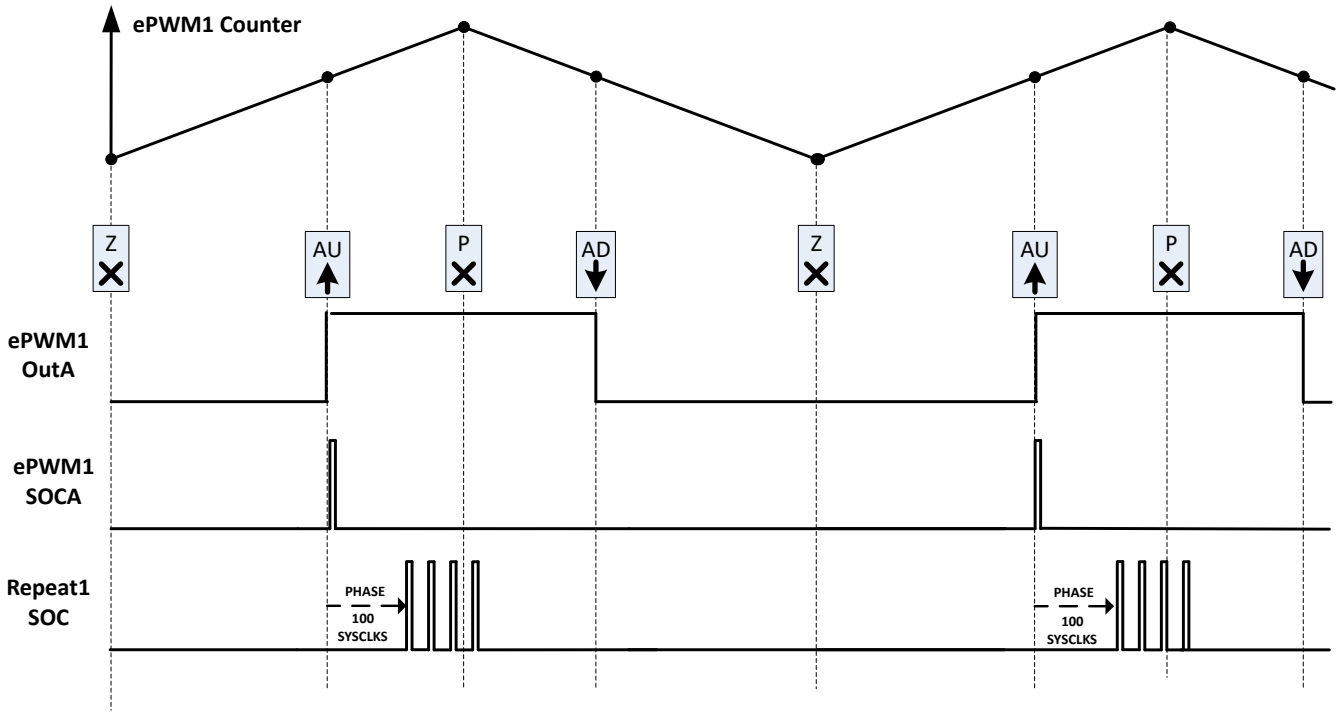
Note

Oversampling and undersampling modes are mutually exclusive for each repeater module. However, multiple repeater modules can (and are intended to) be used in different modes concurrently.

15.3.2.2.3 Trigger Phase Delay

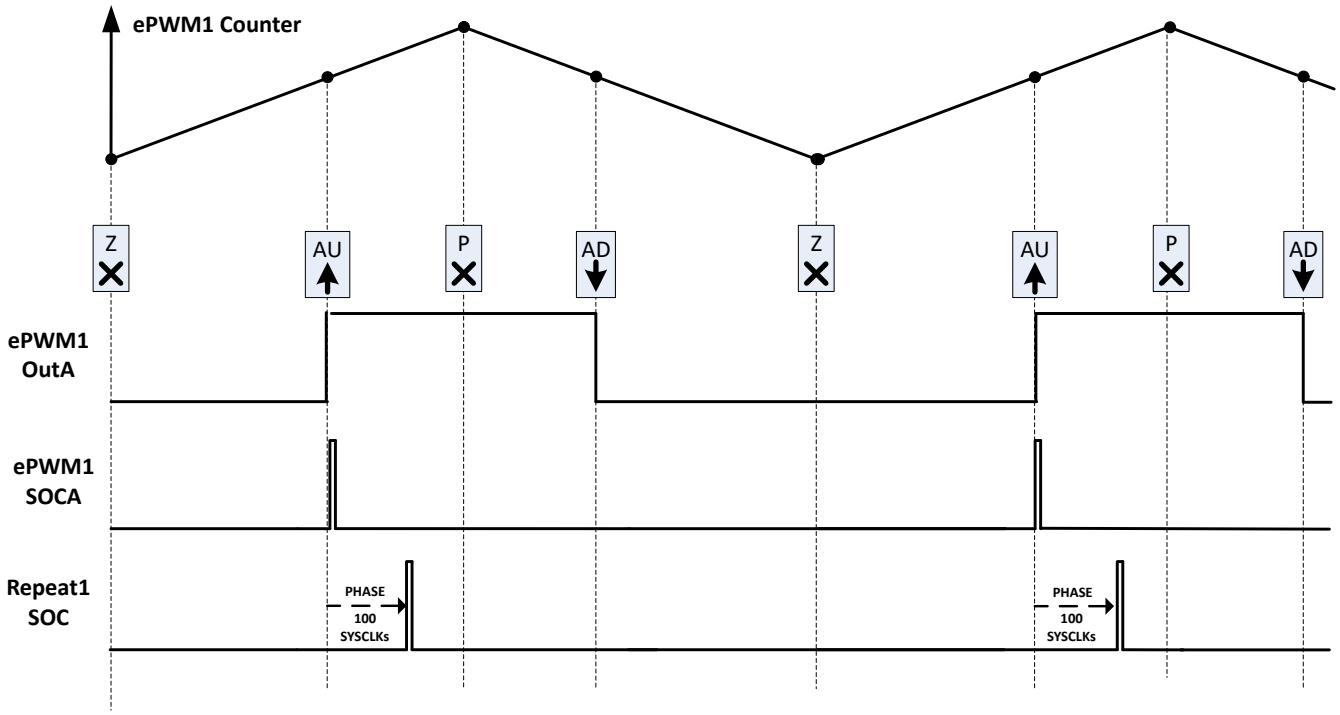
The repeater module can delay the initial trigger by a specified number of SYSCLK cycles. This feature can be used in combination with oversampling or undersampling modes, or as a standalone delay by setting NSEL = 0. The phase delay does not affect the timing between subsequent repeated oversampled triggers—the phase delay only delays the initial trigger. When PHASE = 0, the initial trigger arrives at the same time as an unmodified trigger. Figure 15-6 shows an example of phase delay combined with oversampling. Figure 15-7 shows an example of a standalone phase delay with a single SOC trigger.

Phase delay enables the application to tie the trigger start point to an ePWM event while allowing for a necessary sampling delay (for example, settling time). In addition, when phase delay is combined with oversampling functionality, a single trigger can generate an interleaved burst of conversions across multiple ADCs. To achieve this, set PHASE in increments of (t_{sample}/n_interleaved_ADCs). Figure 15-8 shows an example of interleaving 12 samples across 3 ADCs.



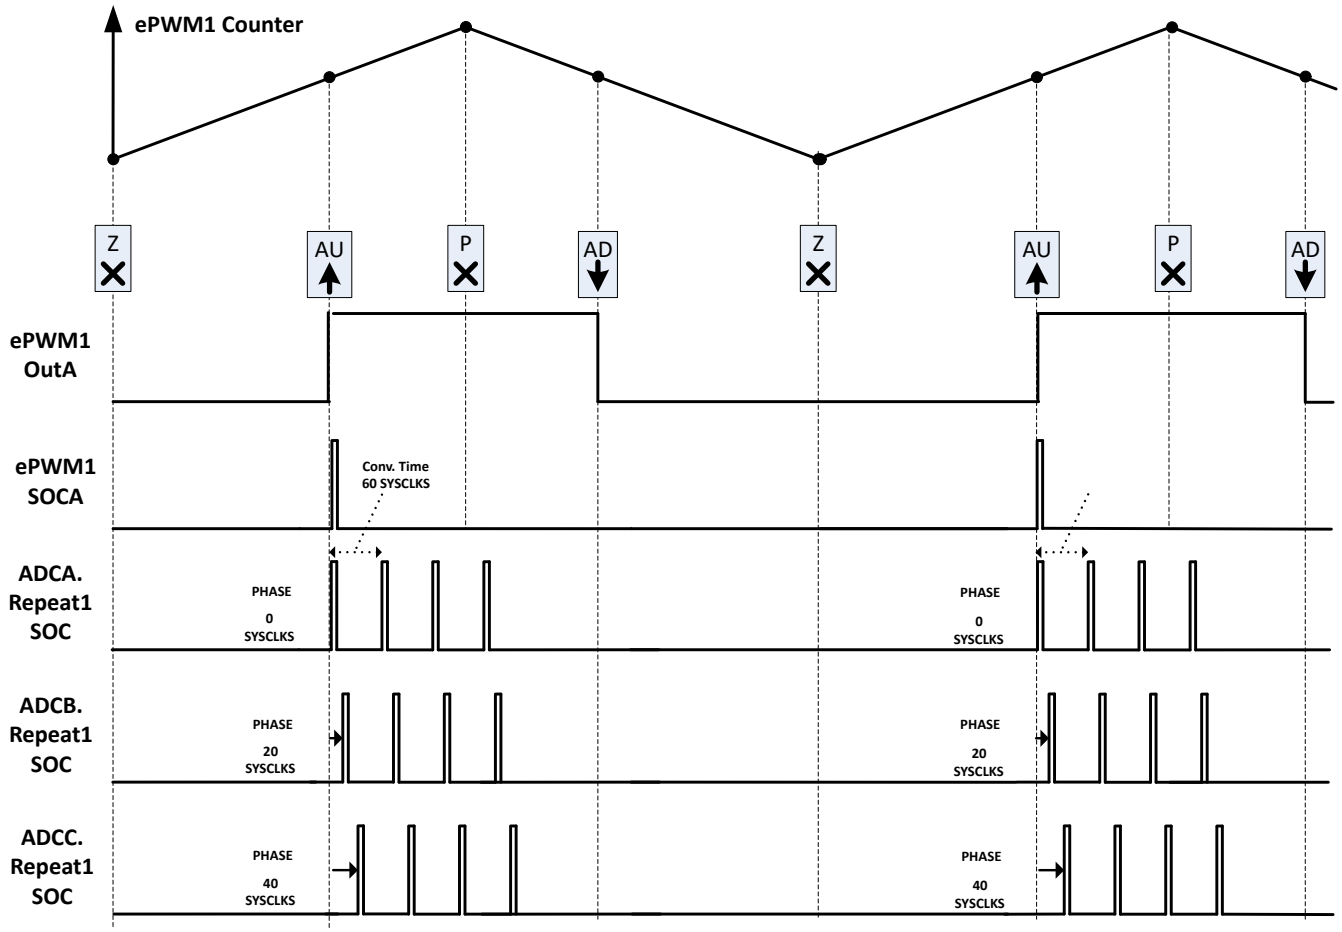
TRIGGER = ePWM SOCA, NSEL = 3, PHASE = 100, MODE = Oversampling, SPREAD = 0

Figure 15-6. Oversampled ADC Trigger Example with Phase Delay



TRIGGER = ePWM SOCA, NSEL = 0, PHASE = 100, MODE = (either), SPREAD = (don't care)

Figure 15-7. ADC Trigger Example with Phase Delay



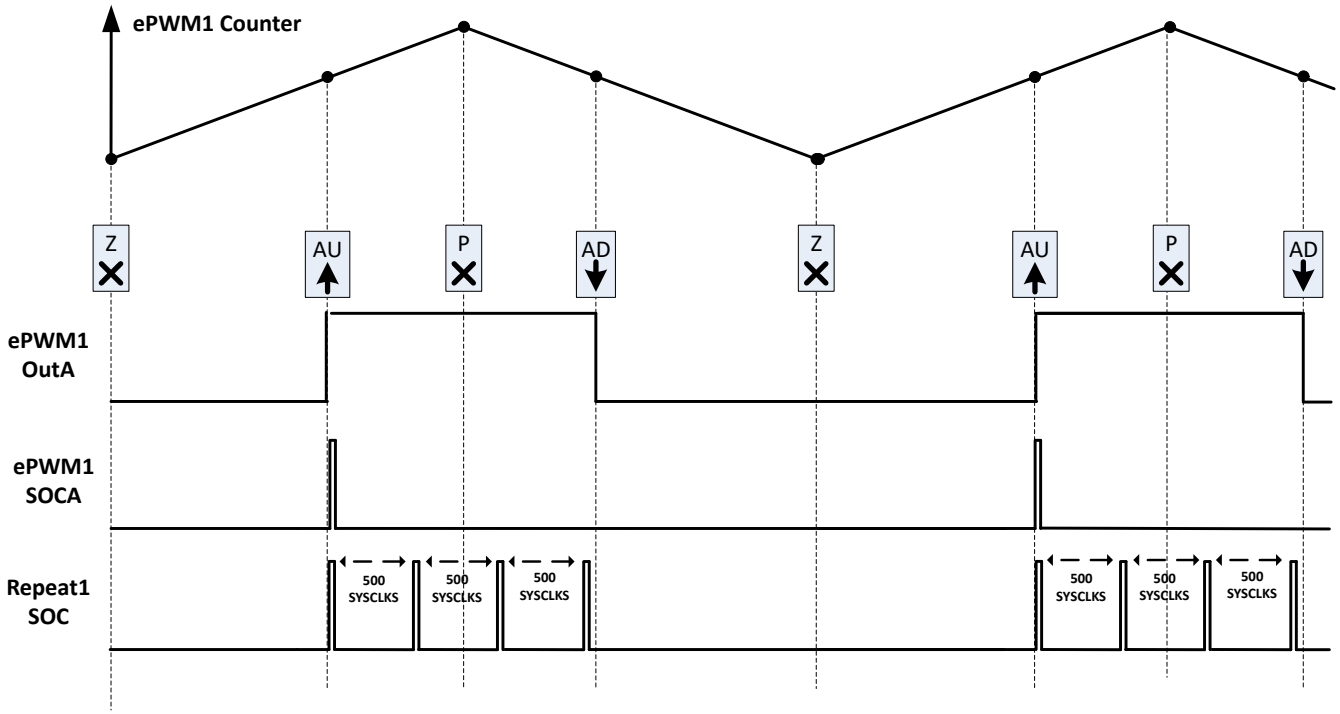
TRIGGER = ePWM SOCA, NSEL = 3, MODE = Oversampling, PHASE = (varies per ADC), SPREAD = 0

Figure 15-8. ADC Interleaved Trigger Example (12 Samples Across 3 ADCs)

15.3.2.2.4 Re-trigger Spread

If additional time between samples is desired, the application can configure SPREAD equal to the number of SYSCLK cycles desired between samples. Figure 15-9 shows an example of oversampling from an ePWM trigger with a 500-cycle spread between samples.

- By default, SPREAD = 0, and samples are re-triggered as soon as all associated SOCs are no longer pending.
- If SPREAD is set to a value smaller than the time needed for the associated SOCs to complete, then the ADC performs the triggered conversions back-to-back, and SPREAD is effectively 0.
- SPREAD has no effect in undersampling mode, or when NSEL = 0.



TRIGGER = ePWM SOCA, NSEL = 3, MODE = Oversampling, PHASE = 0, SPREAD = 500

Figure 15-9. ADC Repeated Trigger Example with Sample Spread

15.3.2.2.5 Trigger Repeater Configuration

To configure ADC oversampling or undersampling using the trigger repeater module, follow this procedure:

1. Set up the SOC by writing to ADCSOCxCTL. Specify one of the two repeater modules (REP1TRIG or REP2TRIG) as the trigger source.
2. Configure the repeater module by writing to the REPxCTL register:
   a. Configure oversampling or undersampling mode using the MODE bit.
   b. Specify the desired SOC trigger source in the TRIGGER field.
   c. If desired, configure a sync source for the repeater module in the SYNCINSEL field. A sync event resets all repeater registers to a ready and waiting state, while preserving NSEL, PHASE and MODE. A software-initiated sync is also possible by writing 1 to the SWSYNC bit.
   d. If desired, clear any previously set phase and trigger overflow flags by writing to the PHASEOVF and TRIGGEROVF bits.
3. Configure the trigger repeat count by writing to the REPxN.NSEL register. The repeater module supports up to 128 repeats for each trigger.
4. Configure the repeater phase delay by writing to the REPxPHASE.PHASE register.
5. To configure a re-trigger spread delay in oversampling mode, write the desired delay value in SYSCLK cycles to the REPxSPREAD.SPREAD register.
6. Configure the PPBLIMIT register. This register defines how many samples the post-processing block accumulates before loading the partial sum value in ADCPPBxPSUM into ADCPPBXSUM.
7. The post-processing block (PPB) and trigger repeater module have independent sync source configurations. To configure the PPB sync source, write to the ADCPPBxCONFIG2 register. For more information on how to configure the ADC post-processing block, see Section 15.8.

Note

When NSEL = 0, the repeater module essentially acts as a pass-through for SOC triggers, but is still useful for applying phase delay. SOC triggers are passed through in both oversampling mode and undersampling mode, even if there are still pending SOCs. In this scenario, the ADC sets a trigger overflow flag for the individual SOC (ADCSOCOVF1.SOCx), not the repeater module. When oversampling with NSEL > 0, the ADC sets the oversampled trigger overflow flag (REPxCTL.TRIGGEROVF) if a trigger arrives while there are pending SOCs.

When NSEL = 0, the repeater module does not set the REPxCTL.MODULEBUSY indicator. In this scenario, the application must make sure that all associated SOC flags have completed before enabling oversampling or undersampling mode by setting NSEL > 0.

15.3.2.2.5.1 Register Shadow Updates

To avoid latency or processing delays between triggers, the application can write updated values to the NSEL, PHASE and SPREAD registers while the repeater module is still actively working. When a new SOC trigger is received, these values are loaded into the NCOUNT, PHASECOUNT and SPREADCOUNT registers, which then count down to zero as each SOC is triggered by the repeater module.

In addition, the application can change the repeater module's oversampling or undersampling mode by writing to the REPxCTL.MODE register while the repeater is actively working, without affecting the current operation. The repeater module loads the value of REPxCTL.MODE into REPxCTL.ACTIVEMODE when a new SOC trigger is received.

15.3.2.2.6 Re-Trigger Logic

The repeater module determines when to re-trigger based on the values of ADCSOCxCTL.TRIGSEL and the SOC flags in ADCSOCFLG1. A repeat trigger is issued when all SOCs configured to be triggered by the repeater module instance are no longer pending. Figure 15-10 describes the trigger repeat logic. Because the SOC pending flag goes low at the end of the sample and hold phase, the module has plenty of time to re-trigger conversions without introducing any latency between repeat conversions.

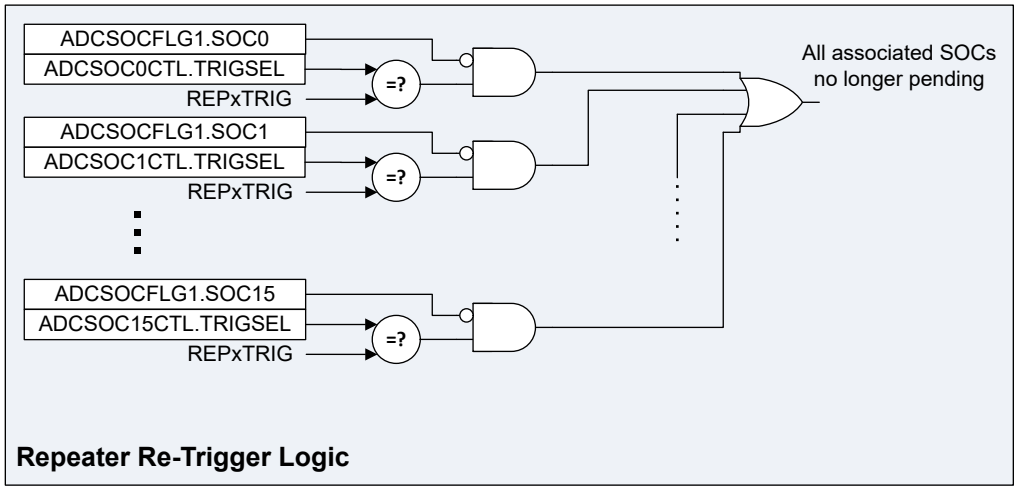


Figure 15-10. Trigger Repeater Repeat Logic

Re-triggering in Burst Mode

If the ADC is in burst mode, and the repeater is selected as the BURSTTRIG source, then the repeater fires a re-trigger pulse whenever there are no high-priority associated SOCs pending, and there are no round-robin SOCs pending.

15.3.2.2.7 Multi-Path Triggering Behavior

With the trigger repeater modules, it is possible to have one trigger source take multiple paths to set SOCs in various ways. For example, ePWM1 can directly trigger SOC3 and SOC4, while one repeater block uses ePWM1 to generate oversampling triggers on SOCs 0-2, and the second repeater block generates undersampled triggers to SOC5. Assuming all SOCs are configured for round-robin priority and the various triggers all arrive in the same cycle, the conversion order is SOC0 to SOC5 in increasing order; this is then followed by the oversampled conversions on SOC0-SOC2.

15.3.3 ADC Acquisition (Sample and Hold) Window

External signal sources vary in the ability to drive an analog signal quickly and effectively. To achieve rated resolution, the signal source needs to charge the sampling capacitor in the ADC core to within 0.5 LSBs of the signal voltage. The acquisition window is the amount of time the sampling capacitor is allowed to charge and is configurable for SOCx by the ADCSOCxCTL.ACQPS register.

ACQPS is a 9-bit register that can be set to a value between 0 and 511, resulting in an acquisition window duration of:

Acquisition window = (ACQPS + 1) * (System Clock (SYSCLK) cycle time)

- The acquisition window duration is based on the System Clock (SYSCLK), not the ADC clock (ADCCLK).
- The selected acquisition window duration must be at least as long as one ADCCLK cycle.
- The data sheet specifies a minimum acquisition window duration (in nanoseconds). The user is responsible for selecting an acquisition window duration that meets this requirement.

15.3.4 Sample Capacitor Reset

In certain systems where the ADC successively samples multiple signal sources, memory crosstalk can occur. Memory crosstalk is the tendency of the ADC conversion to be pulled towards the value of the previous conversion, due to inadequate acquisition/settling time. This happens because the ADC sample capacitor voltage starts near the previously converted voltage, then settles towards the newly applied voltage on the current channel. If the acquisition window is not long enough for the sample capacitor to settle, this can result in some sample error reflected in the ADC conversion.

The 12-bit ADC modules in this device include a sample capacitor reset feature to help mitigate memory crosstalk. When sample capacitor reset is enabled, after every conversion, the sampling capacitor voltage is reset to the VREFLO voltage. This reset takes an extra ADCCLK cycle to complete. The sample capacitor reset function is inactive by default for each SOC. If desired, the application can activate sample capacitor reset by writing 0 to the SAMPCAPRESET bit in the ADCSOCxCTL register. When sample capacitor reset is active, overall ADC throughput is slightly decreased due to the extra ADCCLK cycle in the conversion period.

15.3.5 ADC Input Models

For single-ended operation, the ADC input characteristics for values in the single-ended input model (see Figure 15-11) can be found in the device data sheet.

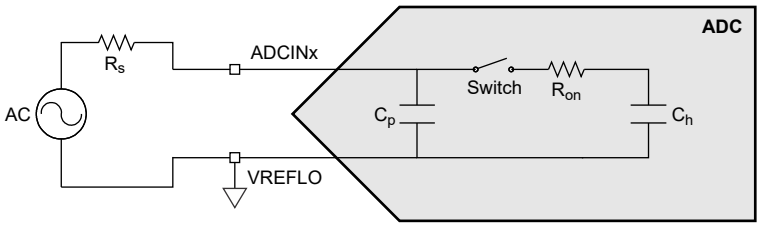

Figure 15-11. Single-Ended Input Model

These input models must be used along with actual signal source impedance to determine the acquisition window duration. See Section 15.13.2 for more information.

15.3.6 Channel Selection

Each SOC can be configured to convert any of the ADC channels. This behavior is selected for SOCx by the ADCSOCxCTL.CHSEL register. This is summarized in Table 15-4.

Table 15-4. Channel Selection of Input Pins

Input Mode	CHSEL	Input
Single-Ended	0	ADCIN0
	1	ADCIN1
	2	ADCIN2
	3	ADCIN3
	4	ADCIN4
	5	ADCIN5
	6	ADCIN6
	7	ADCIN7
	8	ADCIN8
	9	ADCIN9

	27	ADCIN27
	28	ADCIN28
	29	ADCIN29
	30	ADCIN30
	31	ADCIN31

15.3.6.1 External Channel Selection

The ADCSOCxCTRL.EXTCHSEL field for each SOC can be used to automatically control an external mux with digital output pins ADCxEXTMUX[3:0]. This functionality enables the application to add additional ADC channels using an external mux, with minimal software overhead. The ADCxEXTMUX[3:0] outputs can be mapped to GPIO pins by configuring the GPIO output crossbar, or configuring the GPIO mux accordingly. The EXTCHSEL field supports up to 4-bit muxes, but fewer mux selection output pins can be configured if desired.

To select a specific channel on the external mux, configure ADCSOCxCTRL.CHSEL to select the ADC pin that is connected to the mux output, and configure ADCSOCxCTRL.EXTCHSEL to select the desired mux input channel. There are a variety of potential mux topologies possible. A basic example can be a single external mux connected to a single ADC input channel. This setup is illustrated in Figure 15-12.

- To select ADCxIN0.4, the user configures the SOC with CHSEL = 0 and EXTCHSEL = 4.
- To select ADCxIN3, the user configures the SOC with CHSEL = 3. The value of EXTCHSEL does not affect the conversion.

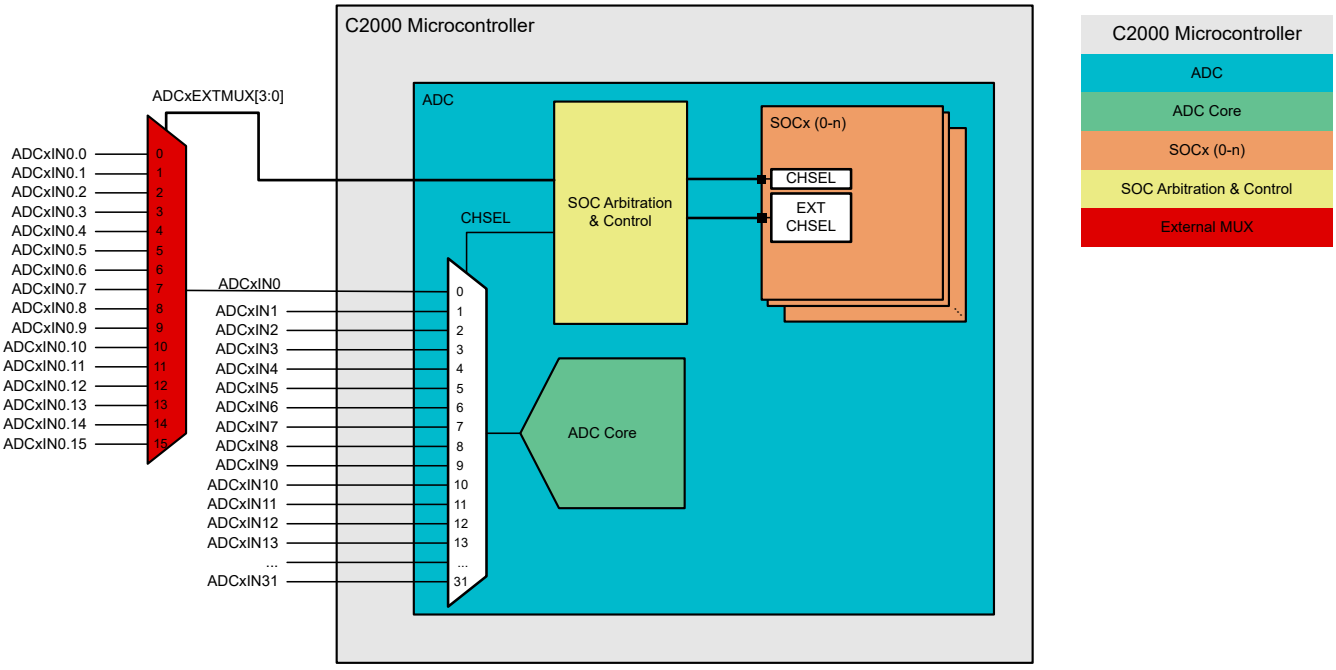

Figure 15-12. ADC with External Input Mux

Another example can be to use multiple external muxes connected to different ADC inputs. This setup is illustrated in Figure 15-13.

- To select ADCxIN0.4, the user configures the SOC with CHSEL = 0 and EXTCHSEL = 4.
- To select ADCxIN3.2, the user configures the SOC with CHSEL = 3 and EXTCHSEL = 2.
- To select ADCxIN5, the user configures the SOC with CHSEL = 5. The value of EXTCHSEL does not affect the conversion.

This scheme saves one digital mux pin, at the expense of using two small muxes instead of a single large mux, and a second ADC input pin.

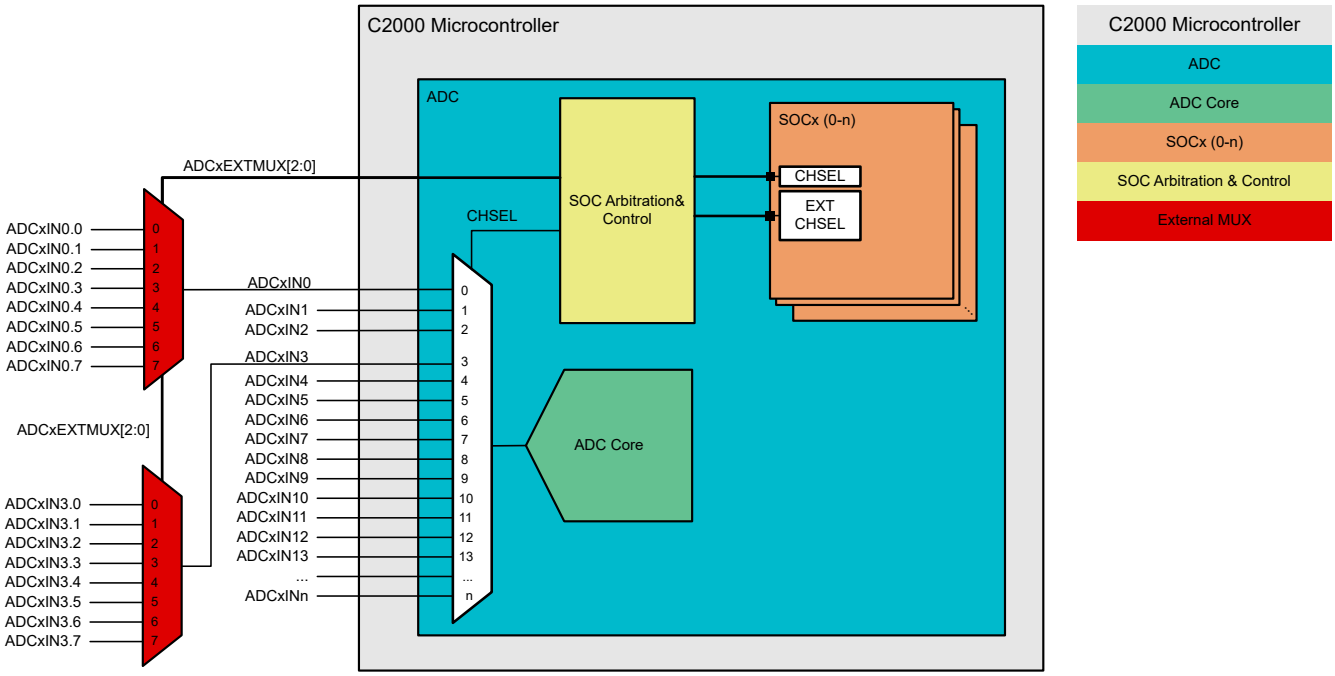

Figure 15-13. ADC with Multiple External Input Muxes and Shared Selection

When using an external channel mux, make sure to comprehend the mux selection and switching delay in the sample/hold time requirement for the SOC. This requirement includes the propagation delay for the output X-BAR (if this is used to configure the mux selection pin), any mux switching delays, and the total resistance and capacitance added to the ADC input network by the external mux device. For more information on calculating the acquisition window size, see Section 15.13.2.

Note

While the external channel selection can technically be used to select up to 16 times the number of total ADC pins (by placing a 16-input mux on each external ADC channel), the system incurs significant added overhead if the total number of channels (internal and external) exceeds 16 – the total number of available SOCs available on the ADC instance. A sensible option is to map the ADCxEXTMUX outputs to ADC pins (AGPIOs). For instance, using one ADC input to sample an external mux output, and 4 inputs for external channel selection, the application effectively gains an additional 11 ADC inputs (from 5 to 16 pins), without using up any additional device pins.

Externally multiplexed ADC channels lose the ability to practically use the analog comparators in the comparator subsystem. However, the digital limit compares in the post-processing block can still be used to generate interrupts and/or PWM trips. For more information, see Section 15.8.

15.3.6.1.1 External Channel Selection Timing

The ADCxEXTMUX output follows two possible timing schemes, depending on the setting of the EXTMUXPRESELECTEN bit in the ADCCTL1 register:

- When EXTMUXPRESELECTEN is set to 0, the ADCxEXTMUX output changes at the beginning of the associated SOC's sample and hold period. The applied external mux setting is maintained until the start of the next SOC sample-and-hold period. This is the default configuration at reset. Examples of SOC timings in this mode are shown in Figure 15-14 and Figure 15-16. When external mux preselect is disabled, make sure to configure the SOC acquisition window duration to account for both external mux settling time and internal channel settling time.
- When EXTMUXPRESELECTEN is set to 1, the ADCxEXTMUX output changes at least one SYSCLK cycle after the end of the sample and hold period. At this point, the ADC sets the external mux selection based on the next highest priority SOC that is pending. If no SOC is pending, then the mux selection is based on the next highest priority SOC, based on the current SOC priority scheme (see Section 15.5 for more information on SOC priority schemes). Examples of SOC timings in this mode are shown in Figure 15-15 and Figure 15-17. Enabling preselect mode enables the application to avoid increasing the acquisition window duration due to external mux switching and settling delays.

Note

When EXTMUXPRESELECTEN is enabled, setting SOC0 as high priority without actually triggering SOC0 conversions is a good way to define an idle value for ADCxEXTMUX. SOC0 always has the highest priority when no SOCs are pending, so the value of ADCSOC0CTL.EXTCHSEL is always pushed onto the mux select pins by default.

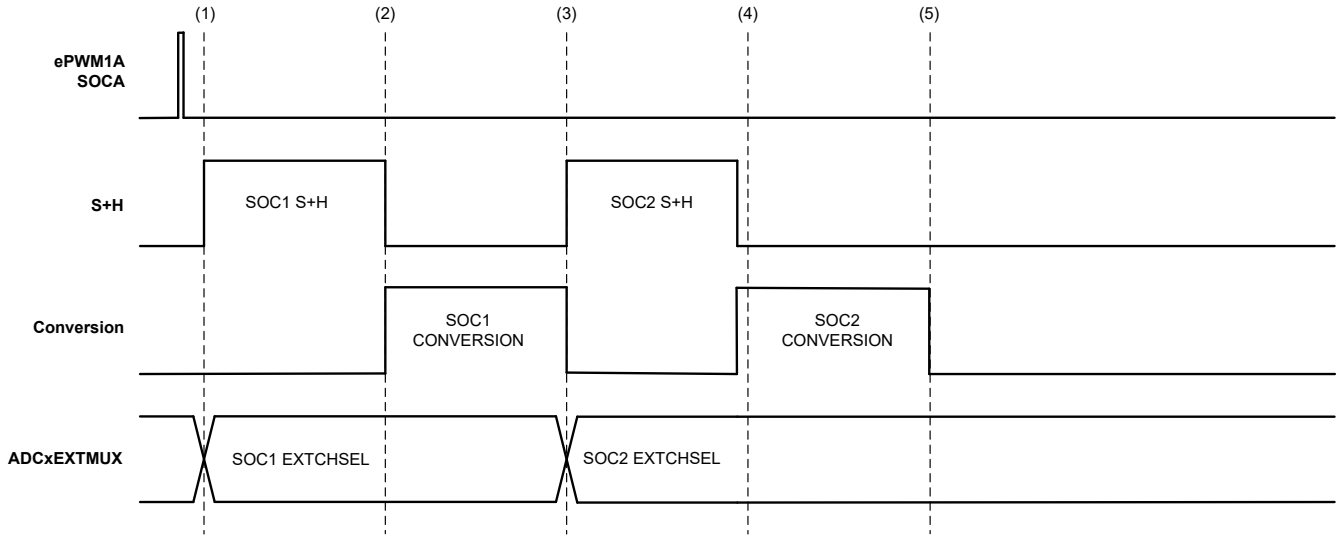

Figure 15-14. ADC External Channel Select Timing Example

In Figure 15-14, the ADC is configured as follows:

- SOC1 and SOC2 are triggered from ePWM1A;
- No high priority SOCs are defined.

The ADC performs the SOC operation sequence in the following order:

1. The initial ePWM1A trigger arrives, setting the SOC1 and SOC2 to pending. SOC1 gains priority, and the sample-and-hold period for SOC1 begins. The ADC pushes the value of ADCSOC1CTL.EXTCHSEL onto the ADCxEXTMUX pins at the same time when the SOC1 sample-and-hold begins.
2. At the end of the sample-and-hold for SOC1, the conversion begins. ADCxEXTMUX remains unchanged until the start of the next SOC sample-and-hold period.

3. In this example case, there are no asynchronous high priority triggers defined, so SOC2 sample-and-hold starts as soon as SOC1 conversion ends. The ADC pushes ADCSOC2CTL.EXTCHSEL onto the ADCxEXTMUX pins.
4. At the end of the sample-and-hold for SOC2, there are no more pending SOCs. SOC2 begins conversion, and ADCxEXTMUX is unchanged.
5. The SOC2 conversion ends. There are no pending SOCs or triggers, so ADCxEXTMUX remains unchanged.

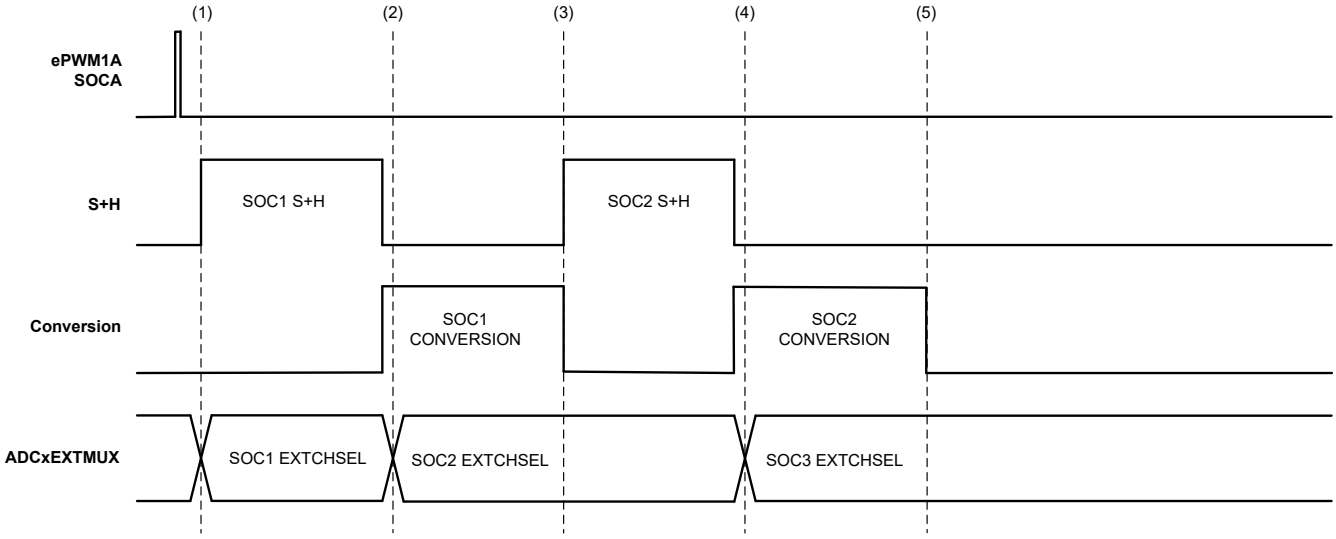

Figure 15-15. ADC External Channel Timing Example in Preselect Mode

In Figure 15-15, the ADC is configured as follows:

- SOC1 and SOC2 are triggered from ePWM1A;
- No high priority SOCs are defined.

The ADC performs the SOC operation sequence in the following order:

1. The initial ePWM1A trigger arrives, setting the SOC1 and SOC2 to pending. SOC1 gains priority, and the sample-and-hold period for SOC1 begins. The ADC pushes the value of ADCSOC1CTL.EXTCHSEL onto the ADCxEXTMUX pins at the same time when the SOC1 sample-and-hold begins.
2. At the end of the sample-and-hold for SOC1, the highest priority SOC that is pending is SOC2, so the ADC pushes the value of ADCSOC2CTL.EXTCHSEL onto the ADCxEXTMUX pins.
3. In this example case, there are no asynchronous high priority triggers defined, so SOC2 sample-and-hold starts as soon as SOC1 conversion ends. The ADC pushes ADCSOC2CTL.EXTCHSEL onto the ADCxEXTMUX pins again, but this is already the current value so there is no change.
4. At the end of the sample-and-hold for SOC2, there are no more pending SOCs. SOC3 has the next highest priority by way of the round-robin pointer, so the ADC pushes the value of ADCSOC3CTL.EXTCHSEL onto ADCxEXTMUX. In this case, the application can set ADCSOC3CTL.EXTCHSEL = ADCSOC1CTL.EXTCHSEL. Although SOC3 is not actually used, this makes sure that the external mux channel is already preselected when the next ePWM1 SOC arrives.
5. The SOC2 conversion ends. There are no pending SOCs or triggers, so ADCxEXTMUX remains unchanged.

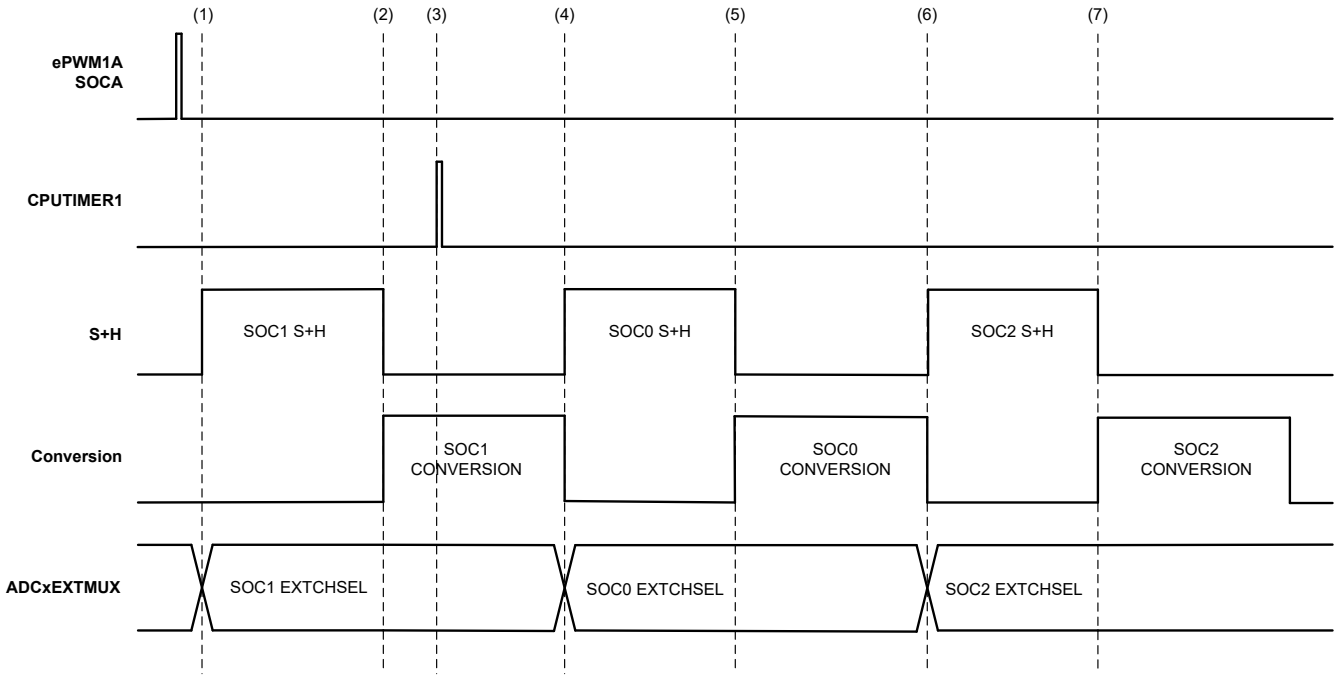

Figure 15-16. ADC External Channel Select Timing Example with Asynchronous Trigger

In Figure 15-16, the ADC is configured as follows:

- SOC1 and SOC2 are triggered from ePWM1A;
- SOC0 is triggered from CPUTIMER1, and has a high priority.

With this configuration, the ADC performs the SOC operation sequence in the following order:

1. The initial ePWM1A trigger arrives, setting the SOC1 and SOC2 flags to pending. SOC1 gains priority, and the SOC1 sample-and-hold period begins. The ADC pushes the value of ADCSOC1CTL.EXTCHSEL onto the ADCxEXTMUX pins at the same time when the SOC1 sample-and-hold begins.
2. At the end of the sample-and-hold for SOC1, the SOC1 conversion begins. ADCxEXTMUX remains unchanged until the start of the next SOC sample-and-hold period.
3. CPUTIMER1 issues a trigger asynchronously, setting the SOC0 flag to pending.
4. Since SOC0 has high priority, SOC0 converts next instead of SOC2. The ADC pushes ADCSOC0CTL.EXTCHSEL onto ADCxEXTMUX when the sample-and-hold period for SOC0 starts.
5. At the end of the sample-and-hold period for SOC0, the conversion for SOC0 begins. ADCxEXTMUX remains unchanged until the start of the next SOC sample-and-hold period.
6. At the end of the conversion for SOC0, SOC2 is the next pending SOC. SOC2's sample-and-hold period begins, and ADCSOC2CTL.EXTCHSEL is pushed onto the ADCxEXTMUX pins.
7. The SOC2 conversion begins, and there are no pending SOCs left. ADCxEXTMUX remains unchanged until a new SOC trigger arrives.

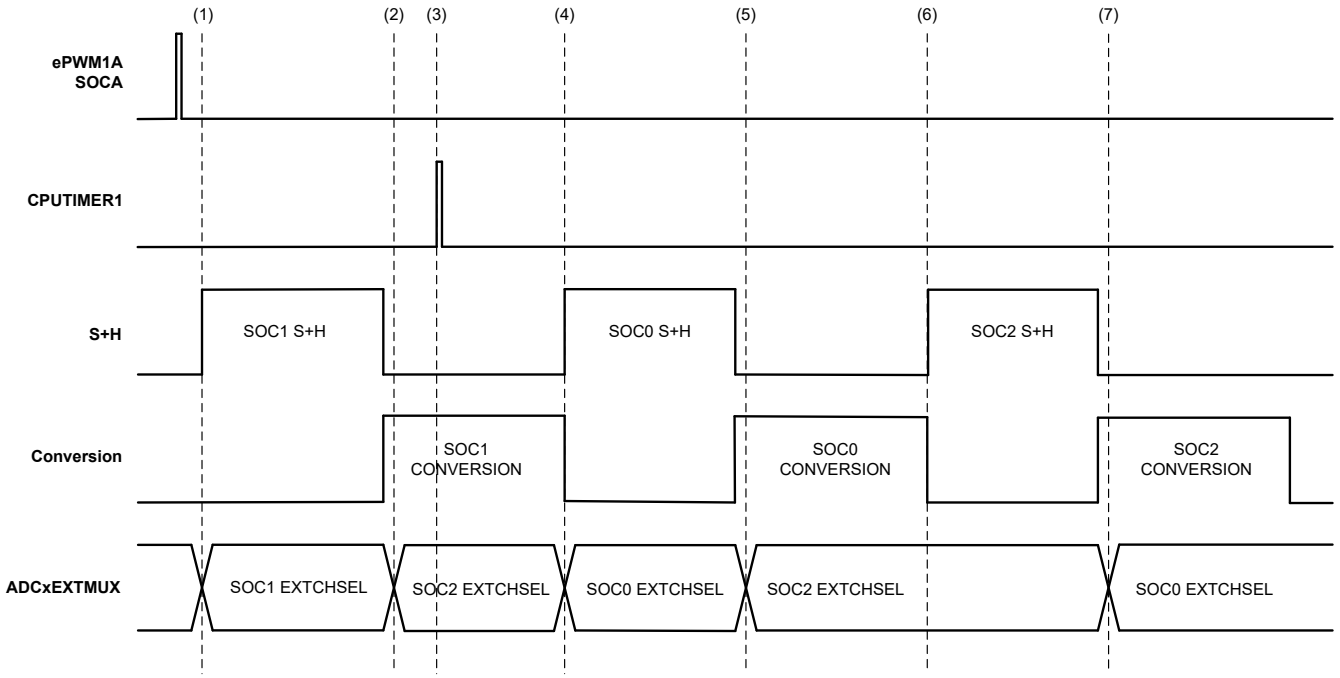

Figure 15-17. ADC External Channel Timing Example in Preselect Mode with Asynchronous Trigger

In Figure 15-17, the ADC is configured as follows:

- SOC1 and SOC2 are triggered from ePWM1A;
- SOC0 is triggered from CPUTIMER1, and has a high priority.

With this configuration, the ADC performs the SOC operation sequence in the following order:

1. The initial ePWM1A trigger arrives, setting the SOC1 and SOC2 flags to pending. SOC1 gains priority, and the SOC1 sample-and-hold period begins. The ADC pushes the value of ADCSOC1CTL.EXTCHSEL onto the ADCxEXTMUX pins at the same time when the SOC1 sample-and-hold begins.
2. At the end of the sample-and-hold for SOC1, the highest priority SOC that is pending is SOC2, so the ADC pushes the value of ADCSOC2CTL.EXTCHSEL onto the ADCxEXTMUX pins.
3. CPUTIMER1 issues a trigger asynchronously, setting the SOC0 flag to pending.
4. Since SOC0 has high priority, SOC0 converts next instead of SOC2. The ADC overwrites the previous speculative external mux selection (ADCSOC2CTL.EXTCHSEL) with ADCSOC0.EXTCHSEL when the sample-and-hold period for SOC0 starts. In situations like this where asynchronous triggers are possible, make sure to set the acquisition window size of the priority SOC large enough to allow for both external mux settling and internal channel settling.
5. At the end of the sample-and-hold period for SOC0, the highest priority SOC that is pending is SOC2, so the ADC pushes EXTCHSEL value for SOC2 onto the ADCxEXTMUX pins. SOC0 begins converting.
6. At the end of the SOC0 conversion, SOC2 is the next highest-priority pending SOC, and so SOC2's sample-and-hold period begins. The ADC again pushes ADCSOC2CTL.EXTCHSEL onto the ADCxEXTMUX pins, but since this is already the current value, the mux pins are unchanged.
7. At the end of the sample-and-hold period for SOC2, there are no SOCs pending. SOC0 has the next highest priority, since the ADC has been configured to give SOC0 high priority. The ADC pushes ADCSOC0CTL.EXTCHSEL onto the ADCxEXTMUX pins.

15.4 SOC Configuration Examples

The following sections provide some specific examples of how to configure the SOCs to produce some conversions.

15.4.1 Single Conversion from ePWM Trigger

To configure ADCA to perform a single conversion on channel ADCIN1 when the ePWM timer reaches the period match, a few things are necessary. First, ePWM3 must be configured to generate an SOCA or SOCB signal (in this statement, SOC refers to a signal in the ePWM module). See the *Enhanced Pulse Width Modulator Module (ePWM)* chapter on how to do this. Assume that SOCB was chosen.

SOC5 is chosen arbitrarily. Any of the 16 SOCs can be used.

Assuming a 100ns sample window is desired with a SYSCLK frequency of 150MHz, then the acquisition window duration must be 100ns/6.667ns = 15 cycles. The ACQPS field must be set to 15 - 1 = 14.

```
AdcaRegs.ADCSOC5CTL.bit.CHSEL = 1;      //SOC5 converts ADCINA1
AdcaRegs.ADCSOC5CTL.bit.ACQPS = 14;     //SOC5 uses a sample duration of 15 SYSCLK cycles
AdcaRegs.ADCSOC5CTL.bit.TRIGSEL = 10;   //SOC5 begins conversion on ePWM3 SOCB
```

As configured, when ePWM3 matches the period and generates the SOCB signal, the ADC begins sampling channel ADCINA1 (SOC5) immediately if the ADC is idle. If the ADC is busy, ADCINA1 begins sampling when SOC5 gains priority (see Section 15.5). The ADC control logic samples ADCINA1 with the specified acquisition window width of 100ns. Immediately after the acquisition is complete, the ADC begins converting the sampled voltage to a digital value. When the ADC conversion is complete, the results are available in the ADCRESULT5 register (see Section 15.12 for exact sample, conversion, and result latch timings).

15.4.2 Oversampled Conversion from ePWM Trigger

To configure the ADC to oversample ADCINA1 4 times, we use the same configurations as the previous example, but apply them to SOC5, SOC6, SOC7, and SOC8.

```
AdcaRegs.ADCSOC5CTL.bit.CHSEL = 1;        //SOC5 converts ADCINA1
    AdcaRegs.ADCSOC5CTL.bit.ACQPS = 14;       //SOC5 uses a sample duration of 15 SYSCLK cycles
    AdcaRegs.ADCSOC5CTL.bit.TRIGSEL = 10;     //SOC5 begins conversion on ePWM3 SOCB
    AdcaRegs.ADCSOC6CTL.bit.CHSEL = 1;        //SOC6 converts ADCINA1
    AdcaRegs.ADCSOC6CTL.bit.ACQPS = 14;       //SOC6 uses a sample duration of 15 SYSCLK cycles
    AdcaRegs.ADCSOC6CTL.bit.TRIGSEL = 10;     //SOC6 begins conversion on ePWM3 SOCB
    AdcaRegs.ADCSOC7CTL.bit.CHSEL = 1;        //SOC7 converts ADCINA1
    AdcaRegs.ADCSOC7CTL.bit.ACQPS = 14;       //SOC7 uses a sample duration of 15 SYSCLK cycles
    AdcaRegs.ADCSOC7CTL.bit.TRIGSEL = 10;     //SOC7 begins conversion on ePWM3 SOCB
    AdcaRegs.ADCSOC8CTL.bit.CHSEL = 1;        //SOC8 converts ADCINA1
    AdcaRegs.ADCSOC8CTL.bit.ACQPS = 14;       //SOC8 uses a sample duration of 15 SYSCLK cycles
    AdcaRegs.ADCSOC8CTL.bit.TRIGSEL = 10;     //SOC8 begins conversion on ePWM3 SOCB
```

As configured, when ePWM3 matches the period and generates the SOCB signal, the ADC begins sampling channel ADCINA1 (SOC5) immediately if the ADC is idle. If the ADC is busy, ADCINA1 begins sampling when SOC5 gains priority (see Section 15.5). Once the conversion is complete for SOC5, SOC6 begins converting ADCINA1 and the results for SOC5 are placed in the ADCRESULT5 register. All four conversions eventually are completed sequentially, with the results in ADCRESULT5, ADCRESULT6, ADCRESULT7, and ADCRESULT8 for SOC5, SOC6, SOC7, and SOC8, respectively.

Note

It is possible, but unlikely, that the ADC can begin converting SOC6, SOC7, or SOC8 before SOC5 depending on the position of the round-robin pointer when the ePWM trigger is received. See Section 15.5 to understand how the next SOC to be converted is chosen.

15.4.3 Multiple Conversions from CPU Timer Trigger

This example shows how to sample multiple signals with different acquisition window requirements. CPU1 Timer 2 is used to generate the trigger. To see how to configure the CPU timer, see the *System Control and Interrupts* chapter.

A good first step when designing a sampling scheme with many signals is to list out the signals and the required acquisition window. From this, calculate the necessary number of SYSCLK cycles for each signal, then the ACQPS register setting. This is shown in Table 15-5, where a SYCLK of 150MHz is assumed (6.666ns cycle time).

Table 15-5. Example Requirements for Multiple Signal Sampling

Signal Name	Acquisition Window Requirement	Acquisition Window (SYSCLK Cycles)	ACQPS Register Value
Signal 1	>160ns	160ns/6.666ns = 24	24 – 1 = 23
Signal 2	>592ns	592ns/6.666ns = 89 (round up)	89 – 1 = 88
Signal 3	>147ns	147ns/6.666ns = 22	22 – 1 = 21
Signal 4	>392ns	392ns/6.666ns = 59 (round up)	59 – 1 = 58

Next decide which ADC pins to connect to each signal. This is highly dependent on the application board layout. Once the pins are selected, determining the value of CHSEL is straightforward (see Table 15-6).

Table 15-6. Example Connections for Multiple Signal Sampling

Signal Name	ADC Pin	CHSEL Register Value
Signal 1	ADCINA5	5
Signal 2	ADCINA0	0
Signal 3	ADCINA3	3
Signal 4	ADCINA2	2

With the information tabulated, generate the SOC configurations:

```
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 5;        //SOC0 converts ADCINA5
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 23;       //SOC0 uses a sample duration of 24 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 3;      //SOC0 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC1CTL.bit.CHSEL = 0;        //SOC1 converts ADCINA0
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 88;       //SOC1 uses a sample duration of 89 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 3;      //SOC1 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC2CTL.bit.CHSEL = 3;        //SOC2 converts ADCINA3
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 21;       //SOC2 uses a sample duration of 22 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 3;      //SOC2 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC3CTL.bit.CHSEL = 2;        //SOC3 converts ADCINA2
AdcaRegs.ADCSOC3CTL.bit.ACQPS = 58;       //SOC3 uses a sample duration of 59 SYSCLK cycles
AdcaRegs.ADCSOC3CTL.bit.TRIGSEL = 3;      //SOC3 begins conversion on CPU1 Timer 2
```

As configured, when CPU1 Timer 2 generates an event, SOC0, SOC1, SOC2, and SOC3 eventually is sampled and converted, in that order. The conversion results for ACINA5 (Signal 1) are in ADCRESULT0. Similarly, The results for ADCINA0 (Signal 2), ADCINA3 (Signal 3), and ADCINA2 (Signal 4) are in ADCRESULT1, ADCRESULT2, and ADCRESULT3, respectively.

Note

There is a possibility, but unlikely, that the ADC can begin converting SOC1, SOC2, or SOC3 before SOC0 depending on the position of the round-robin pointer when the CPU Timer trigger is received. See Section 15.5 to understand how the next SOC to be converted is chosen.

15.4.4 Software Triggering of SOCs

At any point, whether or not the SOCs have been configured to accept a specific trigger, a software trigger can set the SOCs to be converted. This is accomplished by writing bits in the ADCSOCFRC1 register.

Software triggering of the previous example without waiting for the CPU1 Timer 2 to generate the trigger can be accomplished by the statement:

```
AdcaRegs.ADCSOCFRC1.all = 0x000F;        //set SOC flags for SOC0 to SOC3
```

15.5 ADC Conversion Priority

When multiple SOC flags are set at the same time, one of two forms of priority determines the converted order. The default priority method is round-robin. In this scheme, no SOC has an inherent higher priority than another. Priority depends on the round-robin pointer (RRPOINTER). The RRPOINTER reflected in the ADCSOCPRIORITYCTL register points to the last SOC converted. The highest priority SOC is given to the next value greater than the RRPOINTER value, wrapping around back to SOC0 after SOC15. At reset the value is 16 since 0 indicates a conversion has already occurred. When RRPOINTER equals 16 the highest priority is given to SOC0. The RRPOINTER is reset when the ADC module is reset or when the reset value is written to the SOCPRICTL register. The ADC module is reset by writing and clearing the SOFTPRES bit corresponding to the ADC instance.

An example of the round-robin priority method is given in Figure 15-18.

The SOCPRIORITY field in the ADCSOCPRIORITYCTL register can be used to assign high priority from a single to all of the SOCs. When configured as high priority, an SOC interrupts the round-robin wheel after any current conversion completes and inserts in as the next conversion. After the conversion completes, the round-robin wheel continues where the conversion was interrupted. If two high priority SOCs are triggered at the same time, the SOC with the lower number takes precedence.

High priority mode is assigned first to SOC0, then in increasing numerical order. The value written in the SOCPRIORITY field defines the first SOC that is not high priority. In other words, if a value of 4 is written into SOCPRIORITY, then SOC0, SOC1, SOC2, and SOC3 are defined as high priority, with SOC0 the highest.

An example using high priority SOC's is given in Figure 15-19.

A After reset, SOC0 is highest priority SOC; SOC7 receives trigger; SOC7 configured channel is converted immediately.

B RRPOINTER changes to point to SOC 7; SOC8 is now highest priority SOC .

C SOC2 & SOC12 triggers rcvd. simultaneously; SOC12 is first on round robin wheel ; SOC12 configured channel is converted while SOC2 stays pending.

D RRPOINTER changes to point to SOC 12; SOC2 configured channel is now converted .

E RRPOINTER changes to point to SOC 2; SOC3 is now highest priority SOC .

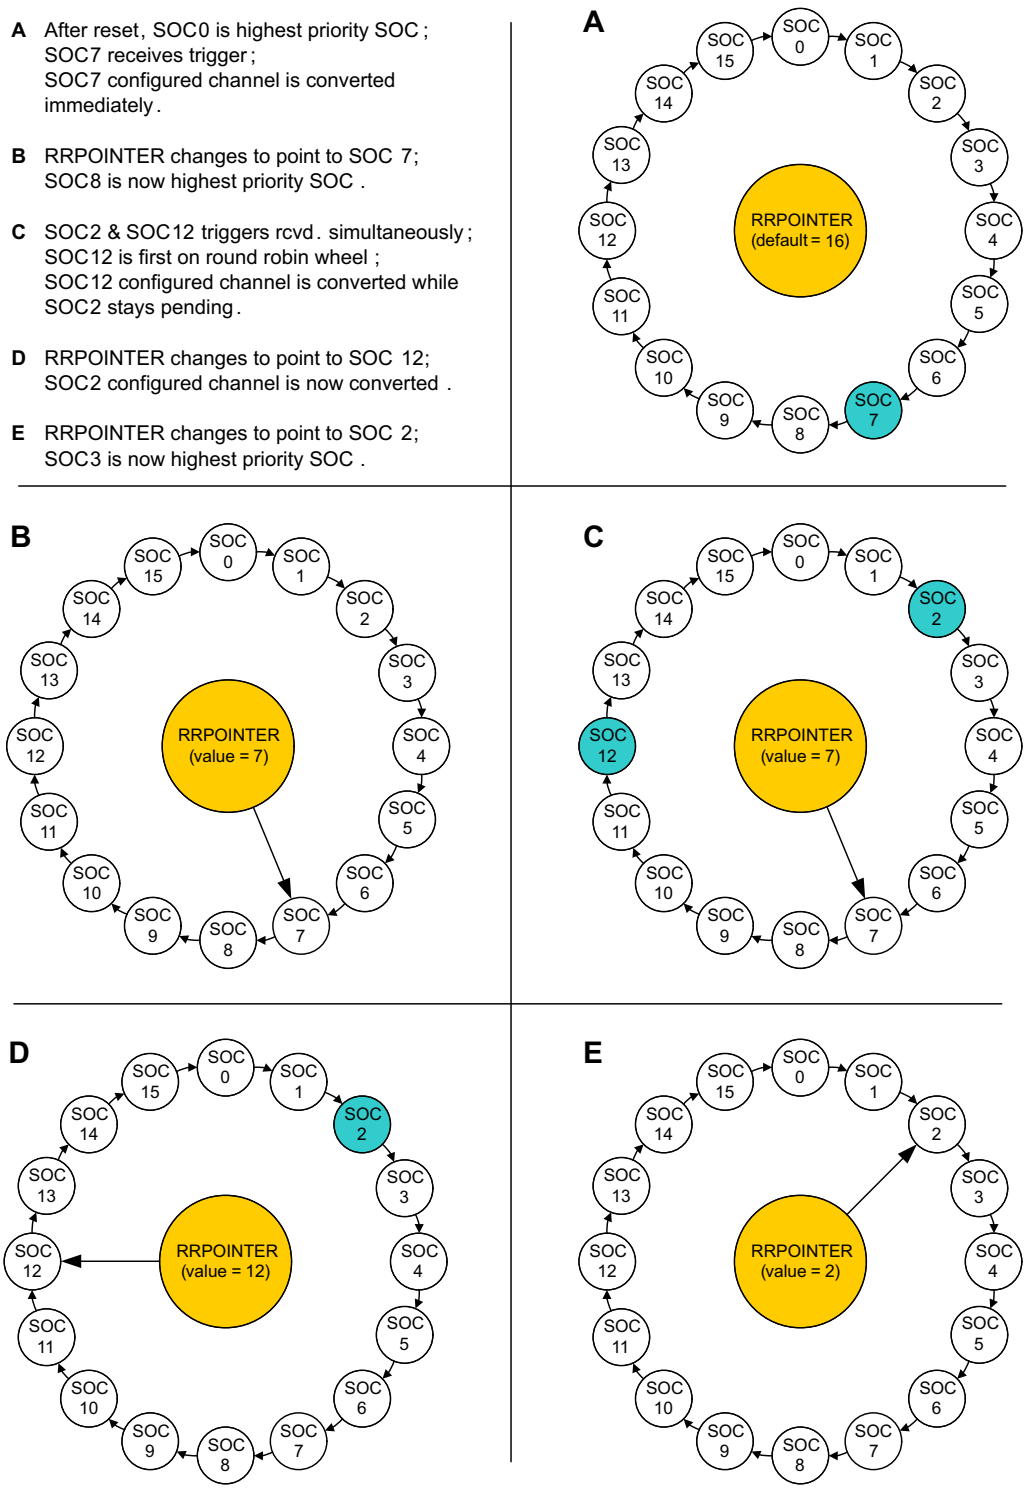

Figure 15-18. Round Robin Priority Example

Example when SOCPRIORITY = 4

A After reset, SOC4 is 1st on round robin wheel ;
SOC7 receives trigger ;
SOC7 configured channel is converted immediately .

B RRPOINTER changes to point to SOC 7;
SOC8 is now 1st on round robin wheel .

C SOC2 & SOC12 triggers rcvd . simultaneously ;
SOC2 interrupts round robin wheel and SOC 2 configured channel is converted while SOC 12 stays pending .

D RRPOINTER stays pointing to 7;
SOC12 configured channel is now converted .

E RRPOINTER changes to point to SOC 12;
SOC13 is now 1st on round robin wheel .

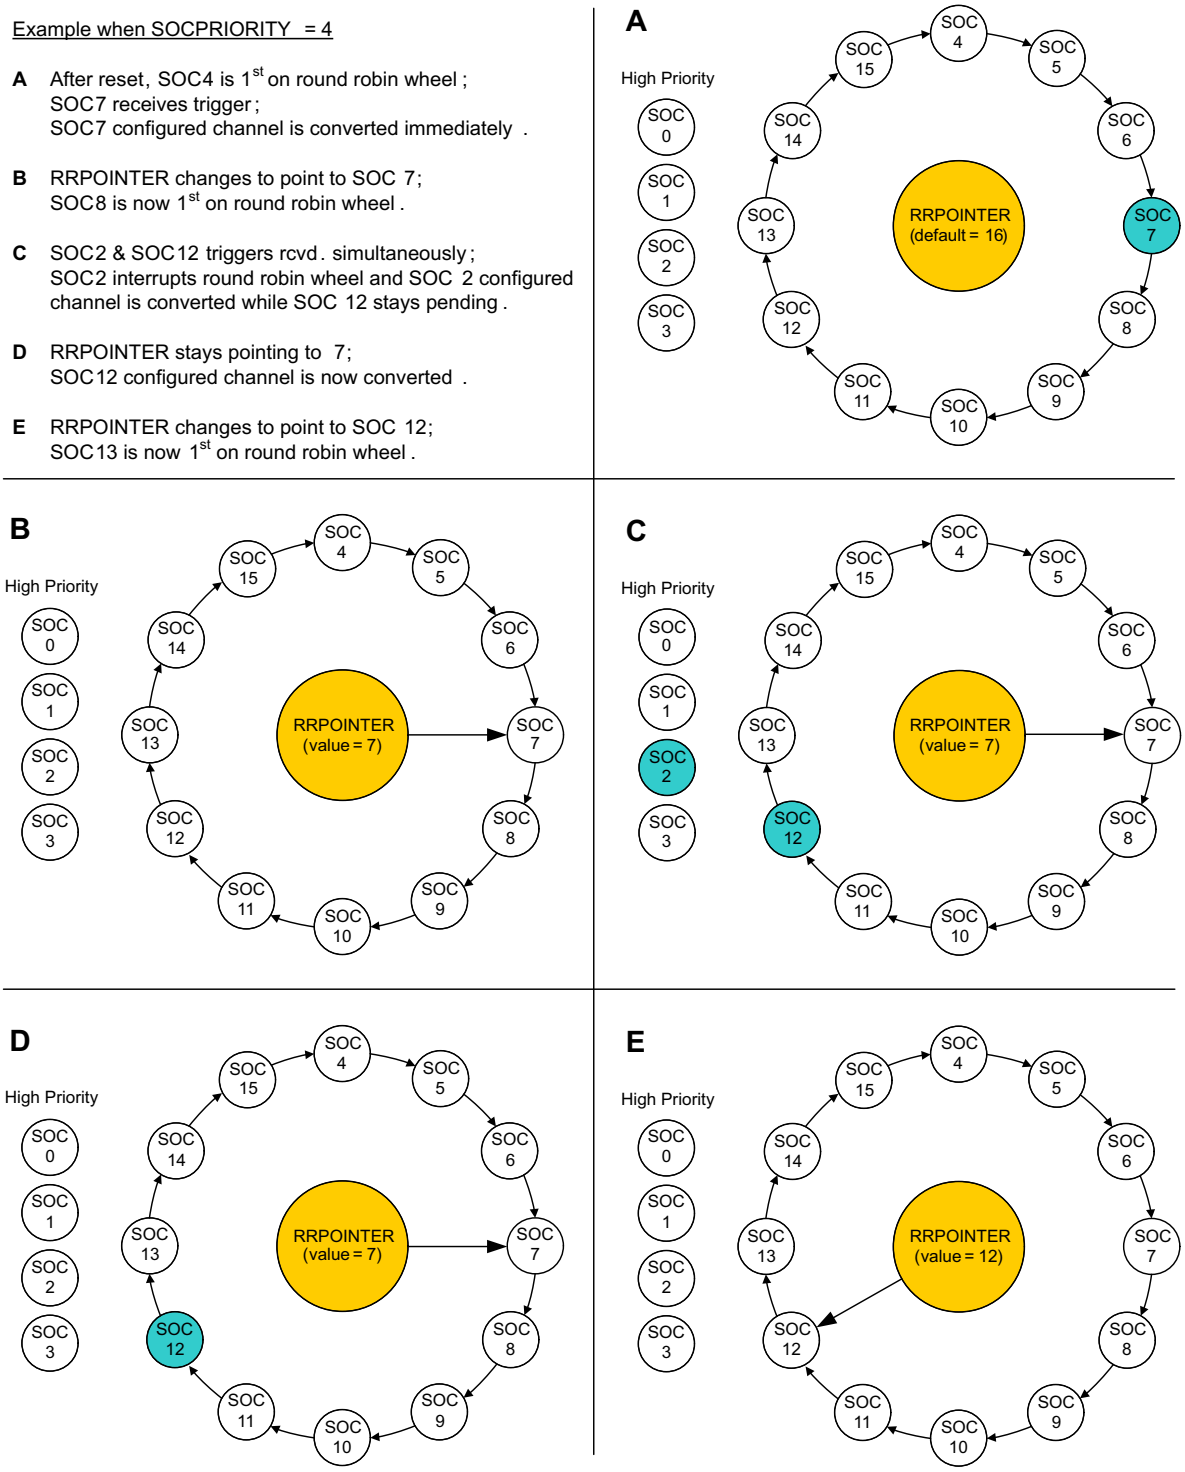

Figure 15-19. High Priority Example

15.6 Burst Mode

Burst mode allows a single trigger to walk through the round-robin SOCs one or more at a time. Setting the bit BURSTEN in the ADCBURSTCTL register configures the ADC wrapper for burst mode. This causes the TRIGSEL field to be ignored, but only for SOCs that are configured for round-robin operation (not high priority). Instead of the TRIGSEL field, all round-robin SOCs are triggered based on the BURSTTRIG field in the ADCBURSTCTL register. Upon reception of the burst trigger, the ADC wrapper does not set all round-robin SOCs to be converted, but only (ADCBURSTCTL.BURSTSIZE + 1) SOCs. The first SOC to be set is the SOC with the highest priority based on the round-robin pointer, and subsequent SOCs are set until BURSTSIZE SOCs have been set.

Note

When configuring the ADC for burst mode, the user is responsible for ensuring that each burst of conversions is allowed to complete before the next burst trigger is received. The value of (ADCBURSTCTL.BURSTSIZE + 1) must be less than or equal to the number of SOCs configured for round-robin priority. If the previous burst is not complete at the time when a new burst trigger arrives, for each SOC that was already pending and receives a new trigger, the corresponding overflow flag in ADCSOCOVF1 is set.

For example, if SOCPRIORITY = 12, that is, SOC12, SOC13, SOC14, and SOC15 are in round-robin, ADCBURSTCTL.BURSTSIZE setting must be ≤3 for burst mode to operate correctly.

15.6.1 Burst Mode Example

Burst mode can be used to sample a different set of signals on every other trigger. In the following example, ADCIN7 and ADCIN5 are converted on the first trigger from CPU1 Timer 2 and every other trigger thereafter. ADCIN2 and ACIN3 are converted on the second trigger from CPU1 Timer 2 and every other trigger thereafter. All signals are converted with 20 SYSCLK cycle wide acquisition windows, but different durations can be configured for each SOC as desired.

```
AdcaRegs.BURSTCTL.BURSTEN = 1;              //Enable ADC burst mode
AdcaRegs.BURSTCTL.BURSTTRIG = 3;            //CPU1 Timer 2 triggers burst of conversions
AdcaRegs.BURSTCTL.BURSTSIZE = 1;            //conversion bursts are 1 + 1 = 2 conversions long
AdcaRegs.SOCPRICTL.bit.SOCPRIORITY = 12;    //SOC0 to SOC11 are high priority
AdcaRegs.ADCSOC12CTL.bit.CHSEL = 7;         //SOC12 converts ADCINA7
AdcaRegs.ADCSOC12CTL.bit.ACQPS = 19;        //SOC12 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC13CTL.bit.CHSEL = 5;         //SOC13 converts ADCINA5
AdcaRegs.ADCSOC13CTL.bit.ACQPS = 19;        //SOC13 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC14CTL.bit.CHSEL = 2;         //SOC14 converts ADCINA2
AdcaRegs.ADCSOC14CTL.bit.ACQPS = 19;        //SOC14 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC15CTL.bit.CHSEL = 3;         //SOC15 converts ADCINA3
AdcaRegs.ADCSOC15CTL.bit.ACQPS = 19;        //SOC15 uses sample duration of 20 SYSCLK cycles
```

When the first CPU1 Timer 2 trigger is received, SOC12 and SOC13 are converted immediately if the ADC is idle. If the ADC is busy, SOC12 and SOC13 are converted once the SOCs gain priority. The results for SOC12 and SOC13 are in ADCRESULT12 and ADCRESULT13, respectively. After SOC13 completes, the round-robin pointer gives the highest priority to SOC14. Because of this, when the next CPU1 Timer 2 trigger is received, SOC14 and SOC15 is set as pending and eventually converted. The results for SOC14 and SOC15 are in ADCRESULT14 and ADCRESULT15, respectively. Subsequent triggers continue to toggle between converting SOC12 and SOC13, and converting SOC14 and SOC15.

While the above example toggles between two sets of conversions, three or more different sets of conversions can be achieved using a similar approach.

15.6.2 Burst Mode Priority Example

An example of priority resolution using burst mode and high-priority SOCs is presented in Figure 15-20.

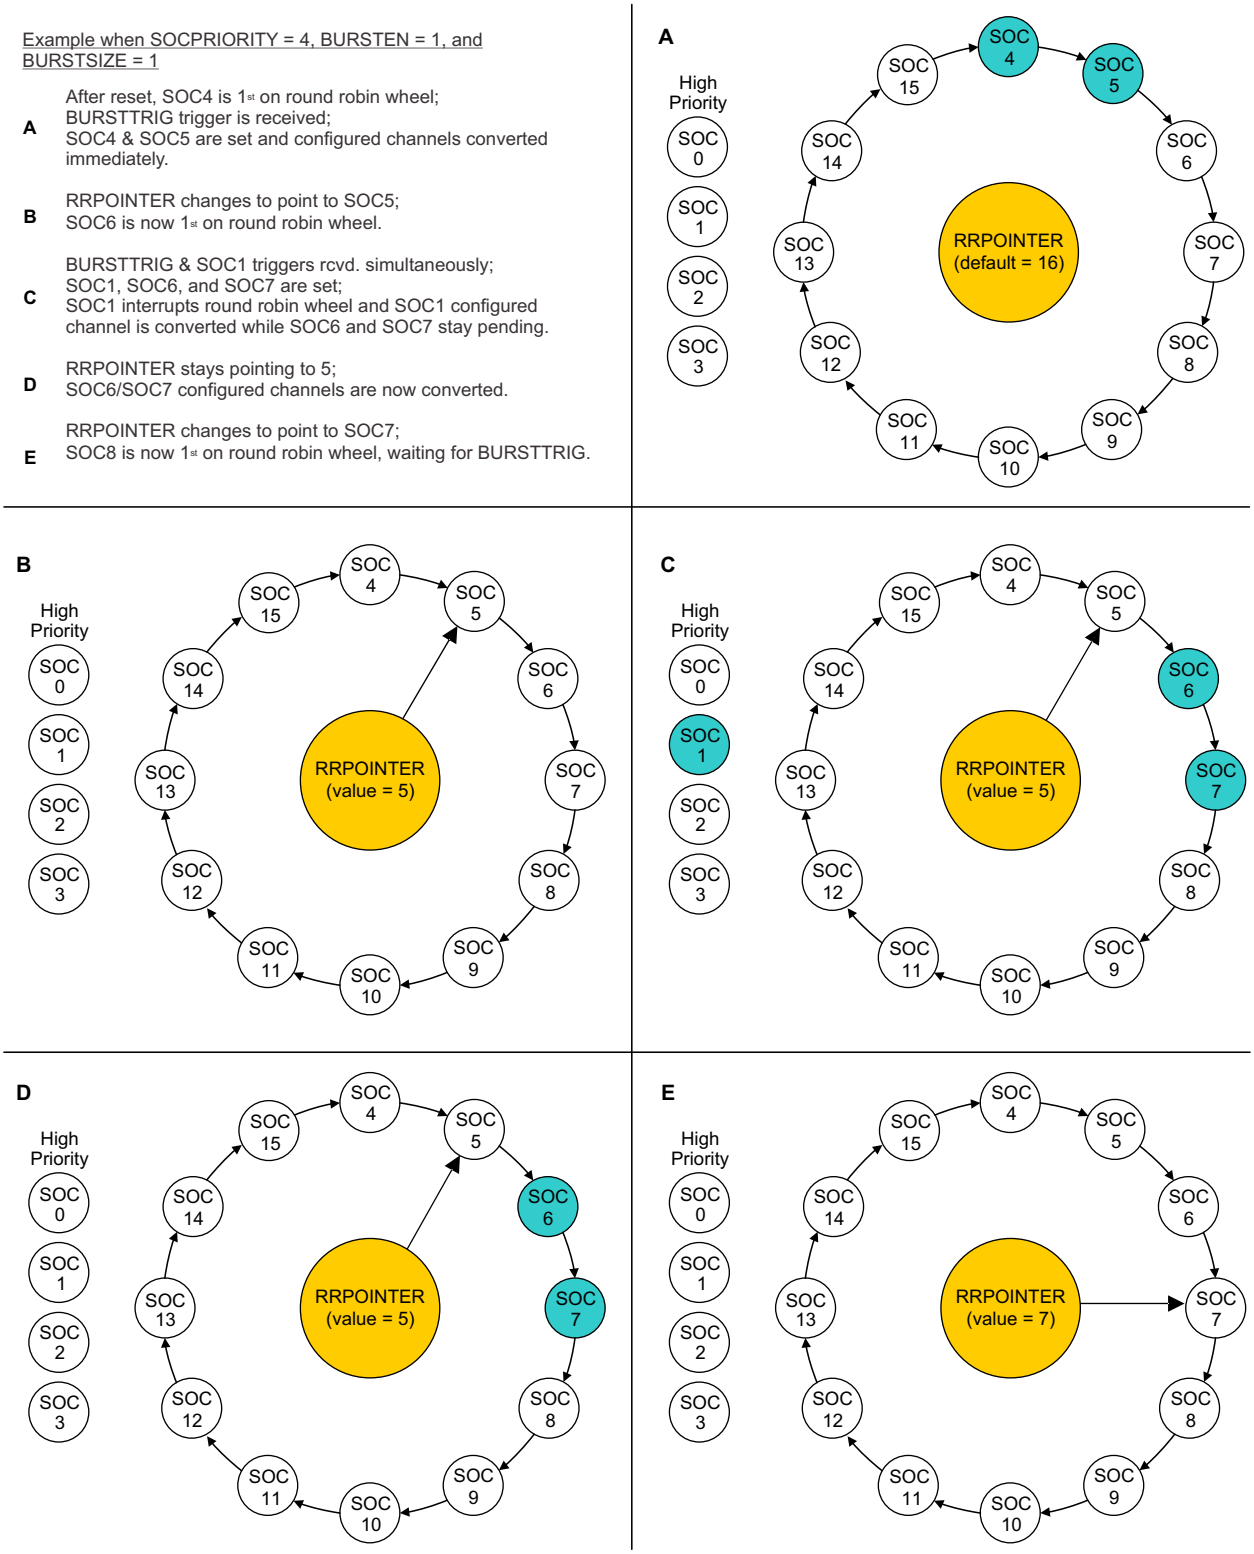

Figure 15-20. Burst Priority Example

15.7 EOC and Interrupt Operation

Each SOC has a corresponding end-of-conversion (EOC) signal. This EOC signal can be used to trigger an ADC interrupt. The ADC can be configured to generate the EOC pulse at either the end of the acquisition window or at the end of the voltage conversion. This is configured using the bit INTPULSEPOS in the ADCCTL1 register. See Section 15.12 for exact EOC pulse location.

Each ADC module has 4 configurable ADC interrupts. These interrupts can be triggered by any of the 16 EOC signals. The flag bit for each ADCINT can be read directly to determine if the associated SOC is complete or the interrupt can be passed on to the PIE. Each ADCINT flag also has a corresponding ADCINTxRESULT flag. The ADCINTxRESULT flag is only set when results corresponding to the EOC are latched. This is useful for interrupt service routines or CLA tasks with early interrupt timing configured, allowing the application code to perform some pre-processing or setup work, and then acting on the ADC conversion result as soon as the result is latched.

It is also possible to generate an ADC interrupt based on a PPB oversampling logic event, such as when the sample count matches the configured limit. There are four oversampling interrupt (OSINT) flags available in each module for this purpose. Any of the ADCINT flags can be configured for an OSINT by configuring the INTxSEL field the corresponding ADCINTSELxNy register.

Note

The ADCCTL1.ADCBSY bit being clear does not indicate that all conversions in a set of SOCs have completed, only that the ADC is ready to process the next conversion. To determine if a sequence of SOCs is complete, link an ADCINT flag to the last SOC in the sequence and monitor that ADCINT flag.

Figure 15-21 shows a block diagram of the ADC interrupt structure.

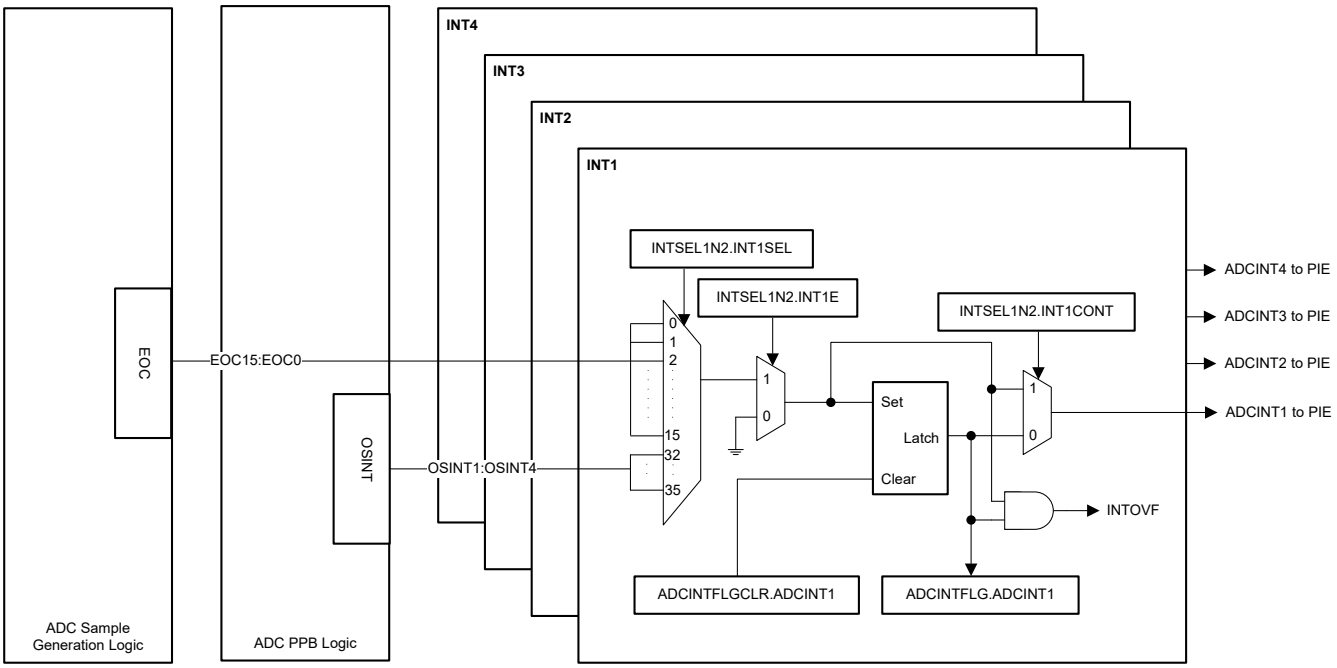

Figure 15-21. ADC EOC Interrupts

15.7.1 Interrupt Overflow

If the EOC signal sets a flag in the ADCINTFLG register, but that flag is already set, an interrupt overflow occurs. By default, overflow interrupts are not passed on to the PIE module. When an overflow occurs on a given flag in the ADCINTFLG register, the corresponding flag in the ADCINOVF register is set. This overflow flag is only used to detect that an overflow has occurred; the flag does not block further interrupts from propagating to the PIE module.

When an ADC interrupt overflow occurs, the application must check the appropriate ADCINTOVF flag inside the ISR or in the background loop and take appropriate action when an overflow is detected. The following code snippets demonstrate how to check the ADCINTOVF flag inside the ISR after attempting to clear the ADCINT flag.

```
// Clear the interrupt flag
AdcaRegs.ADCINTFLGCLR.bit.ADCINT1 = 1;      //clear INT1 flag for ADC-A

// Check if an overflow has occurred
if(1 == AdcaRegs.ADCINTOVF.bit.ADCINT1)     //ADCINT overflow occurred
{
    AdcaRegs.ADCINTOVFCLR.bit.ADCINT1 = 1   //Clear overflow flag
    AdcaRegs.ADCINTFLGCLR.bit.ADCINT1 = 1   //Re-clear ADCINT flag
}
```

```
//
// Clear the interrupt flag
//
ADC_clearInterruptStatus(ADCA_BASE, ADC_INT_NUMBER1);

//
// Check if an overflow has occurred
//
if(true == ADC_getInterruptOverflowStatus(ADCA_BASE, ADC_INT_NUMBER1))
{
    ADC_clearInterruptOverflowStatus(ADCA_BASE, ADC_INT_NUMBER1);
    ADC_clearInterruptStatus(ADCA_BASE, ADC_INT_NUMBER1);
}
```

15.7.2 Continue to Interrupt Mode

The INTxCONT bits in the ADCINTSEL1N2 and ADCINTSEL3N4 registers configure how interrupts are handled when an ADCINTFLG has not yet been cleared from a prior interrupt. This mode is disabled by default and additional overlapping interrupts are not issued to the PIE. By activating this mode, ADC interrupts always reach the PIE. If interrupts occur while ADCINTFLG is set, the ADCINTOVF register remains set regardless of the configuration of the INTxCONT bits.

15.7.3 Early Interrupt Configuration Mode

Enabling early interrupt mode can allow the application to enter the ADC interrupt service routine before the ADC results are ready. This allows the application to do any necessary pre-work so that the application can act on the ADC results immediately when the ADC results become available. If the timing of the early interrupt is too early, then the application needs to waste time until the updated ADC results become available. To prevent this situation, the time the ADC interrupt is entered in early interrupt mode is configurable by way of the DELAY field in the ADCINTCYCLE register.

- To use the configurable interrupt time, the ADC must be in early interrupt mode. To achieve this, clear the bit INTPULSEPOS to 0 in ADCCTL1.
- The DELAY value in the ADCINTCYCLE register sets the number of additional SYSCLK cycles after the falling edge of the SOC pulse before the ADCINT flag is set.
- If the value of DELAY goes beyond EOC, the ADC interrupt is generated along with EOC.
- Writing values to DELAY when INTPULSEPOS is set to 1 does not have any effect on the interrupt generation.

To determine exactly when the ADC result has been latched into the ADCRESULT register, poll the ADCINTxRESULT flag bit in the ADCINTFLG register.

15.8 Post-Processing Blocks

Each ADC module contains four post-processing blocks (PPB). These blocks can be associated with any of the 16 RESULT registers using the ADCPPBxCONFIG.CONFIG bit field. The post-processing blocks have the ability to:

- Remove an offset associated with the ADCIN channel
- Subtract out a reference value
- Compute the delta between the current conversion result and the previous conversion.
- Aggregate successive samples using sum , max, and min calculations
- Automatically calculate average of oversampled conversions without CPU overhead, when sample count is a power of 2
- Transform the conversion result into an absolute value
- Flag a zero-crossing point, with the option to trip a PWM and generate an interrupt
- Flag a high or low compare limit, with the option to trip a PWM and generate an interrupt
- Digitally filter high or low compare results, to help prevent unwanted threshold trips
- Record the delay between the associated SOC trigger and when sampling actually begins

Figure 15-22 presents the structure of each PPB. Subsequent sections explain the use of each submodule.

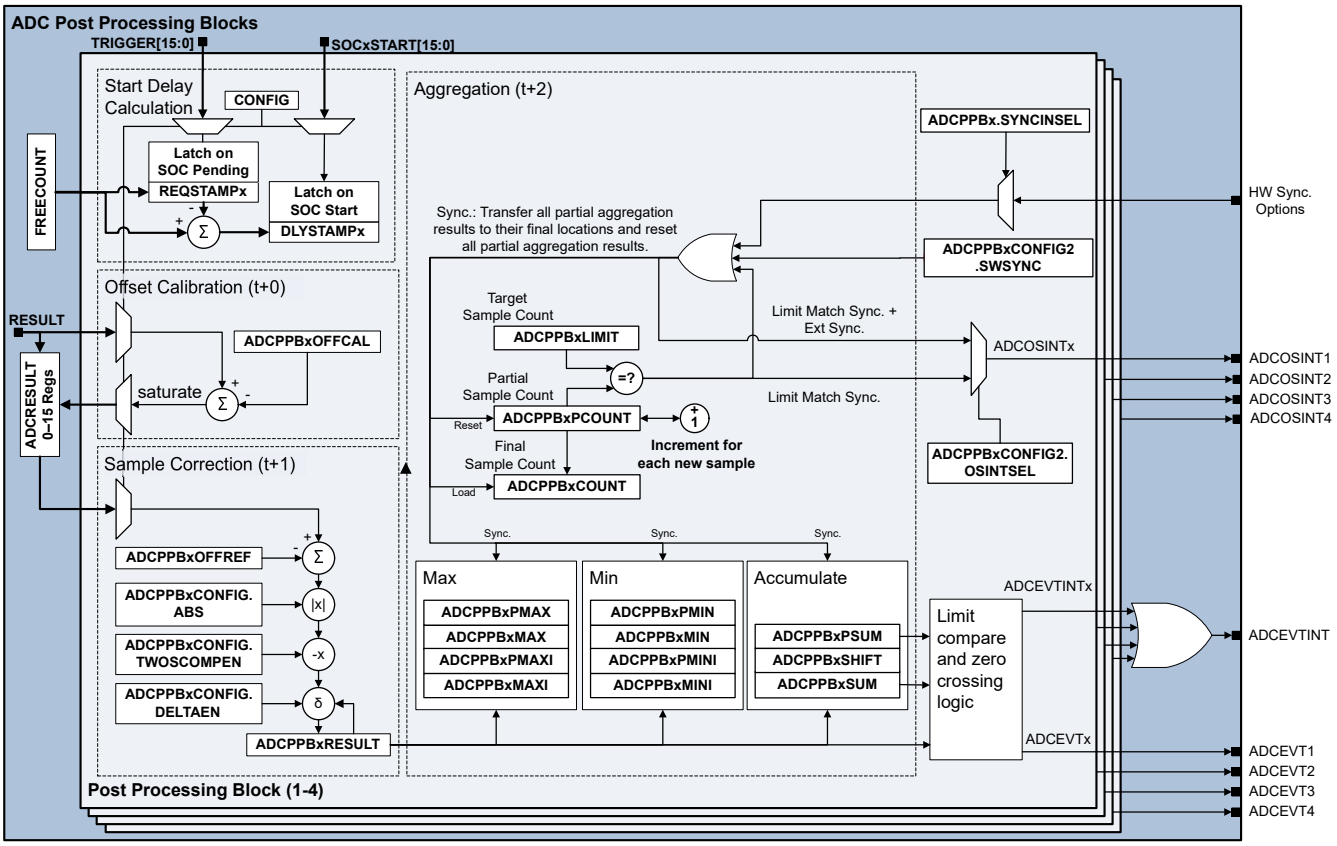

Figure 15-22. ADC PPB Block Diagram

15.8.1 PPB Offset Correction

In many applications, external sensors and signal sources produce an offset. A global trimming of the ADC offset is not enough to compensate for these offsets, which vary from channel to channel. The post-processing block can remove these offsets with zero overhead, saving numerous cycles in tight control loops.

Offset correction is accomplished by first pointing the ADCPPBxCONFIG.CONFIG to the desired SOC, then writing an offset correction value to the ADCPPBxOFFCAL.OFFCAL register. The post-processing block automatically adds or subtracts the value in the OFFCAL register from the raw conversion result and stores the value in the ADCRESULT register. This addition/subtraction saturates at 0 on the low end and 4095 on the high end.

Note

- Writing a 0 to the OFFCAL register effectively disables the offset correction feature, passing the raw result unchanged to the ADCRESULT register.
- To point multiple PPBs to the same SOC is possible. In this case, the OFFCAL value that is actually applied comes from the PPB with the lowest number.

15.8.2 PPB Error Calculation

In many applications, an error from a set point or expected value must be computed from the digital output of an ADC conversion. In other cases, a bipolar signal is necessary or convenient for control calculations. The PPB can perform these functions automatically, reducing the sample to output latency and reducing software overhead.

Error calculation is accomplished by first pointing the ADCPPBxCONFIG.CONFIG to the desired SOC, then writing a value to the ADCPPBxOFFCAL.OFFREF register. The post-processing block automatically subtracts the value in the OFFREF register from the ADCRESULT value and stores the value in the ADCPPBxRESULT register. This subtraction produces a sign-extended 32-bit result. It is also possible to selectively invert the calculated value before storing in the ADCPPBxRESULT register by setting the TWOSCOMPEN bit in the ADCPPBxCONFIG register.

If desired, the absolute value of the ADC result after the offset reference calculation can be obtained by setting the ADDCPPBxCONFIG.ABSEN bit. The absolute value is computed before evaluating the TWOSCOMPEN logic, so setting both TWOSCOMPEN and ABSEN always results in a negative value stored in ADCPPBxRESULT.

Note

- Do not write a value larger than 12 bits to the ADCPPBxOFFREF register.
- Since the ADCPPBxRESULT register is unique for each PPB, to point multiple PPBs to the same SOC and get different results for each PPB is possible.
- Writing a 0 to the ADCPPBxOFFREF register effectively disables the error calculation feature, passing the ADCRESULT value unchanged to the ADCPPBxRESULT register.

15.8.3 PPB Result Delta Calculation

The ADC's post-processing block has the capability to calculate the delta from the previous conversion sample. When enabled, the ADCPPBxRESULT register contains the difference between the current conversion result and the previous conversion. This delta is computed on the actual conversion result, not the result of the a prior delta calculation. The delta calculation occurs after OFFREF, TWOSCOMPEN and ABSEN calculations have been applied.

To enable result delta computation, write 1 to the DELTAEN bit in the ADCPPBxCONFIG register.

15.8.4 PPB Limit Detection and Zero-Crossing Detection

Many applications perform a limit check against the ADC conversion results. The PPB can automatically perform a check against high and low limits, or whenever ADCPPBxRESULT changes sign. Based on these comparisons, the PPB can generate a trip to the PWM and an interrupt automatically, lowering the sample to ePWM latency and reducing software overhead. This functionality also enables safety-conscious applications to trip the ePWM based on an out-of-range ADC conversion without any CPU intervention.

To enable this functionality, first point the ADCPPBxCONFIG.CONFIG to the desired SOC, then write a value to one or both of the registers ADCPPBxTRIPHI.LIMITHI and ADCPPBxTRIPLO.LIMITLO (zero-crossing detection does not require further configuration). Whenever these limits are exceeded, the PPBxTRIPHI bit or PPBxTRIPLO bit is set in the ADCEVTSTAT register. Note that the PPBxZERO bit in the ADCEVTSTAT register is gated by end-of-conversion (EOC), not by the sign change in the ADCPPBxRESULT register. The ADCEVTCLR register has corresponding bits to clear these event flags. The ADCEVTSEL register has corresponding bits which allow the events to propagate through to the PWM. The ADCEVTINTSEL register has corresponding bits that allow the events to propagate through to the PIE.

One PIE interrupt is shared between all the PPBs for a given ADC module as shown in Figure 15-23.

Figure 15-24 illustrates the ADC limit compare and zero-crossing logic.

Note

- If different actions need to be taken for different PPB events from the same ADC module, then the ADCEVTINT ISR has to read the PPB event flags in the ADCEVTSTAT register to determine which event caused the interrupt.
- If different ePWM trips need to be generated separately for high compare, low compare, and zero-crossing, this can be achieved by pointing multiple PPBs to the same SOC.
- The zero-crossing detect circuit considers a result of zero to be positive.

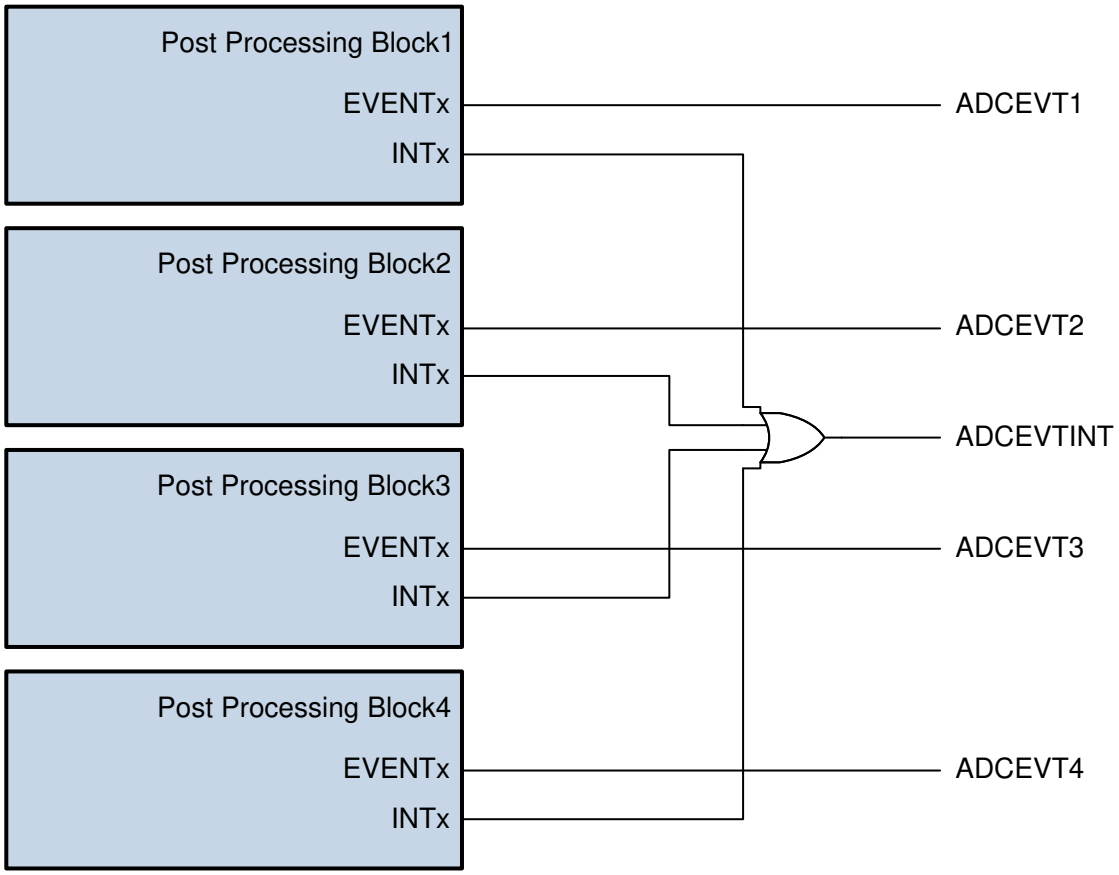

Figure 15-23. ADC PPB Interrupt Event

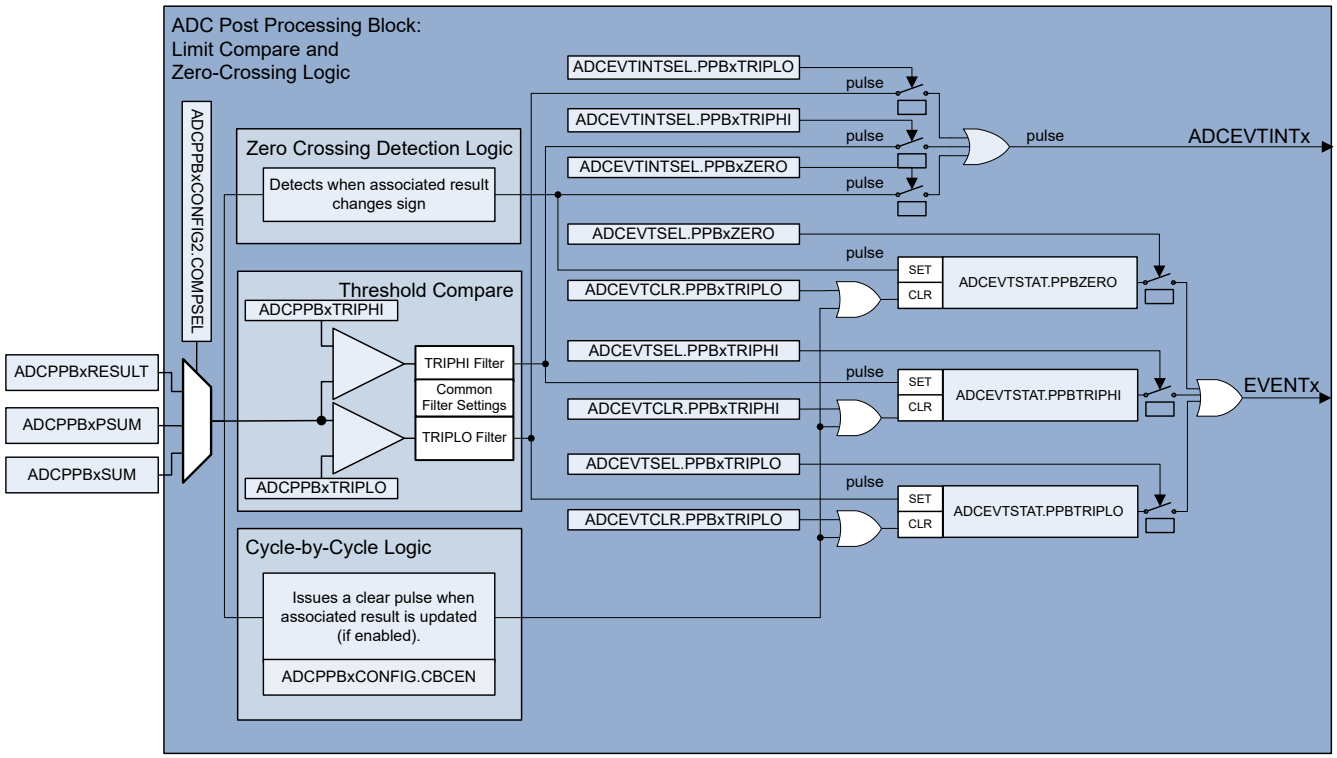

Figure 15-24. ADC PPB Limit Compare and Zero-Crossing Logic

15.8.4.1 PPB Digital Trip Filter

The ADC provides digital filters on the TRIPHI and TRIPLO signals to help prevent unwanted threshold trips. Each digital filter works on a window of FIFO samples (SAMPWIN) taken from the threshold comparator output. The filter output resolves to the majority value of the sample window, where majority is defined by the threshold (THRESH) value. If the majority threshold is not satisfied, the filter output remains unchanged. Figure 15-25 shows a block diagram of the PPB digital trip filter.

For proper operation, the value of THRESH must be greater than SAMPWIN / 2, and less than or equal to SAMPWIN.

A prescale function (CLKPRESCALE) determines the filter sampling rate. The filter FIFO captures one sample for every CLKPRESCALE cycles of SYSCLK. Old data from the FIFO is discarded.

The digital trip filters are disabled by default. To enable and configure the digital trip filters, write the desired values to the ADCPPBTRIPxFILCTL and ADCPPBTRIPxFILCLKCTL registers. Note that for SAMPWIN, THRESH and PRESCALE, the filter adds 1 to the value in the register field (for example, write 15 to SAMPWIN to enable a filter sample window of 16). To clear the FIFO and re-initialize the filter, write 1 to the FILINIT bit in the ADCPPBTRIPxFILCTL register.

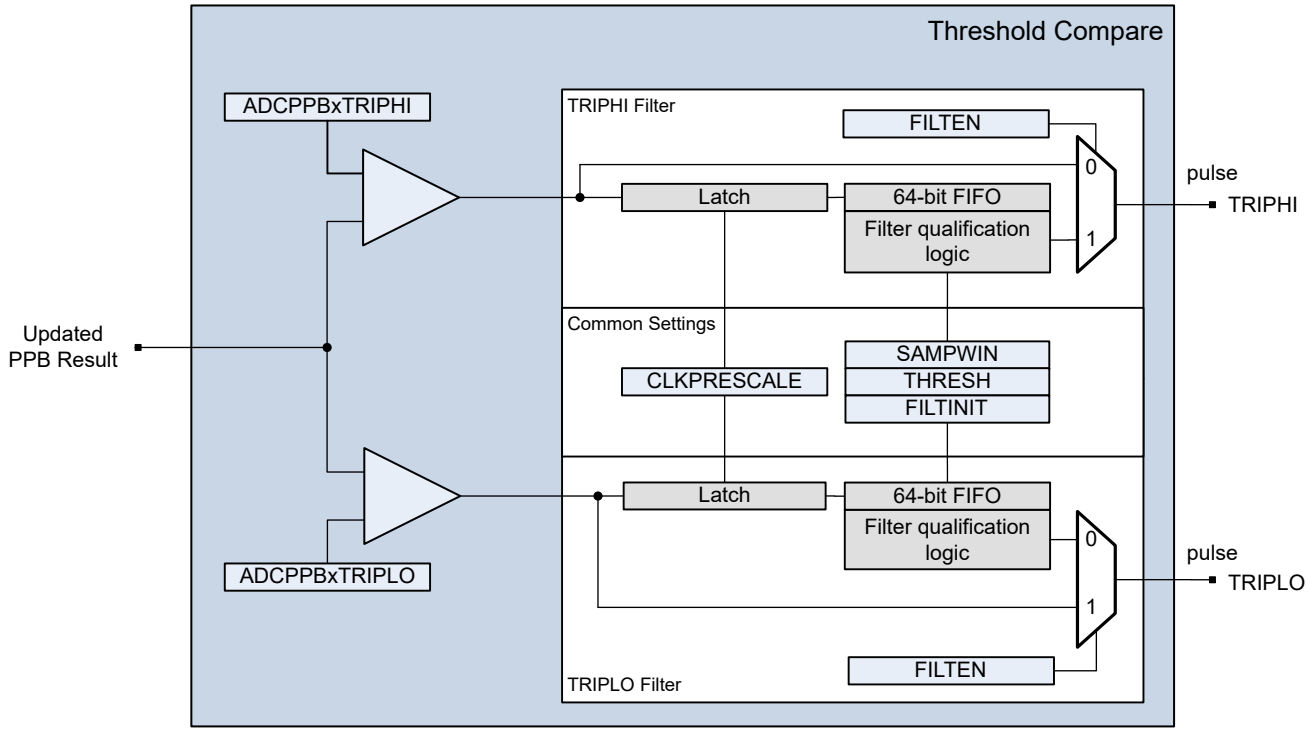

Figure 15-25. ADC PPB Limit Filter Logic

15.8.5 PPB Sample Delay Capture

When multiple control loops are running asynchronously on the same ADC, there is a chance that an ADC request from two or more loops collide, causing one of the samples to be delayed. This shows up as a measurement error in the system. By knowing when this delay occurs and the amount of delay that has occurred, software can employ extrapolation techniques to reduce the error.

To this effect, each PPB has the field DLYSTAMP in the ADCPPBxSTAMP register. This field contains the number of SYSCLK cycles between when the associate SOC was triggered and when the SOC began converting.

This is achieved by having a global 12-bit free running counter based off of SYSCLK, which is in the field FREECOUNT in the ADCCOUNTER register. When the trigger for the associated SOC arrives, the value of this counter is loaded into the bit field ADCPPBxTRIPLO.REQSTAMP. When the actual sample window for that SOC begins, the value in REQSTAMP is subtracted from the current FREECOUNT value and stored in DLYSTAMP.

Note

If more than 4096 SYSCLK cycles elapse between the SOC trigger and the actual start of the SOC acquisition, the FREECOUNT register can overflow more than once, leading to incorrect DLYSTAMP value. Be cautious when using very slow conversions to prevent this from happening.

The sample delay capture does not function, if the associated SOC is triggered using software. The sample delay capture, however, correctly records the delay, if the software triggering of a different SOC causes the SOC associated with the PPB to be delayed

15.8.6 PPB Oversampling

This ADC has built-in support for oversampling in the post-processing block, including an accumulator, min/max for peak detection, and outlier removal. The oversampling support module exists at the output of the sample correction module, as shown in Figure 15-22. The oversampling module works by accumulating results in partial registers until either the sample count limit defined in the ADCPPBxLIMIT register is reached, an external hardware sync event occurs, or the software forces a sync event by writing to the SWSYNC bit in the ADCPPBxCONFIG2 register.

15.8.6.1 Accumulation, Minimum, Maximum, and Average Functions

At the end of each ADC sample conversion, the PPB updates the partial result registers ADCPPBxPSUM, ADCPPBxPMIN, and ADCPPBxPMAX with the newly processed conversion result from the ADCPPBxRESULT register, and the partial conversion count register (ADCPPBxPCOUNT) increments by 1. When the partial conversion count equals the limit defined in ADCPPBxLIMIT, or the PPB receives a hardware or software sync signal, the PPB takes the following actions:

1. The PPB loads the values of the respective partial result registers into the final result registers ADCPPBxPSUM, ADCPPBxPMIN, and ADCPPBxPMAX.
2. The PPB loads the partial count in ADCPPBxPCOUNT into the final conversion count register ADCPPBxCOUNT.
3. The partial count register and partial result registers reset to zero.
4. The ADC generates an oversampling interrupt (OSINTx) event pulse, which triggers a CPU interrupt if so configured in the ADCINTSEL1N2 or ADCINTSEL3N4 registers.

The PPB can also be configured to generate an oversampling interrupt when there is a hardware or software sync event. To trigger an OSINTx pulse when a sync event occurs, write 1 to the OSINTSEL bit in the ADCPPBxCONFIG2 register.

The PPB can automatically compute the average of the accumulated samples if ADCPPBxLIMIT is set to a power of 2 (up to a maximum of 1024 samples). To perform automatic averaging over 2^n samples, set the SHIFT field in the ADCPPBxCONFIG2 register to n. When this field is set, the PPB divides the value of ADCPPBxPSUM by 2^n before loading into ADCPPBxSUM.

To compute an average from the accumulated sum when the number of samples is not a power of 2, divide the value of ADCPPBxSUM by the value of ADCPPBxCOUNT using the CPU.

Note

When using a sync signal to the repeater module and post-processing block to reset the ADC, note that the repeater sync signal does not stop or abort any pending SOCs. If both sync signals are issued simultaneously, any additional pending SOCs can propagate through the post-processing block after the sync signal has been issued. To fully clear or reset the ADC when using the repeater and PPB accumulation logic together:

1. Disable the repeater module trigger source.
2. Reset the trigger repeater by issuing a sync signal to the repeater module.
3. Wait for any pending SOCs to complete.
4. Finally, issue a sync signal to the post-processing block to complete the ADC reset.

15.8.6.2 Outlier Rejection

The post-processing block enables the application to easily perform outlier rejection, by eliminating the largest and smallest samples during each SOC burst. To eliminate outliers, the following formula can be used in a software routine or ISR:

$$\text{Average} = \frac{(\text{ADCPPBxSUM} - \text{ADCPPBxMAX} - \text{ADCPPBxMIN})}{(\text{ADCPPBxCOUNT} - 2)} \quad (6)$$

15.9 Opens/Shorts Detection Circuit (OSDETECT)

The opens/shorts detection circuit (OSDETECT) can be used to detect pin faults in the system. The circuit connects to the ADC input after the channel select multiplexer but before the S+H circuit as shown in Figure 15-26.

Note

- The divider resistance tolerances can vary widely; hence, this feature must not be used to check for conversion accuracy.
- See the data sheet for implementation and availability of analog input channels.
- Due to high drive impedance, a S+H duration much longer than the ADC minimum is needed.

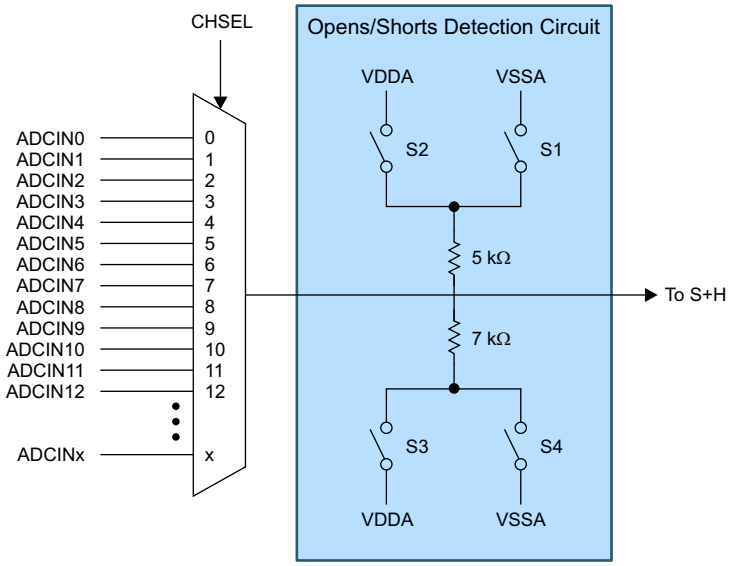

Figure 15-26. Opens/Shorts Detection Circuit

The circuit can be operated by writing a value to the DETECTCFG field in the ADCOSDETECT register. This causes the circuit to source a voltage onto the input during the S+H phase of any conversion. The voltage and drive strength of the OSDETECT circuit for different DETECTCFG settings is given in Table 15-7.

Table 15-7. DETECTCFG Settings

ADCOSDETECT. DETECTCFG	Source Voltage	S4	S3	S2	S1	Drive Impedance
0	Off	Open	Open	Open	Open	Open
1	Zero Scale	Closed	Open	Open	Closed	5K || 7K
2	Full Scale	Open	Closed	Closed	Open	5K || 7K
3	5/12 VDDA	Open	Closed	Open	Closed	5K || 7K
4	7/12 VDDA	Closed	Open	Closed	Open	5K || 7K
5	Zero Scale	Open	Open	Open	Closed	5K
6	Full Scale	Open	Open	Closed	Open	5K
7	Zero Scale	Closed	Open	Open	Open	7K

15.9.1 Implementation

A representative circuit with the OSDETECT implementation consists of the signal source with series resistance R_S, shunt capacitor C_P, the equivalent OSDETECT resistance $R_{OSDETECT}$ and voltage $V_{OSDETECT}$ is shown in Figure 15-27 and can be used as a basis to calculate the signal level going in to the sampling capacitor. $R_{OSDETECT}$ and $V_{OSDETECT}$ are the equivalent input resistance and voltage source contributed by the OSDETECT circuit with values shown in Table 15-7 for the different configuration settings. Refer to Figure 15-27 when deriving the input signal to S/H if signal source V_S is driving while the OSDETECT feature is enabled.

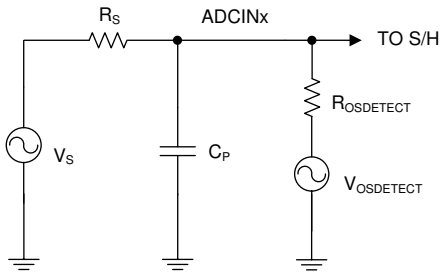

Figure 15-27. Input Circuit Equivalent with OSDETECT Enabled

The input impedance R_S and C_P are integral parts of the signal source or can have been implemented in the design to precondition the signal or to control signal settling time to meet S/H requirements. The input path has to be considered when using the OSDETECT feature, as this affects the conversion results. For instance, driving an input signal when this feature is enabled connects signal V_S to the OSDETECT circuit through R_S and affects the ADC results. Larger C_P values (in the order greater than hundreds of pF) require using higher ACQPS to make sure the signal at the input has settled prior to conversion.

To enable the circuit:

1. Configure the ADC for conversion (for example, channel, SOC, ACQPS, prescaler, trigger, and so on).
2. Set up the ADCOSDETECT register for the desired voltage divider connection as shown in Table 15-7.
3. Initiate a conversion and inspect the conversion result.

Interpret the results based on what is driving on the input side and what are the values of R_S and C_P. If the V_S signal can be disconnected from the input pin, the circuit can be used to detect open and shorted input pins as described in the following sections.

15.9.2 Detecting an Open Input Pin

By cycling through the various OSDETECT settings, the input signal is pulled towards the sourced voltages. An input with good drive strength (pin not open) is minimally affected. However, if the pin is open, the sampled voltages is close to the source voltages specified in Table 15-7.

15.9.3 Detecting a Shorted Input Pin

By cycling through the various OSDETECT settings, the input signal is pulled towards the sourced voltages. An input with finite drive strength (pin not shorted) is pulled toward each sourced voltage. However, if the pin is shorted, the signal remains at the same voltage.

15.10 Power-Up Sequence

Upon device power-up or system level reset, the ADC is powered down and disabled. When powering up the ADC, use the following sequence:

1. Set the bit to enable the desired ADC clock in the PCLKCR13 register.
2. Set the desired ADC clock divider in the PRESCALE field of ADCCTL2.
3. Power up the ADC by setting the ADCPWDNZ bit in ADCCTL1.
4. Allow a delay before sampling. See the data sheet for the necessary time.

If multiple ADCs are powered up simultaneously, steps 1 and step 3 can each be done for all ADCs in one write instruction. Also, only one delay is necessary as long as the delay occurs after all the ADCs have begun powering up.

15.11 ADC Calibration

During the fabrication and test process, Texas Instruments calibrates the gain, offset, and linearity of the ADCs, the gain and offset of the PGAs, and the offset of the buffered DACs. These trim settings are stored in TI reserved OTP memory, and can be loaded using C-callable functions.

- The Device_cal() function copies the trim values for ADC , DAC offset, and PGA gain and offset from OTP memory to the respective trim registers.
- The trim functions in Device_cal() can be called individually in C2000Ware as ADC_setOffsetTrim(), ADC_setINLTrim() and DAC_setOffsetTrim(). These functions fetch production test trim values from TI reserved OTP memory locations, and write the values to the corresponding analog module register destinations.

Until the appropriate factory trim is loaded, the ADC and other analog modules are not specified to operate within the data sheet specifications. Similarly, if trim values other than the factory settings are placed into the trim registers, the ADC (and other modules) is not specified to operate within the data sheet specifications.

The boot ROM calls the calibration functions, so trim values are initially populated without user intervention. However, if the trims are cleared due to a module reset or modified for some other reason, then the user must call the calibration functions (defined in the C2000Ware header files).

15.11.1 ADC Zero Offset Calibration

ADC offset error is determined and calibrated during factory testing. However, the user still has the option to perform offset calibration if the end application specifically requires this. This section describes how to perform offset calibration using internal VREFLO connection for single-ended operation.

Zero offset error is defined as the difference from 0 that occurs when converting a voltage at VREFLO. The zero offset error can be positive or negative. To correct this error, an adjustment of equal magnitude and opposite polarity is written into the ADCOFFTRIMx register. The value contained in this register is applied before the results are available in the ADC result registers. This operation is fully contained within the ADC core, so the timing of the results is not affected, and the full dynamic range of the ADC is maintained for any trim value.

Note

Regardless of the converter resolution, the size of each ADCOFFTRIMx step is (VREFHI-VREFLO)/ 65536.

Use the following procedure to re-calibrate the ADC offset in 12-bit single-ended mode:

1. Set ADCOFFTRIMx to +112 steps (0x70). This adds an artificial offset to account for negative offset that can reside in the ADC core.
2. Perform some multiple of 16 conversions on VREFLO (internal connection), accumulating the results (for example, 32*16 conversions = 512 conversions). Use the maximum value of ACQPS to make sure longer settling time to account for parasitic impedance of internal VREFLO connections.
3. Divide the accumulated result by the multiple of 16 (for example, for 512 conversions, divide by 32).
4. Set ADCOFFTRIMx to 112 – result from step 3.

15.12 ADC Timings

The process of converting an analog voltage to a digital value is broken down into an S+H phase and a conversion phase. The ADC sample and hold circuits (S+H) are clocked by SYSCLK while the ADC conversion process is clocked by ADCCLK. ADCCLK is generated by dividing down SYSCLK based on the PRESCALE field in the ADCCTL2 register.

The S+H duration is the value of the ACQPS field of the SOC being converted, plus one, times the SYSCLK period. The user must make sure that this duration exceeds both 1 ADCCLK period and the minimum S+H duration specified in the data sheet. The conversion time is approximately14 ADCCLK cycles (with sample cap reset inactive) or 15 ADCCLK cycles (with sample cap reset active). The exact conversion time is always a whole number of SYSCLK cycles. See the timing diagrams and tables in Section 15.12.1 for exact timings.

15.12.1 ADC Timing Diagrams

The following diagrams show the ADC conversion timings for two SOCs given the following assumptions:

- SOC0 and SOC1 are configured to use the same trigger.
- No other SOCs are converting or pending when the trigger occurs.
- The round robin pointer is in a state that causes SOC0 to convert first.
- ADCINTSEL is configured to set an ADCINT flag upon end of conversion for SOC0 (whether this flag propagates through to the CPU to cause an interrupt is determined by the configurations in the PIE module).

Table 15-8 describes the parameters in the following timing diagrams. .

Table 15-9 and Table 15-10 lists the ADC timings.

Table 15-8. ADC Timing Parameter Descriptions

Parameter	Description
t_{SH}	The duration of the S+H window. At the end of this window, the value on the S+H capacitor becomes the voltage to be converted into a digital value. The duration is given by (ACQPS + 1) SYSCLK cycles. ACQPS can be configured individually for each SOC, so t_{SH} is not necessarily the same for different SOCs. **Note:** The value on the S+H capacitor is captured approximately 5ns before the end of the S+H window regardless of device clock settings.
t_{LAT}	The time from the end of the S+H window until the ADC results latch in the ADCRESULTx register. If the ADCRESULTx register is read before this time, the previous conversion results are returned.
t_{EOC}	The time from the end of the S+H window until the S+H window for the next ADC conversion can begin. The subsequent sample can start before the conversion results are latched.
t_{INT}	The time from the end of the S+H window until an ADCINT flag is set (if configured). If the INTPULSEPOS bit in the ADCCTL1 register is set, t_{INT} coincides with the end of conversion (EOC) signal. If the INTPULSEPOS bit is 0, and the OFFSET field in the ADCINTCYCLE register is not 0, then there is a delay of OFFSET SYSCLK cycles before the ADCINT flag is set. This delay can be used to enter the ISR or trigger the DMA exactly when the sample is ready. If the INTPULSEPOS bit is 0, t_{INT} coincides with the end of the S+H window. If t_{INT} triggers a read of the ADC result register (directly through DMA or indirectly by triggering an ISR that reads the result), care must be taken to make sure the read occurs after the results latch (otherwise, the previous results are read).
t_{DMA}	The time from the end of the S+H window until a DMA read of the ADC conversion result is triggered, when ADCCTL1.TDMAEN = 1. If TDMAEN is set to 0, then the DMA trigger occurs at T_{INT}. In certain conditions, the ADCINT flag can be set before the ADCRESULT value is latched. To make sure that the DMA read occurs after the ADCRESULT value has been latched, write 1 to ADCCTL1.TDMAEN to enable DMA timings.

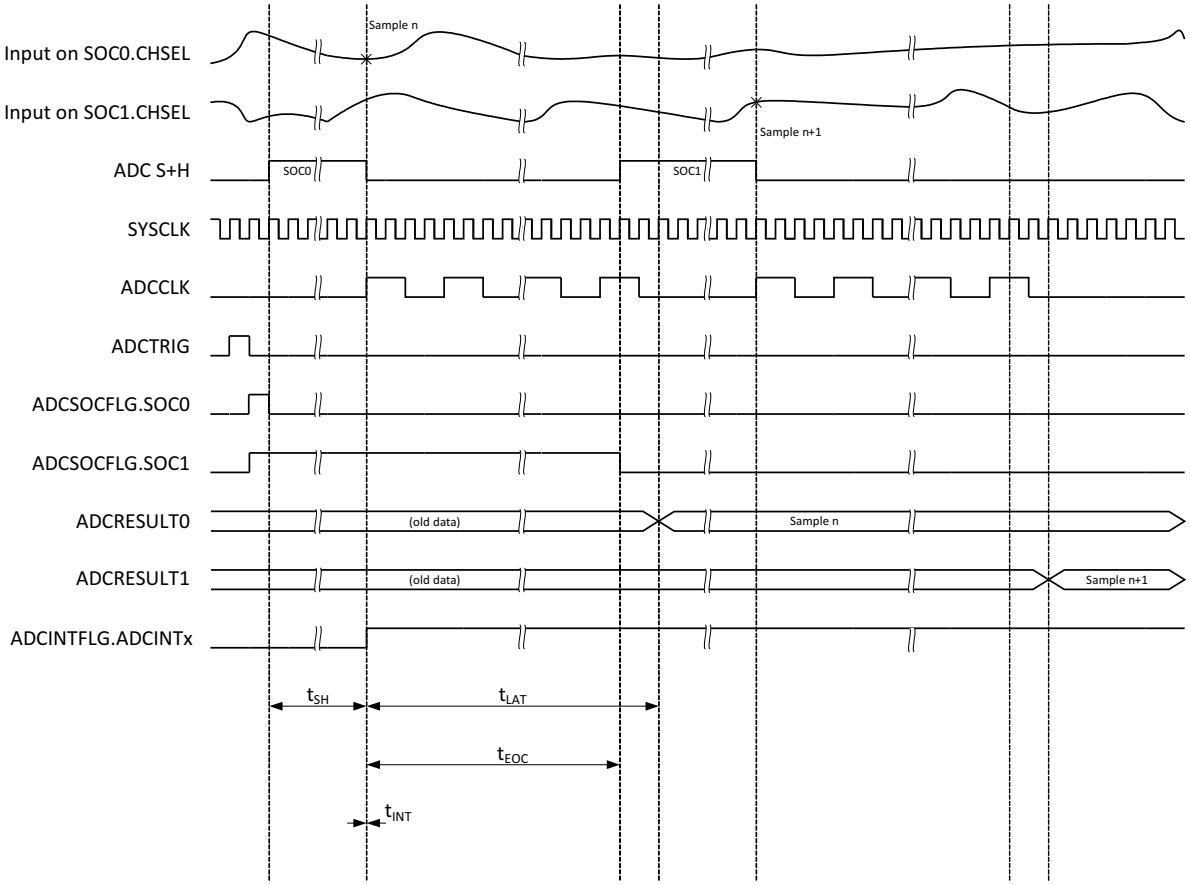

Figure 15-28. ADC Timings for 12-bit Mode in Early Interrupt Mode

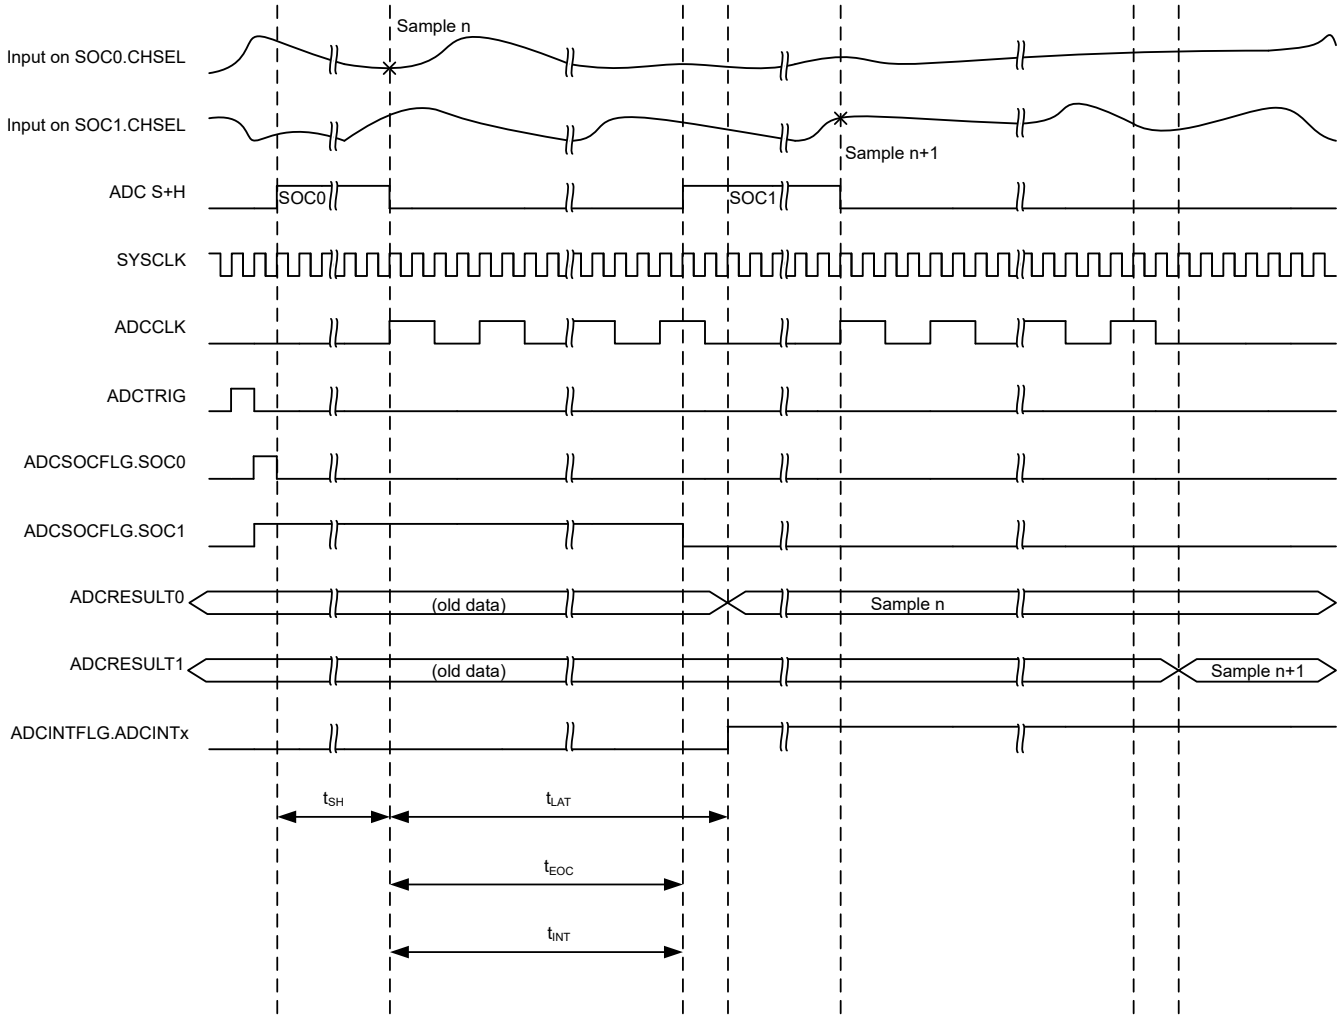

Figure 15-29. ADC Timings for 12-bit Mode in Late Interrupt Mode

Table 15-9. ADC Timings in 12-bit Mode with SAMPCAPRESETSEL = 0

ADCCLK Prescale		SYSCLK Cycles				
ADCCTL2. PRESCALE	Prescale Ratio	t_{EOC}	t_{LAT}	t_{INT} (Early)(1)	t_{INT} (Late)	t_{DMA}
0	1	15	20	1	15	20
2	2	30	35	1	30	35
3	2.5	38	46	1	38	46
4	3	45	50	1	45	50
5	3.5	53	58	1	53	58
6	4	60	65	1	60	65
7	4.5	68	73	1	68	73
8	5	75	80	1	75	80
9	5.5	83	88	1	83	88
10	6	90	95	1	90	95
11	6.5	98	103	1	98	103
12	7	105	110	1	105	110
13	7.5	113	118	1	113	118
14	8	120	125	1	120	125
15	8.5	128	133	1	128	133

(1) By default, t_{INT} occurs one SYSCLK cycle after the S+H window, if INTPULSEPOS is 0. This can be changed by writing to the OFFSET field in the ADCINTCYCLE register.

Table 15-10. ADC Timings in 12-bit Mode with SAMPCAPRESETSEL = 1

ADCCLK Prescale		SYSCLK Cycles				
ADCCTL2. PRESCALE	Prescale Ratio	t_{EOC}	t_{LAT}	t_{INT} (Early)(1)	t_{INT} (Late)	t_{DMA}
0	1	14	19	1	14	19
2	2	28	33	1	28	33
3	2.5	35	40	1	35	40
4	3	42	47	1	42	47
5	3.5	49	54	1	49	54
6	4	56	61	1	56	61
7	4.5	63	68	1	63	68
8	5	70	75	1	70	75
9	5.5	77	82	1	77	82
10	6	84	89	1	84	89
11	6.5	91	96	1	91	96
12	7	98	103	1	98	103
13	7.5	105	110	1	105	110
14	8	112	117	1	112	117
15	8.5	119	124	1	119	124

(1) By default, t_{INT} occurs one SYSCLK cycle after the S+H window, if INTPULSEPOS is 0. This can be changed by writing to the OFFSET field in the ADCINTCYCLE register.

15.12.2 Post-Processing Block Timings

The value of ADCRESULT is always available at time t_{LAT}, as specified in Section 15.12.1. The value of ADCPPBxRESULT, and the limit and zero-crossing comparisons are available 1 SYSCLK cycle later, as long as multiple PPB instances do not point to the same SOC. Table 15-11 shows PPB result availability timings when there are no SOCs shared between multiple PPBs. In cases where multiple PPBs point to the same SOC, PPB results become available sequentially, starting with the lowest numbered PPB. The first ADCPPBxRESULT becomes available 1 SYSCLK cycle after t_{LAT}, and each subsequent ADCPPBxRESULT becomes available 1 SYSCLK cycle after the previous PPB has completed the limit and zero-crossing comparison. The serialized PPB results are therefore spaced 2 or 3 SYSCLK cycles apart, depending on whether the comparison uses ADCPPBxRESULT or PSUM/SUM respectively. This timing is as shown in Table 15-12. PPB aggregation values (PSUM, SUM, PCOUNT, COUNT, PMAX, MAX, PMIN, MIN, PMINI, MINI, PMAXI, MAXI) are available 1 cycle after the associated ADCPPBxRESULT becomes available.

Furthermore, the LIMIT and zero-crossing compares occur 1 cycle after the compared results become available. In the case that the comparison is done against ADCPPBxRESULT, the comparison occurs 1 SYSCLK cycle after ADCPPBxRESULT becomes available. In the case that the comparison is done against PSUM or SUM, the comparison occurs 2 SYSCLK cycles after ADCPPBxRESULT is available.

Table 15-11. PPB Result Timings (One PPB per SOC)

Register	Description	Results Available
ADCRESULTy	ADC result	t_{LAT}
ADCPPBxRESULT	PPB result	t_{LAT} + 1 SYSCLK

15.13 Additional Information

The following sections contain additional practical information.

15.13.1 Ensuring Synchronous Operation

For best performance, all ADCs on the device must be operated synchronously. The device data sheet specifies the performance in both synchronous and asynchronous mode for those parameters which differ between the modes of operation.

To make sure synchronous operation, all ADCs on the device must operate in lockstep. This is accomplished by writing configurations to all ADCs that cause the sampling and conversion phases of all ADCs to be exactly aligned. The easiest way to accomplish this is to write identical values to the SOC configurations for each ADC for trigger select and ACQPS (S+H duration). In addition, synchronous ADCs must also configure identical values for the SOC priority control, burst mode, burst trigger, and burst size.

15.13.1.1 Basic Synchronous Operation

The following example configures two SOCs each on ADCA and ADCC with identical trigger select and ACQPS values. This results in synchronous operation between ADCA and ADCC. For devices with more than two ADCs, the same principles can be used to synchronize all the ADCs.

```
Example: Basic Synchronous Operation
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4;      //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0;      //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4;      //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1;      //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB
```

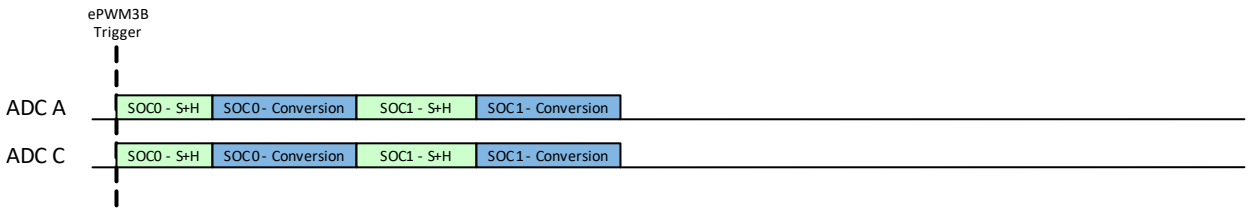

Figure 15-30. Example: Basic Synchronous Operation

Several things can be noted from Figure 15-30. First, while the ACQPS values must be the same for SOCs with the same number, different ACQPS values can be used for SOCs with different numbers. Because of this, synchronous operation does not require a single global S+H time, but instead only channels sampled simultaneously require identical S+H durations. Another important point from this example is that any channel select value can be used for any SOC. Finally, this example assumes round-robin operation. If high-priority SOCs are to be used, the priority must be configured the same on all ADCs.

15.13.1.2 Synchronous Operation with Multiple Trigger Sources

As long as each set of SOCs has identical trigger select and ACQPS settings, multiple trigger sources can be used while still achieving synchronous operation.

The following example demonstrates synchronous operation between ADCA and ADCC while using three SOCs and two trigger sources. Figure 15-31 demonstrates that any combination of relative trigger timings still results in synchronous operation.

```
Example: Synchronous Operation With Multiple Trigger Sources
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4;      //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0;      //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4;      //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1;      //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC2CTL.bit.CHSEL = 0;      //SOC2 converts ADCINA0
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 19;     //SOC2 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 2;    //SOC2 begins conversion on CPU Timer1
AdccRegs.ADCSOC2CTL.bit.CHSEL = 2;      //SOC2 converts ADCINC2
AdccRegs.ADCSOC2CTL.bit.ACQPS = 19;     //SOC2 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC2CTL.bit.TRIGSEL = 2;    //SOC2 begins conversion on CPU Timer1
```

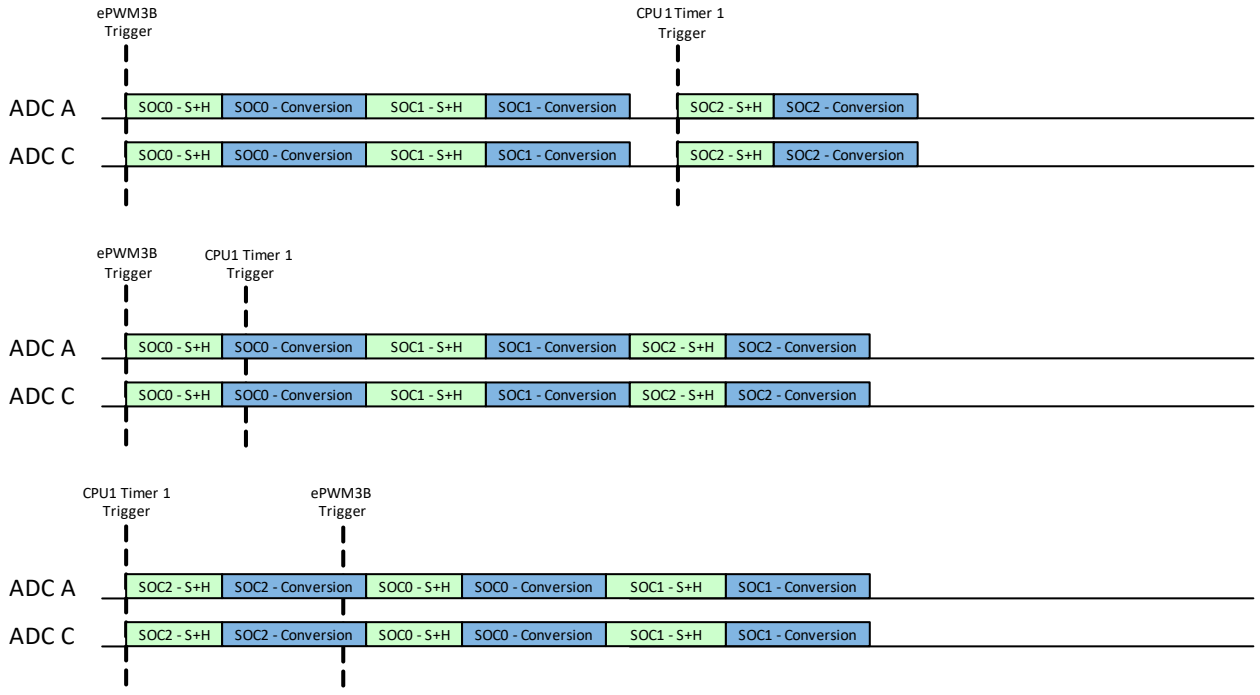

Figure 15-31. Example: Synchronous Operation with Multiple Trigger Sources

Note that any trigger source that can be selected in the TRIGSEL field can be used except for software triggering. There is no way to issue the software triggers for all ADCs simultaneously, so likely results in asynchronous operation. ADCINT1 or ADCINT2 can also be used as a trigger as long as the ADCINTSOCSEL1 and ADCINTSOCSEL2 registers are configured identically for all ADCs and software triggering is not used to start the chain of conversions.

15.13.1.3 Synchronous Operation with Uneven SOC Numbers

If only one trigger source is used, one ADC can use more SOCs than the other ADCs while still operating synchronously.

```
Example: Synchronous Operation With Uneven SOC Numbers
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4;      //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0;      //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4;      //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1;      //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30;     //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10;   //SOC1 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC2CTL.bit.CHSEL = 0;      //SOC2 converts ADCINA0
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 30;     //SOC2 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 10;   //SOC2 begins conversion on ePWM3 SOCB
```

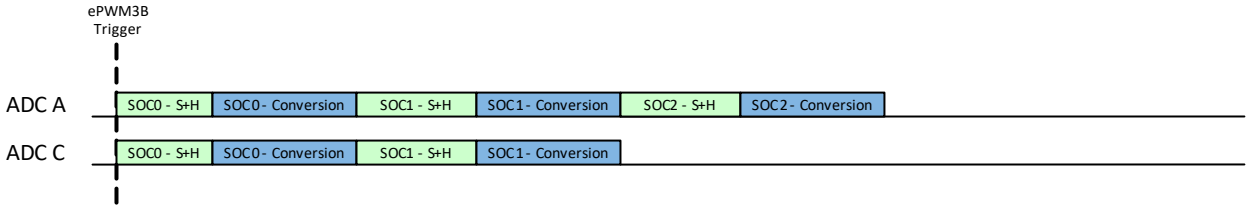

Figure 15-32. Example: Synchronous Operation with Uneven SOC Numbers

Note that if the trigger comes again before all SOCs have completed the conversions, ADCC begins converting immediately on SOC0 while ADCA does not start converting SOC0 again until SOC2 is complete. This results in asynchronous operation, so care must be taken to not overflow the trigger.

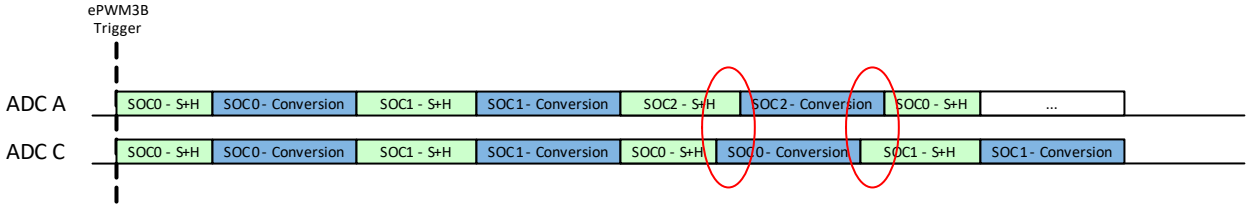

Figure 15-33. Example: Asynchronous Operation with Uneven SOC Numbers – Trigger Overflow

15.13.1.4 Non-overlapping Conversions

If conversion timings can be made sure to not overlap by the user, then it is not necessary to configure all SOCs identically on all ADCs to achieve performance equivalent to synchronous operation. For example, if the two ADC triggers in a system come from two ePWM sources that are always 180-degrees out-of-phase, then SOC0 can be used for both ADCA and ADCC with different trigger sources and different ACQPS values.

```
Example: Operation with Non-overlapping Conversions
//ePWM3 SOCA and SOCB are 180 degrees out of phase
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4;      //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;   //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0;      //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;     //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 9;    //SOC0 begins conversion on ePWM3 SOCA
```

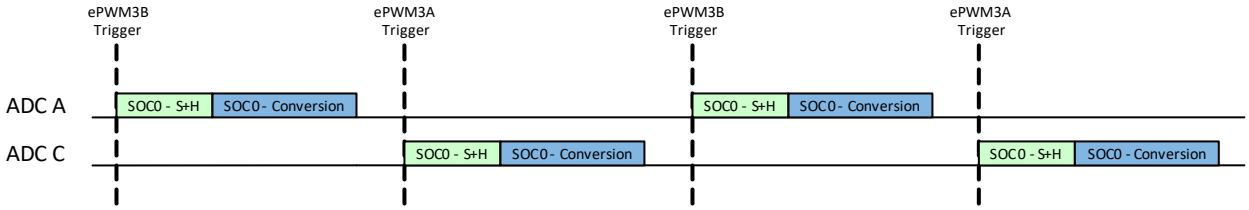

Figure 15-34. Example: Synchronous Equivalent Operation with Non-Overlapping Conversions

15.13.2 Choosing an Acquisition Window Duration

For correct operation, the input signal to the ADC must be allowed adequate time to charge the sample and hold capacitor, Ch. Typically, the S+H duration is chosen such that the sampling capacitor is charged to within ½ LSB or ¼ LSB of the final value, depending on the tolerable settling error.

The best methodology to determine the required settling time is to simulate the ADC and ADC driving circuits to make sure adequate settling performance. See *ADC Input Circuit Evaluation for C2000 MCUs* and *Charge-Sharing Driving Circuits for C2000 ADCs* for additional guidance on ADC signal conditioning circuit design and evaluation.

An approximation of the required settling time can also be determined using an RC settling model. The time constant for the model is given by the equation:

$$\tau = (R_S + R_{on}) \times C_h + R_S \times \left(C_S + C_p\right) \tag{7}$$

And the number of time constants needed is given by the equation:

$$k = ln\left(\frac{2^n}{settling\ error}\right) - ln\left(\frac{C_S + C_P}{CH}\right) \tag{8}$$

So the total S+H time must be set to at least:

$$t = k \cdot \tau \tag{9}$$

Where the following parameters are provided by the ADC input model in the device data sheet:

- n = ADC resolution (in bits)
- R_{ON} = ADC sampling switch resistance (provided in Ω)
- C_H = ADC sampling capacitor (provided in pF)
- C_p = ADC channel parasitic input capacitance (provided in pF)

And the following parameters are dependent on the application design:

- settling error = tolerable settling error (in LSBs)
- R_s = ADC driving circuit source impedance (typically in Ω or kΩ)
- C_S = capacitance on ADC input pin (typically in pF or nF)

For example, assuming the following parameters:

- n = 12-bits
- R_{ON} = 500Ω
- C_H = 12.5pF
- C_p = 12.7pF
- settling error = ¼ LSB
- R_s = 180Ω
- C_s = 150pF

The time constant is calculated as:

$$\tau = (180\Omega + 500\Omega) \times 12.5pF + 180\Omega \times (150pF + 12.7pF) = 37.8ns \quad (10)$$

And the number of required time constants is:

$$k = ln\left(\frac{2^{12}}{0.25}\right) - ln\left(\frac{150pF + 12.7pF}{12.5pF}\right) = 9.70 - 2.57 = 7.13 \quad (11)$$

So the S+H time must be set to at least: 37.8ns × 7.13 = 270ns

If SYSCLK = 150MHz , then each SYSCLK cycle is 6.667ns. S+H duration is 270ns/6.667ns = 40.5 SYSCLK cycles, so ACQPS for this input is set to at least CEILING(40.5) – 1 = 39.

While this gives a rough estimate of the required acquisition window, a better method is to setup a circuit with the ADC input model, a model of the source impedance/capacitance, and any board parasitics in SPICE (or similar software) and simulate to verify that the sampling capacitor settles to the desired accuracy.

Note

The device data sheet specifies a minimum ADC S+H window duration. Do not use an ACQPS value that gives a duration less than this specification.

15.13.3 Achieving Simultaneous Sampling

While each ADC does not have dual S+H circuits, achieving simultaneous sampling is accomplished by setting the SOC triggers on two or more ADC modules to use the same trigger source. The following example demonstrates simultaneous sampling on 3 ADCs based on an ePWM3 event. ADCINA3, ADCINB2, and ADCINC5 are sampled. An acquisition window of 20 SYSCLK cycles is used, but different durations are possible.

```
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 3;        //SOC0 converts ADCINA3
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;       //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;     //SOC0 begins conversion on ePWM3 SOCB
AdcbRegs.ADCSOC0CTL.bit.CHSEL = 2;        //SOC0 converts ADCINB2
AdcbRegs.ADCSOC0CTL.bit.ACQPS = 19;       //SOC0 uses sample duration of 20 SYSCLK cycles
AdcbRegs.ADCSOC0CTL.bit.TRIGSEL = 10;     //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 5;        //SOC0 converts ADCINC5
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;       //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10;     //SOC0 begins conversion on ePWM3 SOCB
```

When the ePWM3 trigger is received, all 3 ADCs begin converting in parallel immediately. All results are stored in the ADCRESULT0 register for each ADC. Note that this assumes that all ADCs are idle when the trigger is received. If one or more ADCs is busy, the samples do not happen at exactly the same time.

15.13.4 Result Register Mapping

The ADC results and the ADC PPB results are duplicated for each memory bus controller in the system. Bus controllers include all CPUs, DMAs, and CLAs present on the specific part family and part number. For each bus controller, no access configuration is needed to allow read access to the result registers, and no contention occurs in cases where multiple bus controllers try to read the ADC results simultaneously.

15.13.5 Internal Temperature Sensor

The internal temperature sensor measures the junction temperature of the device. The output of the sensor can be sampled with the ADC through an internal connection. This can be enabled on channel ADCIN13 on ADCA ADCIN12 on ADCC , ADCIN18 on ADCB, and on the CMPSS3_HP4 and CMPSS5_HP4 inputs and on the CMPSS2_HP5 input by setting the ENABLE bit in the TSNSCTL register.

To convert the temperature sensor reading into a temperature, pass the temperature sensor reading to the ADC_getTemperatureC() function in the ADC driverlib.

15.13.6 Designing an External Reference Circuit

Figure 15-35 shows the basic organization of the external voltage reference generation circuitry. For best performance, the externally generated reference voltage must be buffered by a precision op-amp with good bandwidth and low output impedance before being driven into the ADC reference pin. A capacitor between the high and low reference pins must be placed on the PCB as close to the pins as practical to help absorb high-frequency currents. A series resistor (typically <1Ω) in series with this capacitor is sometimes necessary to maintain op-amp stability.

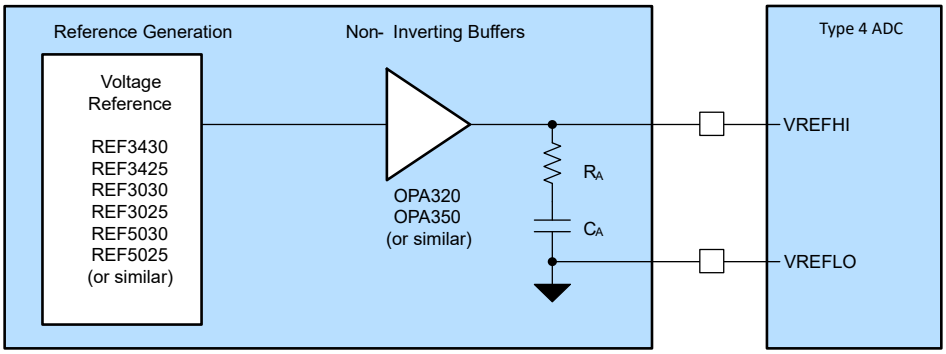

Figure 15-35. ADC Reference System

15.13.7 ADC-DAC Loopback Testing

For system diagnostic or functional safety purposes, the user application can perform a loopback test of the ADC module to verify that the ADC is converting correctly. Using the output of the DAC in the first CMPSS module, the device can be configured to supply a series of known voltages to the input of the converter, and the conversion result verified against expected results. Loopback test mode is enabled by setting the bit corresponding to the ADC module under test in the ADCLOOPBACK register in the analog subsystem module to 1. Figure 15-36 shows the connection between the CMPSS DAC output and the ADC.

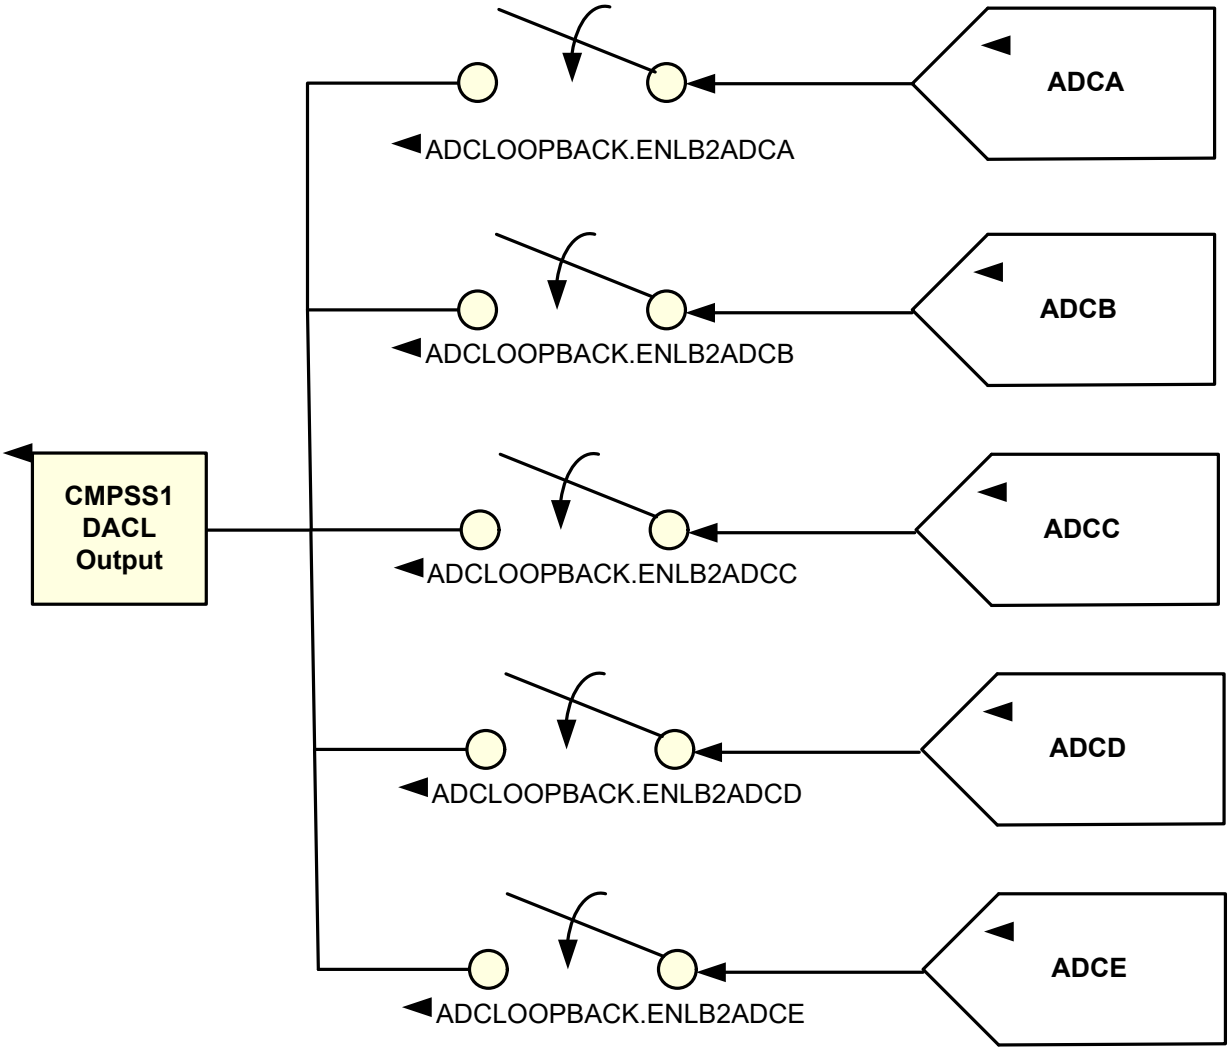

Figure 15-36. CMPSS to ADC Loopback Connection

In ADC loopback test mode, the following special considerations apply:

- The ADC module always samples the CMPSS1 DACL output, regardless of what channel is selected in the ADCSOCxCTL.CHSEL field.
- The minimum sampling window size (ACQPS) when converting the DAC output is 3.41µs (512 SYSCLK cycles at 150MHz SYSCLK) .
- The output resolution of the CMPSS DAC is 6 bits. The lower 6 bits of the input DACVAL are discarded.
- ADC loopback test mode affects CMPSS trip voltages. Avoid enabling ADC loopback mode during regular CMPSS operation.

For more information on the CMPSS module and how to configure the CMPSS DAC, see the *Comparator Subsystem (CMPSS)* chapter.

15.13.8 Internal Test Mode

For diagnostic purposes, the ADC can sample various internal node voltages using a special input selection mux called INTERNALTEST. When internal test mode is enabled, the INTERNALTEST mux selection overrides the ADC-A input channel mux: ADC-A samples the INTERNALTEST selection instead of the channel selected by ADCSOCxCTL.CHSEL. Internal test mode can be used to sample the VDDCORE voltage, VREFLO, VDDA, VSSA, and the CMPSS DAC outputs.

To enable internal test mode, write the desired node selection to the TESTSEL field of the INTERNALTESTCTL analog subsystem register. For safety, INTERNALTESTCTL includes a write key field that must be simultaneously written with the value 0xA5A5 for writes to take effect; otherwise, writes to this register are ignored. For details of internal test mux connections to various internal device voltage nodes, refer to the INTERNALTESTCTL register description.

To disable internal test mode, write 0 to the TESTSEL field of the INTERNALTESTCTL register.

When using internal test mode, the following special considerations apply:

- INTERNALTESTCTL.TESTSEL overrides the value of ADCSOCxCTL.CHSEL on ADCA when a non-zero value is configured.
- The minimum sampling window size (ACQPS) when converting INTERNALTEST is 3.41µs (512 SYSCLK cycles at 150MHz SYSCLK) .
- The effective resolution of the CMPSS DAC outputs to INTERNALTEST is 6 bits.

For more information on the CMPSS module and how to configure the CMPSS DAC, see the *Comparator Subsystem (CMPSS)* chapter.

15.13.9 ADC Gain and Offset Calibration

Using the INTERNALTEST mux, gain balancing between multiple ADCs can be performed. By calculating the relative gain error between the ADCs, conversion results can be post-processed in software such that each ADC has the same output for each equivalent input.

To activate gain calibration mode, configure the TESTSEL field of the INTERNALTESTCTL analog subsystem register to select ENZ_CALIB_GAIN_3P3V. In this mode, the voltage sampled by all ADCs when triggered is (VREFHI * 0.9), overriding the channel selection in ADCSOCxCTL.CHSEL. To turn off gain calibration mode and return to normal operation, configure the TESTSEL field of INTERNALTESTCTL to 0.

15.14.2 ADC Examples

NOTE: These examples are located in the C2000Ware installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/adc

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

15.14.2.1 ADC Software Triggering

FILE: adc_ex1_soc_software.c

This example converts some voltages on ADCA and ADCC based on a software trigger.

The ADCC will not convert until ADCA is complete, so the ADCs will not run asynchronously. However, this is much less efficient than allowing the ADCs to convert synchronously in parallel (for example, by using an ePWM trigger).

External Connections

- A0, A1, C1, and C3 should be connected to signals to convert

Watch Variables

- *myADC0Result0* - Digital representation of the voltage on pin A0
- *myADC0Result1* - Digital representation of the voltage on pin A1
- *myADC1Result0* - Digital representation of the voltage on pin C1
- *myADC1Result1* - Digital representation of the voltage on pin C3

15.14.2.2 ADC ePWM Triggering

FILE: adc_ex2_soc_epwm.c

This example sets up ePWM1 to periodically trigger a conversion on ADCA.

External Connections

- A0 should be connected to a signal to convert

Watch Variables

- *myADC0Results* - A sequence of analog-to-digital conversion samples from pin A0. The time between samples is determined based on the period of the ePWM timer.

15.14.2.3 ADC Temperature Sensor Conversion

FILE: adc_ex3_temp_sensor.c

This example sets up the ePWM to periodically trigger the ADC. The ADC converts the internal connection to the temperature sensor, which is then interpreted as a temperature by calling the ADC_getTemperatureC() function.

Watch Variables

- *sensorSample* - The raw reading from the temperature sensor
- *sensorTemp* - The interpretation of the sensor sample as a temperature in degrees Celsius.

15.14.2.4 ADC Synchronous SOC Software Force (adc_soc_software_sync)

FILE: adc_ex4_soc_software_sync.c

This example converts some voltages on ADCA and ADCC using input 5 of the input X-BAR as a software force. Input 5 is triggered by toggling GPIO0, but any spare GPIO could be used. This method will ensure that both ADCs start converting at exactly the same time.

External Connections

- A2, A3, C1, C3 pins should be connected to signals to convert

Watch Variables

- *myADC0Result0* : a digital representation of the voltage on pin A2
- *myADC0Result1* : a digital representation of the voltage on pin A3
- *myADC1Result0* : a digital representation of the voltage on pin C1
- *myADC1Result1* : a digital representation of the voltage on pin C3

15.14.2.5 ADC Continuous Triggering (adc_soc_continuous)

FILE: adc_ex5_soc_continuous.c

This example sets up the ADC to convert continuously, achieving maximum sampling rate.
External Connections

- A0 pin should be connected to signal to convert

Watch Variables

- *adcAResults* - A sequence of analog-to-digital conversion samples from pin A0. The time between samples is the minimum possible based on the ADC speed.

15.14.2.6 ADC Continuous Conversions Read by DMA (adc_soc_continuous_dma)

FILE: adc_ex6_soc_continuous_dma.c

This example sets up two ADC channels to convert simultaneously. The results will be transferred by the DMA into a buffer in RAM.

External Connections
- A3 & C3 pins should be connected to signals to convert

Watch Variables
- *myADC0DataBuffer* : a digital representation of the voltage on pin A3
- *myADC1DataBuffer* : a digital representation of the voltage on pin C3

15.14.2.7 ADC PPB Offset (adc_ppb_offset)

FILE: adc_ex7_ppb_offset.c

This example software triggers the ADC. Some SOCs have automatic offset adjustment applied by the post-processing block. After the program runs, the memory will contain ADC & post-processing block(PPB) results.

External Connections
- A2, C1 pins should be connected to signals to convert

Watch Variables
- *myADC0Result* : a digital representation of the voltage on pin A2
- *myADC0PPBResult* : a digital representation of the voltage on pin A2, minus 100 LSBs of automatically added offset
- *myADC1Result* : a digital representation of the voltage on pin C1
- *myADC1PPBResult* : a digital representation of the voltage on pin C1 plus 100 LSBs of automatically added offset

15.14.2.8 ADC PPB Limits (adc_ppb_limits)

FILE: adc_ex8_ppb_limits.c

This example sets up the ePWM to periodically trigger the ADC. If the results are outside of the defined range, the post-processing block will generate an interrupt.

The default limits are 1000LSBs and 3000LSBs. With VREFHI set to 3.3V, the PPB will generate an interrupt if the input voltage goes above about 2.4V or below about 0.8V.

External Connections
- A0 should be connected to a signal to convert

Watch Variables
- None

15.14.2.9 ADC PPB Delay Capture (adc_ppb_delay)

FILE: adc_ex9_ppb_delay.c

This example demonstrates delay capture using the post-processing block.

Two asynchronous ADC triggers are setup:
- ePWM1, with period 2048, triggering SOC0 to convert on pin A0
- ePWM2, with period 9999, triggering SOC1 to convert on pin A2
  Each conversion generates an ISR at the end of the conversion. In the ISR for SOC0, a conversion counter is incremented and the PPB is checked to determine if the sample was delayed.
  After the program runs, the memory will contain:

conversion : the sequence of conversions using SOC0 that were delayed
- *delay* : the corresponding delay of each of the delayed conversions

15.14.2.10 ADC ePWM Triggering Multiple SOC

FILE: adc_ex10_multiple_soc_epwm.c

This example sets up ePWM1 to periodically trigger a set of conversions on ADCA and ADCC. This example demonstrates multiple ADCs working together to process of a batch of conversions using the available parallelism across multiple ADCs.

ADCA Interrupt ISRs are used to read results of both ADCA and ADCC.

External Connections
- A0, A1, A2 and C1, C3, C4 pins should be connected to signals to be converted.

Watch Variables
- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2
- *adcCResult0* - Digital representation of the voltage on pin C1
- *adcCResult1* - Digital representation of the voltage on pin C3
- *adcCResult2* - Digital representation of the voltage on pin C4

15.14.2.11 ADC Burst Mode

FILE: adc_ex11_burst_mode_epwm.c

This example sets up ePWM1 to periodically trigger ADCA using burst mode. This allows for different channels to be sampled with each burst.

Each burst triggers 3 conversions. A0 and A1 are part of every burst while the third conversion rotates between A2, A3, and A4. This allows high importance signals to be sampled at high speed while lower priority signals can be sampled at a lower rate.

ADCA Interrupt ISRs are used to read results for ADCA.

External Connections
- A0, A1, A2, A3, A4

Watch Variables
- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2
- *adcAResult3* - Digital representation of the voltage on pin A3
- *adcAResult4* - Digital representation of the voltage on pin A4

15.14.2.12 ADC Burst Mode Oversampling

FILE: adc_ex12_burst_mode_oversampling.c

This example is an ADC oversampling example implemented with software. The ADC SOCs are configured in burst mode, triggered by the ePWM SOC A event trigger.

External Connection
- A2

Watch Variables
- *lv_results* - Array of digital values measured on pin A2 (oversampling is configured by Oversampling_Amount)

15.14.2.13 ADC SOC Oversampling

FILE: adc_ex13_soc_oversampling.c

This example sets up ePWM1 to periodically trigger a set of conversions on ADCA including multiple SOCs that all convert A2 to achieve oversampling on A2.

ADCA Interrupt ISRs are used to read results of ADCA.

External Connections

- A0, A1, A2 should be connected to signals to be converted.

Watch Variables

- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2

15.14.2.14 ADC PPB PWM trip (adc_ppb_pwm_trip)

FILE: adc_ex14_ppb_pwm_trip.c

This example demonstrates EPWM tripping through ADC limit detection PPB block. ADCAINT1 is configured to periodically trigger the ADCA channel 2 post initial software forced trigger. The limit detection post-processing block(PPB) is configured and if the ADC results are outside of the defined range, the post-processing block will generate an ADCxEVTy event. This event is configured as EPWM trip source through configuring EPWM XBAR and corresponding EPWM's trip zone and digital compare sub-modules. The example showcases

- one-shot
- cycle-by-cycle
- and direct tripping of PWMs through ADCAEVT1 source via Digital compare submodule.

The default limits are 0LSBs and 3600LSBs. With VREFHI set to 3.3V, the PPB will generate a trip event if the input voltage goes above about 2.9V.

External Connections

- A2 should be connected to a signal to convert
- Observe the following signals on an oscilloscope
  - ePWM1(GPIO0 - GPIO1)
  - ePWM2(GPIO2 - GPIO3)
  - ePWM3(GPIO4 - GPIO5)
-

Watch Variables

- adcA2Results - digital representation of the voltage on pin A2

15.14.2.15 ADC Trigger Repeater Oversampling

FILE: adc_ex15_trigger_repeater_oversampling.c

This example configures ADC for oversampling using trigger repeater block. The ePWM1 is configured to periodically trigger the ADC SOC and the trigger repeater module is configured to generate 4 repeated pulses. Post-processing block will take the repeated pulses, accumulates them and stores the results in ppb sum register.

External Connections

- A0 should be connected to signals to convert.

Watch Variables

- *myADC0Result* - Digital representation of the voltage on pin A0
- *myPPB0Result* - Digital representation of the voltage of the 4 repeated pulses on pin A0

15.14.2.16 ADC Trigger Repeater Undersampling

FILE: adc_ex16_trigger_repeater_undersampling.c

This example configures ADC for undersampling using trigger repeater block. The ePWM1 is configured to periodically trigger the ADC SOC and the trigger repeater module is configured to generate 1 pulse out of three pulses. Post-processing block will take the undersampled pulse, accumulates them and stores the results in ppb sum register.

External Connections

- A0 should be connected to signals to convert.

Watch Variables

- *myADC0Result* - Digital representation of the voltage on pin A0
- *myPPB0Result* - Digital representation of the voltage of the undersample pulse on pin A0

15.15 ADC Registers

This section describes the ADC Registers.

15.15.1 ADC Base Address Table

Table 15-14. ADC Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected

Complex bit access types are encoded to fit into small table cells. Table 15-16 shows the codes that are used for access types in this section.

Table 15-16. ADC_RESULT_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.15.2.1 ADCRESULT0 Register (Offset = 0h) [Reset = 0000h]

ADCRESULT0 is shown in Figure 15-37 and described in Table 15-17.

Return to the Summary Table.

Complex bit access types are encoded to fit into small table cells. Table 15-62 shows the codes that are used for access types in this section.

Table 15-62. ADC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.15.3.1 ADCCTL1 Register (Offset = 0h) [Reset = 0000h]

ADCCTL1 is shown in Figure 15-81 and described in Table 15-63.

Return to the Summary Table.

ADC Control 1 Register

Table 15-63. ADCCTL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	TDMAEN	R/W	0h	Enable Alternate DMA Timings. This bit controls when the DMA is triggered. 0 DMA is triggered at the same time as the CPU interrupt 1 DMA is always triggered at tDMA regardless or whether the ADC is in early interrupt mode or late interrupt mode Reset type: SYSRSn
14	EXTMUXPRESELECTEN	R/W	0h	If th the ADC SOC sequence is deterministic, the ADCEXTMUX pins can be set earlier: at the end of the S+H window of the previous conversion instead of the beginning of the S+H window of the current conversion. This allows some of the external mux settling time to be pipelined with the previous conversion's conversion time. However, this will not work in the case where high-priority SOCs can arrive asynchronously. 0 ADCEXTMUX pins only change at beginning of S+H window 1 ADCEXTMUX pins are set after the end of S+H window based on pending SOCs Reset type: SYSRSn
13	ADCBSY	R	0h	ADC Busy. Set when ADC SOC is generated, cleared by hardware four ADC clocks after negative edge of S/H pulse. Used by the ADC state machine to determine if ADC is available to sample. 0 ADC is available to sample next channel 1 ADC is busy and cannot sample another channel Reset type: SYSRSn
12	RESERVED	R	0h	Reserved

Table 15-63. ADCCTL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11-8	ADCBSYCHN	R	0h	ADC Busy Channel. Set when an ADC Start of Conversion (SOC) is generated. When ADCBSY=0: holds the value of the last converted SOC When ADCBSY=1: reflects the SOC currently being processed 0h SOC0 is currently processing or was last SOC converted 1h SOC1 is currently processing or was last SOC converted 2h SOC2 is currently processing or was last SOC converted 3h SOC3 is currently processing or was last SOC converted 4h SOC4 is currently processing or was last SOC converted 5h SOC5 is currently processing or was last SOC converted 6h SOC6 is currently processing or was last SOC converted 7h SOC7 is currently processing or was last SOC converted 8h SOC8 is currently processing or was last SOC converted 9h SOC9 is currently processing or was last SOC converted Ah SOC10 is currently processing or was last SOC converted Bh SOC11 is currently processing or was last SOC converted Ch SOC12 is currently processing or was last SOC converted Dh SOC13 is currently processing or was last SOC converted Eh SOC14 is currently processing or was last SOC converted Fh SOC15 is currently processing or was last SOC converted Reset type: SYSRSn
7	ADCPWDNZ	R/W	0h	ADC Power Down (active low). This bit controls the power up and power down of all the analog circuitry inside the analog core. 0 All analog circuitry inside the core is powered down 1 All analog circuitry inside the core is powered up Reset type: SYSRSn
6-3	RESERVED	R	0h	Reserved
2	INTPULSEPOS	R/W	0h	ADC Interrupt Pulse Position. 0 Interrupt pulse generation occurs when ADC begins conversion (at the end of the acquisition window) plus a number of SYSCLK cycles as specified in the ADCINTCYCLE.OFFSET register. 1 Interrupt pulse generation occurs at the end of the conversion, 1 cycle prior to the ADC result latching into its result register Reset type: SYSRSn
1-0	RESERVED	R	0h	Reserved

15.15.3.2 ADCCTL2 Register (Offset = 1h) [Reset = 0000h]

ADCCTL2 is shown in Figure 15-82 and described in Table 15-64.

Return to the Summary Table.

Table 15-73. ADCINTSOCSEL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SOC15	R/W	0h	SOC15 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC15. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC15. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC15. 10 ADCINT2 will trigger SOC15. 11 Invalid selection. Reset type: SYSRSn
29-28	SOC14	R/W	0h	SOC14 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC14. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC14. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC14. 10 ADCINT2 will trigger SOC14. 11 Invalid selection. Reset type: SYSRSn
27-26	SOC13	R/W	0h	SOC13 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC13. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC13. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC13. 10 ADCINT2 will trigger SOC13. 11 Invalid selection. Reset type: SYSRSn
25-24	SOC12	R/W	0h	SOC12 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC12. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC12. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC12. 10 ADCINT2 will trigger SOC12. 11 Invalid selection. Reset type: SYSRSn

Table 15-73. ADCINTSOCSEL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-22	SOC11	R/W	0h	SOC11 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC11. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC11. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC11. 10 ADCINT2 will trigger SOC11. 11 Invalid selection. Reset type: SYSRSn
21-20	SOC10	R/W	0h	SOC10 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC10. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC10. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC10. 10 ADCINT2 will trigger SOC10. 11 Invalid selection. Reset type: SYSRSn
19-18	SOC9	R/W	0h	SOC9 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC9. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC9. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC9. 10 ADCINT2 will trigger SOC9. 11 Invalid selection. Reset type: SYSRSn
17-16	SOC8	R/W	0h	SOC8 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC8. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC8. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC8. 10 ADCINT2 will trigger SOC8. 11 Invalid selection. Reset type: SYSRSn
15-14	SOC7	R/W	0h	SOC7 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC7. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC7. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC7. 10 ADCINT2 will trigger SOC7. 11 Invalid selection. Reset type: SYSRSn
13-12	SOC6	R/W	0h	SOC6 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC6. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC6. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC6. 10 ADCINT2 will trigger SOC6. 11 Invalid selection. Reset type: SYSRSn

Table 15-73. ADCINTSOCSEL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11-10	SOC5	R/W	0h	SOC5 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC5. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC5. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC5. 10 ADCINT2 will trigger SOC5. 11 Invalid selection. Reset type: SYSRSn
9-8	SOC4	R/W	0h	SOC4 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC4. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC4. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC4. 10 ADCINT2 will trigger SOC4. 11 Invalid selection. Reset type: SYSRSn
7-6	SOC3	R/W	0h	SOC3 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC3. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC3. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC3. 10 ADCINT2 will trigger SOC3. 11 Invalid selection. Reset type: SYSRSn
5-4	SOC2	R/W	0h	SOC2 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC2. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC2. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC2. 10 ADCINT2 will trigger SOC2. 11 Invalid selection. Reset type: SYSRSn
3-2	SOC1	R/W	0h	SOC1 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC1. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC1. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC1. 10 ADCINT2 will trigger SOC1. 11 Invalid selection. Reset type: SYSRSn
1-0	SOC0	R/W	0h	SOC0 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC0. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC0. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC0. 10 ADCINT2 will trigger SOC0. 11 Invalid selection. Reset type: SYSRSn

15.15.3.12 ADCSOCFLG1 Register (Offset = 12h) [Reset = 0000h]

ADCSOCFLG1 is shown in Figure 15-92 and described in Table 15-74.

Return to the Summary Table.

ADC SOC Flag 1 Register

Table 15-74. ADCSOCFLG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Flag. Indicates the state of SOC15 conversions. 0 No sample pending for SOC15. 1 Trigger has been received and sample is pending for SOC15. This bit will be automatically cleared when the SOC15 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
14	SOC14	R	0h	SOC14 Start of Conversion Flag. Indicates the state of SOC14 conversions. 0 No sample pending for SOC14. 1 Trigger has been received and sample is pending for SOC14. This bit will be automatically cleared when the SOC14 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
13	SOC13	R	0h	SOC13 Start of Conversion Flag. Indicates the state of SOC13 conversions. 0 No sample pending for SOC13. 1 Trigger has been received and sample is pending for SOC13. This bit will be automatically cleared when the SOC13 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn

Table 15-74. ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SOC12	R	0h	SOC12 Start of Conversion Flag. Indicates the state of SOC12 conversions. 0 No sample pending for SOC12. 1 Trigger has been received and sample is pending for SOC12. This bit will be automatically cleared when the SOC12 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
11	SOC11	R	0h	SOC11 Start of Conversion Flag. Indicates the state of SOC11 conversions. 0 No sample pending for SOC11. 1 Trigger has been received and sample is pending for SOC11. This bit will be automatically cleared when the SOC11 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
10	SOC10	R	0h	SOC10 Start of Conversion Flag. Indicates the state of SOC10 conversions. 0 No sample pending for SOC10. 1 Trigger has been received and sample is pending for SOC10. This bit will be automatically cleared when the SOC10 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
9	SOC9	R	0h	SOC9 Start of Conversion Flag. Indicates the state of SOC9 conversions. 0 No sample pending for SOC9. 1 Trigger has been received and sample is pending for SOC9. This bit will be automatically cleared when the SOC9 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
8	SOC8	R	0h	SOC8 Start of Conversion Flag. Indicates the state of SOC8 conversions. 0 No sample pending for SOC8. 1 Trigger has been received and sample is pending for SOC8. This bit will be automatically cleared when the SOC8 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn

Table 15-74. ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SOC7	R	0h	SOC7 Start of Conversion Flag. Indicates the state of SOC7 conversions. 0 No sample pending for SOC7. 1 Trigger has been received and sample is pending for SOC7. This bit will be automatically cleared when the SOC7 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
6	SOC6	R	0h	SOC6 Start of Conversion Flag. Indicates the state of SOC6 conversions. 0 No sample pending for SOC6. 1 Trigger has been received and sample is pending for SOC6. This bit will be automatically cleared when the SOC6 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
5	SOC5	R	0h	SOC5 Start of Conversion Flag. Indicates the state of SOC5 conversions. 0 No sample pending for SOC5. 1 Trigger has been received and sample is pending for SOC5. This bit will be automatically cleared when the SOC5 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
4	SOC4	R	0h	SOC4 Start of Conversion Flag. Indicates the state of SOC4 conversions. 0 No sample pending for SOC4. 1 Trigger has been received and sample is pending for SOC4. This bit will be automatically cleared when the SOC4 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
3	SOC3	R	0h	SOC3 Start of Conversion Flag. Indicates the state of SOC3 conversions. 0 No sample pending for SOC3. 1 Trigger has been received and sample is pending for SOC3. This bit will be automatically cleared when the SOC3 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn

Table 15-74. ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SOC2	R	0h	SOC2 Start of Conversion Flag. Indicates the state of SOC2 conversions. 0 No sample pending for SOC2. 1 Trigger has been received and sample is pending for SOC2. This bit will be automatically cleared when the SOC2 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
1	SOC1	R	0h	SOC1 Start of Conversion Flag. Indicates the state of SOC1 conversions. 0 No sample pending for SOC1. 1 Trigger has been received and sample is pending for SOC1. This bit will be automatically cleared when the SOC1 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn
0	SOC0	R	0h	SOC0 Start of Conversion Flag. Indicates the state of SOC0 conversions. 0 No sample pending for SOC0. 1 Trigger has been received and sample is pending for SOC0. This bit will be automatically cleared when the SOC0 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not. Reset type: SYSRSn

15.15.3.13 ADCSOCFRC1 Register (Offset = 14h) [Reset = 0000h]

ADCSOCFRC1 is shown in Figure 15-93 and described in Table 15-75.

Return to the Summary Table.

ADC SOC Force 1 Register

Figure 15-93. ADCSOCFRC1 Register

15	14	13	12	11	10	9	8

Table 15-75. ADCSOCFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R-0/W1S	0h	SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
14	SOC14	R-0/W1S	0h	SOC14 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC14 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC14 flag bit to 1. This will cause a conversion to start once priority is given to SOC14. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC14 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
13	SOC13	R-0/W1S	0h	SOC13 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC13 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC13 flag bit to 1. This will cause a conversion to start once priority is given to SOC13. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC13 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn

Table 15-75. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SOC12	R-0/W1S	0h	SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
11	SOC11	R-0/W1S	0h	SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
10	SOC10	R-0/W1S	0h	SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
9	SOC9	R-0/W1S	0h	SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn

Table 15-75. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SOC8	R-0/W1S	0h	SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
7	SOC7	R-0/W1S	0h	SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
6	SOC6	R-0/W1S	0h	SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
5	SOC5	R-0/W1S	0h	SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn

Table 15-75. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOC4	R-0/W1S	0h	SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
3	SOC3	R-0/W1S	0h	SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
2	SOC2	R-0/W1S	0h	SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn
1	SOC1	R-0/W1S	0h	SOC1 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC1 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC1 flag bit to 1. This will cause a conversion to start once priority is given to SOC1. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC1 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn

Table 15-75. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SOC0	R-0/W1S	0h	SOC0 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC0 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. Reset type: SYSRSn

15.15.3.14 ADCSOCOVF1 Register (Offset = 16h) [Reset = 0000h]

ADCSOCOVF1 is shown in Figure 15-94 and described in Table 15-76.

Return to the Summary Table.

ADC SOC Overflow 1 Register

Table 15-76. ADCSOCOVF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Overflow Flag. Indicates an SOC15 event was generated in hardware while an existing SOC15 event was already pending. 0 No SOC15 event overflow. 1 SOC15 event overflow. An overflow condition does not stop SOC15 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
14	SOC14	R	0h	SOC14 Start of Conversion Overflow Flag. Indicates an SOC14 event was generated in hardware while an existing SOC14 event was already pending. 0 No SOC14 event overflow. 1 SOC14 event overflow. An overflow condition does not stop SOC14 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
13	SOC13	R	0h	SOC13 Start of Conversion Overflow Flag. Indicates an SOC13 event was generated in hardware while an existing SOC13 event was already pending. 0 No SOC13 event overflow. 1 SOC13 event overflow. An overflow condition does not stop SOC13 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
12	SOC12	R	0h	SOC12 Start of Conversion Overflow Flag. Indicates an SOC12 event was generated in hardware while an existing SOC12 event was already pending. 0 No SOC12 event overflow. 1 SOC12 event overflow. An overflow condition does not stop SOC12 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn

Table 15-76. ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R	0h	SOC11 Start of Conversion Overflow Flag. Indicates an SOC11 event was generated in hardware while an existing SOC11 event was already pending. 0 No SOC11 event overflow. 1 SOC11 event overflow. An overflow condition does not stop SOC11 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
10	SOC10	R	0h	SOC10 Start of Conversion Overflow Flag. Indicates an SOC10 event was generated in hardware while an existing SOC10 event was already pending. 0 No SOC10 event overflow. 1 SOC10 event overflow. An overflow condition does not stop SOC10 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
9	SOC9	R	0h	SOC9 Start of Conversion Overflow Flag. Indicates an SOC9 event was generated in hardware while an existing SOC9 event was already pending. 0 No SOC9 event overflow. 1 SOC9 event overflow. An overflow condition does not stop SOC9 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
8	SOC8	R	0h	SOC8 Start of Conversion Overflow Flag. Indicates an SOC8 event was generated in hardware while an existing SOC8 event was already pending. 0 No SOC8 event overflow. 1 SOC8 event overflow. An overflow condition does not stop SOC8 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
7	SOC7	R	0h	SOC7 Start of Conversion Overflow Flag. Indicates an SOC7 event was generated in hardware while an existing SOC7 event was already pending. 0 No SOC7 event overflow. 1 SOC7 event overflow. An overflow condition does not stop SOC7 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
6	SOC6	R	0h	SOC6 Start of Conversion Overflow Flag. Indicates an SOC6 event was generated in hardware while an existing SOC6 event was already pending. 0 No SOC6 event overflow. 1 SOC6 event overflow. An overflow condition does not stop SOC6 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn

Table 15-76. ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	SOC5	R	0h	SOC5 Start of Conversion Overflow Flag. Indicates an SOC5 event was generated in hardware while an existing SOC5 event was already pending. 0 No SOC5 event overflow. 1 SOC5 event overflow. An overflow condition does not stop SOC5 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
4	SOC4	R	0h	SOC4 Start of Conversion Overflow Flag. Indicates an SOC4 event was generated in hardware while an existing SOC4 event was already pending. 0 No SOC4 event overflow. 1 SOC4 event overflow. An overflow condition does not stop SOC4 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
3	SOC3	R	0h	SOC3 Start of Conversion Overflow Flag. Indicates an SOC3 event was generated in hardware while an existing SOC3 event was already pending. 0 No SOC3 event overflow. 1 SOC3 event overflow. An overflow condition does not stop SOC3 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
2	SOC2	R	0h	SOC2 Start of Conversion Overflow Flag. Indicates an SOC2 event was generated in hardware while an existing SOC2 event was already pending. 0 No SOC2 event overflow. 1 SOC2 event overflow. An overflow condition does not stop SOC2 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
1	SOC1	R	0h	SOC1 Start of Conversion Overflow Flag. Indicates an SOC1 event was generated in hardware while an existing SOC1 event was already pending. 0 No SOC1 event overflow. 1 SOC1 event overflow. An overflow condition does not stop SOC1 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
0	SOC0	R	0h	SOC0 Start of Conversion Overflow Flag. Indicates an SOC0 event was generated in hardware while an existing SOC0 event was already pending. 0 No SOC0 event overflow. 1 SOC0 event overflow. An overflow condition does not stop SOC0 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn

15.15.3.15 ADCSOCOVFCLR1 Register (Offset = 18h) [Reset = 0000h]

ADCSOCOVFCLR1 is shown in Figure 15-95 and described in Table 15-77.

Return to the Summary Table.

ADC SOC Overflow Clear 1 Register

Table 15-77. ADCSOCOVFCLR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R-0/W1S	0h	SOC15 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC15 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC15 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
14	SOC14	R-0/W1S	0h	SOC14 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC14 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC14 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
13	SOC13	R-0/W1S	0h	SOC13 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC13 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC13 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
12	SOC12	R-0/W1S	0h	SOC12 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC12 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC12 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn

Table 15-77. ADCSOCOVFCLR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R-0/W1S	0h	SOC11 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC11 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC11 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
10	SOC10	R-0/W1S	0h	SOC10 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC10 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC10 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
9	SOC9	R-0/W1S	0h	SOC9 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC9 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC9 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
8	SOC8	R-0/W1S	0h	SOC8 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC8 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC8 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
7	SOC7	R-0/W1S	0h	SOC7 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC7 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC7 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
6	SOC6	R-0/W1S	0h	SOC6 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC6 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC6 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn

Table 15-77. ADCSOCOVFCLR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	SOC5	R-0/W1S	0h	SOC5 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC5 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC5 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
4	SOC4	R-0/W1S	0h	SOC4 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC4 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC4 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
3	SOC3	R-0/W1S	0h	SOC3 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC3 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC3 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
2	SOC2	R-0/W1S	0h	SOC2 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC2 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC2 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
1	SOC1	R-0/W1S	0h	SOC1 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC1 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC1 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn
0	SOC0	R-0/W1S	0h	SOC0 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC0 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC0 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. Reset type: SYSRSn

15.15.3.16 ADCSOC0CTL Register (Offset = 1Ah) [Reset = 00000200h]

ADCSOC0CTL is shown in Figure 15-96 and described in Table 15-78.

Return to the Summary Table.

Table 15-94. ADCEVTSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	PPB4ZERO	R	0h	Post Processing Block 4 Zero Crossing Flag. When set indicates the ADCPPB4RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
13	PPB4TRIPLO	R	0h	Post Processing Block 4 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
12	PPB4TRIPHI	R	0h	Post Processing Block 4 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
11	RESERVED	R	0h	Reserved
10	PPB3ZERO	R	0h	Post Processing Block 3 Zero Crossing Flag. When set indicates the ADCPPB3RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn

Table 15-94. ADCEVTSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	PPB3TRIPLO	R	0h	Post Processing Block 3 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
8	PPB3TRIPHI	R	0h	Post Processing Block 3 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
7	RESERVED	R	0h	Reserved
6	PPB2ZERO	R	0h	Post Processing Block 2 Zero Crossing Flag. When set indicates the ADCPPB2RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
5	PPB2TRIPLO	R	0h	Post Processing Block 2 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority Reset type: SYSRSn
4	PPB2TRIPHI	R	0h	Post Processing Block 2 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Table 15-129. ADCPPB4OFFREF Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	OFFREF	R/W	0h	ADC Post Processing Block 4 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB4RESULT register. This subtraction is not saturated. 0000h No change. The ADCRESULT value is passed on. 0001h ADCRESULT - 1 is passed on. 0002h ADCRESULT - 2 is passed on. ... 8000h ADCRESULT - 32,768 is passed on. ... FFFFh ADCRESULT - 65,535 is passed on. NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode. Reset type: SYSRSn

15.15.3.68 ADCPPB4TRIPHI Register (Offset = 9Eh) [Reset = 00000000h]

ADCPPB4TRIPHI is shown in Figure 15-148 and described in Table 15-130.

Return to the Summary Table.

Table 15-142. REP1CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	TRIGGEROVF	R/W1C	0h	ADC Trigger Repeater 1 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers (NCOUNT was not 0 or SOCs associated with Repeater 1 were still pending). Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0 if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set Reset type: SYSRSn
6	PHASEOVF	R/W1C	0h	ADC Trigger Repeater 1 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger (PHASECOUNT was not 0). Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set Reset type: SYSRSn
5	RESERVED	R	0h	Reserved
4	RESERVED	R	0h	Reserved
3	MODULEBUSY	R	0h	ADC Trigger Repeater 1 Module Busy indicator. In oversampling mode: 0 = Repeater 1 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 1 still has repeated triggers remaining (NCOUNT > 0) or associated SOCs are still pending (SOCBUSY is 1) If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored. Reset type: SYSRSn
2	RESERVED	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling Reset type: SYSRSn
0	MODE	R/W	0h	ADC trigger repeater 1 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP1CTL.TRIGSEL is received, the repeater will repeat the trigger REP1N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP1CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP1N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling Reset type: SYSRSn

15.15.3.81 REP1N Register (Offset = CCh) [Reset = 00000000h]

REP1N is shown in Figure 15-161 and described in Table 15-143.

Return to the Summary Table.

ADC Trigger Repeater 1 N Select Register

Table 15-145. REP1SPREAD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	SPREADCOUNT	R	0h	ADC trigger repeater 1 spread status. When a trigger is sent to the ADC in oversampling mode, this register will start counting down from SPREAD until SPREADCOUNT equals 0. The next repeated trigger to the ADC in oversampling mode will not occur until SPREADCOUNT is 0 (minimum time is complete) and REP1CTL.BUSY = 0 (SOCs associated with trigger repeater 1 are no longer pending). Reset type: SYSRSn
15-0	SPREAD	R/W	0h	ADC trigger repeater 1 spread delay configuration. In oversampling mode, defines the minimum number of SYSCLKs to wait before creating the next repeated trigger to the ADC. If SPREAD is less than the time needed for all SOCs associated with repeater 1 to sample and convert, then the repeater will generate triggers as fast as the ADC can convert the associated conversions. If SPREAD is greater than the time needed for all SOCs associated with repeater 1 to sample and convert, then repeated triggers to the ADC will be SPREAD SYSCLK cycles apart. 0 = oversampled repeated triggers occur as fast as the ADC can sample and convert associated SOCs 1 = time between repeated triggers is at least 1 SYSCLKs 2 = time between repeated triggers is at least 2 SYSCLKs ... 65535 = time between repeated triggers is at least 65535 SYSCLKs Reset type: SYSRSn

Table 15-147. REP2CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	TRIGGEROVF	R/W1C	0h	ADC Trigger Repeater 2 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers (NCOUNT was not 0 or SOCs associated with Repeater 2 were still pending). Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0 if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set Reset type: SYSRSn
6	PHASEOVF	R/W1C	0h	ADC Trigger Repeater 2 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger (PHASECOUNT was not 0). Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set Reset type: SYSRSn
5	RESERVED	R	0h	Reserved
4	RESERVED	R	0h	Reserved
3	MODULEBUSY	R	0h	ADC Trigger Repeater 2 Module Busy indicator. In oversampling mode: 0 = Repeater 2 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 2 still has repeated triggers remaining (NCOUNT > 0) or associated SOCs are still pending (SOCBUSY is 1) If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored. Reset type: SYSRSn
2	RESERVED	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling Reset type: SYSRSn
0	MODE	R/W	0h	ADC trigger repeater 2 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP2CTL.TRIGSEL is received, the repeater will repeat the trigger REP2N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP2CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP2N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling Reset type: SYSRSn

15.15.3.86 REP2N Register (Offset = DCh) [Reset = 00000000h]

REP2N is shown in Figure 15-166 and described in Table 15-148.

Return to the Summary Table.

ADC Trigger Repeater 2 N Select Register

Chapter 16

Buffered Digital-to-Analog Converter (DAC)

The buffered digital-to-analog converter (DAC) is an analog module that can output a programmable, arbitrary reference voltage.

16.1 Introduction

The buffered DAC module consists of an internal 12-bit DAC and an analog output buffer that is capable of driving an external load. For driving even higher loads than typical, a trade-off can be made between load size and output voltage swing. For the load conditions of the buffered DAC, see the device-specific data sheet. The buffered DAC is a general-purpose DAC that can be used to generate a DC voltage in addition to AC waveforms such as sine waves, square waves, triangle waves and so forth. Software writes to the DAC value register can take effect immediately or can be synchronized with EPWMSYNCPER events.

16.1.1 DAC Related Collateral

Foundational Materials

- C2000 Academy - DAC
- *High Speed, Digital to Analog Converters Basics Application Report*
- *Real-Time Control Reference Guide*
  - Refer to the DAC section
- *Understanding Data Converters Application Report*

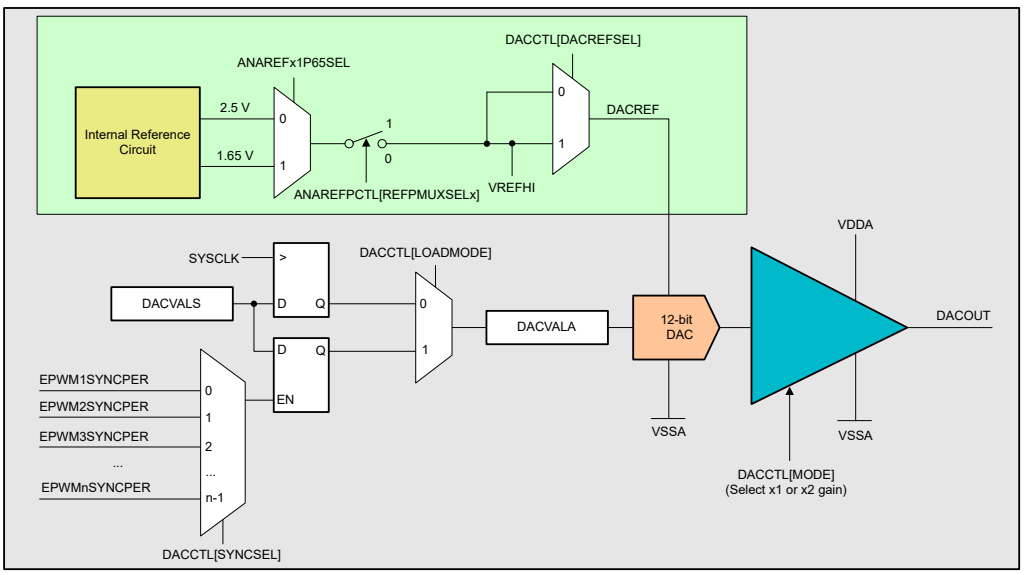
16.1.2 Features

Each buffered DAC has the following features:

- 12-bit programmable internal DAC
- Selectable reference voltage source
- x1 and x2 gain modes
- Ability to synchronize with EPWMSYNCPER

16.1.3 Block Diagram

The block diagram for the buffered DAC is shown in Figure 16-1.



DAC Module
Reference Voltage Source
Output Buffer
12-Bit DAC
Internal Reference Circuit

A. VDAC is not available for this device; so, VREFHI and VSSA are the reference voltages.

Figure 16-1. DAC Module Block Diagram

16.2 Using the DAC

The internal DAC's reference voltage source, DACREF, is set to VREFHI. The x2 gain mode is only available when VREFHI is set as DACREF and internal reference mode is used, which can be configured by DACCTL[MODE] register. The internal reference circuit generates 1.65V and 2.5V. To select either 2.5V or 1.65V, configure ANAREFx1P65SEL register and set ANAREFPCTL[REFPMUXSELx] register to 0 (see the *Analog Subsystem* chapter on how to switch to internal reference mode). Even though the buffered DAC has an x2 gain mode, the maximum output voltage from the buffered DAC is not greater than VDDA. Table 16-1 lists the gain mode combinations supported by the buffered DAC. In this table, x = A or B, X = Don't Care, VREFHI = 2.5v, VDDA = 3.3v, and DACVAL = 4095.

Table 16-1. DAC Supported Gain Mode Combinations

DACREFSEL	ANAREFPCTL[REFPMUXSELx]	ANAREFx1P65SEL	Reference Source	Reference Voltage (V)	Mode	Maximum DAC Output (V)	Support Status
1	0	0	Internal	1.65	0	1.65	Not Supported
1	0	0	Internal	1.65	1	3.3	Supported
1	0	1	Internal	2.5	0	2.5	Supported
1	0	1	Internal	2.5	1	2.5	Not Supported
1	1	X	External	VREFHI	0	2.5	Supported
1	1	X	External	VREFHI	1	2.5	Not Supported

Two sets of DACVAL registers, DACVALA and DACVALS, are present in the buffered DAC module. DACVALA is a read-only register that actively controls the buffered DAC value. DACVALS is a writable shadow register that loads into DACVALA either immediately or synchronized with the next EPWMSYNCPER event. If the clock to the buffered DAC is disabled while the buffered DAC is outputting a voltage, the output voltage remains unaffected, but DACVALA and DACVALS is no longer updated with register writes. Enabling the clock to the buffered DAC restores the DAC to the state before the clock was disabled.

The output of the internal DAC is calculated with the following equation:

$$DACOUT = \frac{DACVALA * DACREF}{4096} \quad (12)$$

The buffered DAC can be used to level-shift the PGA input signal (see the *Programmable Gain Amplifier (PGA)* chapter for details). The output buffer of the buffered DAC can exhibit non-linear behavior near the supply rails (VDDA/VSSA). To determine the linear range of the buffered DAC, see the device-specific data sheet.

16.2.1 Initialization Sequence

1. Enable the buffered DAC clock.
2. Set DACREF with DACREFSEL.
3. Power up the buffered DAC with DACOUTEN.
4. Wait for the power-up time to elapse before outputting a voltage. To determine the power-up time of the buffered DAC, see the device data sheet.
5. For predictable behavior of the buffered DAC, consecutive writes to DACVALS must be spaced apart according to the settling time of the buffered DAC. To determine the settling time of the buffered DAC, see the device data sheet.

16.2.2 DAC Offset Adjustment

Zero offset error is defined as the difference between the voltage at midcode (2048) and 1.25V (for 2.5V reference voltage). DAC offset error is calibrated at 2.5V reference voltage and loaded into the DAC offset trim register as part of the Device_cal() function. If the DAC is used at any reference voltage other than 2.5V, the offset trim must be adjusted to make sure the offset error performance stays within the device-specific data sheet limits. The DAC offset register is a 16-bit register that contains the 8-bit signed offset trim in the lower half of the register. Use the function call DAC_tuneOffsetTrim() found in C2000Ware to adjust the offset.

16.2.3 EPWMSYNCPER Signal

EPWMSYNCPER comes from the Time-Base submodule of the EPWM. For a detailed description of how this signal is generated, refer to the *Time-Base Submodule* section of the *Enhanced Pulse Width Modulator (ePWM)* chapter.

The EPWMSYNCPER signal that loads DACVALA when DACCTL [LOADMODE] = 1 is a level trigger load. If TBCTR and TBPRD of the EPWM are both 0, EPWMSYNCPER is held at a high level and DACVALA is immediately loaded from DACVALS irrespective of the value of DACCTL [LOADMODE]. Due to this, configure the EPWM first before setting DACCTL [LOADMODE] to 1.

Note

The name of the sync signal that the GPDAC receives from the EPWM has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCI and EPWMSYNCO. For a description of these signals, see the *Enhanced Pulse Width Modulator (ePWM)* chapter.

16.3 Lock Registers

A DACLOCK register is provided to prevent spurious writes from modifying the DACCTL, DACVALS, and DACOUTEN registers. Once a register is protected through DACLOCK, write access are locked out until the device is reset.

16.4.2 DAC Examples

NOTE: These examples are located in the C2000Ware installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dac

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

16.4.2.1 Buffered DAC Enable

FILE: buffdac_ex1_enable.c

This example generates a voltage on the buffered DAC output, DACOUTA/ADCINA0 and uses the default DAC reference setting of VREFHI.

16.4.2.2 Buffered DAC Random

FILE: buffdac_ex2_random.c

This example generates random voltages on the buffered DAC output, DACOUTA/ADCINA0 and uses the default DAC reference setting of VREFHI.

16.4.2.3 Buffered DAC Sine (buffdac_sine)

FILE: buffdac_ex3_waveform.c

This example generates a sine wave on the buffered DAC output, DACOUTA/ADCINA0 (HSEC Pin 9) and uses the default DAC reference setting of VREFHI.

16.5 DAC Registers

This Section describes the DAC Registers.

16.5.1 DAC Base Address Table

Table 16-3. DAC Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
DacaRegs	DAC_REGS	DACA_BASE	0x0000_5C00	YES	YES	YES	YES

16.5.2 DAC_REGS Registers

Table 16-4 lists the memory-mapped registers for the DAC_REGS registers. All register offset addresses not listed in Table 16-4 should be considered as reserved locations and the register contents should not be modified.

Table 16-4. DAC_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DACREV	DAC Revision Register		Go
1h	DACCTL	DAC Control Register	EALLOW	Go
2h	DACVALA	DAC Value Register - Active		Go
3h	DACVALS	DAC Value Register - Shadow		Go
4h	DACOUTEN	DAC Output Enable Register	EALLOW	Go
5h	DACLOCK	DAC Lock Register	EALLOW	Go
6h	DACTRIM	DAC Trim Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 16-5 shows the codes that are used for access types in this section.

Table 16-5. DAC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

16.5.2.1 DACREV Register (Offset = 0h) [Reset = 0000h]

DACREV is shown in Figure 16-2 and described in Table 16-6.

Chapter 17

Comparator Subsystem (CMPSS)

The Comparator Subsystem (CMPSS) consists of analog comparators and supporting circuits that are useful for power applications such as peak current mode control, switched-mode power, power factor correction, voltage trip monitoring, and so forth.

See the *C2000 Real-Time Control Peripheral Reference Guide* for a list of all devices with modules of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

17.1 Introduction

The comparator subsystem is built around a number of modules. Each subsystem contains two comparators, two reference 12-bit DACs, and two digital filters. The subsystem also includes two ramp generators. The ramp generators ramp up and down.Comparators are denoted "H" or "L" within each module where “H” and “L” represent high and low, respectively. Each comparator generates a digital output which indicates whether the voltage on the positive input is greater than the voltage on the negative input. The positive input of the comparator is driven from an external pin or by the PGA (see the *Analog Subsystem* chapter for mux options available to the CMPSS). The negative input can be driven by an external pin or by the programmable reference 12-bit DAC . Each comparator output passes through a programmable digital filter that can remove spurious trip signals. An unfiltered output is also available if filtering is not required.

Two ramp generator circuits are optionally available to control the reference 12-bit DAC values for the high and low comparators in the subsystem. The DAC along with a wrapper can be used to generate a ramp which is used for slope compensation in Peak Current Mode Control (PCMC) and other applications.

17.1.1 CMPSS Related Collateral

Foundational Materials

- C2000 Academy - CMPSS

17.1.2 Features

Each CMPSS includes:

- Two analog comparators
- Two independently programmable reference 12-bit DACs
- Dual decrementing/incrementing ramp generators
- Two digital filters, max filter clock prescale = 2^{24}
- Ability to synchronize submodules with EPWMSYNCPER
- Ability to extend clear signal with EPWMBLANK
- Ability to synchronize output with SYSCLK
- Ability to latch output
- Ability to invert output
- Option to use hysteresis on the input
- Option for positive input of comparator to be driven by an external signal or by the PGA
- Option for negative input of comparator to be driven by an external signal or by the reference DAC
- VDDA is the DAC reference voltage
- Option to use the low comparator DAC output on an external pin (select instances only, mutually exclusive with use of compare functionality)
- External connection to CMPSS filters
- Ramp generator prescaler
- CMPSS based Low Power Mode (LPM) wakeup

17.1.3 Block Diagram

The block diagram for the CMPSS is shown in Figure 17-1.

- CTRIPx(x= "H" or "L") signals are connected to the ePWM X-BAR for ePWM trip response. See the *Enhanced Pulse Width Modulator (ePWM)* chapter for more details on the ePWM X-BAR mux configuration.
- CTRIPxOUTx(x= "H" or "L") signals are connected to the Output X-BAR for external signaling. See the *General-Purpose Input/Output (GPIO)* chapter for more details on the Output X-BAR mux configuration.
- CMPxDACL is the low comparator DAC output which is available only in CMPSS1 module. To enable this DAC output, set the register CMPxDACOUTEN from analog subsystem.

Note

Enabling the DACL to a pin disables all other functionality: DACH, both ishcondition="(c2000-platform=invicta) or (c2000-platform=topoaria_f280013x) or (c2000-platform=topoauto_f280015x) or (c2000-platform=predator_f28p55x)" type="note">Enabling the DACL to a pin disables all other functionality: DACH, both COMP, the Ramp Generator, and the digital filters.

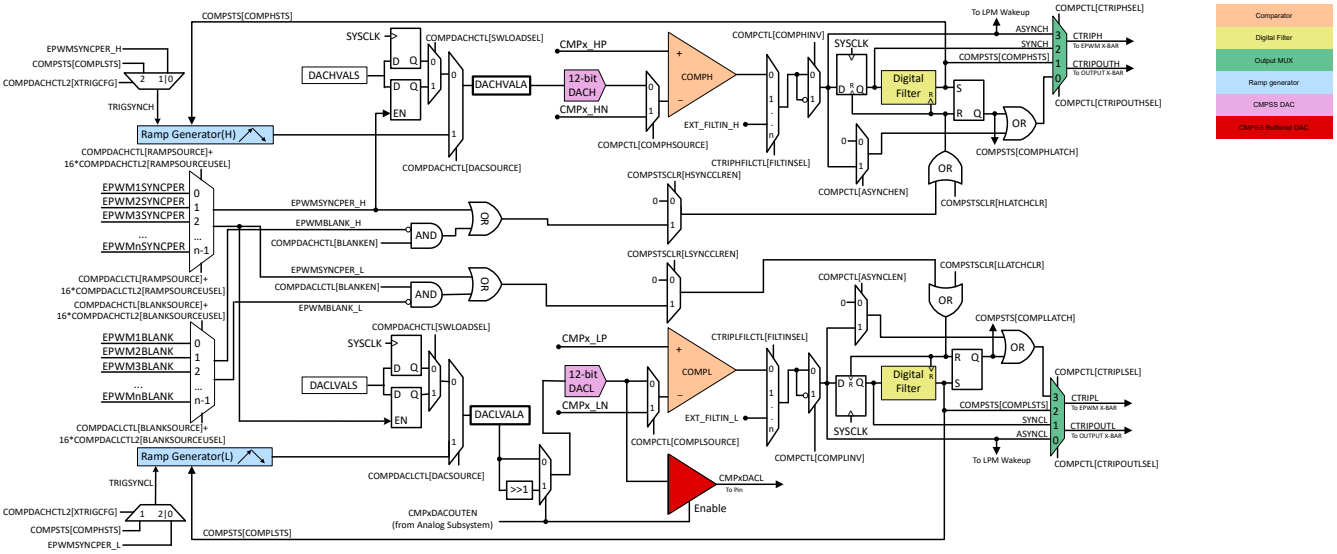

Figure 17-1. CMPSS Module Block Diagram

17.2 Comparator

The comparator generates a high digital output when the voltage on the positive input is greater than the voltage on the negative input, and a low digital output when the voltage on the positive input is less than the voltage on the negative input. The comparator is illustrated in Figure 17-2.

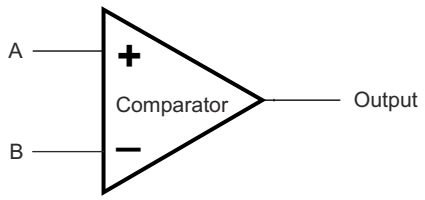

Figure 17-2. Comparator Block Diagram

Voltages	Output
Voltage A > Voltage B	1
Voltage A < Voltage B	0

17.3 Reference DAC

Each reference 12-bit DAC can be configured to drive a reference voltage into the negative input of the respective comparator. Some CMPSS instances also allow the low DAC output to be routed to a pin to act as an external DAC. In this case, all other CMPSS module functionality is not useable, including the high DAC, both comparators, ramp generation, and the digital filters.

Two sets of DACxVAL registers, DACxVALA and DACxVALS, are present for each reference 12-bit DAC. DACxVALA is a read-only register that actively controls the reference 12-bit DAC value. DACxVALS is a writable shadow register that loads into DACxVALA either immediately or synchronized with the next EPWMSYNCPER event. The high and low reference 12-bit DAC (DACx) can optionally source the register DACxVALA value from the ramp generator instead of the register DACxVALS.

The operating range of the reference 12-bit DAC is bounded by DACREF and VSSA. The reference 12-bit DAC is illustrated in Figure 17-3.

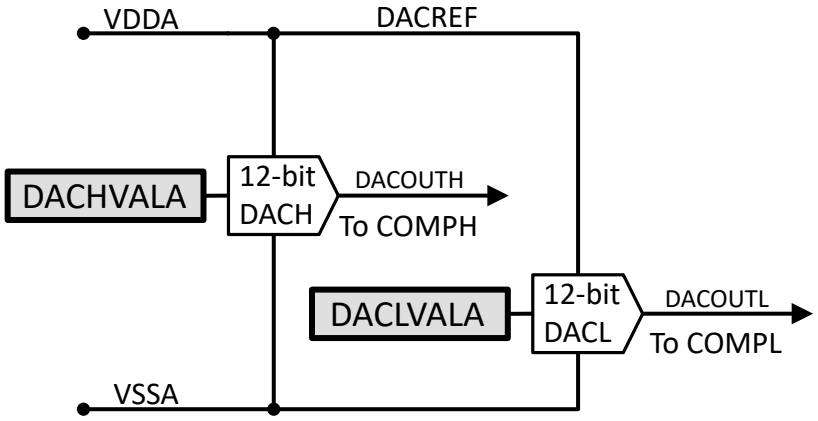

Figure 17-3. Reference DAC Block Diagram

The output of the reference 12-bit DAC can be calculated as:

$$DACOUT = \frac{(1 + DACVALA)*DACREF}{4096} \quad (13)$$

Note

- In the situations where both the DACH and DACL are driving the high and low comparators, a trip on one comparator can temporarily disturb the DAC output of the other comparator. The amount and length of time of this disturbance is specified in the device data sheet as “CMPSS DAC output disturbance” and “CMPSS DAC disturbance time”, respectively.

  Users must design the system carefully so that if the input signal crosses either DACH or DACL and trips the associated comparator, the input signal stays more than a “CMPSS DAC output disturbance” away from the other comparator trip point for “CMPSS DAC disturbance time”.
- The DACH setting must always be higher than the DACL setting. If the user is not using the DACL, the DACLVALS register must be set to 0 to avoid the comparator COMPL from tripping and affecting the DACH. In this case, there is no limitation on the DACHVALS setting. Accordingly, when not using the DACH, the user must set the DACHVALS register to the maximum.
- The CMPSS instance can be enabled before programming the reference DAC values.

17.4 Ramp Generator

This section discusses the characteristics and behavior of the ramp generator.

17.4.1 Ramp Generator Overview

The ramp generator produces a falling or rising ramp input for the high-reference 12-bit DAC and the low-reference 12-bit DAC when selected. In this mode, the reference 12-bit DAC uses the most-significant 12 bits of the RAMPSTS countdown register as the input. The low 4 bits of the RAMPSTS countdown register effectively act as a prescale for the falling or rising ramp rate configurable with RAMPxSTEPVALA. There is an additional dedicated prescaler for the ramp generator configurable with the RAMPCLKDIV register.

The ramp generator is enabled by setting DACSOURCE = 1. When DACSOURCE = 1 is selected, the value of RAMPSTS is loaded from RAMPxREFS and the register remains static until the selected TRIGSYNC signal is received. After receiving the selected TRIGSYNC signal, the value of RAMPxSTEPVALA is subtracted from RAMPSTS on every subsequent SYSCLK cycle.

To prevent the subtraction from commencing a SYSCLK cycle after a TRIGSYNC event, the RAMPDLYA register that serves as a delay counter can be used to hold off the RAMPSTS subtraction or addition. On receiving a TRIGSYNC event, the value of RAMPDLYA is decremented by one on every SYSCLK cycle until the register reaches zero. So, the RAMPSTS subtraction only begins when RAMPDLYA is zero.Similarly, in increment mode (RAMPDIR = 1), the RAMPSTS addition only begins when RAMPDLYA is zero.

Note

- For the ramp decrement mode of operation, set the registers COMPXINV and RAMPDIR to 0, and for the ramp increment mode of operation, set the registers COMPXINV and RAMPDIR to 1.

17.4.2 Ramp Generator Behavior

The ramp generator makes state changes on every rising edge of DACSOURCE, TRIGSYNC, and COMPHSTS.

On the rising edge of DACSOURCE: the registers RAMPxREFA, RAMPxSTEPVALA, and RAMPDLYA are loaded with the shadow registers. Also, the register RAMPSTS is loaded with RAMPxREFS.

On the rising edge of the selected TRIGSYNC: the registers RAMPxREFA, RAMPxSTEPVALA, and RAMPDLYA are loaded with the shadow registers. Also, the register RAMPSTS is loaded with RAMPxREFS and starts decrementing in the decrement mode (RAMPDIR = 0) or incrementing in the increment mode (RAMPDIR = 1) when RAMPDLYA counter reaches zero.

On the rising edge of COMPHSTS with RAMPLOADSEL = 1: the registers RAMPxREFA, RAMPxSTEPVALA, and RAMPDLYA are loaded with the shadow registers. Also, the register RAMPSTS is loaded with RAMPxREFS and stops decrementing in the decrement mode (RAMPDIR = 0) or incrementing in the increment mode (RAMPDIR = 1).

On the rising edge of COMPHSTS with RAMPLOADSEL = 0: the register RAMPSTS is loaded with RAMPxREFA. So, the register RAMPSTS stops decrementing and incrementing in the decrement mode and the increment mode, respectively.

Additionally, if the value of RAMPSTS reaches zero and the ramp generator is in the decrement mode (RAMPDIR = 0), the RAMPSTS register remains static at zero until the next TRIGSYNC is received. If the ramp generator is in the increment mode (RAMPDIR = 1) and the value of RAMPSTS reaches 0xFFFF, the RAMPSTS register value remains at that value until the next TRIGSYNC is received. These state changes are illustrated in the ramp generator block diagram in Figure 17-4.

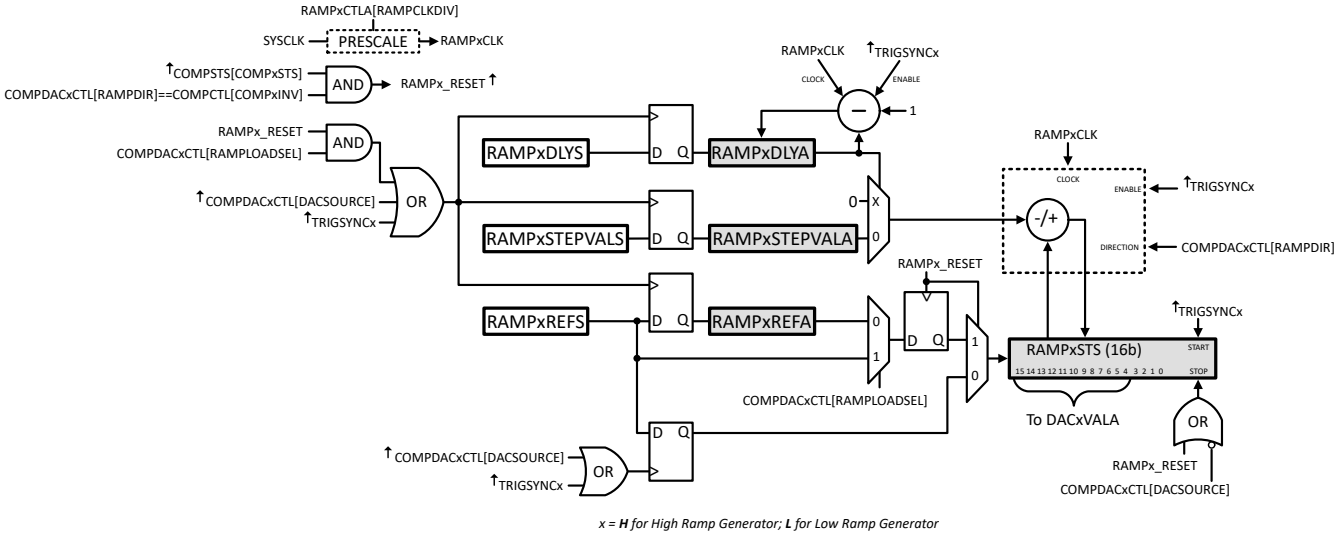

Figure 17-4. Ramp Generator Block Diagram

17.4.3 Ramp Generator Behavior at Corner Cases

Since the ramp generator makes state changes on every rising edge of TRIGSYNCx and COMPHSTS, the following behavior can be expected on instances when these two events occur simultaneously or very close together.

Case 1: COMPHSTS rising edge occurs one or more cycles before TRIGSYNC rising edge.
RAMPSTS stops decrementing on COMPHSTS rising edge event. RAMPSTS starts decrementing on TRIGSYNCx rising edge event when RAMPDLYA reaches 0.

Case 2: COMPHSTS rising edge occurs simultaneously as TRIGSYNCx rising edge.
EPWMSYNCPER rising edge event takes precedence and RAMPSTS starts decrementing when RAMPDLYA reaches 0. COMPHSTS rising edge event is ignored and does not halt RAMPSTS.

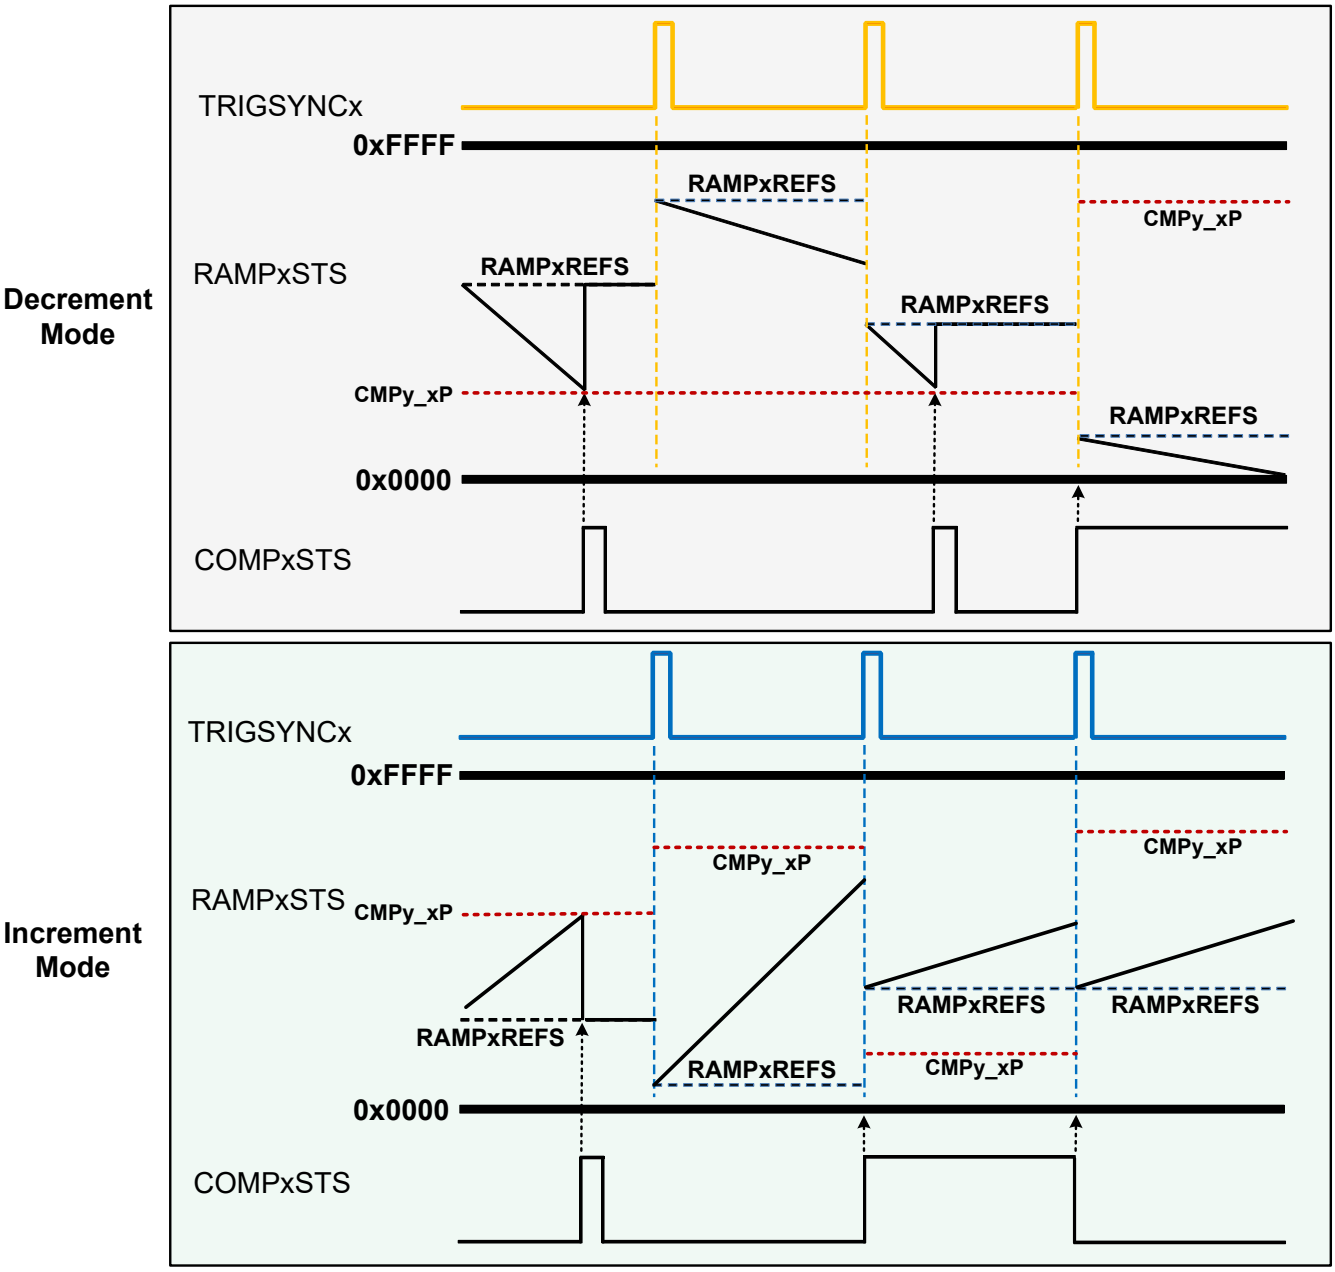
Case 3: COMPHSTS rising edge occurs one or more cycles after TRIGSYNCx rising edge but before RAMPDLYA reaches 0.
RAMPSTS does not decrement when RAMPDLYA reaches 0.

Case 4: COMPHSTS rising edge occurs simultaneously as RAMPDLYA reaches 0 from TRIGSYNCx rising edge.
RAMPSTS does not decrement.

This behavior is also illustrated in Figure 17-5.

Note

For the ramp decrement mode of operation, set the registers COMPXINV and RAMPDIR to 0, and for the ramp increment mode of operation, set the registers COMPXINV and RAMPDIR to 1.



x = H for High Ramp Generator; L for Low Ramp Generator
y= CMPSS module number

Figure 17-5. Ramp Generator Behavior

17.5 Digital Filter

The digital filter works on a window of FIFO samples (SAMPWIN) taken from the input. The filter output resolves to the majority value of the sample window, where majority is defined by the threshold (THRESH) value. If the majority threshold is not satisfied, the filter output remains unchanged.

For proper operation, the value of THRESH must be greater than SAMPWIN / 2 and less than or equal to SAMPWIN.

A prescale function (CLKPRESCALE) determines the filter sampling rate, where the filter FIFO captures one sample every prescale system clocks. Old data from the FIFO is discarded.

Note that for SAMPWIN, THRESH and CLKPRESCALE, the internal number used by the digital filter is + 1 in all cases. In essence, samples = SAMPWIN + 1, threshold = THRESH + 1 and prescale = CLKPRESCALE + 1.

A conceptual model of the digital filter is shown in Figure 17-6.

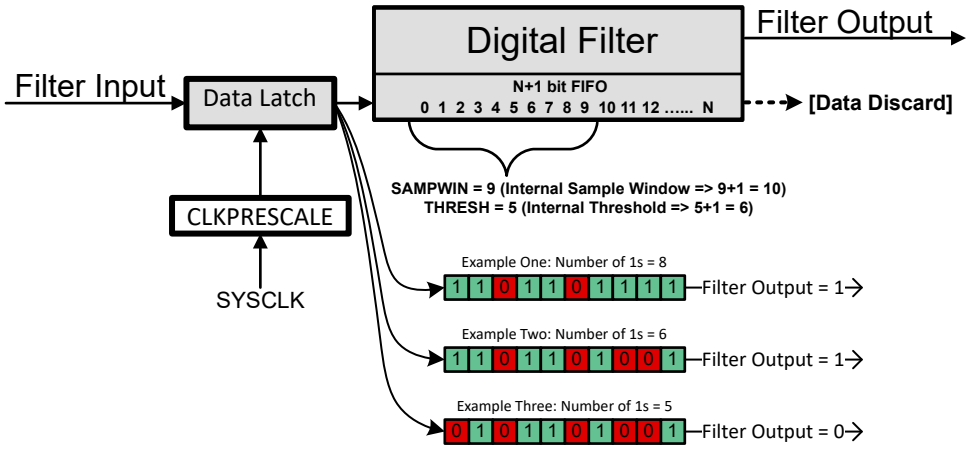


Figure 17-6. Digital Filter Behavior

Equivalent C code of the filter implementation is:

```
if (FILTER_OUTPUT == 0) {
    if (Num_1s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 1;
    }
}
else {
    if (Num_0s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 0;
    }
}
```

17.5.1 Filter Initialization Sequence

For proper operation of the digital filter, the following initialization sequence is recommended:

1. Configure and enable the comparator for operation.
2. Configure the digital filter parameters for operation:
   - Set SAMPWIN for the number of samples to monitor in the FIFO window.
   - Set THRESH for the threshold required for majority qualification.
   - Set CLKPRESCALE for the digital filter clock prescale value.
3. Initialize the sample values in the digital FIFO window by setting FILINIT.
4. Clear COMPSTS latch using COMPSTSCLR, if the latched path is desired.
5. Configure the CTRIP and CTRIPOUT signal paths.
6. If desired, configure the destination module, for example, ePWM, GPIO, and so on to accept the filtered signals.

17.6 Using the CMPSS

17.6.1 LATCHCLR, EPWMSYNCPER, and EPWMBLANK Signals

The LATCHCLR signal holds the digital filter, synchronization block, and the latch output in reset (0) after the required delays. The LATCHCLR signal is activated in software using xLATCHCLR (x = H or L). The LATCHCLR signal can also be activated by EPWMSYNCPER when xSYNCCLREN (x = H or L) is set. If a longer LATCHCLR signal is required, the EPWMBLANK signal can be used to extend the LATCHCLR signal by setting BLANKEN.

EPWMSYNCPER and EPWMBLANK (BLANKWDW) come from the Time-Base and Digital Compare submodules of the EPWM, respectively. For a detailed description of how these two signals are generated, refer to the respective submodule section in the *Enhanced Pulse Width Modulator (ePWM)* chapter.

The EPWMSYNCPER signal that loads DACxVALA when COMPDACCTL[SWLOADSEL] = 1 is a level trigger load. If TBCTR and TBPRD of the EPWM are both 0, EPWMSYNCPER is held at level high and DACxVALA is loaded immediately from DACxVALS irrespective of the value of COMPDACCTL[SWLOADSEL]. Due to this, configure the EPWM first before setting COMPDACCTL[SWLOADSEL] to 1.

Note

The name of the sync signal that the CMPSS receives from the EPWM has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCI and EPWMSYNCO. For a description of what are these signals, see the *Enhanced Pulse Width Modulator (ePWM)* chapter.

17.6.2 Synchronizer, Digital Filter, and Latch Delays

The synchronization block adds a delay of 1-2 sysclks. If the digital filter is bypassed (all filter settings are 0), the digital filter adds a delay of 2 sysclks. The latch adds 1 sysclk delay.

17.6.3 Calibrating the CMPSS

The CMPSS has two sources of offset errors: comparator offset error and compdac offset error. In the data sheet, the comparator offset error is referred to as ***Input referred offset error*** and compdac offset error is referred to as ***Static offset error*** . See the device data sheet for the values.

If both inputs of the comparator are driven from a pin, only the comparator offset error applies. However if the inverting input of the comparator is driven from the compdac, then only the compdac offset error applies. This is because the compdac offset error includes comparator offset error.

Due to the offset errors, the CMPSS must be calibrated to make sure trips happen at the expected levels. The following flow outlines how the calibration can be performed if the inverting input of the comparator is driven from the compdac.

Notes before calibration:

1. A static DC signal is required on the non-inverting input of the comparator.
2. Hysteresis can be disabled for calibration and can be re-enabled after calibration is complete.
3. A noisy input can make calibration difficult, so use the latch with non-zero filter settings depending on how noisy is the signal on the non-inverting input.

This approach sweeps down the compdac:

1. Set the starting compdac value to max, 0xFFF.
   - Optional: Instead of setting the starting compdac value to maximum, set to ***Vtarget*** + ***Static offset error*** + ***Margin*** . Where ***Vtarget*** is the approximate DC voltage on the non-inverting input, ***Static offset error*** is the compdac offset error specification and ***Margin*** is some amount of guard band. This can lead to a faster calibration but only works if ***Vtarget*** is known. Alternatively, if ***Vtarget*** is unknown, the ADC can be used to convert ***Vtarget*** .
2. Decrement compdac value by 1.
3. Wait for compdac to settle.
4. Clear latch.
5. Wait for possible latch set.
6. If latch is set, trip code is found exit.
   - Optional: The trip code can be double checked by:
     a. Increasing compdac value by 1.
     b. Clear latch.
     c. Wait for possible latch set.
     d. Latch can be unset.
7. If latch is unset, go back to step 2 and repeat.

It is also possible to calibrate the CMPSS, if both inputs of the comparator are driven from a pin. For this case, the flow stays the same but the voltage on the inverting pin of the comparator is swept externally.

17.6.4 Enabling and Disabling the CMPSS Clock

If the clock to the CMPSS module is disabled while the comparator is active, the following behavior can be expected:

- The comparator remains unaffected and continues to trip from voltages on the inputs.
- If the reference 12-bit DAC is driving the negative input of the comparator, the voltage on the negative input remains static and unaffected but DACVALA can no longer be updated from the ramp generator or DACVALS.
- The ramp generator, synchronize block and digital filter freeze on the current states.

Enabling the clock to the CMPSS restores the clock to the state before the clock was disabled.

17.7 CMPSS DAC Output

Select instances of the module can optionally route the low DAC output to an external pin to be used as an external DAC. This is subject to the following constraints:

- This is available only on select instances; consult the device data sheet to determine if the CMPSS DAC has been pinned out for a particular instance.
- All other CMPSS module functionality is unusable when the output DAC is enabled. This includes the high DAC, both comparators and the digital filters.
- See the device data sheet for effective resolution of the CMPSS DAC output.

Note

The CMPSS low DAC output does not necessarily appear on the same pins that are available for low comparator input. Consult the pinout of the device data sheet to determine which pin the CMPSS output DAC is available on.

17.8.2 CMPSS Examples

NOTE: These examples are located in the C2000Ware installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/cmpss

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

17.8.2.1 CMPSS Asynchronous Trip

FILE: cmpss_ex1_asynch.c

This example enables the CMPSS1 COMPH comparator and feeds the asynchronous CTRIPOUTH signal to the GPIO14/OUTPUTXBAR3 pin and CTRIPH to GPIO15/EPWM8B.

CMPSS is configured to generate trip signals to trip the EPWM signals. CMPIN1P is used to give positive input and internal DAC is configured to provide the negative input. Internal DAC is configured to provide a signal at VDD/2. An EPWM signal is generated at GPIO15 and is configured to be tripped by CTRIPOUTH.

When a low input(VSS) is provided to CMPIN1P,
- Trip signal(GPIO14) output is low
- PWM8B(GPIO15) gives a PWM signal

When a high input(higher than VDD/2) is provided to CMPIN1P,
- Trip signal(GPIO14) output turns high
- PWM8B(GPIO15) gets tripped and outputs as high

External Connections
- Give input on CMPIN1P (HSEC Pin 15)
- Outputs can be observed on GPIO14 and GPIO15 using an oscilloscope

Watch Variables
- None

17.8.2.2 CMPSS Digital Filter Configuration

FILE: cmpss_ex2_digital_filter.c

This example enables the CMPSS1 COMPH comparator and feeds the output through the digital filter to the GPIO14/OUTPUTXBAR3 pin.

CMPIN1P is used to give positive input and internal DAC is configured to provide the negative input. Internal DAC is configured to provide a signal at VDD/2.

When a low input(VSS) is provided to CMPIN1P,
- GPIO14 output is low

When a high input(higher than VDD/2) is provided to CMPIN1P,

- GPIO14 output turns high

17.9 CMPSS Registers

This Section describes the CMPSS Registers.

17.9.1 CMPSS Base Address Table

Table 17-2. CMPSS Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected

Complex bit access types are encoded to fit into small table cells. Table 17-4 shows the codes that are used for access types in this section.

Table 17-4. CMPSS_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

17.9.2.1 COMPCTL Register (Offset = 0h) [Reset = 0000h]

COMPCTL is shown in Figure 17-7 and described in Table 17-5.

Return to the Summary Table.

Chapter 18

Programmable Gain Amplifier (PGA)

The Programmable Gain Amplifier (PGA) is used to amplify an input voltage for the purpose of increasing the dynamic range of the downstream ADC and CMPSS modules.

18.1 Programmable Gain Amplifier (PGA) Overview

The integrated PGA helps to reduce cost and design effort for many control applications that traditionally require external, standalone amplifiers. On-chip integration makes sure that the PGA is compatible with the downstream analog-to-digital converter (ADC) and comparator subsystem (CMPSS) modules. Software selectable gain, filter settings, and different operational modes make the PGA adaptable to various performance needs.

18.1.1 Features

Features available to PGA modules are:

- Rail to rail input and output voltage within VDDA and VSSA range
- Programmable gain modes including unity gain and other values from 2× to 64×
- Standalone gain mode using off-chip passive components
- Post-gain filtering using on-chip resistors
- Differential input support
- Hardware assisted chopping for offset reduction
- Support for Kelvin ground connections using PGA_INM pins

18.1.2 Block Diagram

Figure 18-1 shows the block diagram of the PGA. The active component in the PGA is an embedded operational amplifier (op-amp) that is configurable as a non-inverting or inverting amplifier with internal feedback resistors. These internal feedback resistor values are paired to produce software selectable voltage gains.

Three PGA signals are available at the device pins:

- PGA_INP is the positive input to the PGA op-amp.
- PGA_INM is the negative input to the PGA op-amp.
- PGA_OUT supports op-amp output filtering with RC components. The filtered signal is available for sampling and monitoring by on-chip ADC and CMPSS modules.

Take note that PGA_OUT _INT is an internal signal at the op-amp output, which is available for sampling and monitoring by the internal ADC and CMPSS modules.

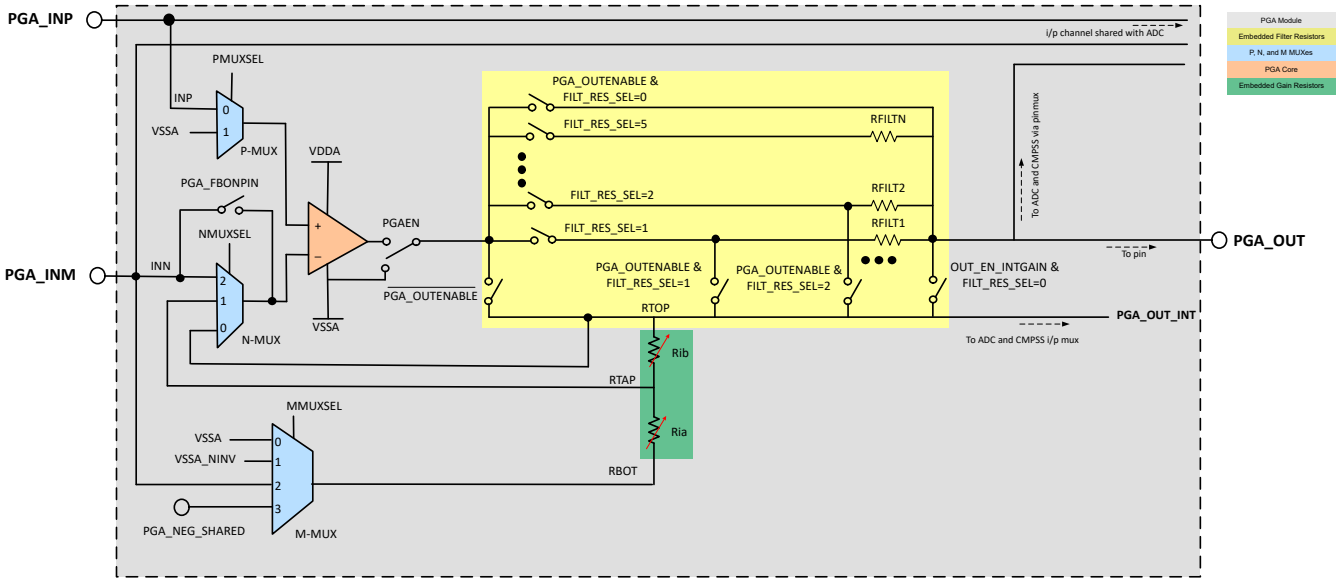

Figure 18-1. PGA Block Diagram

18.2 Linear Output Range

The absolute output range of the PGA is bounded by the analog VDDA and VSSA supplies – the PGA cannot produce output voltages greater than VDDA or less than VSSA.

Although the PGA can produce full-scale output across the absolute voltage range of VSSA to VDDA, the amplifier output is only linear within a subset of the absolute range. This reduced range is referred to as the linear output range.

The PGA performance specifications in the device data sheet only apply to the linear output range. For best performance, the input signal can be conditioned in such a way that the PGA stays within the linear output range during normal system operation.

Note

The voltage input range required to operate the PGA in the linear output range is unique for each gain mode. See the device data sheet for the linear output range.

18.3 Gain Values

Gain values of PGA are software-selectable using the PGACTL[GAIN] register field. The gain of the PGA in the subtractor and non-inverting modes is determined by a preset ratio between resistors R_{ia} and R_{ib}.

The target values for the gain resistors for subtractor and non-inverting modes are shown in Table 18-1.

Table 18-1. Different Gain Values and Corresponding Resistor Values

PGACTL[GAIN]	Non-inverting Gain	Inverting Gain	R_{ia}	R_{ib}
000	1	NA	256K	0(1)
001	2	-1	16K	16K
010	4	-3	8K	24K
011	8	-7	8K	56K
100	16	-15	8K	120K
101	32	-31	8K	248K
110	64	-63	4K	252K

(1) These values are nominal; tolerance is specified in electrical spec table given in the device data sheet.

Note

Changing the gain mode during normal operation is allowed, but a minimum configuration settling time can be observed when doing so. See the device data sheet for the gain switch settling time.

18.4 Modes of Operation

PGA can support four different operational modes based on the values in MUXSEL register, which are given in Table 18-2:

1. Buffer mode: PGA works in unity gain mode.
2. Standalone mode: PGA operates as a conventional op-amp.
3. Non-inverting mode: PGA works as a non-inverting op-amp.
4. Subtractor mode: PGA output voltage equals to the subtraction of the two inputs.

Table 18-2. Modes of Operation

Mode	MUXSEL[PMUXSEL]	MUXSEL[NMUXSEL]	MUXSEL[MMUXSEL]
Buffer mode	0	0	0
Standalone mode	0	2	0
Non-inverting mode	0	1	1
Subtractor mode	0	1	2 or 3

18.4.1 Buffer Mode

In this mode, PGA provides a high input impedance, low output impedance, and a voltage gain of approximately one. The block diagram of PGA in this mode is shown in Figure 18-2. This mode is also known as voltage follower, or unity gain mode. Even though this mode does not provide any voltage amplification, this mode is extremely useful because this mode prevents one stage's input impedance from loading the prior stage's output impedance. Not only does buffer mode isolate the load from the signal source, but also offers impedance matching between different parts of a circuit. The buffer op-amp also has a low output impedance that can drive a load without being affected by the load's impedance. Moreover, the low output impedance helps to maintain the signal voltage across the load, preventing voltage drops that can affect the performance of the circuit.

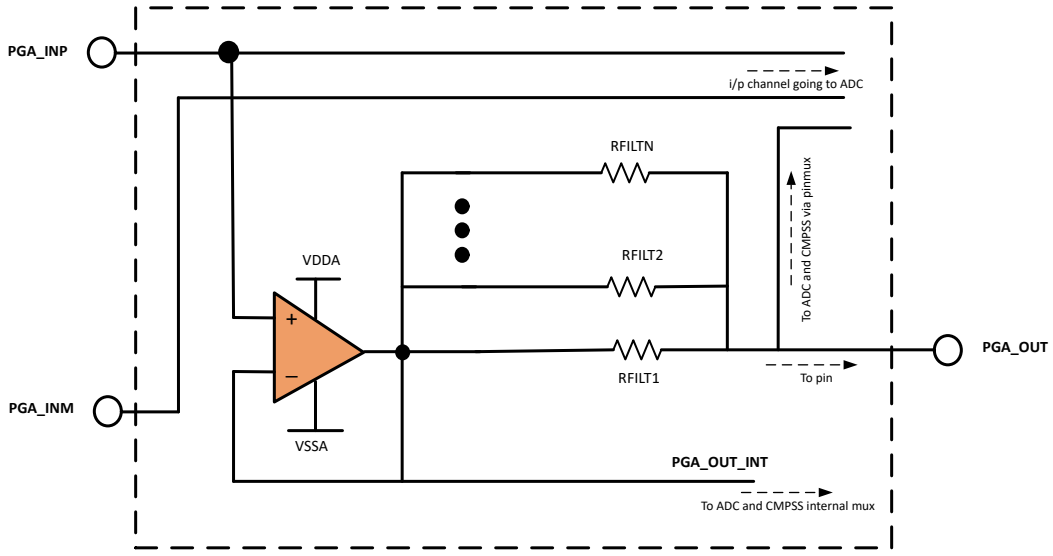

Figure 18-2. Buffer Mode

18.4.2 Standalone Mode

In this mode, a standalone operational amplifier is available that can support a number of analog applications using a minimum number of external components. Figure 18-3 Shows the block diagram of PGA in this mode. In this mode, the output voltage is determined by the external resistors connected to the inverting and non-inverting pins, as well as the feedback circuitry connected to the output.

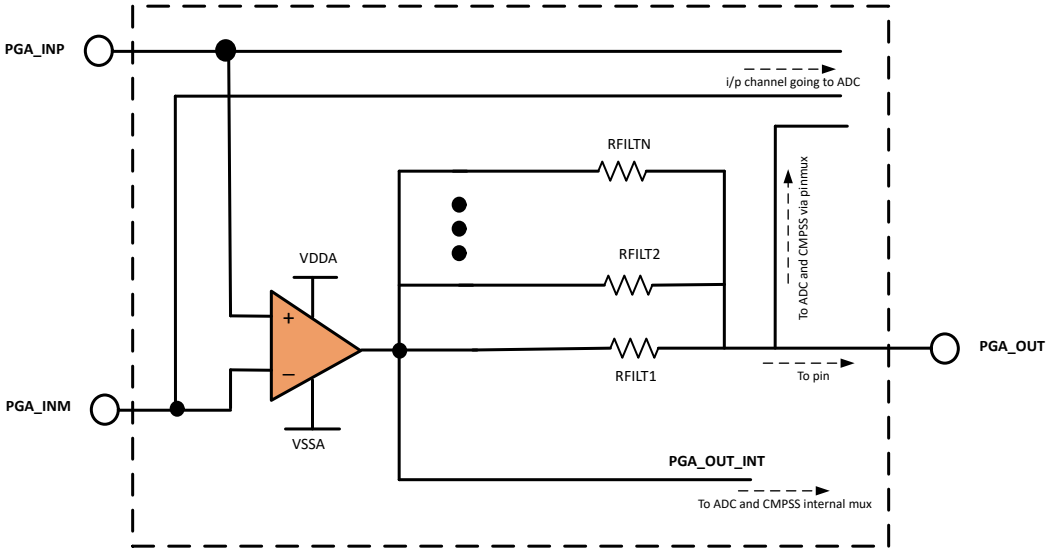

Figure 18-3. Standalone Mode

18.4.3 Non-inverting Mode

In non-inverting mode, the input voltage signal is applied directly to the non-inverting pin PGA_INP and generates an amplified output signal that is proportional and in phase with the input signal. The block diagram of PGA in this mode is illustrated in Figure 18-4. Feedback control of the non-inverting operational amplifier is achieved by applying a small part of the output voltage signal back to the inverting input terminal by way of a voltage divider network R_{ia} – R_{ib}. The voltage gain in this mode can be calculated using Equation 14:

$$V_{PGA\_OUT} = \left(1 + \frac{R_{ib}}{R_{ia}}\right) V_{PGA\_INP} \quad (14)$$

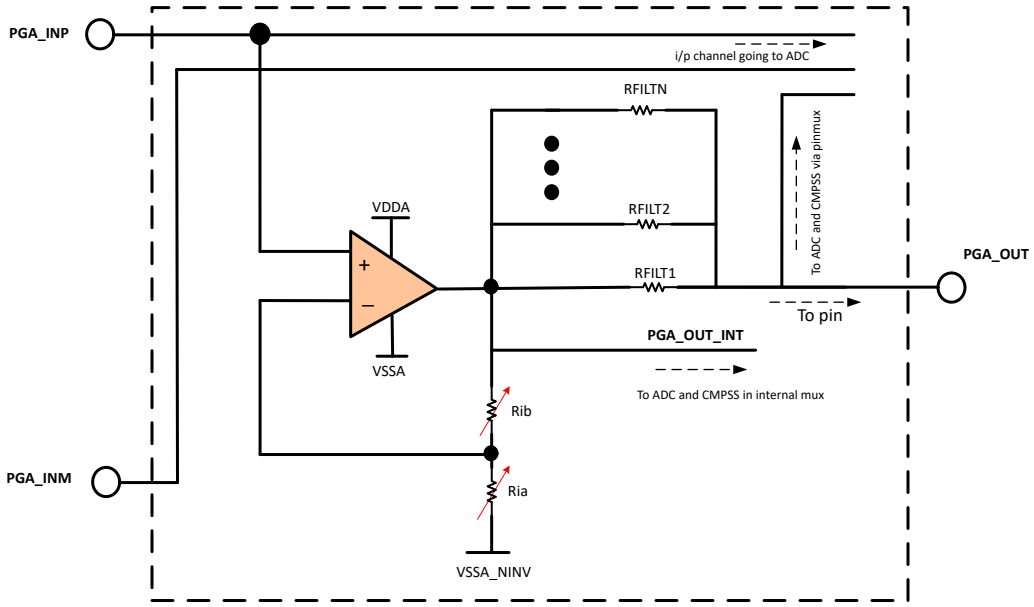

Figure 18-4. Non-inverting Mode

18.4.4 Subtractor Mode

In subtractor mode, the subtraction of the two input voltages is possible. Superposition is used to calculate the output voltage resulting from each input voltage, and then the two output voltages are subtracted to arrive at the final output voltage. The block diagram of PGA in this mode is demonstrated in Figure 18-5. The voltage gain can be derived as:

$$V_{PGA\_OUT} = \left(1 + \frac{R_{ib}}{R_{ia}}\right)V_{PGA\_INP} - \left(\frac{R_{ib}}{R_{ia}}\right)V_{PGA\_INM} \quad (15)$$

The differential signal is multiplied by the stage gain, so the subtractor mode name is a good choice for the circuit. If a voltage divider circuit with similar values of R_{ia}-R_{ib} is added to the non-inverting pin, this mode only amplifies the differential portion of the input signal; therefore, this mode rejects the common-mode portion of the input signal.

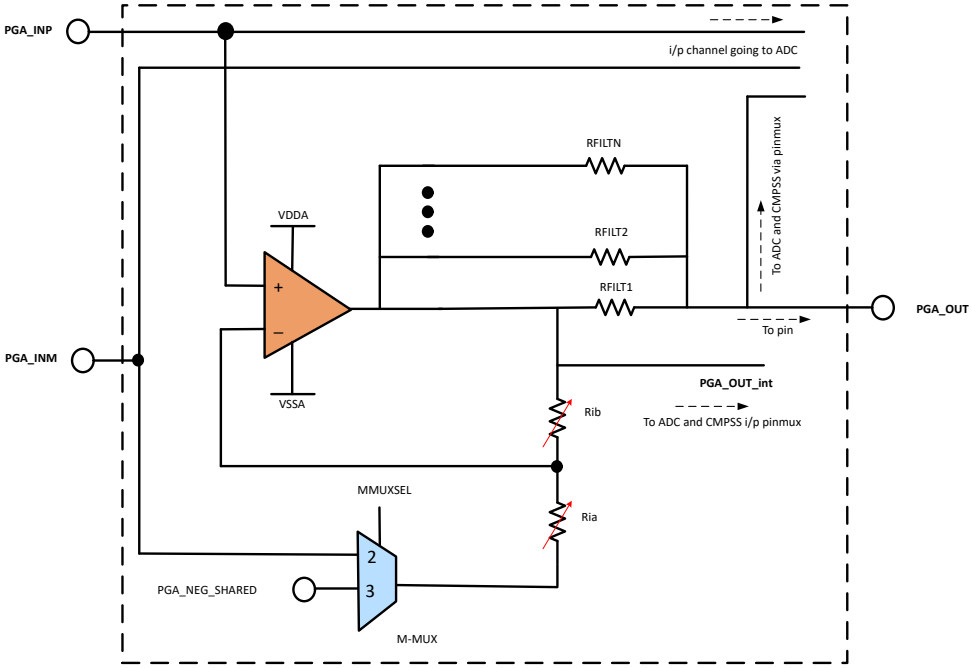

Figure 18-5. Subtractor Mode

18.5 External Filtering

To remove any unwanted high-frequency noise, two types of low-pass filter can be implemented using internal resistors of PGA module:

1. Low-pass filter using internal filter resistors R_{FILT} and external capacitor
2. Low-pass filter using internal gain resistors R_{ib} and external capacitor

18.5.1 Low-Pass Filter Using Internal Filter Resistor and External Capacitor

The PGA output can be routed to a pin through an embedded series resistor for the purpose of low-pass filtering the amplified signal. The filter resistance is software selectable using the PGACTL[FILT_RES_SEL] register field. The default selection of PGACTL[FILT_RES_SEL] = 0 disables the filter path.

The cutoff frequency can be estimated using the standard low-pass RC given by:

$$f_{cutoff} = \frac{1}{2\pi R_{FILT} C_{FILTER}} \quad (16)$$

Each gain mode requires a minimum amount of series resistance when filtering is enabled. The values are shown in Table 18-3. Also, the external capacitor value C_{FILTER} influences the ADC sampling performance. See Section 18.10.2.2 for more information.

Table 18-3. Minimum Filter Resistance

PGACTL[GAIN]	Minimum R_{FILT} Required PGACTL[FILT_RES_SEL]
0	50Ω
1	50Ω
2	50Ω
3	100Ω
4	100Ω
5	200Ω
6	400Ω

18.5.2 Single Pole Low-Pass Filter Using Internal Gain Resistor and External Capacitor

Some applications cannot tolerate having an RC network at the output of the amplifier. Amplifier output current flowing through the filter resistor creates a voltage offset that introduces output error. In this case, one can opt to filter the noise spikes by placing a feedback capacitor across the feedback loop. In fact, a simple single-pole low pass filter can be implemented by placing an external capacitance between PGA_INM and PGA_OUT in internal gain mode, which is shown in Figure 18-6.

This form of very simple filter is normally used in instances where a small amount of roll off is required. PGA feedback node RTAP can be brought on pin PGA_INM for external filtering by selecting PMUXSEL = 00, NMUXSEL = 01, and MMUXSEL = 01. Also, to enable this mode, PGA_FB_ON_PIN input/register needs to be set to 1.

The cutoff frequency for this type of filter can be calculated very easily by working out the frequency at which the reactance of the capacitor equals the resistance of the resistor R_{ib}, which is defined by Equation 17:

$$f_{cutoff} = \frac{1}{2\pi R_{ib} C_{Ext}} \tag{17}$$

The gain for this op amp circuit can be calculated in the normal way ignoring the effect of the capacitor:

$$Gain = \left(1 + \frac{R_{ib}}{R_{ib}}\right) \tag{18}$$

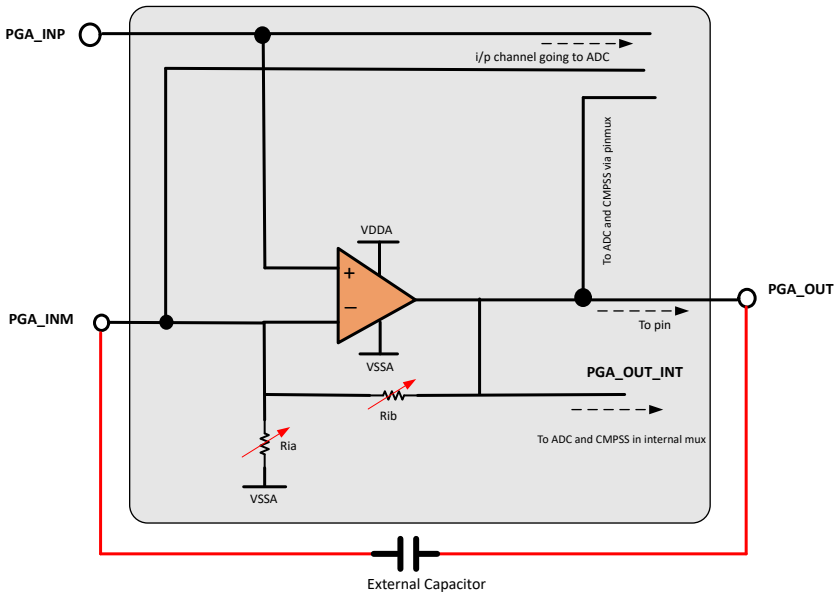

Figure 18-6. Low-Pass Filter Using External Capacitor

18.6 Error Calibration

Op-Amp error calibration is the process of adjusting the Op-Amp parameters to minimize or eliminate errors. Calibration can be done using different methods, depending on the type of error and the Op-Amp configuration. To reduce inherent offset, factory-generated values are written to the trim registers by calling the Device_cal() function that is located in TI reserved OTP.

18.6.1 Offset Error

This error occurs due to mismatches in the Op-Amp input terminals. The offset error appears as a constant DC offset across the PGA output range, see Figure 18-7. The built-in Device_cal() function reduces the offset error so that the error falls within the data sheet specifications.

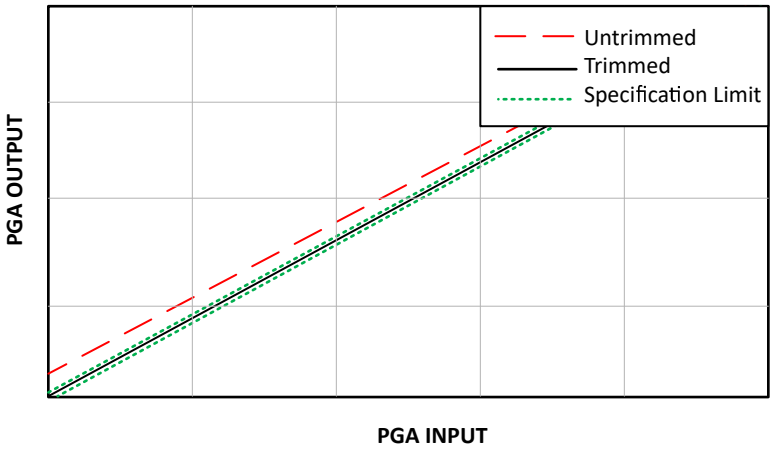

Figure 18-7. PGA Offset Trim

18.6.2 Gain Error

This error occurs due to mismatches in the Op-Amp gain. After the offset error has been removed, the remaining error, the gain error appears as a scaled error that increases in magnitude with increasing PGA output voltage, see Figure 18-8. The hardware trim targets the gain performance so that the hardware trim falls within the data sheet specifications.

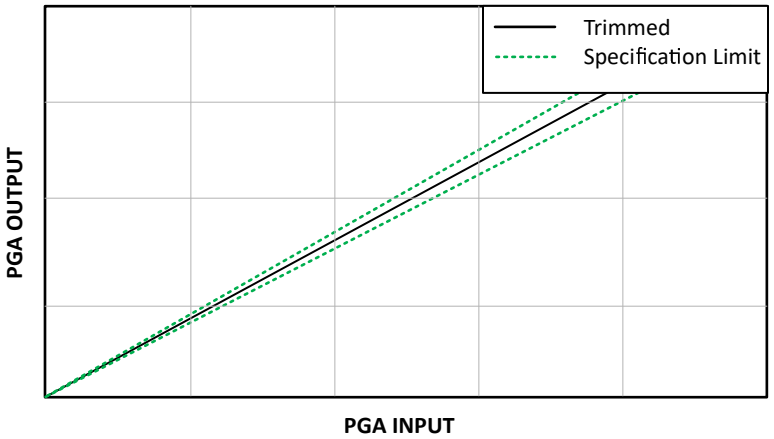

Figure 18-8. PGA Gain Error

18.7 Chopping Feature

The PGA supports chopping feature, which is a continuous-time modulation technique in which the signal and offset are modulated to different frequencies. The motivation behind adding this feature is primarily to reduce input referred offset to a very small number (in micro volt order). Not only chopping is dynamic technique that continuously reduces offset, but also this technique removes low frequency 1/f noise as well as offset drift over temperature or time.

The chopping feature is demonstrated in Figure 18-9. In broad terms, an input voltage first passes through a chopper driven by a clock at frequency f_{ch}; so, the voltage is converted to a square-wave voltage. Then, the modulated signal along with the offset are amplified by the fully differential amplifier. The second chopper then demodulates the amplified input signal back to DC, while the offset is shifted to the frequency of the clock f_{ch} harmonics. The DC offset can be filtered out by a low-pass filter.

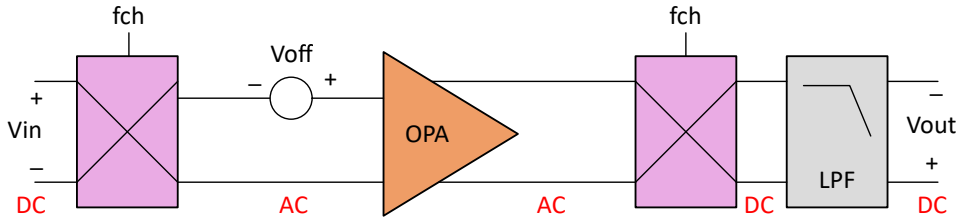

Figure 18-9. General Chopping Technique

This device supports ADC-assisted method. In this method, the chopping control signal comes from the on-chip ADC module. Moreover, Start of Conversion (SOC) in the ADC module can be used to implement chopping. In this method, PGA output is sampled by the on-chip ADC module. Note that the ADC-assisted method relies on ADC module for filtering the output instead of using external low-pass filter. To remove the offset, an average of the output signal can be taken in ADC module. This functionality is provided in post-processing block in ADC module. (See Chapter 15). The ADC-assisted chopping stands out from purely analog chopping methods due to the ability to offer higher accuracy and precision.

Figure 18-10 shows the general diagram of ADC-assisted chopping mode, in which a logic block is used to generate the necessary signal to handle chopping. To configure the ADC-assisted chopping, write to the PGA_CHOP field in the MUXSEL register. To configure control signal for ADC-assisted chopping, write to the CHOP_EXTCTRL field in the PGACTL register.

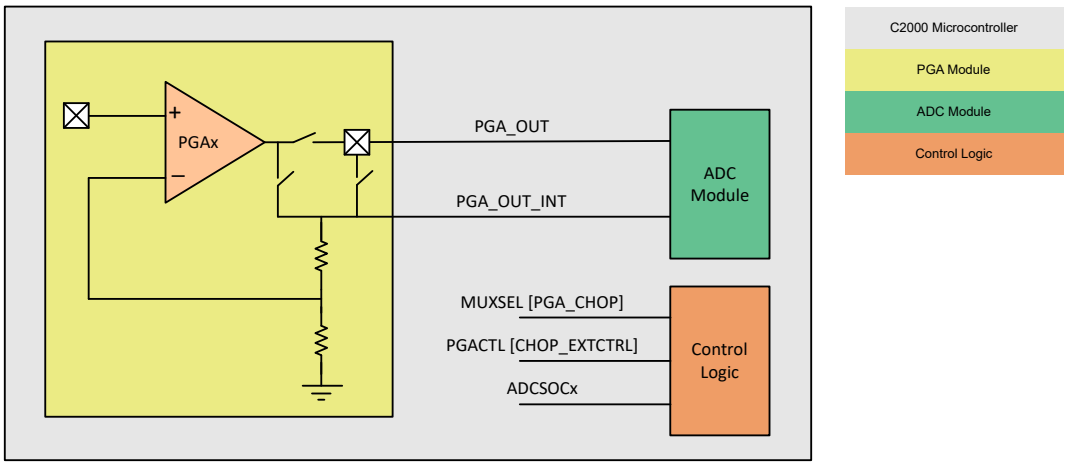

Figure 18-10. ADC-Assisted Chopping Block Diagram

This logic takes care of different scenarios, like two ADCs using the same PGA at different time intervals. For a given PGA, the ADC assisted chopping feature is supported on ADCs which are connected to PGA_OUT_INT for that PGA. Table 18-4 shows the connectivity between PGA and ADC modules.

Table 18-4. PGA and ADC Connection

PGA Connectivity to ADC	ADC
PGA1_OUT_INT	A21, B21
PGA2_OUT_INT	C21, B22
PGA3_OUT_INT	C22, A22

18.8 Enabling and Disabling the PGA Clock

If the clock to the PGA is disabled while the PGA is outputting a voltage, the output voltage remains unaffected but the PGA registers are no longer updated with register writes. Enabling the clock resumes register writes.

18.9 Lock Register

The PGALOCK register provides the ability to block writes to certain PGA configuration registers. Locking register writes can prevent spurious or malicious code from modifying critical register settings. Once a register has been locked using the PGALOCK register, only a module-level or device-level reset can restore write functionality.

18.10 Analog Front-End Integration

The PGAs operate in concert with the other embedded analog modules (ADC, CMPSS, Buffered DAC) as an analog front-end system.

18.10.1 Buffered DAC

Buffered DACs are commonly used in a variety of applications such as dc-coupled applications,in which the drive amplifier must provide the required gain and offset voltage, to match the signal to the input voltage range of the ADC. As a best practice, the PGA input signal is conditioned so that the PGA output is centered within the linear range. The input signal requires some combination of offset and attenuation to achieve this goal. For example, an external resistor divider can attenuate the input signal while the embedded buffered DAC can provide a positive voltage offset, see Figure 18-11.

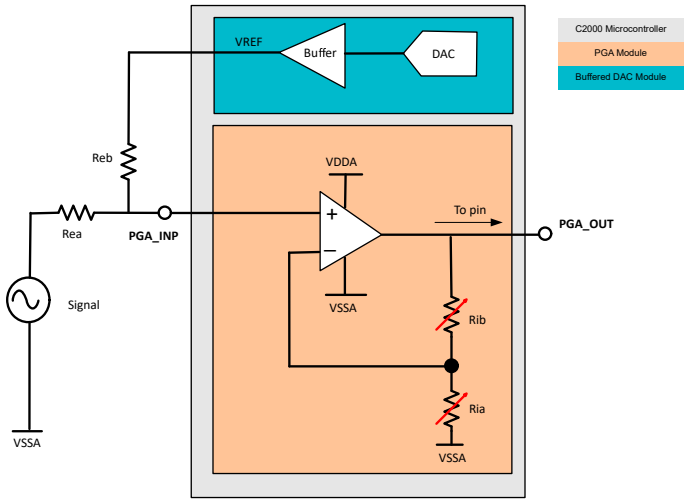

Figure 18-11. Level Shifting Using Internal DAC

With the topology shown in Figure 18-11, the voltage seen at the PGA_INP pin can be calculated as:

$$V_{PGA\_OUT} = \frac{R_{ib} + R_{ia}}{R_{ia}}\left(\frac{R_{eb}}{R_{ea} + R_{eb}}V_{signal} + \frac{R_{ea}}{R_{ea} + R_{eb}}V_{REF}\right) \quad (19)$$

Supplying a V_{DAC_OUT} of 1.65V transforms a bipolar V_{SIGNAL} range of -0.5V to +0.5V into a V_{PGA_INP} range of 0.22V to 0.88V, which is an excellent choice for the 3× gain mode.

See Chapter 16 for buffered DAC usage information.

18.10.2 Analog-to-Digital Converter (ADC)

In the simplest application, the PGA amplifies small input signals to increase the ADC dynamic range. The PGA also provides the additional benefit of buffering input signals from the ADC sample and hold capacitor, which further reduces sampling error.

Both the filtered and unfiltered PGA output paths are available for ADC sampling. Minimum ADC acquisition windows are recommended when sampling the PGA paths.

18.10.2.1 Unfiltered Acquisition Window

The device data sheet provides a minimum estimated ADC acquisition window for sampling the PGA_OUT signal with one ADC. This estimated value can provide sampling accuracy close to the specified performance parameters of the ADC. A longer acquisition window can be used for better performance.

18.10.2.2 Filtered Acquisition Window

The minimum ADC acquisition window for sampling the PGA_OF filtered signal with one ADC varies based on the values of R_{FILTER} and C_{FILTER}. To make sure of good performance, choose a C_{FILTER} capacitor that is large enough to satisfy most of the ADC sample and hold capacitor (Ch) charge requirements. The C_{FILTER} value can be sized based on the acceptable amount of ADC sampling error (LSB_{Err}):

$$C_{FILTER} = \frac{C_h \times 4096}{LSB_{Err}} \quad (20)$$

See Chapter 15 to determine the ADC acquisition window, where the ADC source resistance (R_s) is equal to R_{FILTER}.

18.10.3 Comparator Subsystem (CMPSS)

The PGA output can be monitored by a CMPSS module for trips above or below a reference voltage. Up to two independent reference thresholds per CMPSS can be used for trip detection.

Both the filtered and unfiltered PGA output paths are available for CMPSS trip monitoring.

See Chapter 17 for CMPSS usage information.

18.10.4 PGA_NEG_SHARED Feature

This feature allows sharing PGA_INM pin across three available PGA modules, which helps to save two pins for applications where multiple PGAs are required, but the PGA modules all can have a common negative sense point. To enable this feature, MMUXSEL and NMUXSEL must be set to 3 and 1, respectively. As you can see in Figure 18-12, PGA_NEG_SHARED is shared among three PGA modules internally so that the user can employ there PGA modules with only one inverting pin. In three-phase current measurement, three modules of PGA can be employed to monitor the shunt current by using only four pins. The schematic of three-phase current sensing is shown in Figure 18-13.

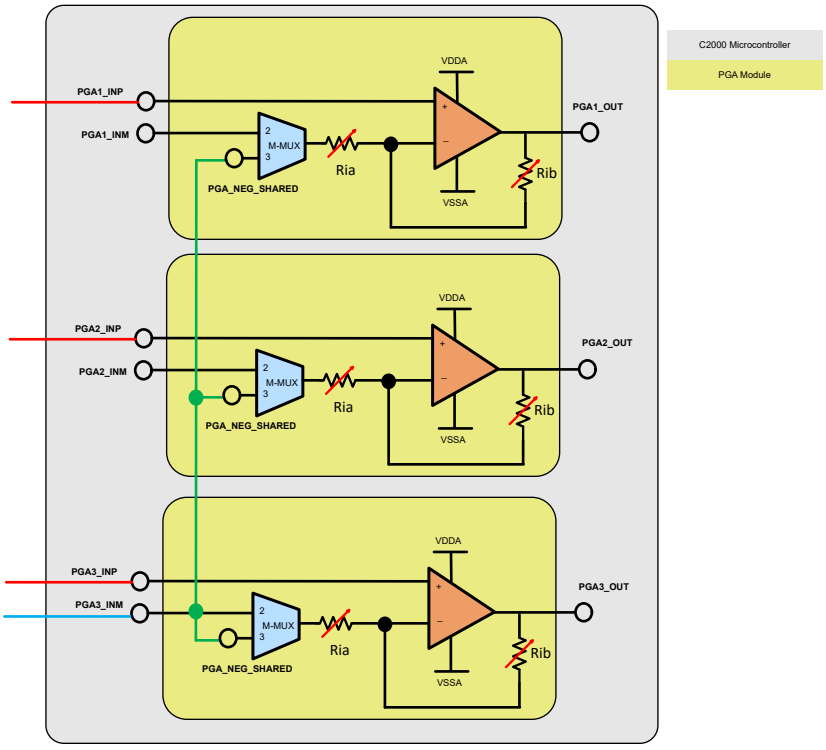

Figure 18-12. Sharing PGA_NEG Pin Between PGA Modules

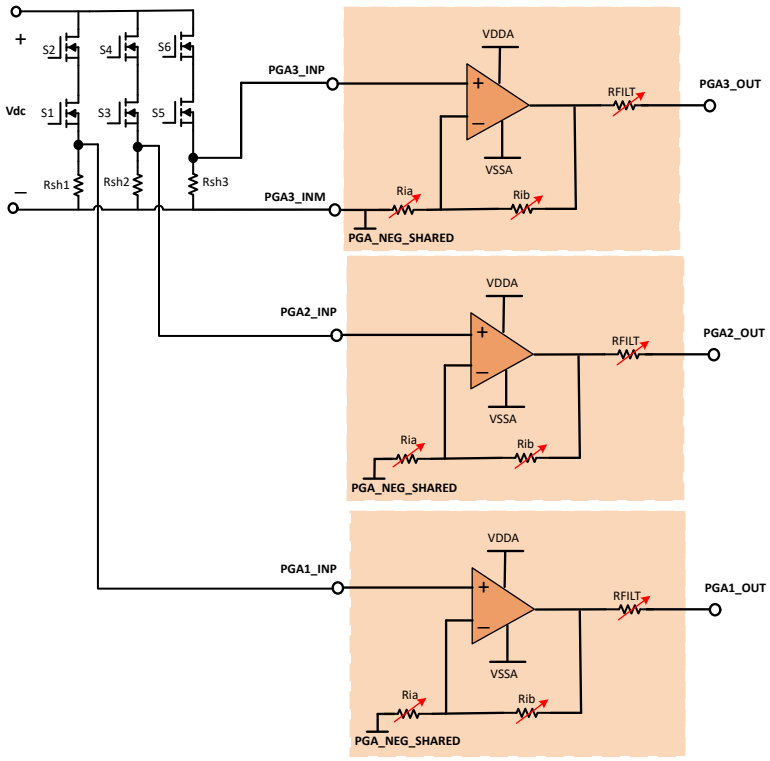

Figure 18-13. Three-phase Current Sensing Using PGA_NEG_SHARED Feature

18.10.5 Alternate Functions

Each PGA has up to three device terminals for operation: non-inverting pin PGA_INP, inverting pin PGA_INM, and output pin PGA_OUT, see Figure 18-14. Alternate paths at the device level allow the input and output filter terminals to take on alternate functions. This can be especially valuable, if the respective PGA resource is not used for an application. See Chapter 14 for more information.

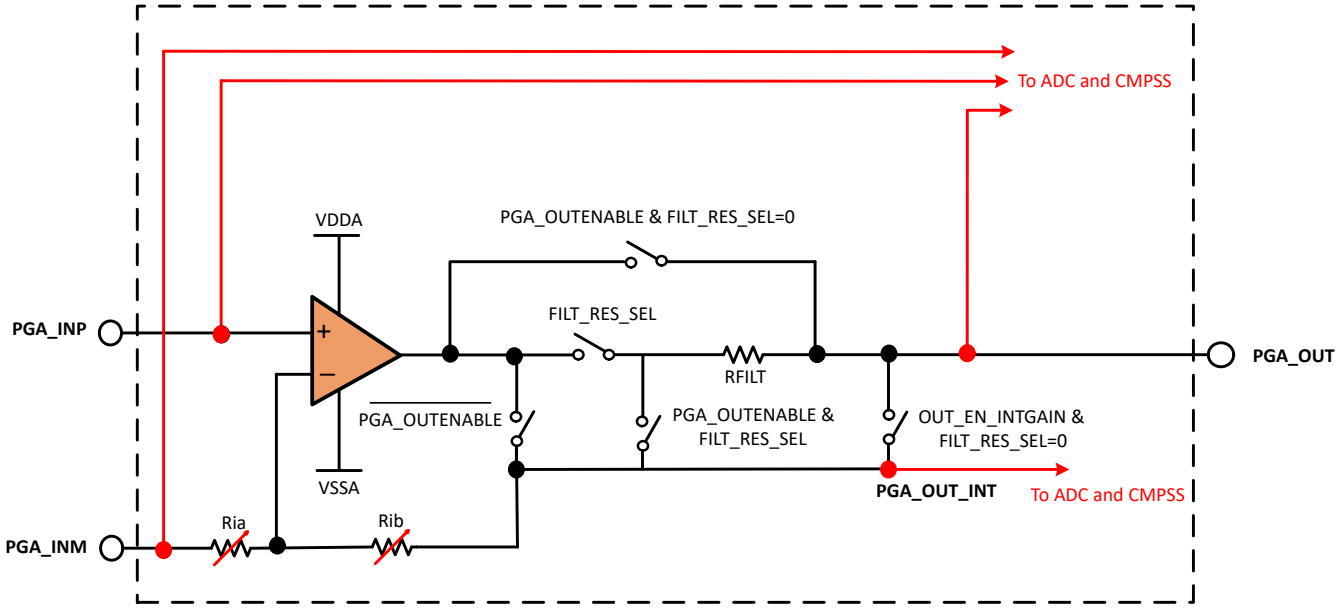

Figure 18-14. PGA Pin Alternate Functions

18.11 Examples

18.11.1 Non-Inverting Amplifier Using Non-Inverting Mode

Given a small positive signal, the PGA can be used to amplify the signal to increase the dynamic range of ADC sampling and comparator trip monitoring. For example, an input signal with a valid range between 0.25V to 0.75V can be amplified in 4× mode to produce an output signal between 1V to 3V.

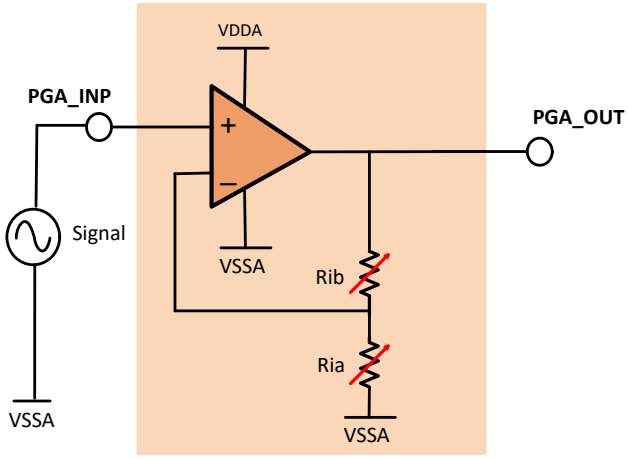

Figure 18-15. Signal Conditioning Using Non-inverting Mode

The amplified output voltage is calculated as:

$$V_{PGA\_OUT} = \left(1 + \frac{R_{ib}}{R_{ib}}\right) V_{Signal} \quad (21)$$

18.11.2 Buffer Mode

Assume that there is an analog sensor that gives a 0 to 12V range signal. To sample the signal using the ADC, a voltage divider along with a unity-gain op-amp is required. In the circuit shown in Figure 18-16, the voltage divider (36kΩ and 100kΩ) brings the 12V sensor voltage down to something less than 3.3V. The 100Ω filter resistor and 1nF capacitor form a low-pass filter with a cut-off frequency of 1.5MHz.

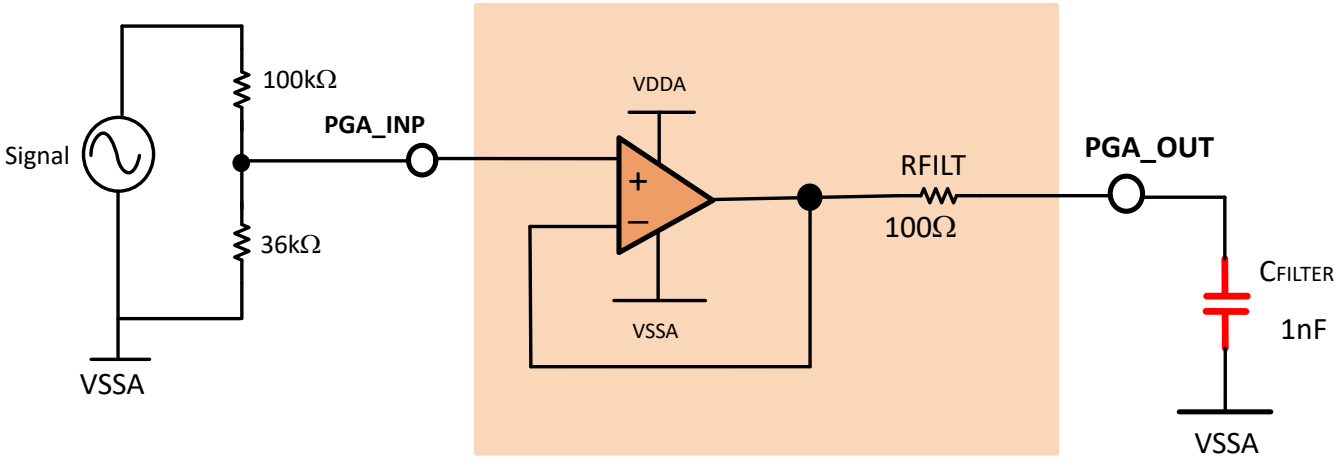

Figure 18-16. Buffer Mode Example

18.11.3 Low-Side Current Sensing

Low-side current sensing connects the sensing resistor between the load and ground. To not adversely affect current flow, the current resistors have a small value that produces a proportionally small voltage across them. The small voltage across the shunt resistor must usually be boosted from tens or hundreds of millivolts to tenths of a volt or volts for upstream conversion by an analog-to-digital converter (ADC). This task can be performed by PGA. Figure 18-17 shows the low-side current sensing using PGA.

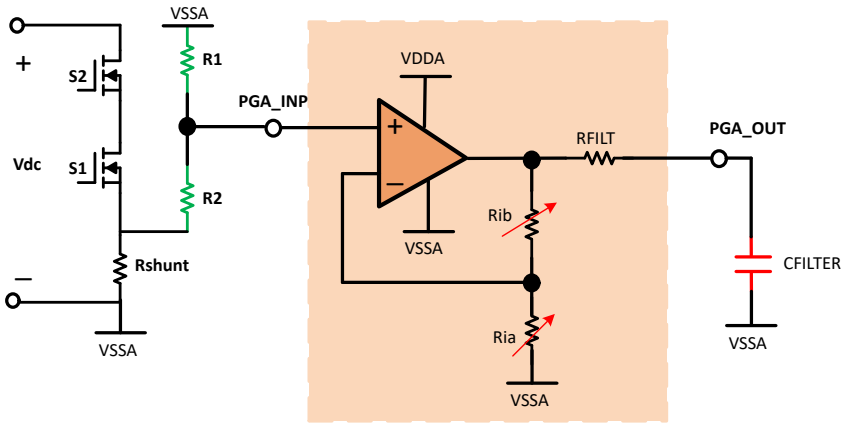

Figure 18-17. PGA Shunt Current Example

In this circuit, the amplifier gain is set by the ratio of R_{ib} divided by R_{ia}. If the divider resisters R_1=R_{ib} and R_2=R_{ia}, then the amplified voltage can be calculated by:

$$V_{PGA\_OUT} = \frac{R_{ib}}{R_{ia}}\left(R_{shunt}I_{load}\right) \quad (22)$$

If low-pass filtering is desired, an external capacitor in conjunction with internal filter resistors R_{FILT} can be used. The filter cutoff frequency is estimated using:

$$f_{cutoff} = \frac{1}{2\pi R_{FILT}C_{FILTER}} \quad (23)$$

18.11.4 Bidirectional Current Sensing

The PGA senses current flow through a sense resistor in both directions, demonstrated in Figure 18-18. The bidirectional current-sensing capability is achieved by applying a positive voltage at the non-inverting pin to offset the output voltage. A positive differential voltage sensed at the inputs results in an output voltage that is greater than the applied reference voltage; likewise, a negative differential voltage at the inputs results in output voltage that is less than the applied reference voltage. The output voltage of the PGA is given by:

$$V_{PGA\_OUT} = \frac{R_{ib}}{R_{ia}}(R_{sense}I_{load}) + V_{REF} \quad (24)$$

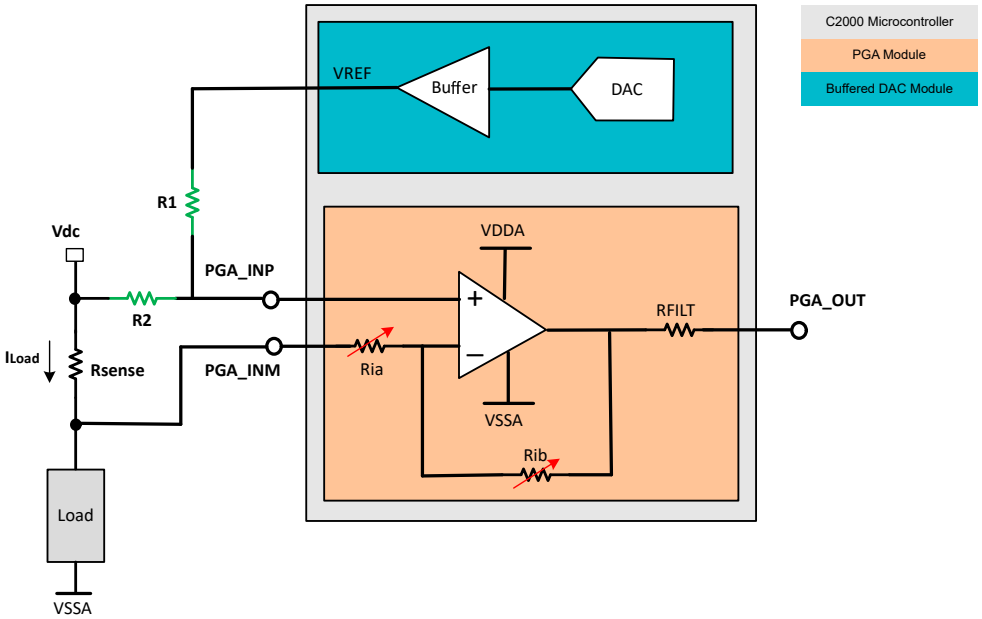

Figure 18-18. Bidirectional Current Sensing

18.12.2 PGA Examples

NOTE: These examples are located in the C2000Ware installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/pga

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

18.12.2.1 PGA DAC-ADC External Loopback Example

FILE: pga_ex1_dac_adc_ext_loopback.c

This example generates 400 mV using the DAC output (it uses an internal voltage reference). The output of the DAC is externally connected to PGA2 for a 3x gain amplification. It uses two ADC channels to sample the DAC output and the amplified voltage output from PGA2. The ADC is connected to these signals internally.

- *External Connections*
- Connect DACA_OUT (Analog Pin A0) to PGA2_INP (Analog Pin A2).
- Connect PGA1_INM (Analog Pin A3) to GND

Watch Variables

- *dacResult* - The DAC output voltage.

- *pgaResult* - The amplified DAC voltage.
- *pgaGain* - The ratio of the amplified DAC voltage to the original DAC output. This should always read a value of ~3.0.

18.13 PGA Registers

This Section describes the PGA Registers.

18.13.1 PGA Base Address Table

Table 18-6. PGA Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure

Chapter 19

Enhanced Pulse Width Modulator (ePWM)

The enhanced pulse width modulator (ePWM) peripheral is a key element in controlling many of the power electronic systems found in both commercial and industrial equipment. These systems include digital motor control, switch mode power supply control, uninterruptible power supplies (UPS), and other forms of power conversion. The ePWM peripheral can also perform a digital-to-analog (DAC) function, where the duty cycle is equivalent to a DAC analog value; it is sometimes referred to as a power DAC.

This chapter is applicable for ePWM type 4 with added register protection capability. See the *C2000 Real-Time Control Peripheral Reference Guide* for a list of all devices with an ePWM module of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

19.1 Introduction

This chapter includes an overview and information about each submodule:

- Time Base (TB) Submodule
- Counter Compare (CC) Submodule
- Action Qualifier (AQ) Submodule
- Dead-Band Generator (DB) Submodule
- PWM Chopper (PC) Submodule
- Trip Zone (TZ) Submodule
- Event Trigger (ET) Submodule
- Digital Compare (DC) Submodule

The ePWM Type 4 is functionally compatible to Type 2 (a Type 3 does not exist). Type 4 has the following enhancements in addition to the Type 2 features:

- **Register Address Map:** Additional registers are required for new features on ePWM Type 4. The ePWM register address space has been remapped for better alignment and easy usage.
- **Delayed Trip Functionality:** Changes have been added to achieve deadband insertion capabilities to support, for example, delayed trip functionality needed for peak current mode control type application scenarios. This has been accomplished by allowing comparator events to go into the Action Qualifier as a trigger event (Events T1 and T2). If comparator T1 / T2 events are used to edit the PWM, changes to the PWM waveform do not take place immediately. Instead, the waveform synchronizes to the next TBCLK.
- **Dead-Band Generator Submodule Enhancements:** Shadowing of the DBCTL register to allow dynamic configuration changes.
- **One Shot and Global Load of Registers:** The ePWM Type 4 allows one shot and global load capability from shadow to active registers to avoid partial loads in, for example, multiphase applications. ePWM Type 4 also allows a programmable prescale of shadow to active load events. ePWM Type 4 Global Load can simplify ePWM software by removing interrupts and making sure that all registers are loaded at the same time.
- **Trip-Zone Submodule Enhancements:** Independent flags have been added to reflect the trip status for each of the TZ sources. Changes have been made to the trip-zone submodule to support certain power converter switching techniques like valley switching.
- **Digital Compare Submodule Enhancements:** Blanking window filter register width has been increased from 8 to 16 bits. DCCAP functionality has been enhanced to provide more programmability.
- **PWM SYNC Related Enhancements:** The ePWM Type 4 allows PWM SYNCOUT generation based on CMPC and CMPD events. These events can also be used for PWMSYNC pulse selection.

The ePWM Type 2 is fully compatible to Type 1. Type 2 has the following enhancements in addition to the Type 1 features:

- **High-Resolution Dead-Band Capability:** High-resolution capability is added to dead-band RED and FED in half-cycle clocking mode.
- **Dead-Band Generator Submodule Enhancements:** The ePWM Type 2 has features to enable both RED and FED on either PWM outputs. Provides increased dead band with 14-bit counters and dead-band / dead-band high-resolution registers are shadowed
- **High-Resolution Extension available on ePWMxB outputs:** Provides the ability to enable high-resolution period and duty cycle control on ePWMxB outputs. This is discussed in more detail in Section 19.15.
- **Counter Compare Submodule Enhancements:** The ePWM Type 2 allows interrupts and SOC events to be generated by additional counter compares CMPC and CMPD.
- **Event Trigger Submodule Enhancements:** Prescaling logic to issue interrupt requests and ADC start of conversion expanded up to every 15 events. This submodule allows software initialization of event counters on SYNC event.
- **Digital Compare Submodule Enhancements:** Digital Compare Trip Select logic [DCTRIPSEL] has up to 12 external trip sources selected by the Input X-BAR logic in addition to an ability to OR all of them (up to 14 [external and internal sources]) to create the respective DCxEVTs.

- **Simultaneous Writes to TBPRD and CMPx Registers:** This feature allows writes to TBPRD, CMPA:CMPAHR, CMPB:CMPBHR, CMPC and CMPD of any ePWM module to be tied to any other ePWM module, and also allows all ePWM modules to be tied to a particular ePWM module if desired.
- **Shadow to Active Load on SYNC of TBPRD and CMP Registers:** This feature supports simultaneous writes of TBPRD and CMPA/B/C/D registers.

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention and must be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel submodules with separate resources that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand the operation quickly.

In this document, the letter x within a signal or submodule name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the ePWMx instance. Thus, EPWM1A and EPWM1B belong to ePWM1 and likewise EPWM4A and EPWM4B belong to ePWM4.

Type0 to Type1 Enhancements

- **Increased Dead-Band Resolution:** Dead-band clocking has been enhanced to allow half-cycle clocking to double resolution.
- **Enhanced Interrupt and SOC Generation:** Interrupts and ADC start-of-conversion can now be generated on both the TBCTR == zero and TBCTR == period events. This feature enables dual edge PWM control. Additionally, the ADC start-of-conversion can be generated from an event defined in the digital compare submodule.
- **High-Resolution Period Capability:** Provides the ability to enable high-resolution period. This is discussed in more detail in Section 19.15.
- **Digital Compare Submodule:** The digital compare submodule enhances the event triggering and trip zone submodules by providing filtering, blanking and improved trip functionality to digital compare signals. Such features are essential for peak current mode control and for support of analog comparators.

Note

The name of the sync signal that goes to the CMPSS has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCI and EPWMSYNCO. For a description of these signals, see Table 19-2.

19.1.2 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMxA and EPWMxB. Multiple ePWM modules are instanced within a device as shown in Figure 19-1. Each ePWM instance is identical with one exception. Some instances include a hardware extension that allows more precise control of the PWM outputs. This extension is the high-resolution pulse width modulator (HRPWM) and is described in Section 19.15. See the device data sheet to determine which ePWM instances include this feature. Each ePWM module is indicated by a numerical value starting with 1. For example, ePWM1 is the first instance and ePWM3 is the third instance in the system and ePWMx indicates any instance.

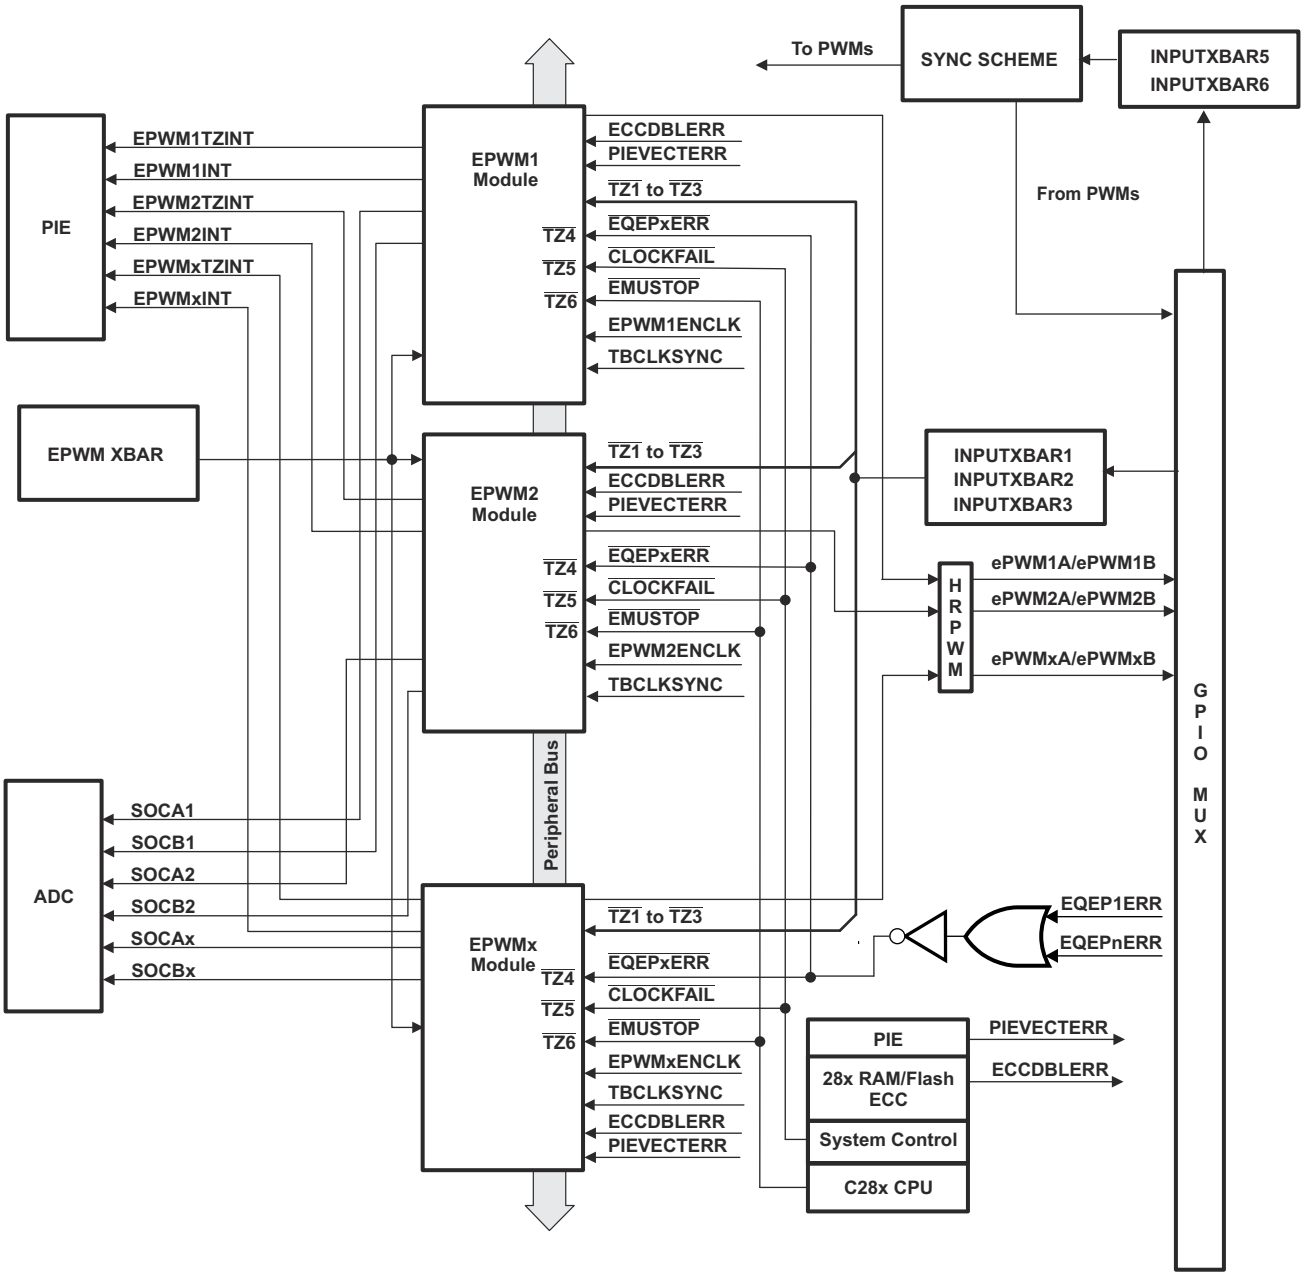
The ePWM modules are chained together by way of a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral submodules (eCAP). The number of submodules is device-dependent and based on target application needs. Submodules can also operate standalone.

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- All events can trigger both CPU interrupts and ADC start of conversion (SOC)
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in Figure 19-1. The signals are described in detail in subsequent sections.

The order in which the ePWM modules are connected can differ from what is shown in Figure 19-1. See Section 19.4.3.3 for the synchronization scheme for a particular device. Each ePWM module consists of eight submodules and is connected within a system by way of the signals shown in Figure 19-2.



A. This signal exists only on devices with an eQEP submodule.

Figure 19-1. Multiple ePWM Modules

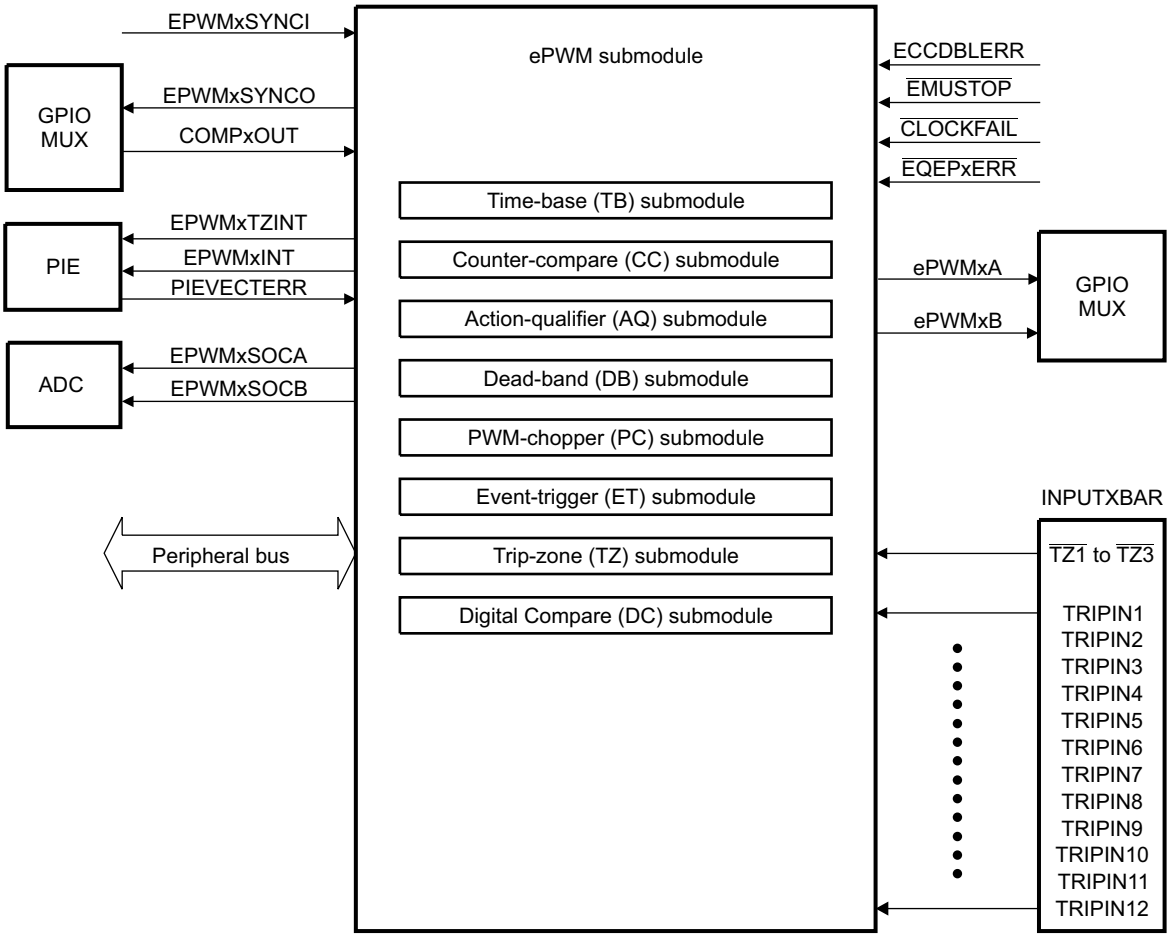


Figure 19-2. Submodules and Signal Connections for an ePWM Module

Figure 19-3 shows more internal details of a single ePWM module. The main signals used by the ePWM module are:

- **PWM output signals (EPWMxA and EPWMxB)**

  The PWM output signals are made available external to the device.

- **Trip-zone signals ($\overline{TZ1}$ to $\overline{TZ6}$)**

  These input signals alert the ePWM module of fault conditions external to the ePWM module. Each submodule on a device can be configured to either use or ignore any of the trip-zone signals. The $\overline{TZ1}$ to $\overline{TZ3}$ trip-zone signals can be configured as asynchronous inputs through the GPIO peripheral using the Input X-BAR logic, refer to Figure 19-51. $\overline{TZ4}$ is connected to an inverted EQEPx error signal (EQEPxERR), which can be generated from any one of the EQEP submodule (for those devices with an EQEP module). $\overline{TZ5}$ is connected to the system clock fail logic, and $\overline{TZ6}$ is connected to the $\overline{EMUSTOP}$ output from the CPU. This allows configuring a trip action when the clock fails or the CPU halts.

- **Time-base synchronization input (EPWMxSYNCI), output (EPWMxSYNCO), and peripheral (EPWMxSYNCPER) signals**

  Each ePWM module can be synchronized with other ePWM modules or other peripherals, using EPWMSYNCINSEL. Each ePWM module can also generate a synchronization output signal. The source of the EPWMxSYNCOUT can be selected and enabled by EPWMSYNCOUTEN and TBCTL2.OSHTSYNCMODE. For more information, see Section 19.4.3.3.

  Each ePWM module also generates another PWMSYNC signal called EPWMxSYNCPER. EPWMxSYNCPER goes to the GPDAC and CMPSS for synchronization purposes. Functionality is configured using the HRPCTL register, but has no relation with the HRPWM. For more information on how EPWMxSYNCPER is used by the GPDAC and CMPSS, see the respective chapters.

- **ADC start-of-conversion signals (EPWMxSOCA and EPWMxSOCB)**

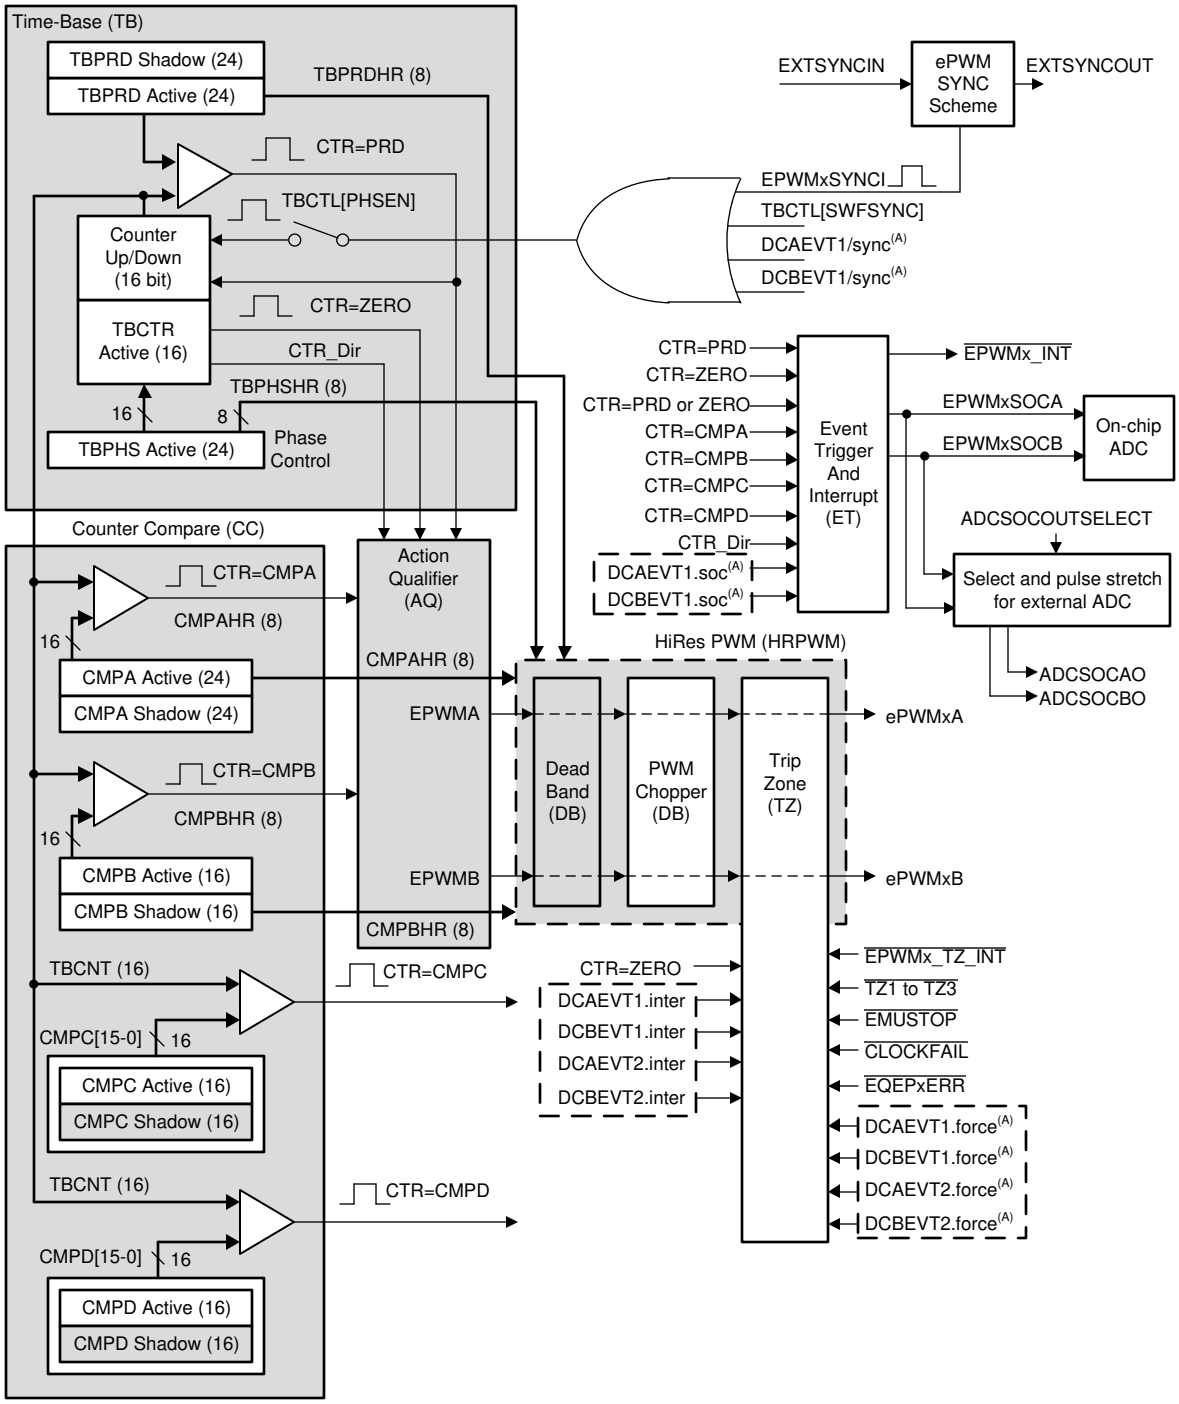
  Each ePWM module has two ADC start of conversion signals. Any ePWM module can trigger a start of conversion. Whichever event triggers the start of conversion is configured in the event-trigger submodule of the ePWM.

- **Comparator output signals (COMPxOUT)**

  Output signals from the comparator module can be fed through the Input X-BAR and EPWM X-BAR to one or all of the 12 trip inputs [TRIPIN1-TRIPIN12] and in conjunction with the trip zone signals can generate digital compare events.

- **Peripheral bus**

  The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.



A. These events are generated by the ePWM Digital Compare (DC) submodule based on the levels of the TRIPIN inputs.

Figure 19-3. ePWM Modules and Critical Internal Signal Interconnects

19.2 Configuring Device Pins

To connect the device input pins to the module, the Input X-BAR and EPWM X-BAR must be used. Some examples of when an external signal can be needed are TZx, TRIPx, and EXTSYNCIN. Any GPIO on the device can be configured as an input. The GPIO input qualification can be set to asynchronous mode by setting the appropriate GPxQSEL register bits to 11b. The internal pullups can be configured in the GPyPUD register. Since the GPIO mode is used, the GPyINV register can invert the signals. Additionally, some TRIPx (TRIP4-12 excluding TRIP6) signals must be routed through the ePWM X-Bar in addition to the Input X-Bar.

The GPIO mux registers must be configured for this peripheral. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux, GPIO settings, and XBAR configuration.

19.3 ePWM Modules Overview

Eight submodules are included in every ePWM peripheral. Each of these submodules performs specific tasks that can be configured by software.

Table 19-1 lists the key submodules together with a list of the main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, see the counter-compare submodule in Section 19.5 for relevant details.

Table 19-1. Submodule Configuration Parameters

Submodule	Configuration Parameter or Option
Time Base (TB)	• Scale the time-base clock (TBCLK) relative to the ePWM clock (EPWMCLK). • Configure the PWM time-base counter (TBCTR) frequency or period. • Set the mode for the time-base counter: – count-up mode: used for asymmetric PWM – count-down mode: used for asymmetric PWM – count-up-and-down mode: used for symmetric PWM • Configure the time-base phase relative to another ePWM module. • Synchronize the time-base counter between modules through hardware or software. • Configure the direction (up or down) of the time-base counter after a synchronization event. • Simultaneous writes to the TBPRD registers on all PWM's corresponding to the configuration on EPWMXLINK. • Configure how the time-base counter behaves when the device is halted by an emulator. • Specify the source for the synchronization output of the ePWM module • Configure one shot and global load of registers in this module.
Counter Compare (CC)	• Specify the PWM duty cycle for output EPWMxA and output EPWMxB • Specify the time at which switching events occur on the EPWMxA or EPWMxB output • Specify the programmable delay for interrupt and SOC generation with additional comparators • Simultaneous writes to the CMPA, CMPB, CMPC, CMPD registers on all PWM's corresponding to the configuration on EPWMXLINK. • Configure one shot and global load of registers in this module.

Table 19-1. Submodule Configuration Parameters (continued)

Submodule	Configuration Parameter or Option
Action Qualifier (AQ)	• Specify the type of action taken when a time-base counter-compare, trip-zone submodule, or comparator event occurs: – No action taken – Output EPWMxA and EPWMxB switched high – Output EPWMxA and EPWMxB switched low – Output EPWMxA and EPWMxB toggled • Force the PWM output state through software control • Configure and control the PWM dead band through software • Configure one shot and global load of registers in this module.
Dead-Band Generator (DB)	• Control of traditional complementary dead-band relationship between upper and lower switches • Specify the output rising-edge-delay value • Specify the output falling-edge delay value • Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification. • Option to enable half-cycle clocking for double resolution. • Allow ePWMxB phase shifting with respect to the ePWMxA output. • Configure one shot and global load of registers in this module.
PWM Chopper (PC)	• Create a chopping (carrier) frequency. • Pulse width of the first pulse in the chopped pulse train. • Duty cycle of the second and subsequent pulses. • Bypass the PWM chopper module entirely. In this case the PWM waveform is passed through without modification.
Trip Zone (TZ)	• Configure the ePWM module to react to one, all, or none of the trip-zone signals or digital compare events. • Specify the trip action taken when a fault occurs: – Force EPWMxA and EPWMxB high – Force EPWMxA and EPWMxB low – Force EPWMxA and EPWMxB to a high-impedance state – Configure EPWMxA and EPWMxB to ignore any trip condition. • Configure how often the ePWM reacts to each trip-zone signal: – One-shot – Cycle-by-cycle • Enable the trip-zone to initiate an interrupt. • Bypass the trip-zone module entirely. • Programmable option for cycle-by-cycle trip clear • If desired, independently configure trip actions taken when time-base counter is counting down.
Event Trigger (ET)	• Enable the ePWM events that trigger an interrupt. • Enable ePWM events that trigger an ADC start-of-conversion event. • Specify the rate at which events cause triggers (every occurrence or every 2nd or up to 15th occurrence) • Poll, set, or clear event flags
Digital Compare (DC)	• Enables comparator (COMP) module outputs and trip zone signals which are configured using the Input X-BAR to create events and filtered events • Specify event-filtering options to capture TBCTR counter, generate blanking window, or insert delay in PWM output or time-base counter based on captured value.

19.4 Time-Base (TB) Submodule

Each ePWM module has a time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system.

Figure 19-4 illustrates the time-base submodule within the ePWM.

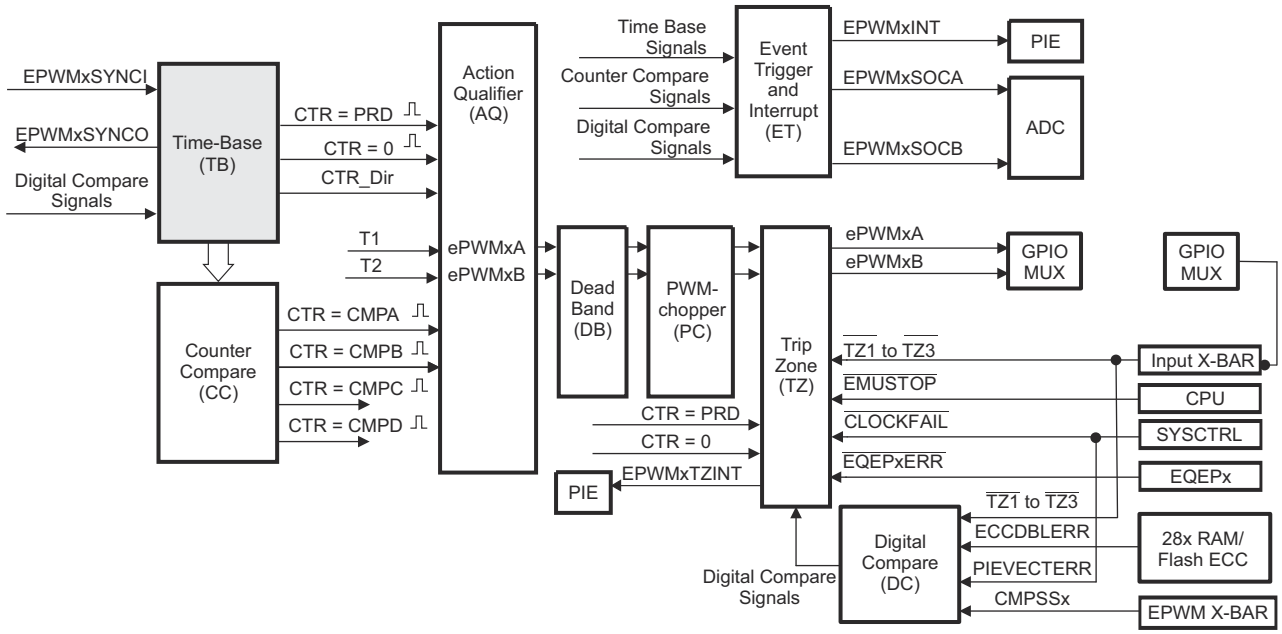


Figure 19-4. Time-Base Submodule

19.4.1 Purpose of the Time-Base Submodule

The time-base submodule can be configured for the following:

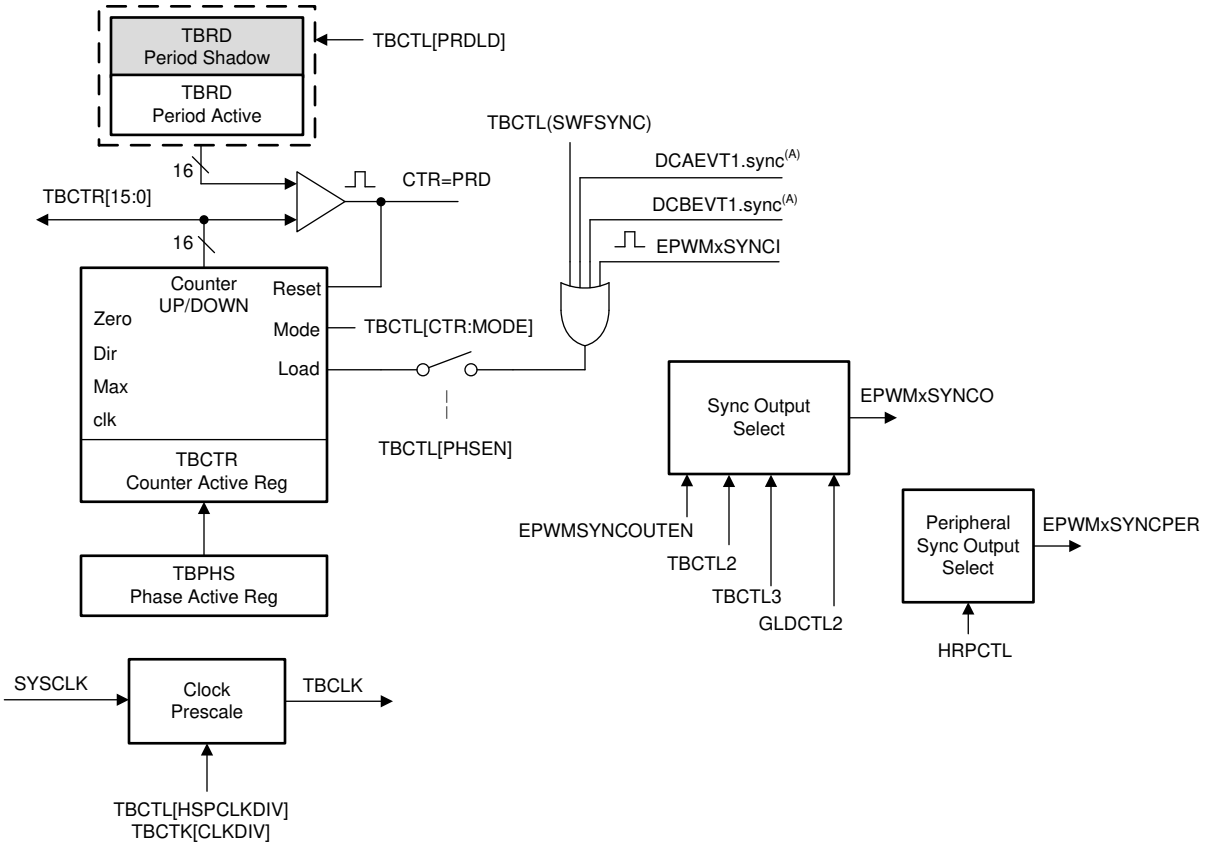
- Specify the ePWM time-base counter (TBCTR) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
  - CTR = PRD: Time-base counter equal to the specified period (TBCTR = TBPRD).
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00).
- Configure the rate of the time-base clock; a prescaled version of the ePWM clock (EPWMCLK). This allows the time-base counter to increment/decrement at a slower rate.

Note

If required by the application code to update the TBCTR value through software while the TBCTR is counting, note that the time-base module needs at least 1 TBCLK cycle for the time-base related events to be realized. Hence, the TBCTR can be written with TBCTR = PRD-1 instead of TBCTR = PRD (in case the counter is counting up) and can be written as TBCTR = 1 instead of TBCTR = 0 (in case the counter is counting down) for the events to be realized.

19.4.2 Controlling and Monitoring the Time-Base Submodule

The block diagram in Figure 19-5 shows the critical signals and registers of the time-base submodule. Table 19-2 provides descriptions of the key signals associated with the time-base submodule.



A. These signals are generated by the digital compare (DC) submodule.

Figure 19-5. Time-Base Submodule Signals and Registers

Table 19-2. Key Time-Base Signals

Signal	Description
EPWMxSYNCI	Time-base synchronization input. Input pulse used to synchronize the time-base counter with the counter of other ePWM modules. For more information on all of the signals available for synchronization, see EPWMSYNCINSEL. For information on the synchronization order of a particular device, see Section 19.4.3.3.
EPWMxSYNCO	Time-base synchronization output. This output pulse is used to synchronize the counter of other ePWM modules. Using EPWMSYNCOUTEN, TBCTL2, TBCTL3 and GLDCTL2, the source of the output pulse is selected.
EPWMxSYNCPER	Time-base peripheral synchronization output. This output signal is used to synchronize the CMPSS to the EPWM. The output signal can be configured using the HRPCTL register. Note that this signal has no relation with the HRPWM.
CTR = PRD	Time-base counter equal to the specified period. This signal is generated whenever the counter value is equal to the active period register value. That is when TBCTR = TBPRD.
CTR = Zero	Time-base counter equal to zero This signal is generated whenever the counter value is zero. That is when TBCTR equals 0x00.
CTR = CMPB	Time-base counter equal to active counter-compare B register (TBCTR = CMPB). This event is generated by the counter-compare submodule and used by the synchronization out logic
CTR_dir	Time-base counter direction. Indicates the current direction of the ePWM's time-base counter. The signal is high when the counter is increasing and the signal is low when the counter is decreasing.
CTR_max	Time-base counter equal max value. (TBCTR = 0xFFFF) Generated event when the TBCTR value reaches the maximum value. This signal is only used only as a status bit
TBCLK	Time-base clock. This is a prescaled version of the ePWM clock (EPWMCLK) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.

19.4.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. Figure 19-6 shows the period (T_{pwm}) and frequency (F_{pwm}) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the ePWM clock (EPWMCLK).

The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down Count Mode:** In up-down count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until the counter reaches zero. At this point, the counter repeats the pattern and begins to increment.
- **Up-Count Mode:** In up-count mode, the time-base counter starts from zero and increments until the counter reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.
- **Down-Count Mode:** In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until the counter reaches zero. When the counter reaches zero, the time-base counter is reset to the period value and begins to decrement once again.

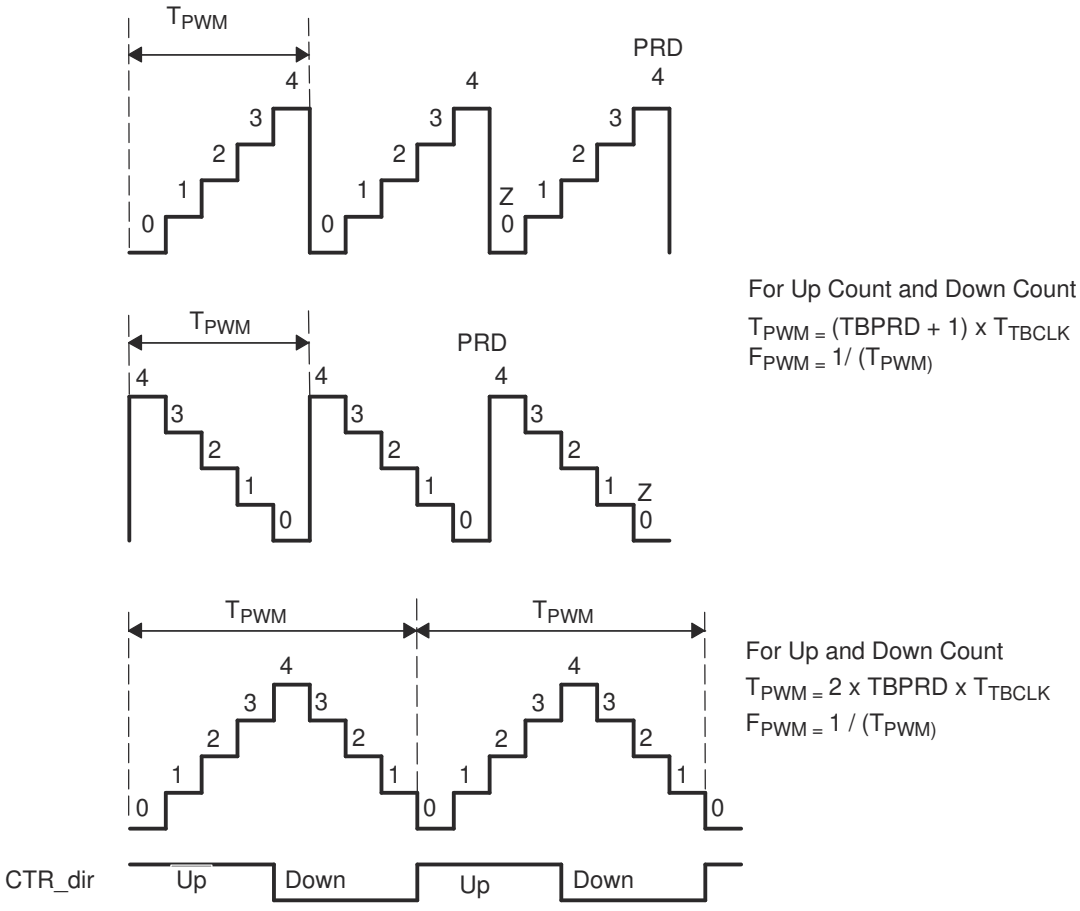


Figure 19-6. Time-Base Frequency and Period

19.4.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register:** The active register controls the hardware and is responsible for actions that the hardware causes or invokes.
- **Shadow Register:** The shadow register buffers provide a temporary holding location for the active register and have no direct effect on any control hardware. At a strategic point in time, the shadow register content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDLD] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:** The TBPRD shadow register is enabled when TBCTL[PRDLD] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active) ← TBPRD (shadow)) when the time-base counter equals zero (TBCTR = 0x00) and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. The PRDLDSYNC bit is valid only if TBCTL[PRDLD] = 0. By default the TBPRD shadow register is enabled. The sources for the SYNC input is explained in Section 19.4.3.3.

  The global load control mechanism can also be used with the time-base period register by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in Global Shadow to Active Load Control Register (GLDCTL). Global load control mechanism is explained in Section 19.4.7.
- **Time-Base Period Immediate Load Mode:** If immediate load mode is selected (TBCTL[PRDLD] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

19.4.3.2 Time-Base Clock Synchronization

The TBCLKSYNC bit in the peripheral clock enable registers allows all users to globally synchronize all enabled ePWM modules to the time-base clock (TBCLK). When set, all enabled ePWM module clocks are started with the first rising edge of TBCLK aligned. For synchronized TBCLKs, the prescalers for each ePWM module must be set identically.

The proper procedure for enabling ePWM clocks is as follows:

1. Enable ePWM module clocks in the PCLKCRx register
2. Set TBCLKSYNC = 0
3. Configure ePWM modules
4. Set TBCLKSYNC = 1

19.4.3.3 Time-Base Counter Synchronization

The ePWM synchronization scheme allows for increased flexibility of synchronization of the ePWM modules. Each ePWM module has a synchronization input (SYNCI), a synchronization output (SYNCO) and a peripheral synchronization output (SYNCPER). In Figure 19-7, EXTSYNCIN1 is sourced from INPUTXBAR5 and EXTSYNCIN2 is sourced from INPUTXBAR6, which can be configured to select any GPIO as the synchronization input. Refer to Section 19.4.3.4 for a list of all sync inputs including INPUTXBAR5 and INPUTXBAR6. Figure 19-8 shows the sources that can be used for EXTSYNCOUT.

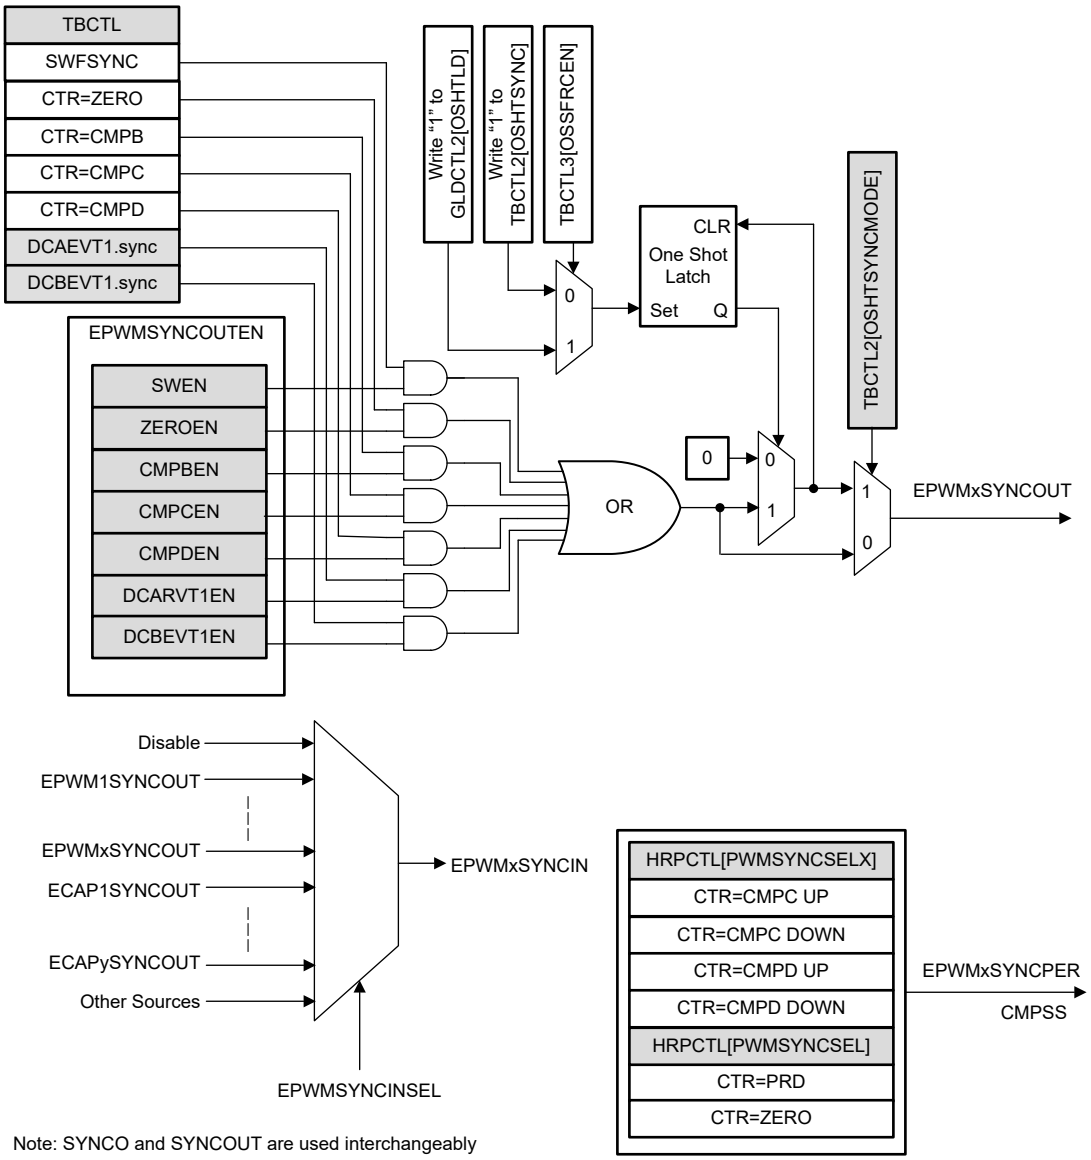

Figure 19-7. Time-Base Counter Synchronization Scheme

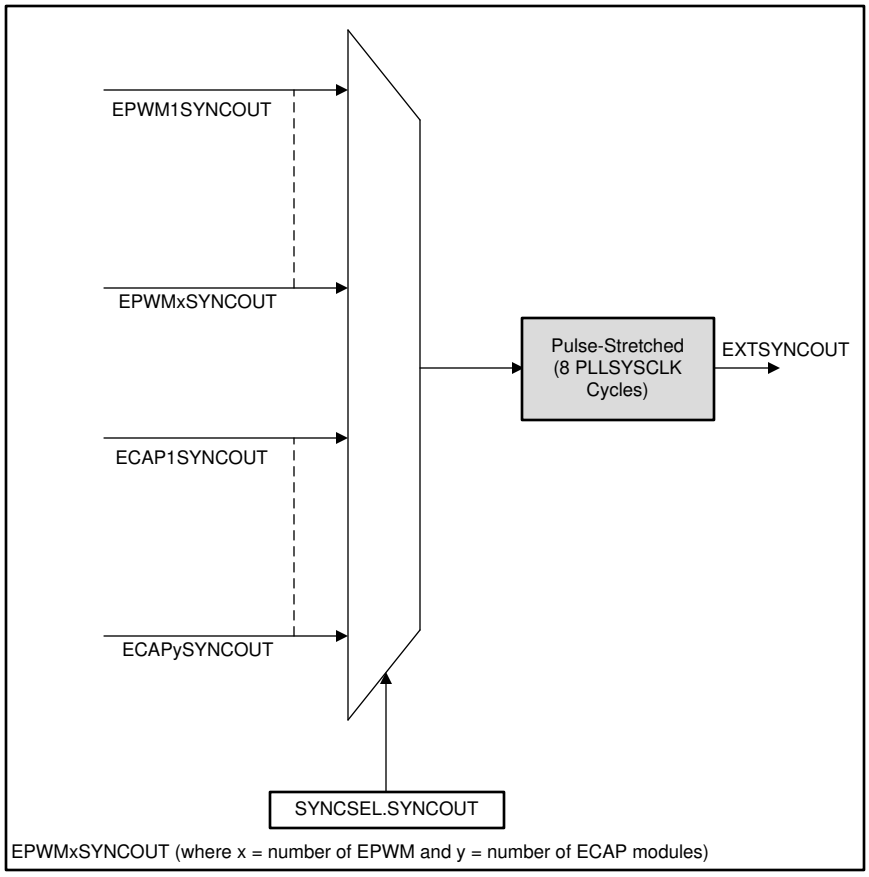

Figure 19-8. ePWM External SYNC Output

Note

See the data sheet for the number of ePWM and eCAP modules available on your specific device.

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCTR) of the ePWM module is automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCI: Synchronization Input Pulse:** The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCTR). This operation occurs on the next valid time-base clock (TBCLK) edge.

  The delay from internal control module to target modules is given by:
  - if (TBCLK = EPWMCLK): 2 x EPWMCLK
  - if (TBCLK < EPWMCLK): 1 x TBCLK
- **Software Forced Synchronization Pulse:** Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCI.
- **Digital Compare Event Synchronization Pulse:** DCAEVT1 and DCBEVT1 digital compare events can be configured to generate synchronization pulses which have the same affect as EPWMxSYNCI.

Note

If the EPWMxSYNCI signal is held high, the sync does not continuously occur. The EPWMxSYNCI is rising edge activated.

Note

When modifying the TBPHS register during run-time, missed action qualifier events can occur due to sudden jumps in the TBCTR value at the time of the SYNCIN pulse. To recreate the behavior of missed action qualifier events, configure an action qualifier event on a T1 or T2 event on a SYNCIN event. The T1 or T2 action qualifier event must be enabled and disabled during runtime depending on the value of TBPHS.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PHSDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The PHSDIR bit is ignored in count-up or count-down modes. See Figure 19-9 through Figure 19-12 for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse.

19.4.3.4 ePWM SYNC Selection

Table 19-3 specifies the sources for the ePWM SYNC input and output.

Table 19-3. ePWM SYNC Selection

EPWMSYNCINSEL.SEL, ECAPSYNCINSEL.SEL	SYNC Source
0	EPWM_SYNC_DISABLE
1	EPWM1_SYNCOUT
2	EPWM2_SYNCOUT

18	ECAP2_SYNCOUT
19-23	Reserved
24	INPUTXBAR5
25	INPUTXBAR6

19.4.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. This bit is part of the device's clock enable registers and is described in the *System Control and Interrupts* section of this manual. When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is:

1. Enable the individual ePWM module clocks. This is described in the *System Control and Interrupts* chapter.

2. Set TBCLKSYNC = 0. This stops the time-base clock within any enabled ePWM module.
3. Configure the prescaler values and desired ePWM modes.
4. Set TBCLKSYNC = 1.

19.4.5 Simultaneous Writes to TBPRD and CMPx Registers Between ePWM Modules

For variable frequency applications, there is a need for simultaneous writes of TBPRD and CMPx registers between ePWM modules. This prevents situations where a CTR = 0 or CTR = PRD pulse forces a shadow to active load of these registers before all registers are updated between ePWM modules (resulting in some registers being loaded from new shadow values while others are loaded from old shadow values). To support this, an ePWM register linking scheme for TBPRD:TBPRDHR, CMPA:CMPAHR, CMPB:CMPBHR, CMPC, and CMPD registers between PWM modules has been added.

Refer to the register description for EPWMXLINK to see the linked register bit-field values for corresponding ePWM. An example of using the EPWMXLINK is linking ePWM2 CMPA with CMPA of ePWM1 through ePWM2's EPWMXLINK[CMPALINK] register bit-field. In this case, a write to CMPA of ePWM1 also changes the CMPA value for ePWM2.

Note

For devices with multiple CPUs, if the XLINK feature is enabled between ePWM modules, the ePWM modules that require XLINK must be selected for the same core for this feature to work. For example, if CPU2 has ePWM3 selected, and CPU1 has ePWM1 selected and XLINK is enabled on ePWM3 to copy the contents of CPU1's ePWM when written to. A write to CPU1's ePWM does not result in a change in CPU2's ePWM register that has XLINK enabled.

19.4.6 Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode that is asymmetrical
- Down-count mode that is asymmetrical
- Up-down-count that is symmetrical
- Frozen where the time-base counter is held constant at the current value

To illustrate the operation of the first three modes, the following timing diagrams show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

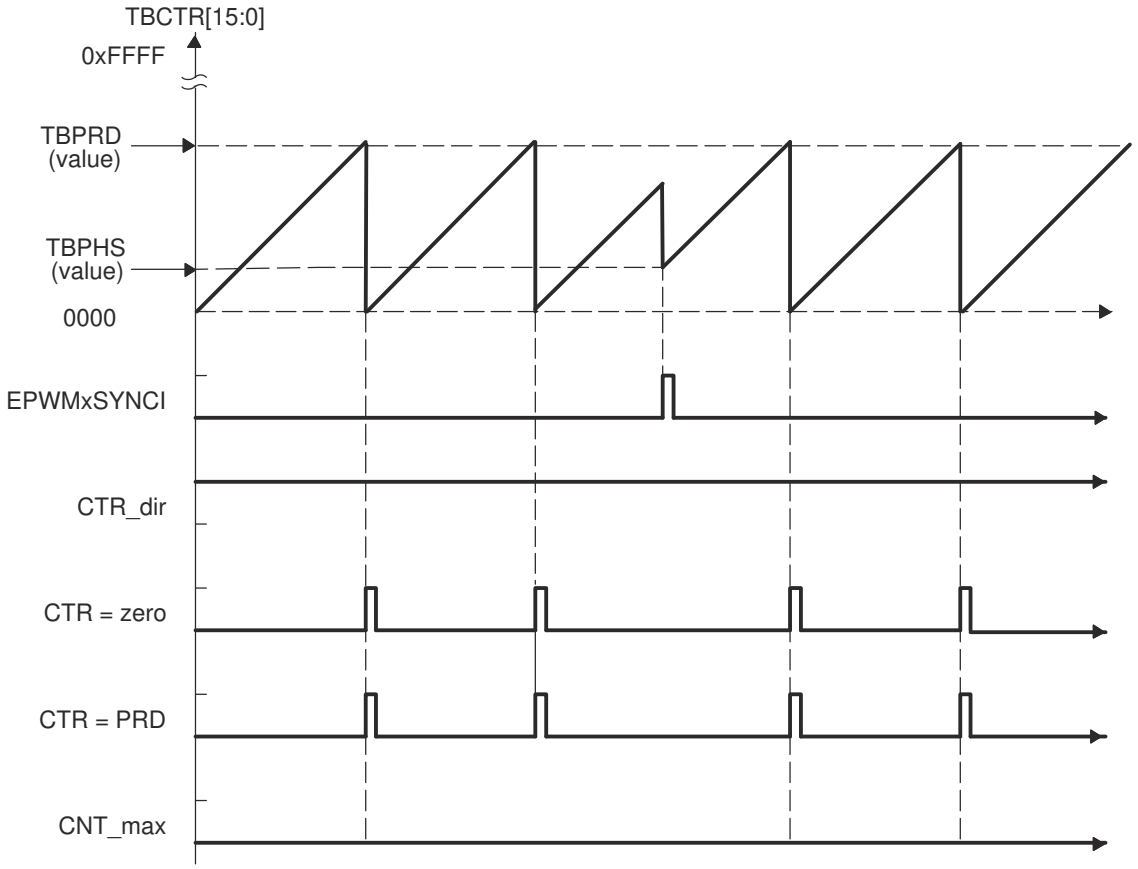

Figure 19-9. Time-Base Up-Count Mode Waveforms

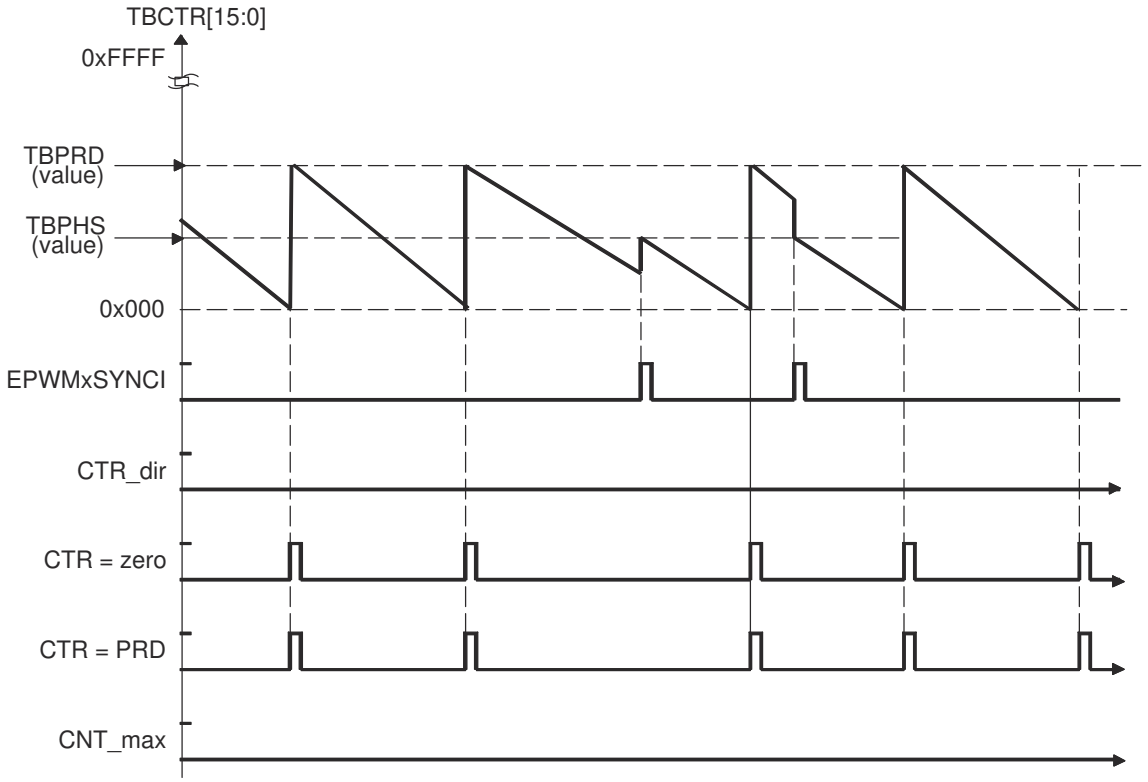

Figure 19-10. Time-Base Down-Count Mode Waveforms

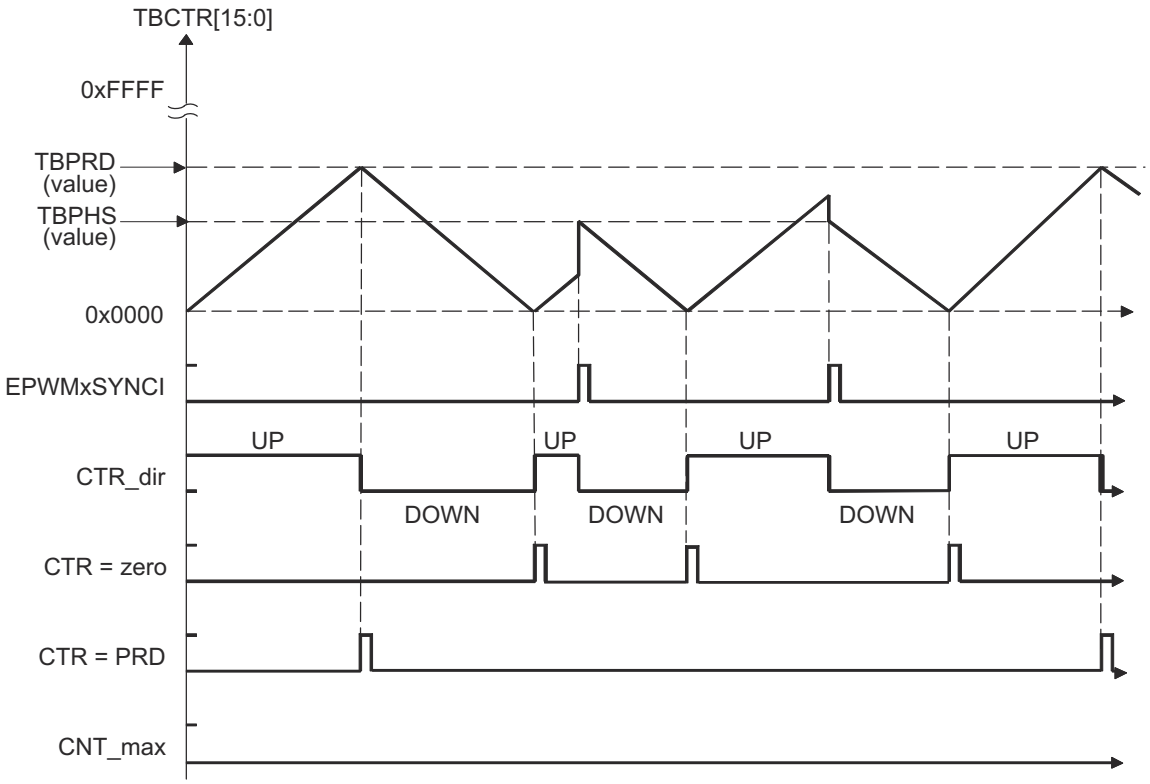

Figure 19-11. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

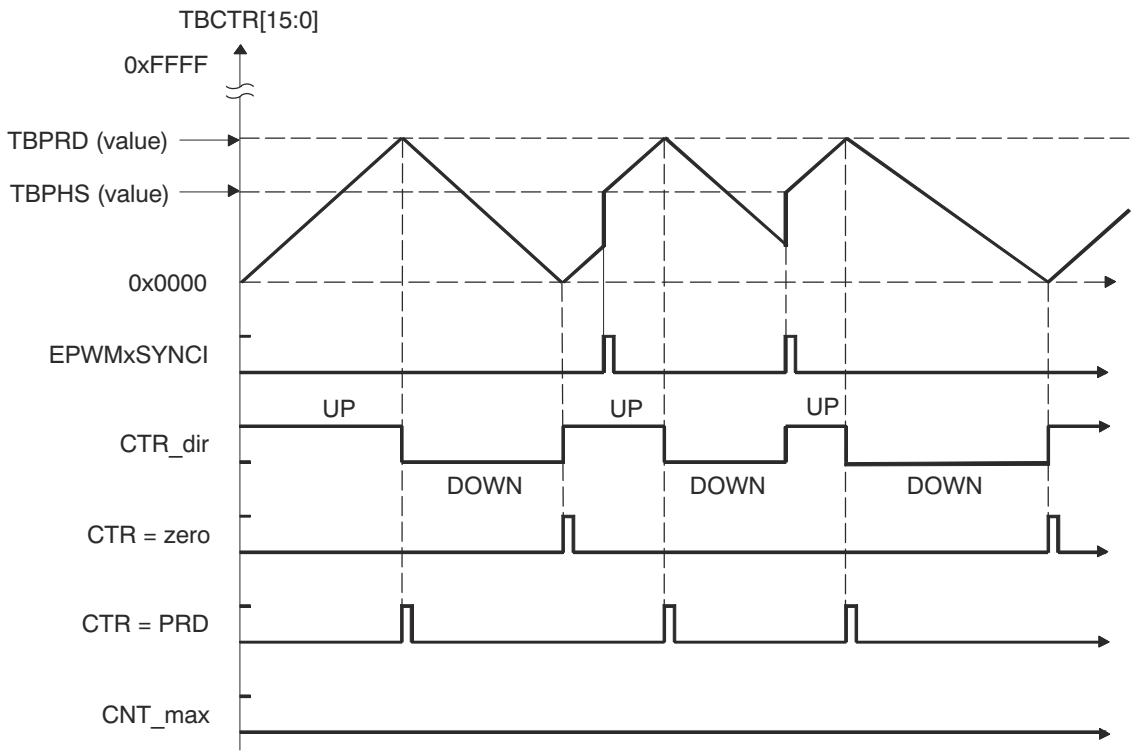

Figure 19-12. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

19.4.7 Global Load

Figure 19-13 shows the signals and registers associated with the global load feature.

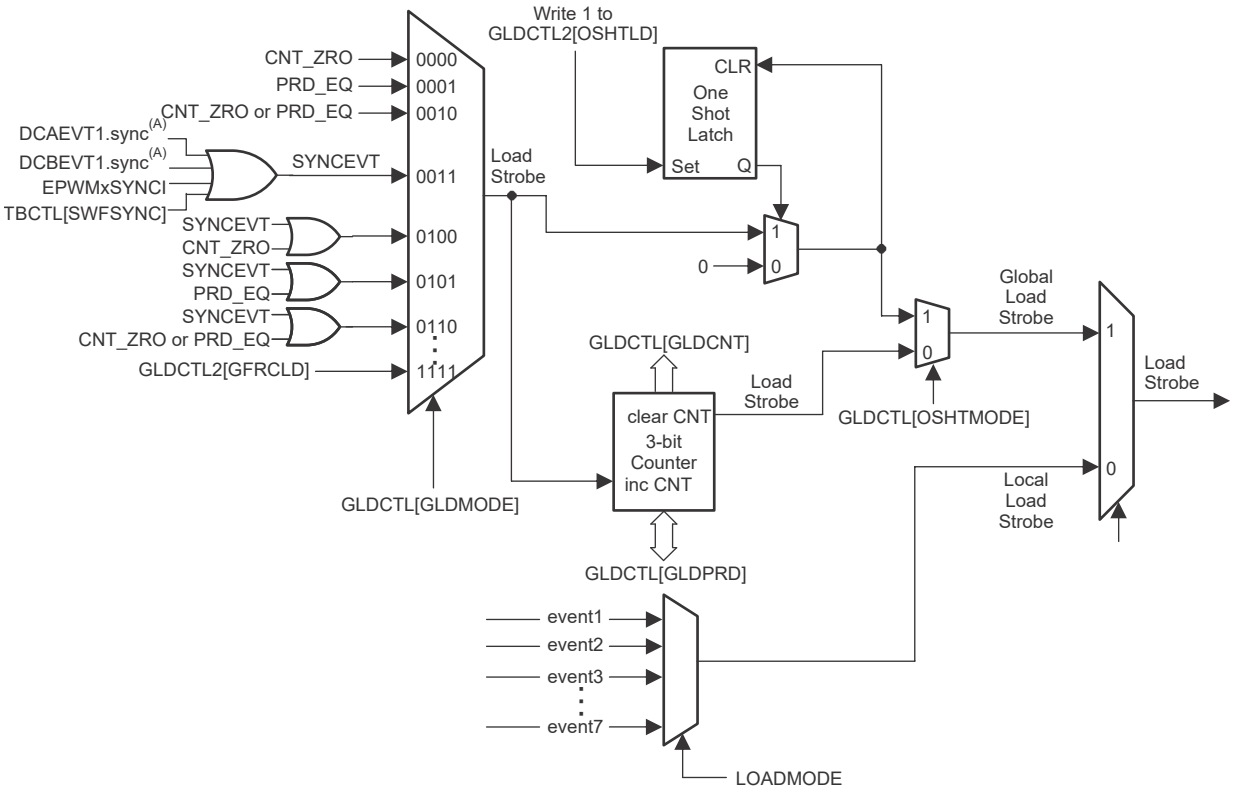

Figure 19-13. Global Load: Signals and Registers

Note

The SYNCEVT signal is only propagated through when PHSEN is SET.

When this feature is enabled, the transfer of contents from the shadow register to the active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in Global Shadow to Active Load Control Register (GLDCTL[GLDMODE]). When GLDCTL[GLD] = 1, shadow to active load event selection bits for individual shadowed registers are ignored and global load mode takes effect for the corresponding registers enabled by GLDCFG[REGx].

When GLDCTL[GLD] = 1 and GLDCFG[REGx] = 0, global load mode does not affect the corresponding register (REGx). Shadow to active load event selection bits for individual shadowed registers decide how the transfer of contents from shadow register to active register takes place.

19.4.7.1 Global Load Pulse Pre-Scalar

This feature provides the capability to choose shadow to active transfers to happen once in 'N' occurrences of selected global load pulse (GLDCTL[GLDMODE]). This pre-scale functionality is not available for registers that cannot or are not configured to use the global load mechanism (that is, GLDCTL[GLD] = 0 or GLDCFG[REGx] = 0).

19.4.7.2 One-Shot Load Mode

This feature allows users to cause the shadow register to active register transfers to occur once. When GLDCTL2[OSHTLD] = 1 the shadow to active register transfer, for registers that are configured to use the global load mechanism, takes place on the event selected by GLDCTL[GLDMODE].

Software force loading of contents from shadow register to active register is possible by using GLDCTL2[GFRCLD]. The GLDCTL2 register can also be linked across multiple PWM modules by using EPWMXLINK[GLDCTL2LINK]. This, along with the one-shot load mode feature discussed above, provides a method to correctly update multiple PWM registers in one or more PWM modules at certain PWM events or, if desired, in the same clock cycle. This is very useful in variable frequency applications and/or multi-phase interleaved applications.

Note

One-shot load mode must not be used when high-resolution mode is enabled.

19.4.7.3 One-Shot Sync Mode

To enable the one-shot sync mode to generate a SYNCOUT pulse, configure the TBCTL2[OSHTSYNCMODE] bit and set the TBCTL2[OSHTSYNC] bit as shown in Figure 19-14.

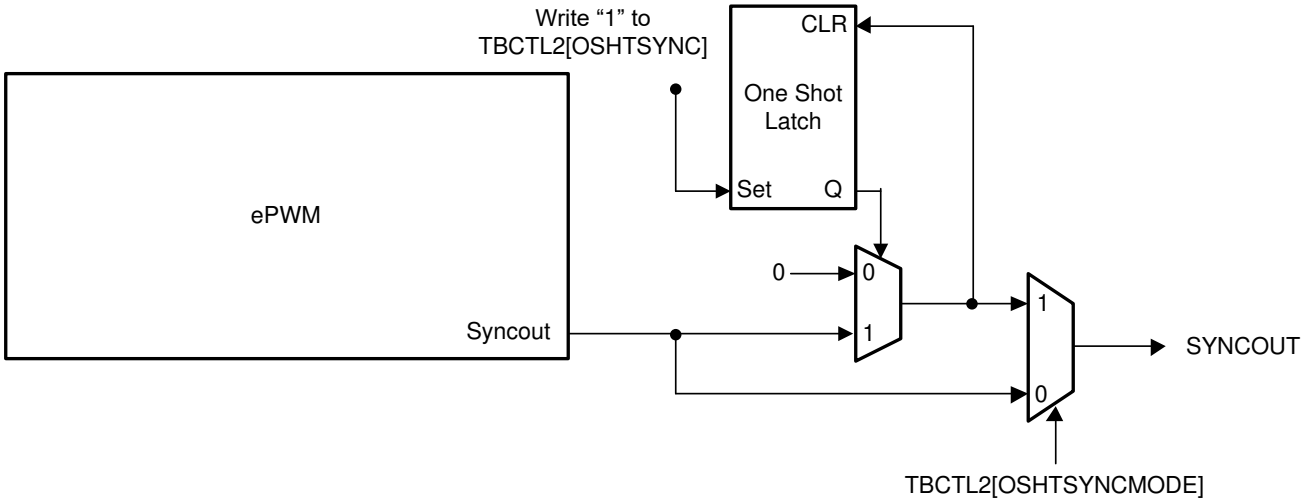

Figure 19-14. One-Shot Sync Mode

19.5 Counter-Compare (CC) Submodule

Figure 19-15 illustrates the counter-compare submodule within the ePWM.

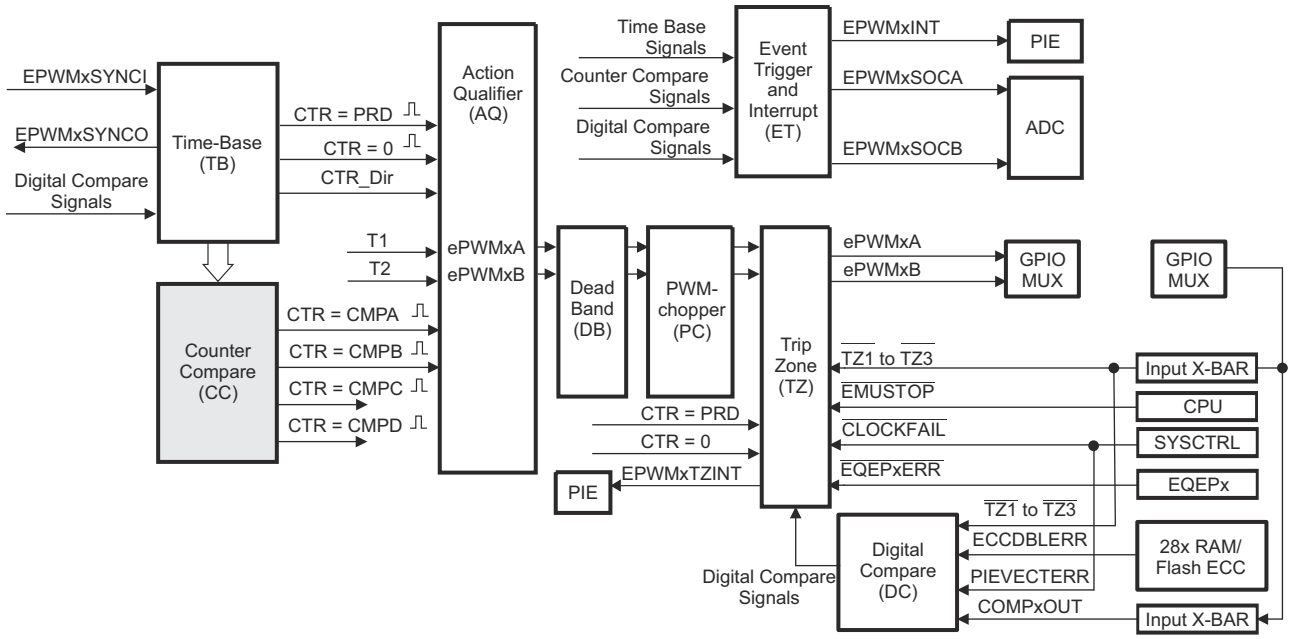

Figure 19-15. Counter-Compare Submodule

19.5.1 Purpose of the Counter-Compare Submodule

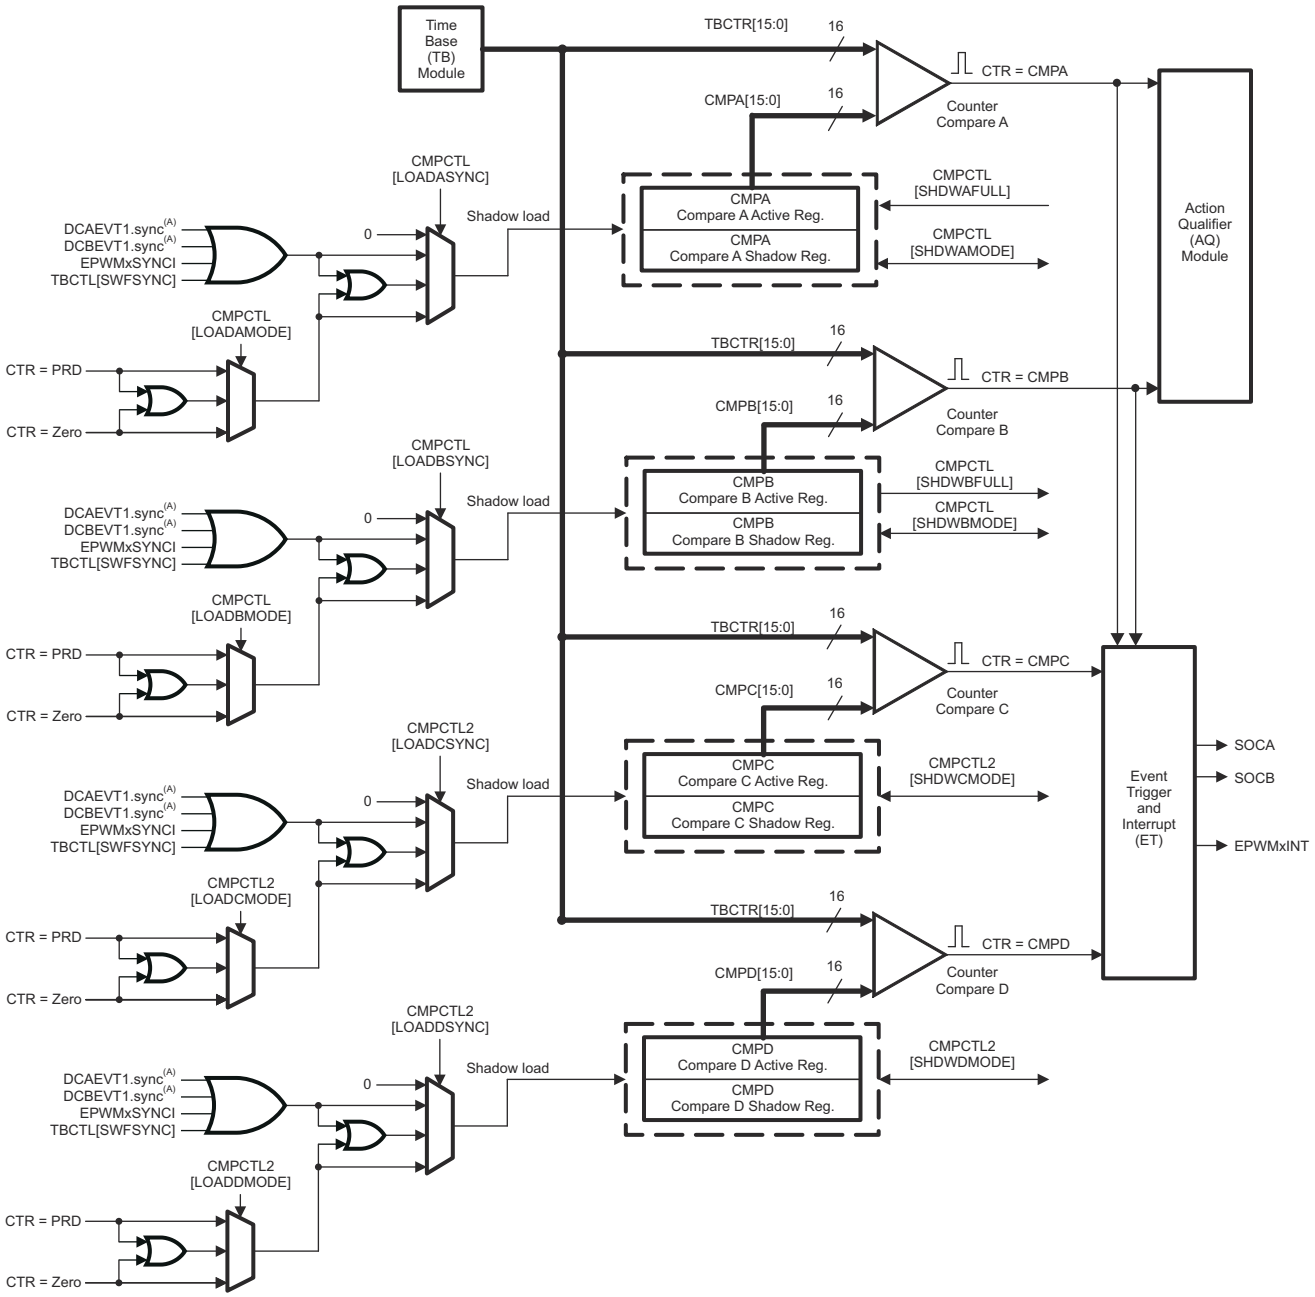
The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA), counter-compare B (CMPB), counter-compare C (CMPC), and counter-compare D (CMPD) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare:

- Generates events based on programmable time stamps using the CMPA, CMPB, CMPC, and CMPD registers:
  - CTR = CMPA: Time-base counter equals counter-compare A register (TBCTR = CMPA)
  - CTR = CMPB: Time-base counter equals counter-compare B register (TBCTR = CMPB)
  - CTR = CMPC: Time-base counter equals counter-compare C register (TBCTR = CMPC)
  - CTR = CMPD: Time-base counter equals counter-compare D register (TBCTR = CMPD)
- Controls the PWM duty cycle, if the action-qualifier submodule is configured appropriately using counter-compare A (CMPA) and counter-compare B (CMPB)
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

19.5.2 Controlling and Monitoring the Counter-Compare Submodule

The counter-compare submodule operation is shown in Figure 19-16.



A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and $\overline{TZ}$ signals).

Figure 19-16. Detailed View of the Counter-Compare Submodule

19.5.3 Operational Highlights for the Counter-Compare Submodule

The counter-compare submodule is responsible for generating events that can be used in the action-qualifier and event-trigger submodules. There are four independent compare events:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCTR = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCTR = CMPB).
3. CTR = CMPC: Time-base counter equal to counter-compare C register (TBCTR = CMPC). This event can be used to generate an event in the event trigger submodule only.
4. CTR = CMPD: Time-base counter equal to counter-compare D register (TBCTR = CMPD). This event can be used to generate an event in the event trigger submodule only

For up-count or down-count mode, each event occurs only once per cycle. For up-down count mode, each event occurs twice per cycle if the compare value is between 0x00-TBPRD; and once per cycle if the compare value is equal to 0x00 or equal to TBPRD. These events are applies to the action-qualifier submodule where the events are qualified by the counter direction and converted into actions if enabled. Refer to Section 19.6.1 for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occur at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. The register that is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPC shadow register and CMPD shadow register, respectively. The behavior of the two load modes is:

Shadow Mode:

The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL[LOADAMODE], CMPCTL[LOADBMODE], CMPCTL[LOADASYNC], and CMPCTL[LOADBSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCI or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LOADAMODE/LOADBMODE

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Note

Refer to Section 19.6.5 for valid configurations of CMPA/CMPB and LOADAMODE/LOADBMODE.

Immediate Load Mode:

If the immediate load mode is selected (that is, CMPCTL[SHDWAMODE] = 1 or CMPCTL[SHDWBMODE] = 1), then a read from or a write to the register goes directly to the active register.

Additional Comparators

The counter-compare submodule on ePWMs type 2 and later are responsible for generating two additional independent compare events based on two compare registers, which is fed to Event Trigger submodule:

1. CTR = CMPC: Time-base counter equal to counter-compare C register (TBCTR = CMPC).
2. CTR = CMPD: Time-base counter equal to counter-compare D register (TBCTR = CMPD).

The counter-compare registers CMPC and CMPD each have an associated shadow register. By default this register is shadowed. The memory address of the active register and the shadow register is identical. The value in the active CMPC and CMPD register is compared to the time-base counter (TBCTR). When the values are equal, the counter compare module generates a “time-base counter equal to counter compare C or counter compare D ” event respectively. Shadowing of this register is enabled and disabled by the CMPCTL2[SHDWCMODE] and CMPCTL2[SHDWDMODE] bit. These bits enable and disable the CMPC shadow register and CMPD shadow register respectively. The behavior of the two load modes is described below:

Shadow Mode:

The shadow mode for the CMPC is enabled by clearing the CMPCTL2[SHDWCMODE] bit and the shadow register for CMPD is enabled by clearing the CMPCTL2[SHDWDMODE] bit. Shadow mode is enabled by default for both CMPC and CMPD.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL2[LOADCMODE], CMPCTL2[LOADDMODE], CMPCTL2[LOADCSYNC], and CMPCTL2[LOADDSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCI or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LOADCMODE/LOADDMODE

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Immediate Load Mode:

If the immediate load mode is selected (that is, CMPCTL2[SHDWCMODE] = 1 or CMPCTL2[SHDWDMODE] = 1), then a read from or a write to the register goes directly to the active register.

Global Load Support

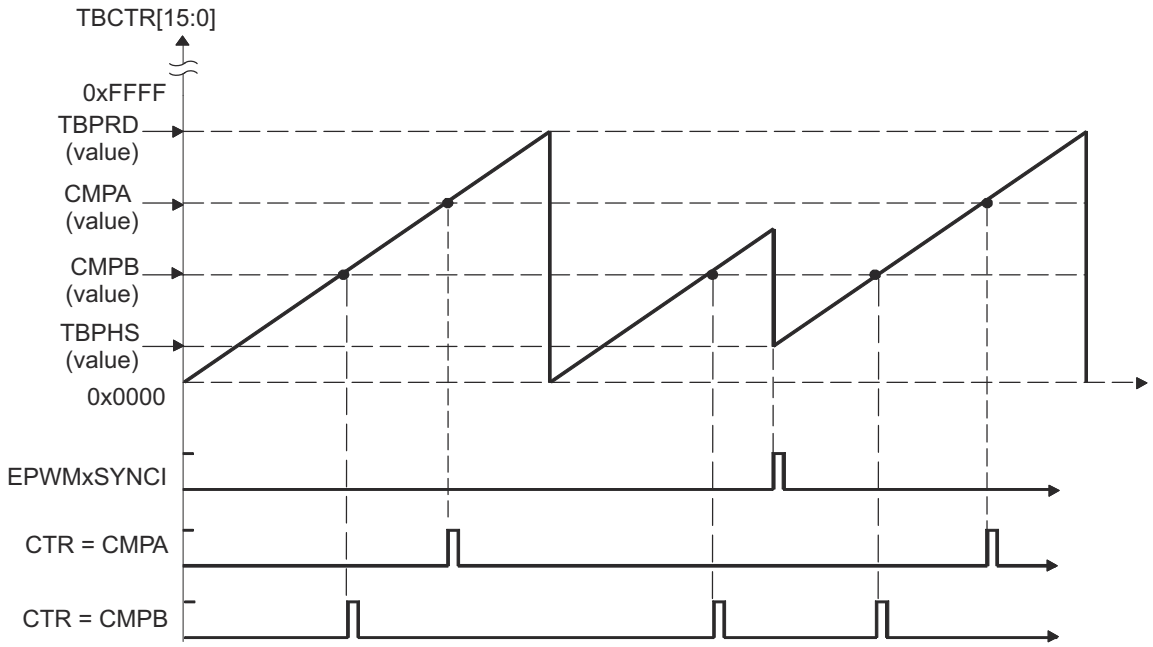
The global load control mechanism can also be used for all counter-compare registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When the global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The global load control mechanism is explained in Section 19.4.7.

19.5.4 Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in Figure 19-17 through Figure 19-20 show when events are generated and how the EPWMxSYNCI signal interacts.



An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCTR count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

Figure 19-17. Counter-Compare Event Waveforms in Up-Count Mode

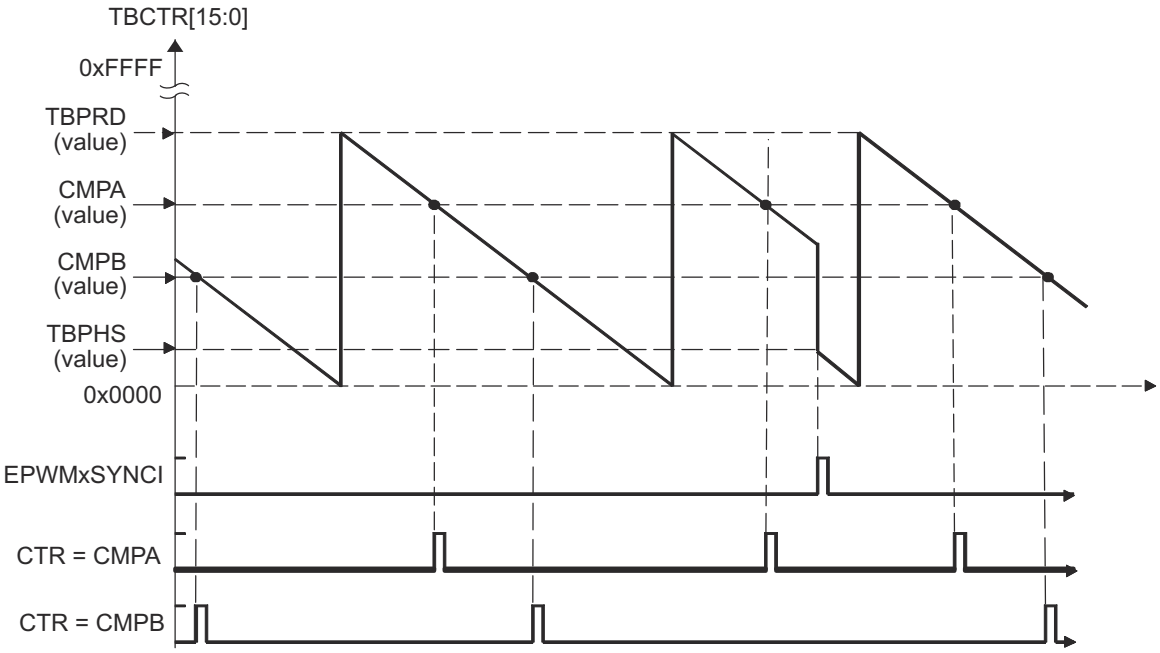


Figure 19-18. Counter-Compare Events in Down-Count Mode

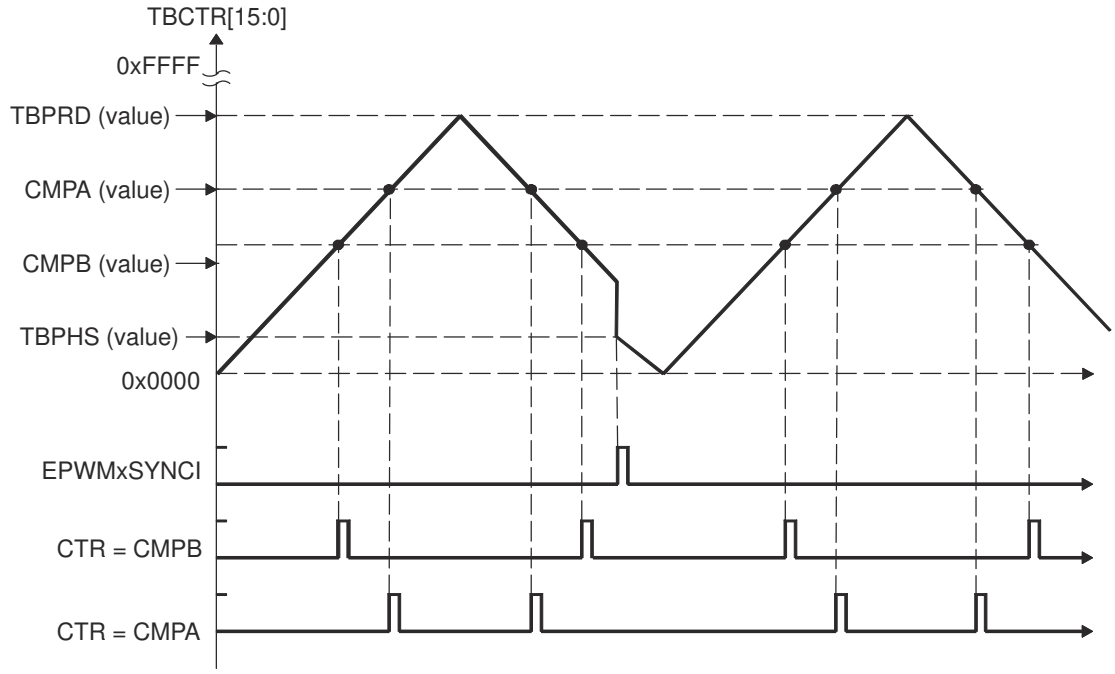

Figure 19-19. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

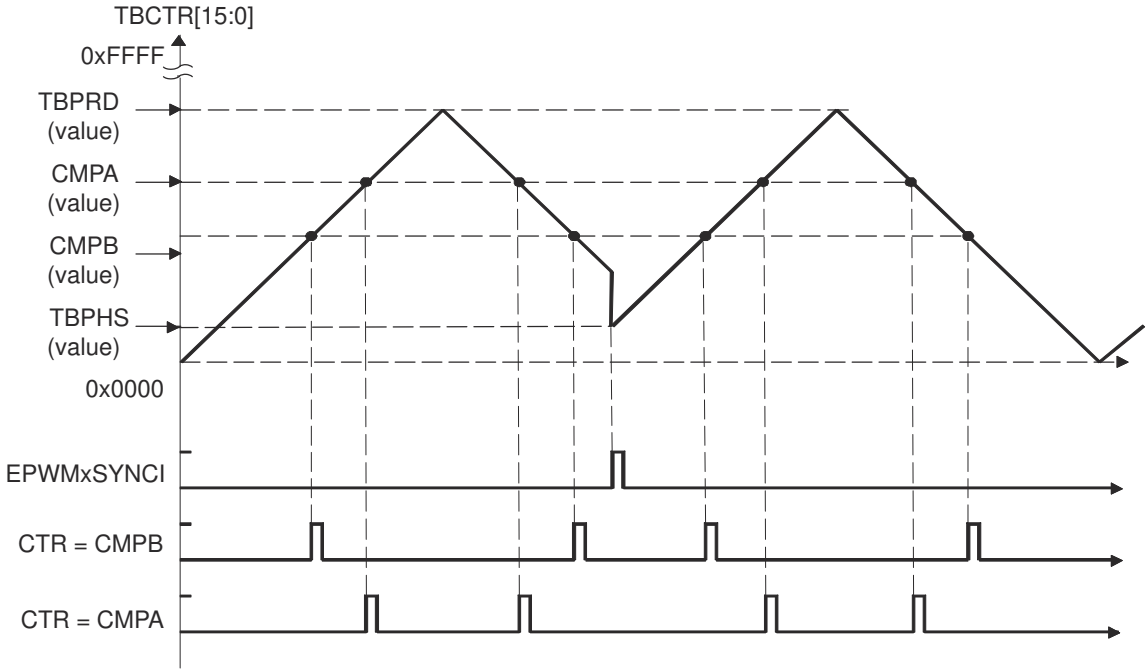

Figure 19-20. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

19.6 Action-Qualifier (AQ) Submodule

The action-qualifier submodule has the most important role in waveform construction and PWM generation. The action-qualifier submodule decides which events are converted into various action types, thereby, producing the required switched waveforms at the EPWMxA and EPWMxB outputs.

Figure 19-21 illustrates the action-qualifier submodule within the ePWM.

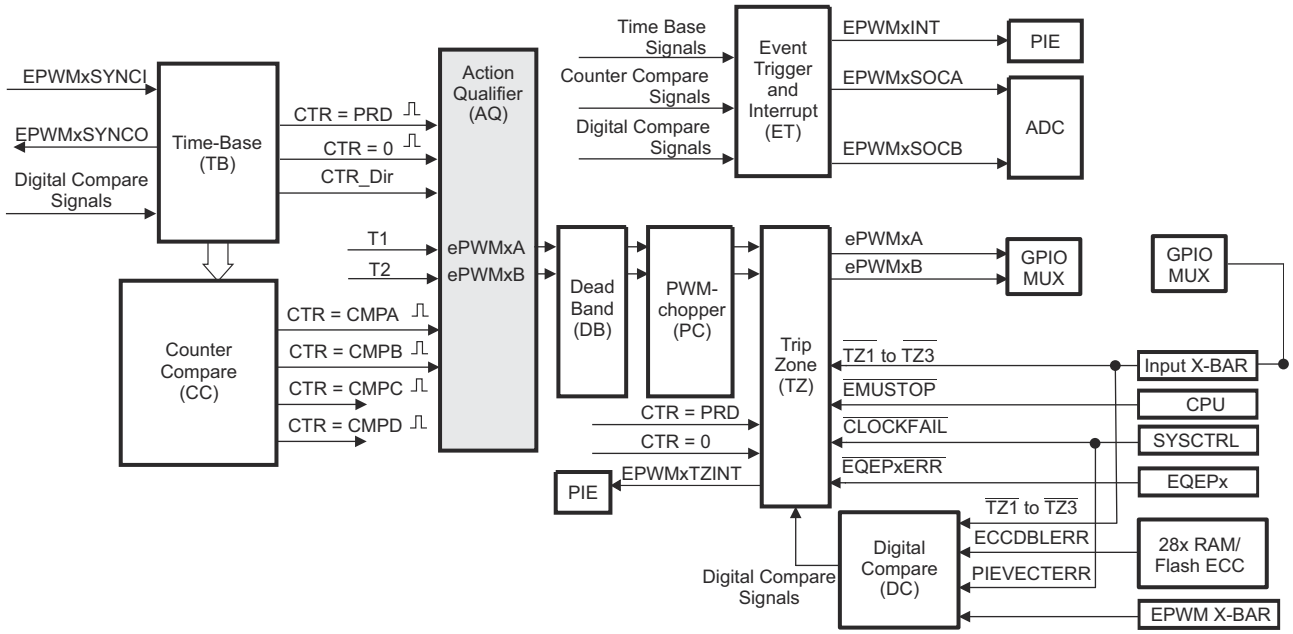

Figure 19-21. Action-Qualifier Submodule

19.6.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
  - CTR = CMPA: Time-base counter equal to the counter-compare A register (TBCTR = CMPA)
  - CTR = CMPB: Time-base counter equal to the counter-compare B register (TBCTR = CMPB)
- T1, T2 events: Trigger events based on comparator, trip or syncin events
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when the time-base counter is decreasing

19.6.2 Action-Qualifier Submodule Control and Status Register Definitions

The action-qualifier submodule operation is shown in Figure 19-22 and monitored by way of the registers in Section 19.17 .

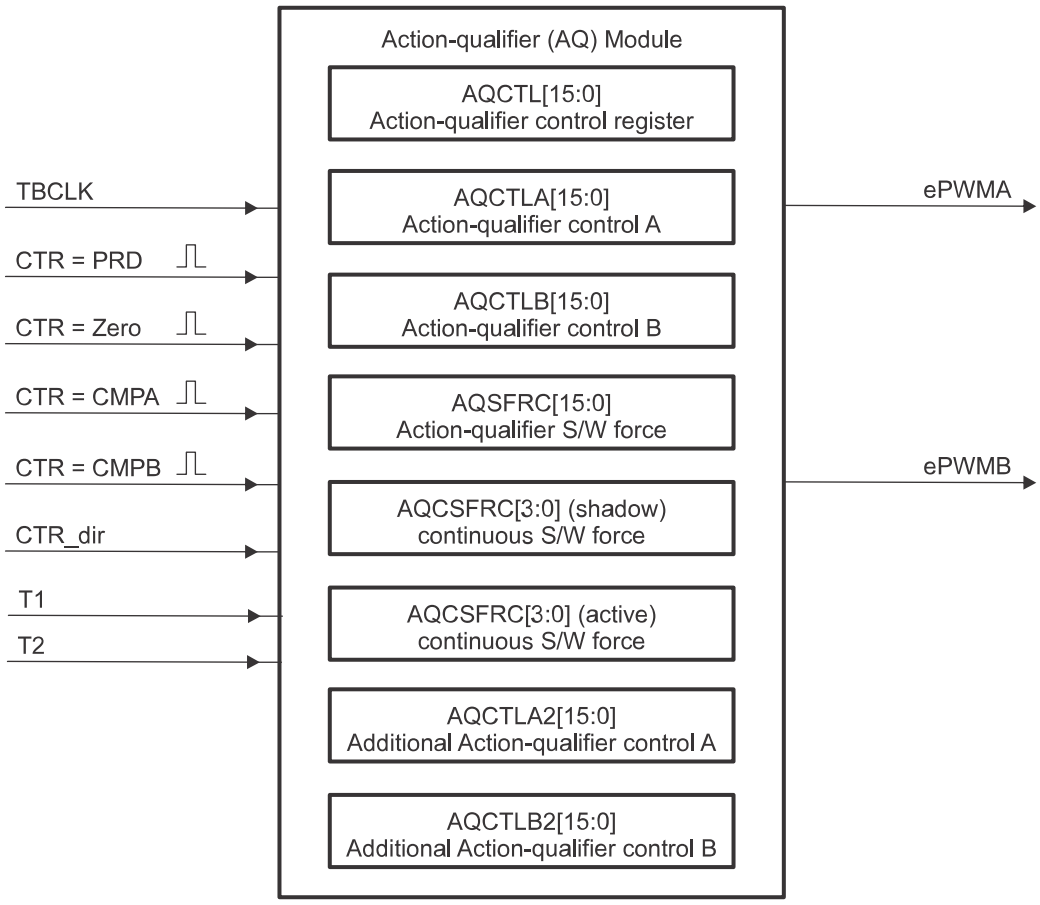

Figure 19-22. Action-Qualifier Submodule Inputs and Outputs

For convenience, the possible input events are summarized again in Table 19-4.

Table 19-4. Action-Qualifier Submodule Possible Input Events

Signal	Description	Registers Compared
CTR = PRD	Time-base counter equal to the period value	TBCTR = TBPRD
CTR = Zero	Time-base counter equal to 0	TBCTR = 0x00
CTR = CMPA	Time-base counter equal to the counter-compare A	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the counter-compare B	TBCTR = CMPB
T1 event	Based on comparator, trip, or syncin events	None
T2 event	Based on comparator, trip, or syncin events	None
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by the AQSFRC and AQCSFRC registers.

Note

If the CSFA is not used in shadow mode, the RLDCSF bit must be configured to disable shadow mode.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:** Set output EPWMxA or EPWMxB to a high level.
- **Clear Low:** Set output EPWMxA or EPWMxB to a low level.
- **Toggle:** If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.
- **Do Nothing:** Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts and ADC start of conversion. See the description in Section 19.10 for details.

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMxA. All qualifier actions are configured using the control registers found in the *ePWM Registers* section.

For clarity, the illustrations in this chapter use a set of symbolic actions. These symbols are summarized in Figure 19-23. Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and the time positions are programmed by way of the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"(the default at reset).

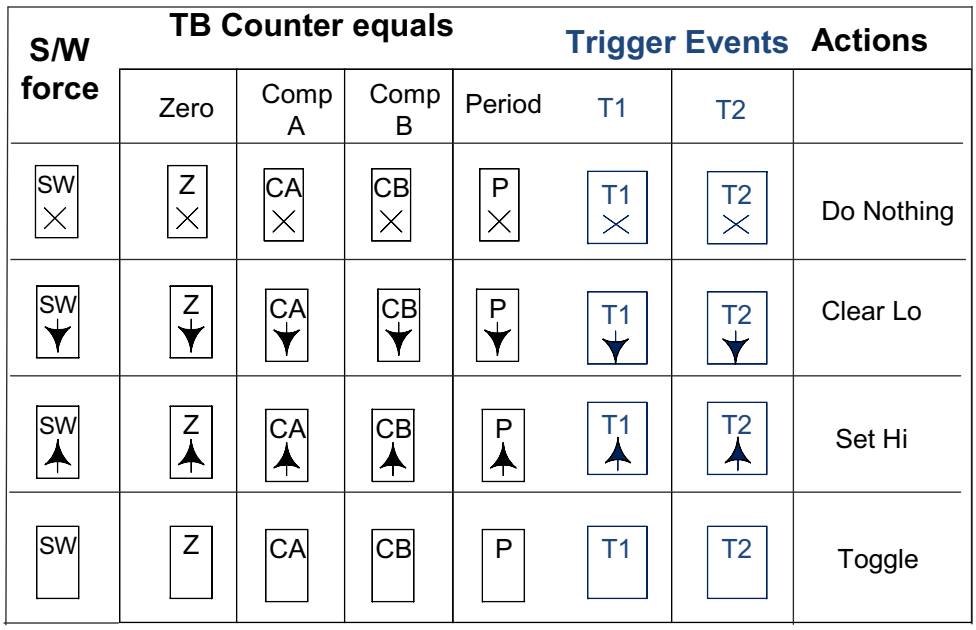

Figure 19-23. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs

The Action Qualifier Trigger Event Source Selection register (AQTSRCSEL) is used to select the source for T1 and T2 events. T1/T2 selection and configuration of a trip/digital-compare event in Action Qualifier submodule is independent of the configuration of that event in the Trip-Zone submodule. A particular trip event can or cannot

be configured to cause trip action in the Trip Zone submodule, but the same event can be used by the Action Qualifier to generate T1/T2 for controlling PWM generation.

19.6.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case, events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down count mode are shown in Table 19-5. A priority level of 1 is the highest priority and level 10 is the lowest. The priority changes slightly depending on the direction of TBCTR.

Table 19-5. Action-Qualifier Event Priority for Up-Down-Count Mode

Priority Level	Event If TBCTR is Incrementing TBCTR = Zero up to TBCTR = TBPRD	Event If TBCTR is Decrementing TBCTR = TBPRD down to TBCTR = 1
1 (Highest)	Software forced event	Software forced event
2	T1 on up-count (T1U)	T1 on down-count (T1D)
3	T2 on up-count (T2U)	T2 on down-count (T2D)
4	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
5	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
6 (Lowest)	Counter equals zero	Counter equals period (TBPRD)

Table 19-6 shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up; therefore, down-count events never are taken.

Table 19-6. Action-Qualifier Event Priority for Up-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	T1 on up-count (T1U)
4	T2 on up-count (T2U)
5	Counter equal to CMPB on up-count (CBU)
6	Counter equal to CMPA on up-count (CAU)
7 (Lowest)	Counter equal to Zero

Table 19-7 shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down; therefore, up-count events never are taken.

Table 19-7. Action-Qualifier Event Priority for Down-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	T1 on down-count (T1D)
4	T2 on down-count (T2D)
5	Counter equal to CMPB on down-count (CBD)
6	Counter equal to CMPA on down-count (CAD)
7 (Lowest)	Counter equal to period (TBPRD)

It is possible to set the compare value greater than the period. In this case, the action takes place as shown in Table 19-8.

Table 19-8. Behavior if CMPA/CMPB is Greater than the Period

Counter Mode	Compare on Up-Count Event CAD/CBD	Compare on Down-Count Event CAD/CBD
Up-Count Mode	If CMPA/CMPB ≤ TBPRD period, then the event occurs on a compare match (TBCTR=CMPA or CMPB).	Never occurs.
	If CMPA/CMPB > TBPRD, then the event does not occur.	
Down-Count Mode	Never occurs.	If CMPA/CMPB < TBPRD, the event occurs on a compare match (TBCTR=CMPA or CMPB).
		If CMPA/CMPB ≥ TBPRD, the event occurs on a period match (TBCTR=TBPRD).
Up-Down Count Mode	If CMPA/CMPB < TBPRD and the counter is incrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB).	If CMPA/CMPB < TBPRD and the counter is decrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB).
	If CMPA/CMPB is ≥ TBPRD, the event occurs on a period match (TBCTR = TBPRD).	If CMPA/CMPB ≥ TBPRD, the event occurs on a period match (TBCTR=TBPRD).

19.6.4 AQCTLA and AQCTLB Shadow Mode Operations

To enable Action Qualifier mode changes which must occur at the end of a period even when the phase changes, shadowing of the AQCTLA and AQCTLB registers has been added on ePWMs type 2 and later. Additionally, shadow to active load on SYNC of these registers is supported as well. Shadowing of this register is enabled and disabled by the AQCTL[SHDWAQAMODE] and AQCTL[SHDWAQBMODE] bits. These bits enable and disable the AQCTLA shadow register and AQCTLB shadow register, respectively. The behavior of the two load modes is:

Shadow Mode:

The shadow mode for the AQCTLA is enabled by setting the AQCTL[SHDWAQAMODE] bit, and the shadow register for AQCTLB is enabled by setting the AQCTL[SHDWAQBMODE] bit. Shadow mode is disabled by default for both AQCTLA and AQCTLB

If the shadow register is enabled, then the content of the shadow register is transferred to the active register on one of the following events as specified by the AQCTL[LDAQAMODE], AQCTL[LDAQBMODE], AQCTL[LDAQASYNC], and AQCTL[LDAQBSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCI or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LDAQAMODE/LDAQBMODE

Global Load Support

Global load control mechanism can also be used for AQCTLA:AQCTLA2, AQCTLB:AQCTLB2, and AQCSFRC registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected, the transfer of contents from shadow register to active register for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The global load control mechanism is explained in Section 19.4.7.

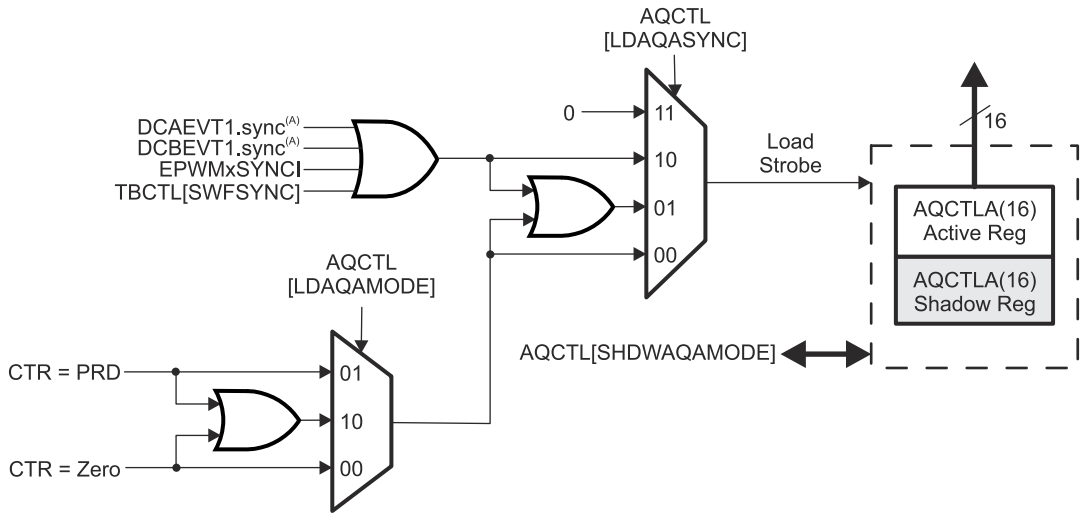
Immediate Load Mode:

If the immediate load mode is selected (that is, AQCTL[SHDWAQAMODE] = 0 or AQCTL[SHDWAQBMODE] = 0), then a read from or a write to the register goes directly to the active register. See Figure 19-24 and Figure 19-25.

Note

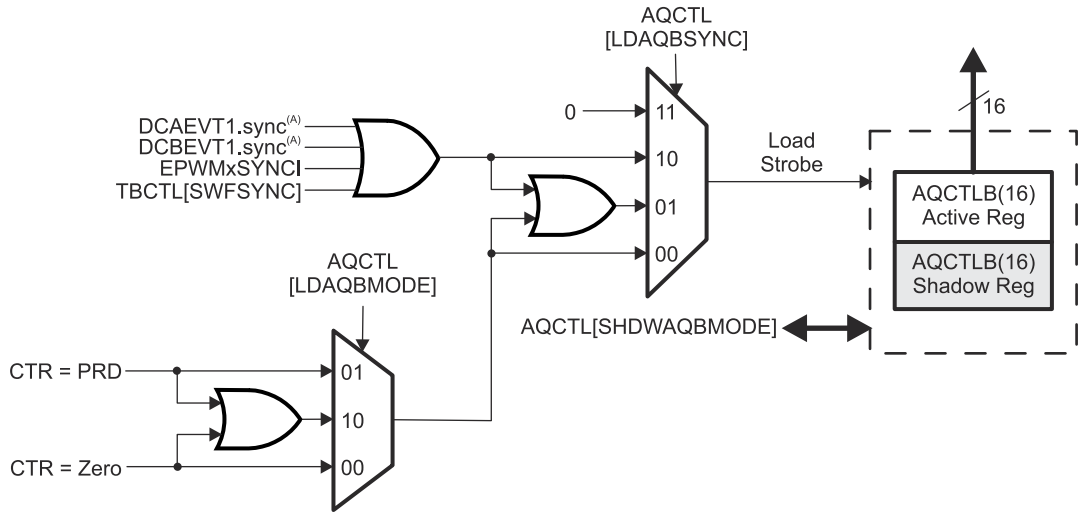
Shadow to Active Load of Action Qualifier Output A/B Control Register [AQCTLA and AQCTLB] on CMPA = 0 or CMPB = 0 boundary

If the Counter-Compare A Register (CMPA) or Counter-Compare B Register (CMPB) is set to a value of 0 and the action qualifier action on AQCTLA and AQCTLB is configured to occur in the same instant as a shadow to active load (that is, CMPA = 0 and AQCTLA shadow to active load on TBCTR = 0 using AQCTL register LDAQAMODE and LDAQAMODE bits), then both events enter contention. It is recommended to use a Non-Zero Counter-Compare when using Shadow to Active Load of Action Qualifier Output A/B Control Register on TBCTR = 0 boundary.



A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and $\overline{TZ}$ signals).

Figure 19-24. AQCTL[SHDWAQAMODE]



A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and $\overline{TZ}$ signals).

Figure 19-25. AQCTL[SHDWAQBMODE]

19.6.5 Configuration Requirements for Common Waveforms

Note

The waveforms in this chapter show the behavior of the ePWMs for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from the respective shadow registers once every period. Specify when the update takes place: either when the time-base counter reaches zero or when the time-base counter reaches the period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

Use up-down count mode to generate a symmetric PWM:

- If loading CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If loading CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD-1.

  This means there is always a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Use up-down count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

When using up-count mode to generate an asymmetric PWM:

- To achieve 0-100% asymmetric PWM, you **must** load CMPA/CMPB on TBPRD. When CMPA/CMPB is not loaded on TBCTR=PRD, boundary conditions can occur depending on the timing of the write and the value written to CMPA/CMPB. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD+1 to achieve 0-100% PWM duty.

When using up-count mode to generate an asymmetric PWM with deadband enabled:

- To achieve 0%-100% PWM use the following configuration: When the CMPA value is too close to 0 or PRD such that the following conditions are met (CMPX < Deadband) or (CMPX > PRD – Deadband), the actions specified by the AQCTL register for CMPX do not take effect. To avoid this, the AQCTL settings must be altered under these conditions only to generate either high or low pulses for both CAU or CAD events (both set or both clear). Make sure that this software update is occurring synchronous to the PWM carrier cycle, and shadow mode is enabled.

When using up-down count mode to generate an asymmetric PWM with deadband enabled:

- To achieve 0%-100% PWM use the following configuration: When the CMPA value is too close to 0 or PRD such that the following conditions are met (CMPX < Deadband/2) or (CMPX > PRD – (Deadband)/2), the actions specified by the AQCTL register for CMPX do not take effect. To avoid this, the AQCTL settings must be altered under these conditions only to generate either high or low pulses for both CAU or CAD events (both set or both clear). Make sure that this software update is occurring synchronous to the PWM carrier cycle, and shadow mode is enabled.

See *Using Enhanced Pulse Width Modulator (ePWM) Module for 0-100% Duty Cycle Control*.

Figure 19-26 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCTR. In this mode, 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing, the CMPA match pulls the PWM output high. Likewise when the counter is decrementing, the compare match pulls the PWM signal low. When CMPA = 0, the PWM signal is high for the entire period giving a 100% duty waveform. When CMPA = TBPRD, the PWM signal is low achieving 0% duty.

When using this configuration in practice, if loading CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If loading CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD-1. This means there is always a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

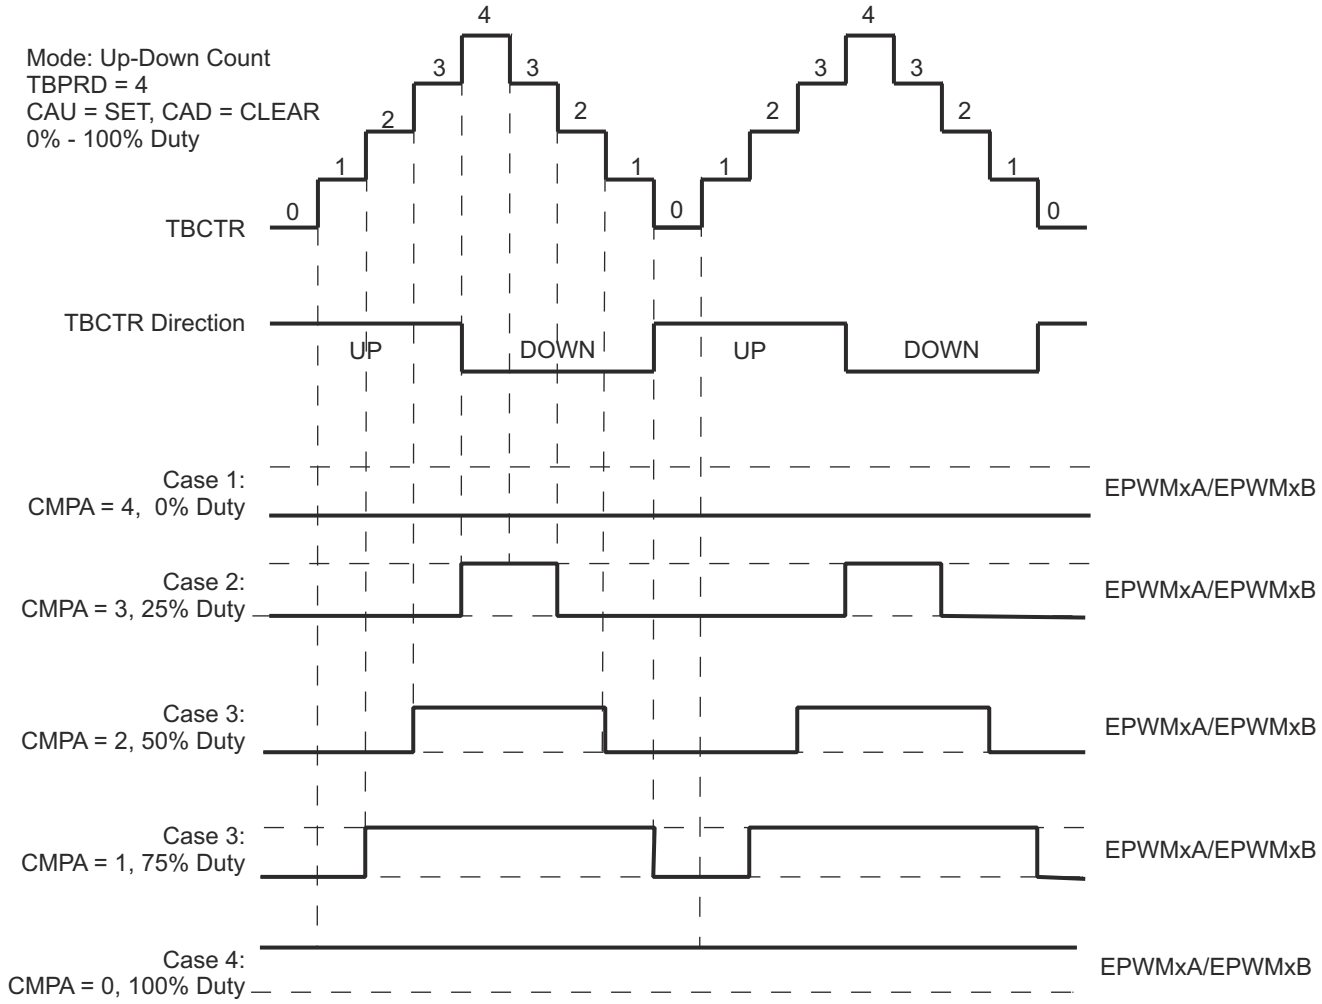


Figure 19-26. Up-Down Count Mode Symmetrical Waveform

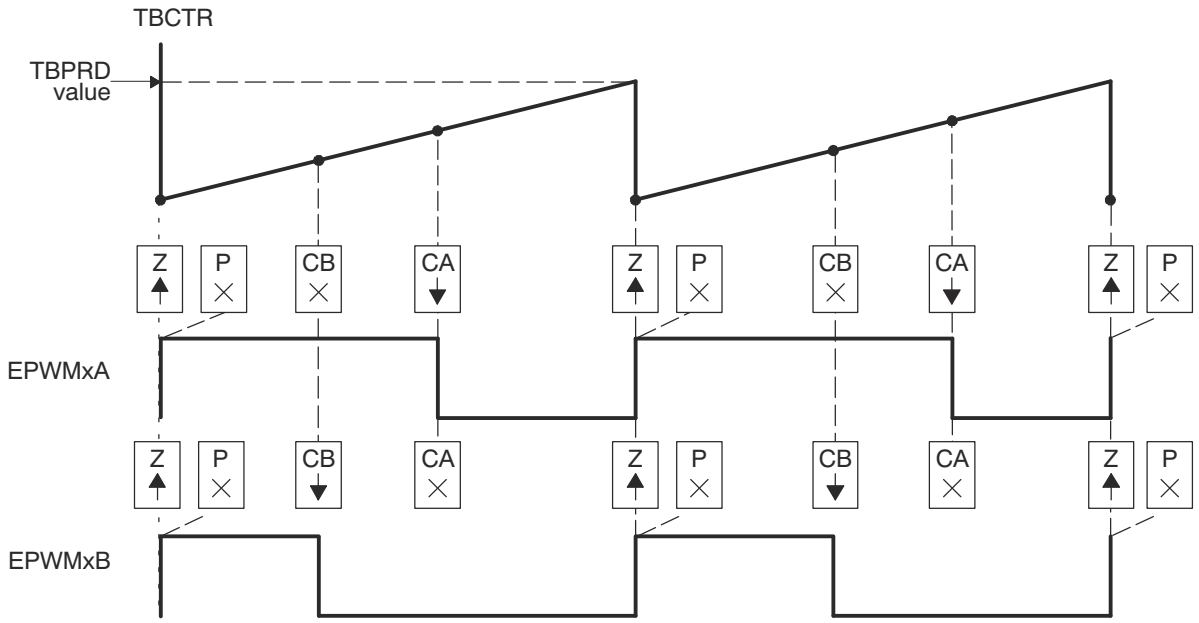
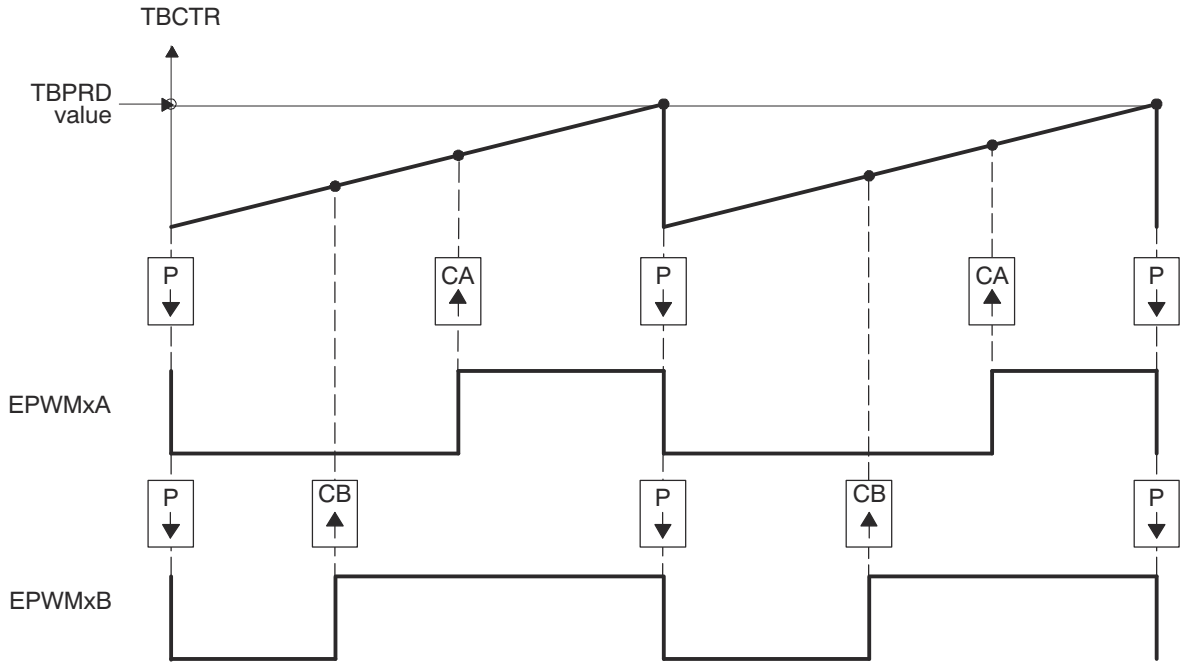
The PWM waveforms in Figure 19-27 through Figure 19-32 show some common action-qualifier configurations. Some conventions used in the figures and examples are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in the respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB.
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means count-up-and count-down mode, Up means up-count mode and Down means down-count mode
- Sym = Symmetric, Asym = Asymmetric



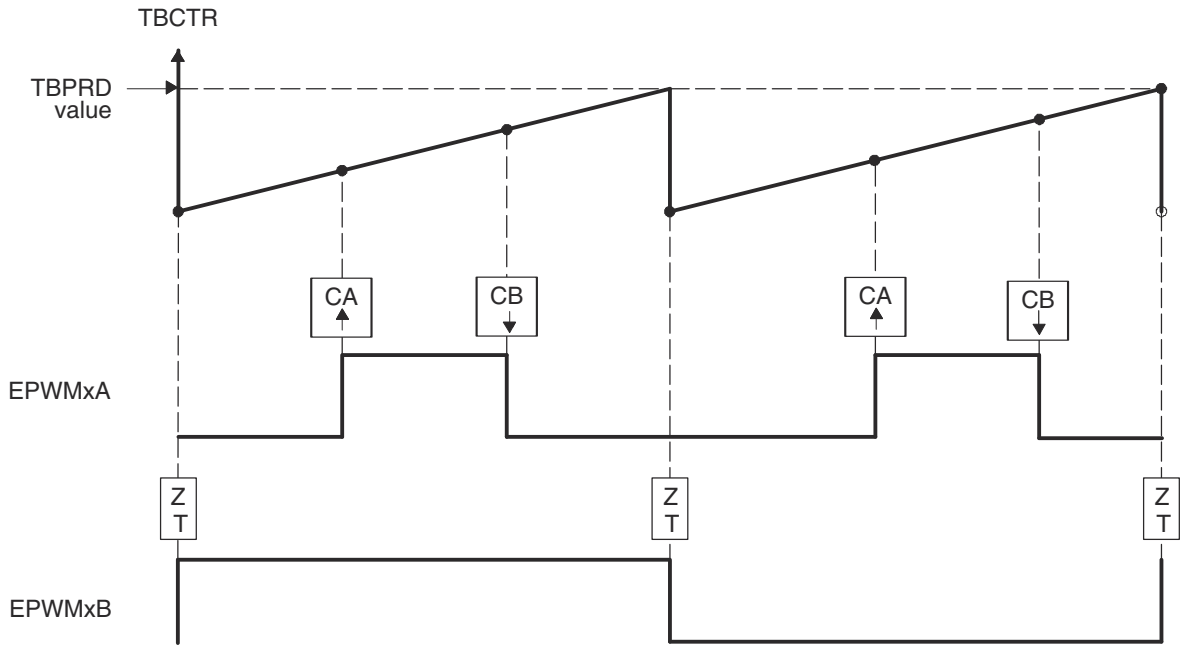
A. PWM period = (TBPRD + 1) × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).
C. Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).
D. The "Do Nothing" actions (X) are shown for completeness, but are not shown on subsequent diagrams.
E. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 19-27. Up, Single Edge Asymmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB—Active High



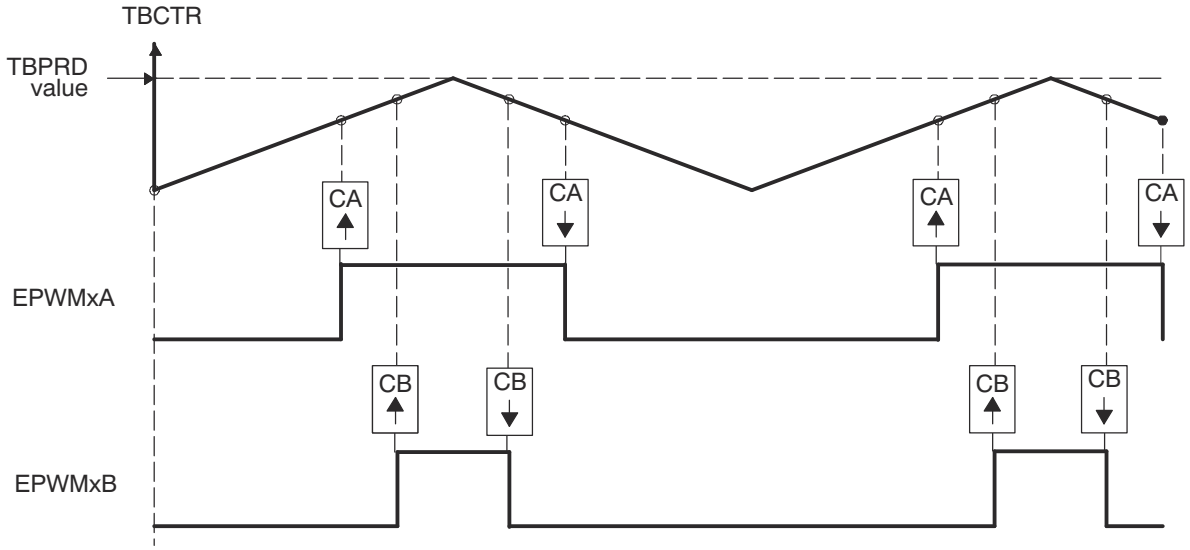
A. PWM period = (TBPRD + 1) × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
D. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 19-28. Up, Single Edge Asymmetric Waveform with Independent Modulation on EPWMxA and EPWMxB—Active Low



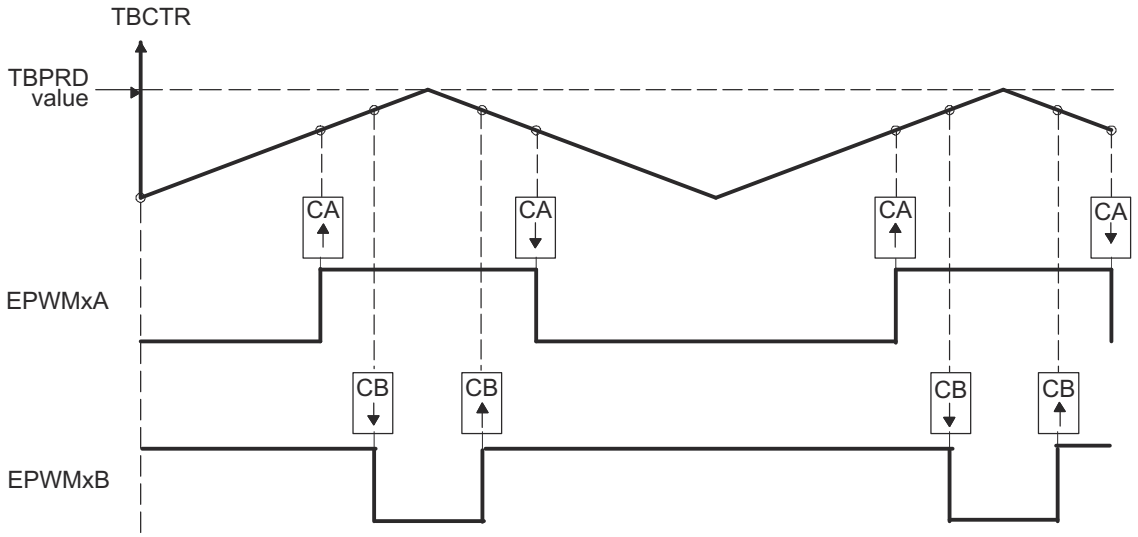
A. PWM frequency = 1/((TBPRD + 1) × T_{TBCLK})
B. Pulse can be placed anywhere within the PWM cycle (0000 - TBPRD)
C. High time duty proportional to (CMPB - CMPA)

Figure 19-29. Up-Count, Pulse Placement Asymmetric Waveform With Independent Modulation on EPWMxA



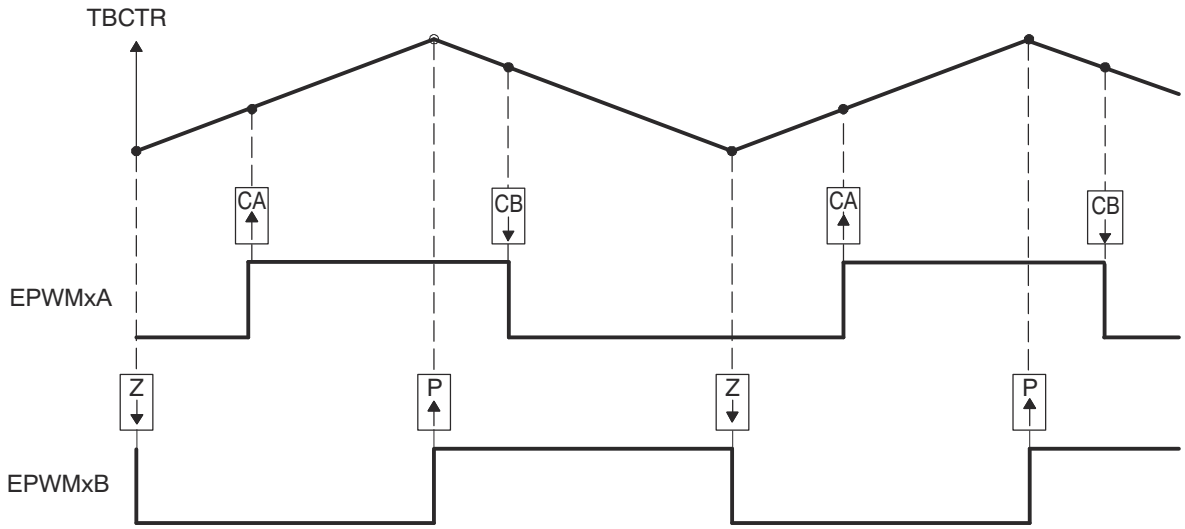
A. PWM period = 2 x TBPRD × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
D. Outputs EPWMxA and EPWMxB can drive independent power switches.

Figure 19-30. Up-Down Count, Dual-Edge Symmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB — Active Low



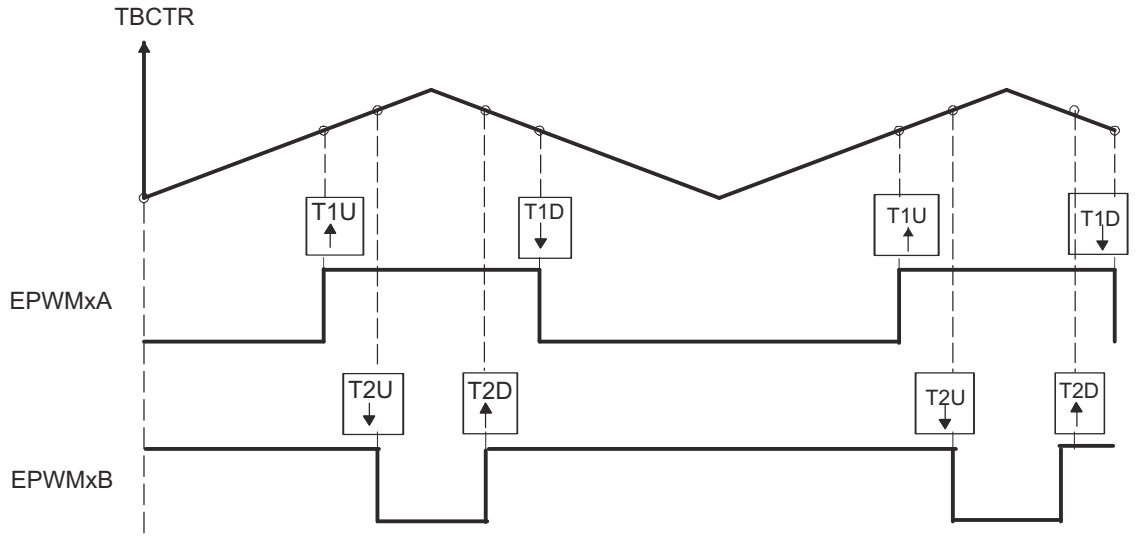
A. PWM period = 2 × TBPRD × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active low, that is, low time duty proportional to CMPA.
C. Duty modulation for EPWMxB is set by CMPB and is active high, that is, high time duty proportional to CMPB.
D. Outputs EPWMx can drive upper/lower (complementary) power switches.
E. Dead-band = CMPB - CMPA (fully programmable edge placement by software). Note the dead-band module is also available if the more classical edge delay method is required.

Figure 19-31. Up-Down Count, Dual-Edge Symmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB — Complementary



A. PWM period = 2 × TBPRD × TBCLK
B. Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.
C. Duty modulation for EPWMxA is set by CMPA and CMPB.
D. Low time duty for EPWMxA is proportional to (CMPA + CMPB).
E. To change this example to active high, CMPA and CMPB actions need to be inverted (that is, Clear on CMPA, Set on CMPB).
F. Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB).

Figure 19-32. Up-Down Count, Dual-Edge Asymmetric Waveform, with Independent Modulation on EPWMxA—Active Low



A. PWM period = 2 × TBPRD × TTBCLK
B. Independent T1 event actions when counter is counting up and when the counter is counting down are used to generate EPWMxA output.
C. Independent T2 event actions when counter is counting up and when the counter is counting down are used to generate EPWMxB output.
D. TZ1 is selected as the source for T1.
E. TZ2 is selected as the source for T2.

Figure 19-33. Up-Down Count, PWM Waveform Generation Utilizing T1 and T2 Events

19.7 Dead-Band Generator (DB) Submodule

Figure 19-34 illustrates the dead-band submodule within the ePWM.

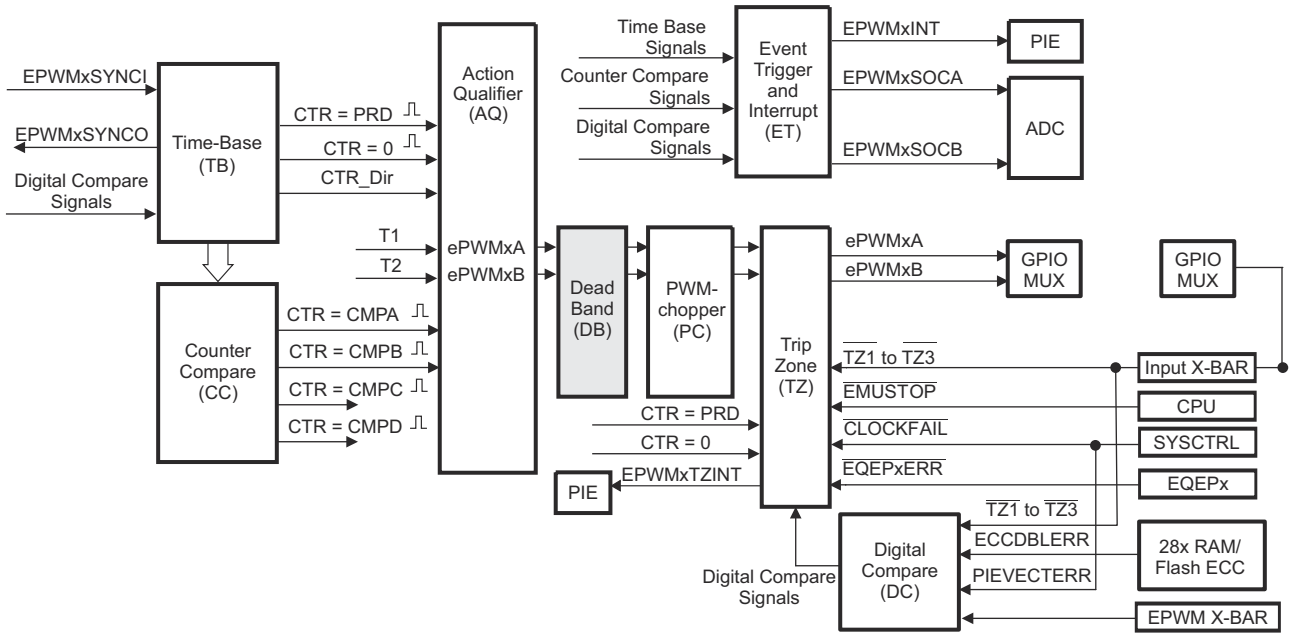


Figure 19-34. Dead_Band Submodule

19.7.1 Purpose of the Dead-Band Submodule

The action-qualifier (AQ) module section discussed how the AQ module can generate the required dead band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-based dead band with polarity control is required, then the dead-band submodule described here must be used.

The key functions of the dead-band module are:

- Generating appropriate signal pairs (EPWMxA and EPWMxB) with dead-band relationship from a single EPWMxA input
- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

19.7.2 Dead-band Submodule Additional Operating Modes

On type 1 ePWM RED can appear on one channel output and FED can appear on the other channel output.

The following list shows the distinct difference between type 1 and type 4 modules with respect to dead-band operating modes:

- By adding S6, S7, and S8 in Figure 19-35, RED and FED can appear on both the A-channel and B-channel outputs. Additionally, both RED and FED together can be applied to either the A-channel or B-channel outputs to allow B-channel phase shifting with respect to the A-channel.

Note

Phase shifting B-channel with respect to the A-channel using the dead-band submodule additional operating modes has limitations with respect to the choice of RED and FED delay with respect to the operating duty cycle of the ePWMxA and ePWMxB outputs.

- The dead-band counters have also been increased to 14 bits
- Deadband and deadband high-resolution registers are now shadowed
- High-resolution deadband RED and FED have been enabled using the DBREDHR and DBFEDHR registers

Note

The PWM chopper is not enabled when high-resolution deadband is enabled.

High-resolution deadband RED and FED requires half-cycle clocking mode (DBCTL[HALFCYCLE] = 1).

Cannot have both RED and FED together applied to both ePWMxA and ePWMxB. RED and FED together can be applied only to either OutA OR OutB.

Phase shifting B-channel with respect to the A-channel: When PWMxB is derived from PWMxA using the DEDB_MODE bit and by delaying rising edge and falling edge by the phase shift amount. When the duty cycle value on PWMxA is less than this phase shift amount, PWMxA's falling edge has precedence over the delayed rising edge for PWMxB. Make sure the duty cycle value of the current waveform applied to the dead-band module is greater than the required phase shift amount.

The Type 4 action qualifier and dead-band outputs of the ePWM module are delayed by one TBCLK cycle in comparison to the Type 2 ePWM module, although the Type 4 behavior is the same as the Type 3 PWM. Both PWMA and PWMB signals are delayed under all circumstances.

Shadow Mode:

The shadow mode for the DBRED is enabled by setting the DBCTL[SHDWDBREDMODE] bit and the shadow register for DBFED is enabled by setting the DBCTL [SHDWDBFEDMODE] bit. Shadow mode is disabled by default for both DBRED and DBFED

If the shadow register is enabled, then the content of the shadow register is transferred to the active register on one of the following events as specified by the DBCTL [LOADREDMODE] and DBCTL [LOADFEDMODE] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero

The DBCTL register can be shadowed. The shadow mode for DBCTL is enabled by setting the DBCTL2[SHDWDBCTLMODE] bit. If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the DBCTL2[LOADDBCTLMODE] register bit:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD)
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero

Note

The application software must enable shadow load mode in the DBCTL[SHDWDBREDMODE] and DBCTL[SHDWDBFEDMODE] **before** programming values for the DBRED and DBFED registers. If the shadow register is enabled **after** programming the DBRED and DBFED registers, the DBRED and DBFED registers are loaded with a value of 0.

Global Load Support

Global load control mechanism can also be used for DBRED:DBREDHR, DBFED:DBFEDHR, and DBCTL registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The Global load control mechanism is explained in Section 19.4.7.

Note

When DBRED/DBFED active is loaded with a new shadow value while DB counters are counting, the new DBRED/DBFED value only affects the NEXT PWMx edge and not the current edge.

A Deadband value of zero cannot be used when the Global Shadow to Active Load is set to occur at CTR=ZERO. Similarly, a Deadband value of PRD cannot be used when the Global Shadow to Active Load is set to occur at CTR=PRD.

TBPRDHR cannot be used with Global load. If high-resolution period must be changed in the application, users must write to the individual period registers from an ePWM ISR (The ISR must be synchronous with the PWM switching period), where the Global Load One-Shot bit is also written to.

19.7.3 Operational Highlights for the Dead-Band Submodule

The configuration options for the dead-band submodule are shown in Figure 19-35.

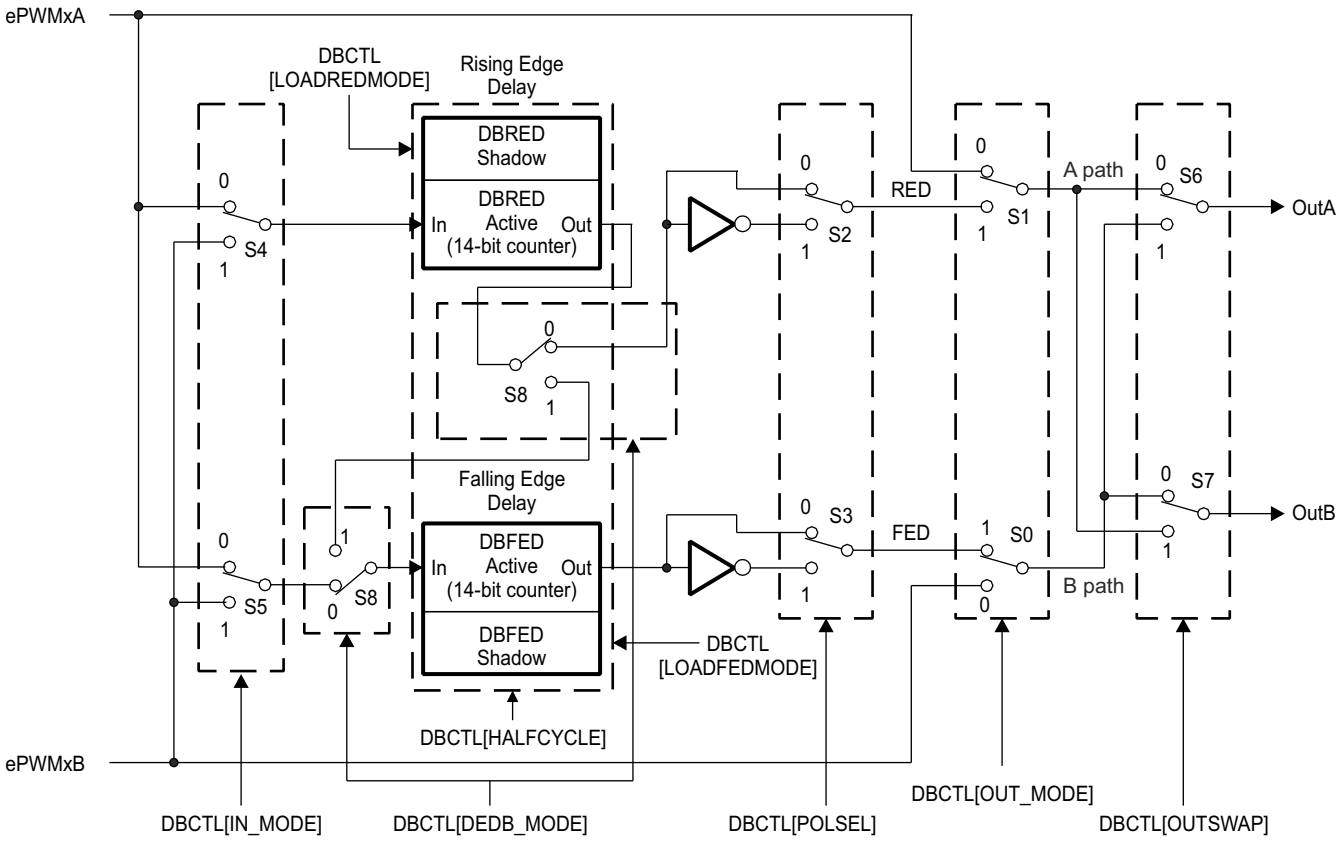

Figure 19-35. Configuration Options for the Dead-Band Submodule

Although all combinations are supported, not all are typical usage modes. Table 19-9 documents some classical dead-band configurations. These modes assume that the DBCTL[IN_MODE] is configured such that EPWMxA In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in Table 19-9 fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED):** Allows the user to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings:** These represent typical polarity configurations that can address all the active-high and active-low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in Figure 19-36. Note that to generate equivalent waveforms to Figure 19-36, configure the action-qualifier submodule to generate the signal as shown for EPWMxA.
- **Mode 6: Bypass rising-edge delay (RED) and Mode 7: Bypass falling-edge delay (FED):** Finally the last two entries in Table 19-9 show combinations where either the falling-edge delay (FED) or rising-edge delay (RED) blocks are bypassed.

Figure 19-36 shows waveforms for typical cases where 0% < duty < 100%.

Table 19-9. Classical Dead-Band Operating Modes

Mode	Mode Description	DBCTL[POLSEL]		DBCTL[OUT_MODE]	
		S3	S2	S1	S0
1	EPWMxA and EPWMxB Passed Through (No Delay)	X	X	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay) EPWMxB Out = EPWMxA In with Falling-Edge Delay	0 or 1	0 or 1	0	1
7	EPWMxA Out = EPWMxA In with Rising-Edge Delay EPWMxB Out = EPWMxB In with No Delay	0 or 1	0 or 1	1	0

Table 19-10. Additional Dead-Band Operating Modes

Mode Description	DBCTL[DEDB-MODE]	DBCTL[OUTSWAP]	
	S8	S6	S7
EPWMxA and EPWMxB signals are as defined by OUT-MODE bits.	0	0	0
EPWMxA = A-path as defined by OUT-MODE bits. EPWMxB = A-path as defined by OUT-MODE bits (rising-edge delay or delay-bypassed A-signal path)	0	0	1
EPWMxA = B-path as defined by OUT-MODE bits (falling-edge delay or delay-bypassed B-signal path) EPWMxB = B-path as defined by OUT-MODE bits	0	1	0
EPWMxA = B-path as defined by OUT-MODE bits (falling-edge delay or delay-bypassed B-signal path) EPWMxB = A-path as defined by OUT-MODE bits (rising-edge delay or delay-bypassed A-signal path)	0	1	1
Rising-edge delay applied to EPWMxA / EPWMxB as selected by S4 switch (IN-MODE bits) on A signal path only. Falling-edge delay applied to EPWMxA / EPWMxB as selected by S5 switch (IN-MODE bits) on B signal path only.	0	X	X
Rising-edge delay and falling-edge delay applied to source selected by S4 switch (IN-MODE bits) and output to B signal path only.(1)	1	X	X

(1) When this bit is set to 1, the user can always either set OUT_MODE bits such that Apath = InA or set OUTSWAP bits such that EPWMxA=Bpath. Otherwise, EPWMxA is invalid.

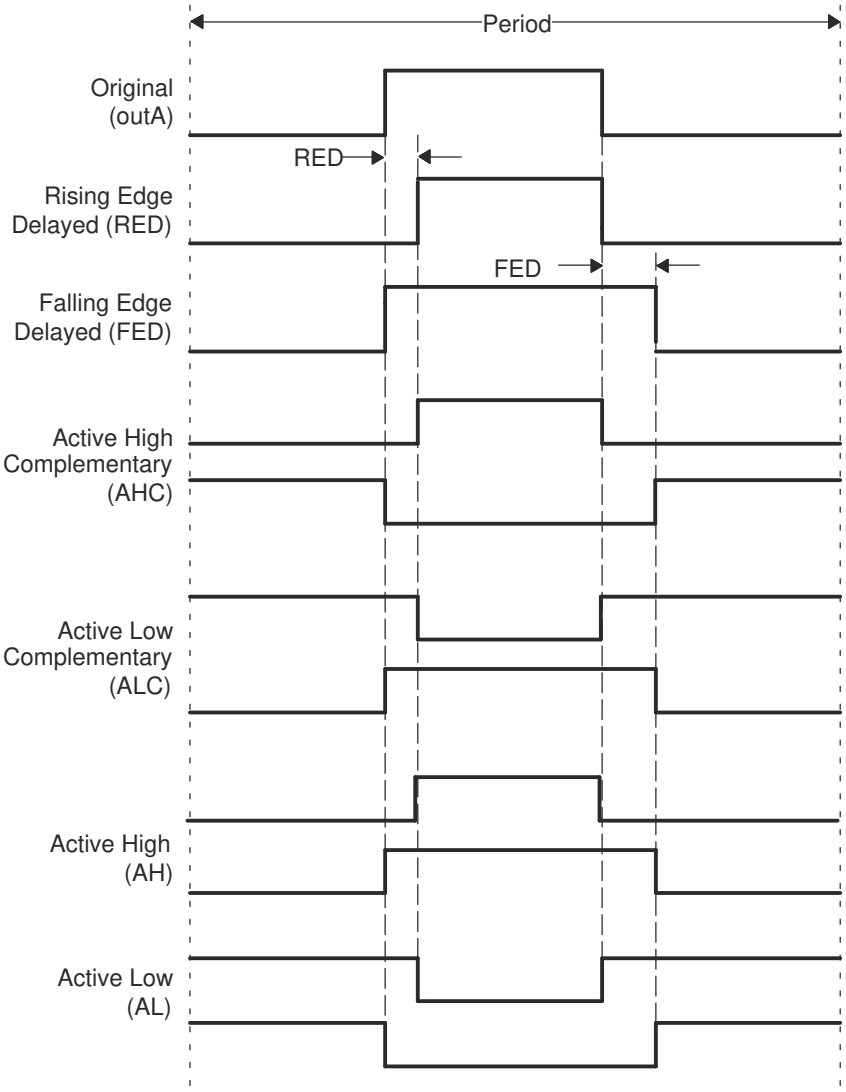

Figure 19-36. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and the value represents the number of TBCLK (time-base clock) pulses by which a signal edge is delayed. For example, the formula to calculate falling-edge-delay and rising-edge-delay is:

FED = DBFED × T_{TBCLK}

RED = DBRED × T_{TBCLK}

Where T_{TBCLK} is the period of TBCLK, the prescaled version of EPWMCLK.

For convenience, delay values for various TBCLK options are shown in Table 19-11. The ePWM input clock frequency that these delay values been computed by is 100MHz.

Table 19-11. Dead-Band Delay Values in µs as a Function of DBFED and DBRED

Dead-Band Value	Dead-Band Delay (µs)		
DBFED, DBRED	TBCLK = EPWMCLK/1	TBCLK = EPWMCLK /2	TBCLK = EPWMCLK/4
1	0.01	0.02	0.04
5	0.05	0.10	0.20
10	0.10	0.20	0.40
100	1.00	2.00	4.00
200	2.00	4.00	8.00
400	4.00	8.00	16.00
500	5.00	10.00	20.00
600	6.00	12.00	24.00
700	7.00	14.00	28.00
800	8.00	16.00	32.00
900	9.00	18.00	36.00
1000	10.00	20.00	40.00

When half-cycle clocking is enabled, the formula to calculate the falling-edge-delay and rising-edge-delay becomes:

$FED = DBFED \times T_{TBCLK}/2$

$RED = DBRED \times T_{TBCLK}/2$

19.8 PWM Chopper (PC) Submodule

The PWM chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if pulse transformer-based gate drivers to control the power switching elements are needed.

Figure 19-37 illustrates the PWM chopper submodule within the ePWM.

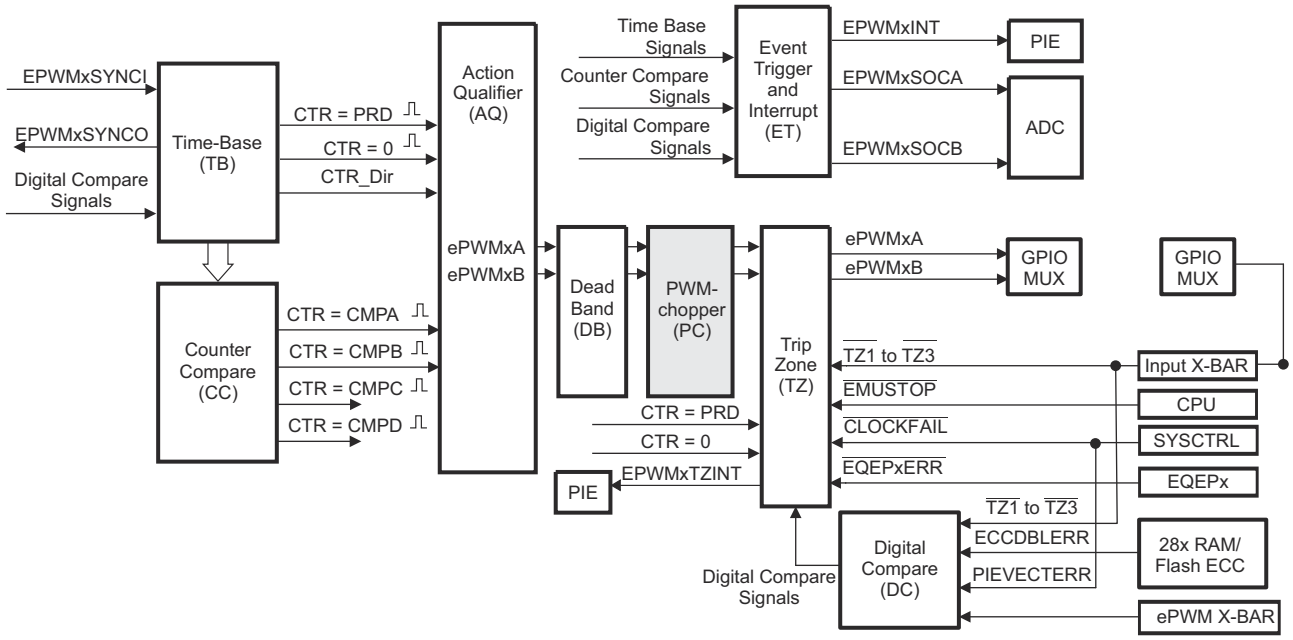

Figure 19-37. PWM Chopper Submodule

19.8.1 Purpose of the PWM Chopper Submodule

The key functions of the PWM chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

19.8.2 Operational Highlights for the PWM Chopper Submodule

Figure 19-38 shows the operational details of the PWM chopper submodule. The carrier clock is derived from EPWMCLK. The clock frequency and duty cycle are controlled using the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to make sure hard and fast power switch turn on, while the subsequent pulses sustain pulses, making sure the power switch remains on. The one-shot width is programmed using the OSHTWTH bits. The PWM chopper submodule can be fully disabled (bypassed) using the CHPEN bit.

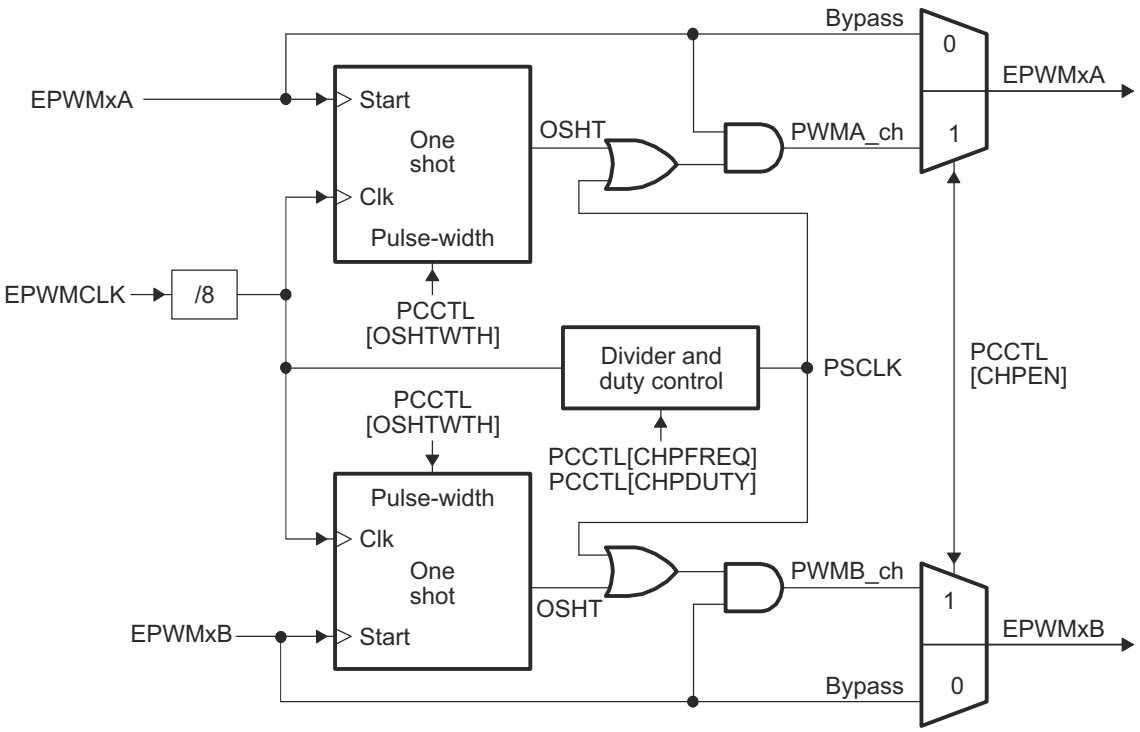

Figure 19-38. PWM Chopper Submodule Operational Details

19.8.3 Waveforms

Figure 19-39 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

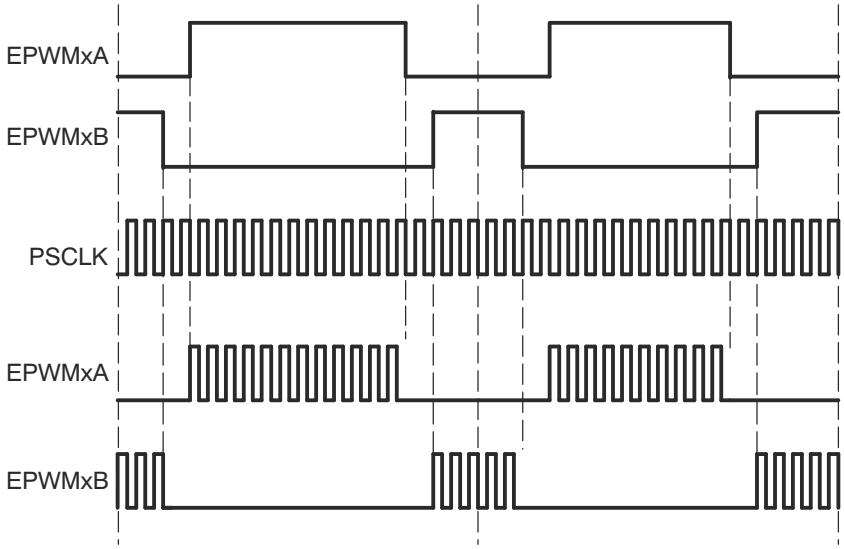

Figure 19-39. Simple PWM Chopper Submodule Waveforms Showing Chopping Action Only

19.8.3.1 One-Shot Pulse

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$$T_{1stpulse} = T_{EPWMCLK} \times 8 \times OSHTWTH$$

Where $T_{EPWMCLK}$ is the period of the system clock (EPWMCLK) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 19-40 shows the first and subsequent sustaining pulses and Table 19-12 gives the possible pulse width values for a EPWMCLK = 80MHz.

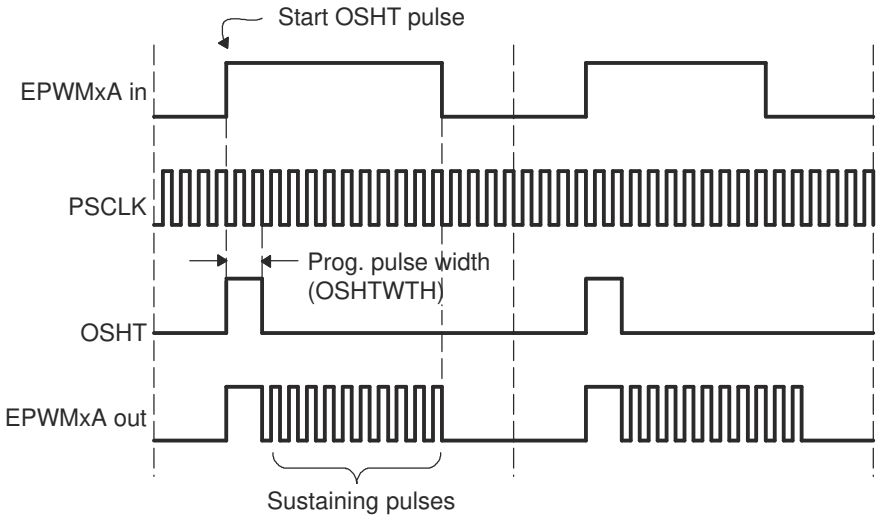

Figure 19-40. PWM Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses

Table 19-12. Possible Pulse Width Values for EPWMCLK = 80MHz

OSHTWTH (hex)	Pulse Width (ns)
0	100
1	200
2	300
3	400
4	500
5	600
6	700
7	800
8	900
9	1000
A	1100
B	1200
C	1300
D	1400
E	1500
F	1600

19.8.3.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses make sure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized using software control.

Figure 19-41 shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

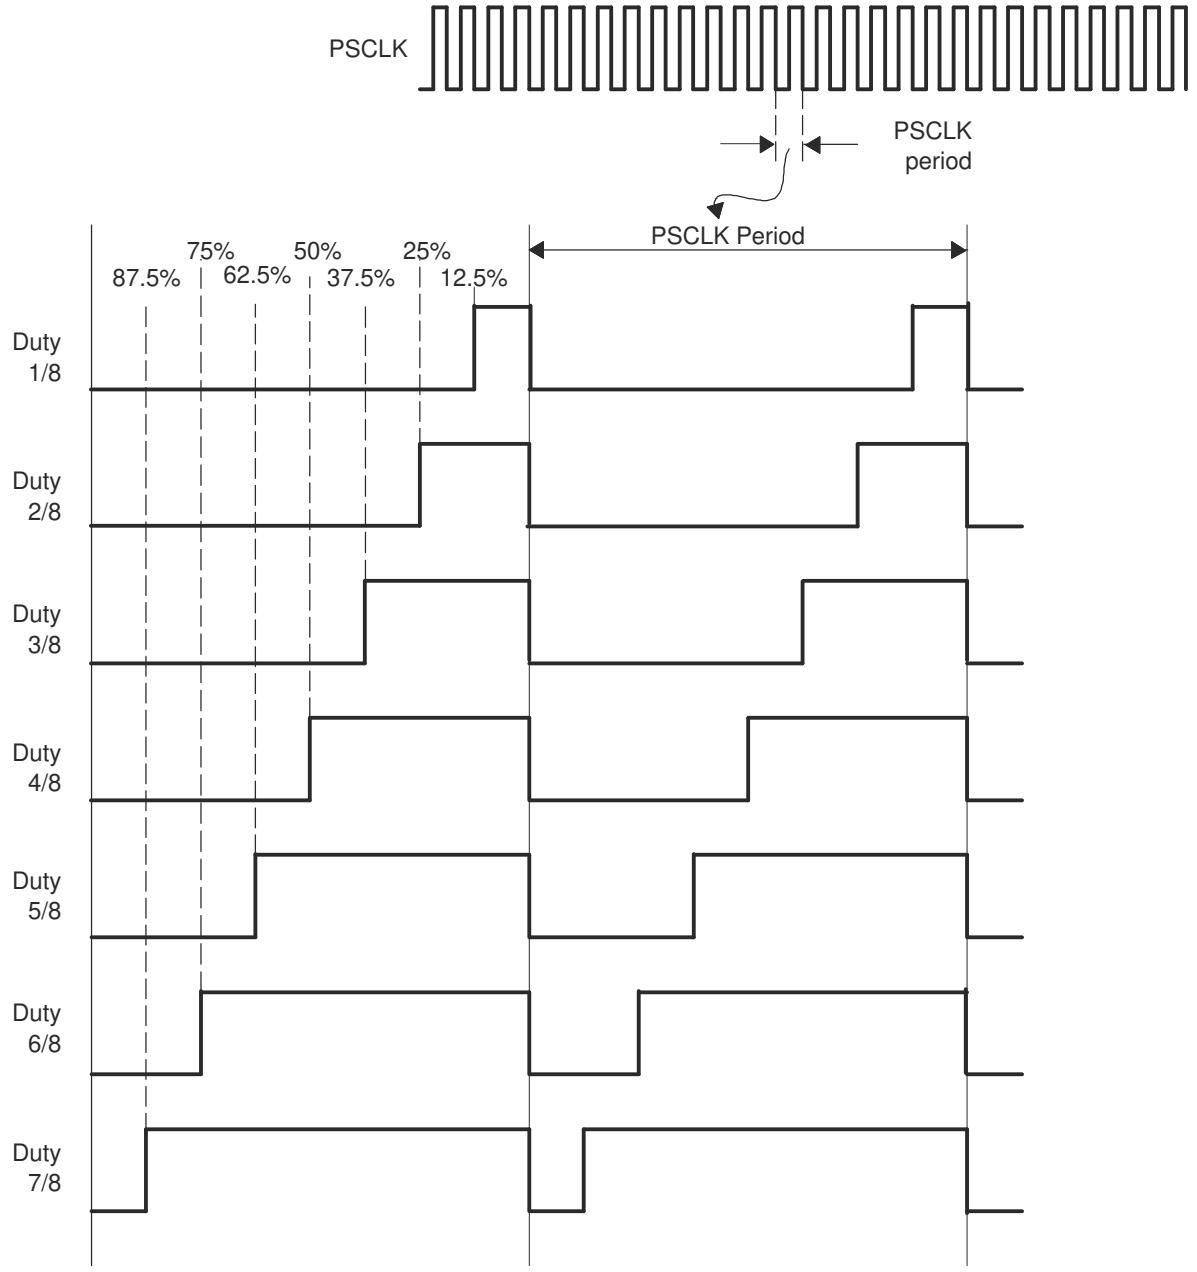

Figure 19-41. PWM Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses

19.9 Trip-Zone (TZ) Submodule

Each ePWM module is connected to six $\overline{TZn}$ signals ($\overline{TZ1}$ to $\overline{TZ6}$). $\overline{TZ1}$ to $\overline{TZ3}$ are sourced from the GPIO mux. $\overline{TZ4}$ is sourced from an inverted EQEPxERR signal on those devices with an EQEP module. $\overline{TZ5}$ is connected to the system clock fail logic, and $\overline{TZ6}$ is sourced from the EMUSTOP output from the CPU. These signals indicate external fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur.

Figure 19-42 illustrates the trip-zone submodule within the ePWM.

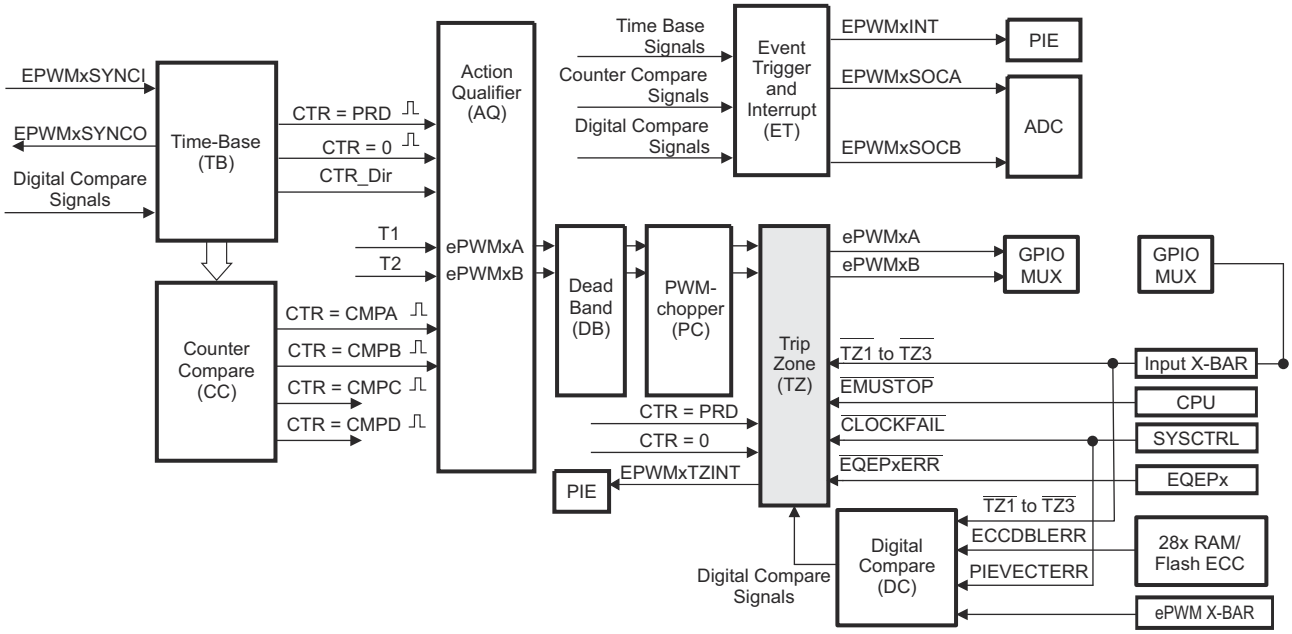

Figure 19-42. Trip-Zone Submodule

19.9.1 Purpose of the Trip-Zone Submodule

The key functions of the trip-zone submodule are:

- Trip inputs $\overline{TZ1}$ to $\overline{TZ6}$ can be flexibly mapped to any ePWM module.
- Upon a fault condition, outputs EPWMxA and EPWMxB can be forced to one of the following:
  - High
  - Low
  - High-impedance
  - No action taken
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Support for digital compare tripping (DC) based on state of on-chip analog comparator module outputs and $\overline{TZ1}$ to $\overline{TZ3}$ signals.
- Each trip-zone input and digital compare (DC) submodule DCAEVT1/2 or DCBEVT1/2 force event can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone input.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if the trip-zone submodule is not required.

19.9.2 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals $\overline{TZ1}$ to $\overline{TZ6}$ (also collectively referred to as $\overline{TZn}$) are active-low input signals. When one of these signals goes low, or when a DCAEVT1/2 or DCBEVT1/2 force happens based on the TZDCSEL register event selection, the indication is that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone signals or DC events. Which trip-zone signals or DC events are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signals can or cannot be synchronized to the ePWMclock (EPWMCLK) and digitally filtered within the GPIO MUX block. A minimum of 3*TBCLK low pulse width on $\overline{TZn}$ inputs is sufficient to trigger a fault condition on the ePWM module. If the pulse width is less than this, the trip condition cannot be latched by CBC or OST latches. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on $\overline{TZn}$ inputs. The GPIOs or peripherals must be appropriately configured. For more information, see the *System Control and Interrupts* chapter.

Each $\overline{TZn}$ input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for an ePWM module. DCAEVT1 and DCBEVT1 events can be configured to directly trip an ePWM module or provide a one-shot trip event to the module. Likewise, DCAEVT2 and DCBEVT2 events can also be configured to directly trip an ePWM module or provide a cycle-by-cycle trip event to the module. This configuration is determined by the TZSEL[DCAEVT1/2], TZSEL[DCBEVT1/2], TZSEL[CBCn], and TZSEL[OSHTn] control bits (where n corresponds to the trip input), respectively.

- **Cycle-by-Cycle (CBC):**

  When a cycle-by-cycle trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and EPWMxB outputs. Table 19-13 lists some of the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up or while the counter is counting down by appropriately configuring bits in the TZCTL2 register. Actions specified in the TZCTL2 register take effect only when the ETZE bit in TZCTL2 is set.

  Additionally, when a cycle-by-cycle trip event occurs, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller. A corresponding flag for the event that caused the CBC event is also set in register TZCBCFLG.

  If the CBC interrupt is enabled using the TZEINT register and DCAEVT2 or DCBEVT2 are selected as CBC trip sources using the TZSEL register, it is not necessary to also enable the DCAEVT2 or DCBEVT2 interrupts in the TZEINT register, as the DC events trigger interrupts through the CBC mechanism.

  The specified condition on the inputs is automatically cleared based on the selection made with TZCLR[CBCPULSE] if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] and TZCBCFLG flag bits remain set until the flag bits are manually cleared by writing to the TZCLR[CBC] and TZCBCCLR flag bits. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] and TZCBCFLG register bits are cleared, then these bits are again immediately set.

- **One-Shot (OSHT):**

  When a one-shot trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and EPWMxB output. Table 19-13 lists some of the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up and while the counter is counting down by appropriately configuring bits in TZCTL2 register. Actions specified in TZCTL2 register take effect only when ETZE bit in TZCTL2 is set.

  Additionally, when a one-shot trip event occurs, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller. A corresponding flag for the event that caused the OST event is also set in register TZOSTFLG. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit. If desired, the TZOSTFLG register bit can be cleared by manually writing to the corresponding bit in the TZOSTCLR register.

If the one-shot interrupt is enabled using the TZEINT register and DCAEVT1 or DCBEVT1 are selected as OSHT trip sources using the TZSEL register, it is not necessary to also enable the DCAEVT1 or DCBEVT1 interrupts in the TZEINT register, as the DC events trigger interrupts through the OSHT mechanism.

Note

Clear the TZFLG and TZOSTFLG flags after making sure that the TRIPIN source of the OST has become inactive. Otherwise, if interrupts are enabled, depending on when the flags are cleared, an OST interrupt can occur and the OST flags are zero.

- **Digital Compare Events (DCAEVT1/2 and DCBEVT1/2):**

  A digital compare DCAEVT1/2 or DCBEVT1/2 event is generated based on a combination of the DCAH/DCAL and DCBH/DCBL signals as selected by the TZDCSEL register. The signals which source the DCAH/DCAL and DCBH/DCBL signals are selected using the DCTRIPSEL register and can be either trip zone input pins or analog comparator CMPSSx signals. For more information on the digital compare submodule signals, see Section 19.11.

  When a digital compare event occurs, the action specified in the TZCTL[DCAEVT1/2] and TZCTL[DCBEVT1/2] bits is carried out immediately on the EPWMxA and EPWMxB output. Table 19-13 lists the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up and while the counter is counting down by appropriately configuring bits in TZCTLDCA and TZCTLDCB register. Actions specified in TZCTLDCA and TZCTLDCB registers take effect only when ETZE bit in TZCTL2 is set.

  In addition, the relevant DC trip event flag (TZFLG[DCAEVT1/2] / TZFLG[DCBEVT1/2]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller.

  The specified condition on the pins is automatically cleared when the DC trip event is no longer present. The TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag bit remains set until the flag is manually cleared by writing to the TZCLR[DCAEVT1/2] or TZCLR[DCBEVT1/2] bit. If the DC trip event is still present when the TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag is cleared, then the flag is again immediately set.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL, TZCTL2, TZCTLDCA, and TZCTLDCB register bit fields. Some of the possible actions, shown in Table 19-13, can be taken on a trip event.

Table 19-13. Possible Actions On a Trip Event

TZCTL Register Bitfield Settings	EPWMxA and EPWMxB	Comment
0,0	High-Impedance	Tripped
0,1	Force to High State	Tripped
1,0	Force to Low State	Tripped
1,1	No Change	Do Nothing. No change is made to the output.

Example 19-1. Trip-Zone Configurations

Scenario A:
A one-shot trip event on $\overline{TZ1}$ pulls both EPWM1A, EPWM1B low and also forces EPWM2A and EPWM2B high.

- Configure the ePWM1 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A is forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B is forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM2
  - TZCTL[TZA] = 1: EPWM2A is forced high on a trip event.
  - TZCTL[TZB] = 1: EPWM2B is forced high on a trip event.

Scenario B:
A cycle-by-cycle event on $\overline{TZ5}$ pulls both EPWM1A, EPWM1B low.
A one-shot event on $\overline{TZ1}$ or $\overline{TZ6}$ puts EPWM2A into a high impedance state.

- Configure the ePWM1 registers as follows:
  - TZSEL[CBC5] = 1: enables $\overline{TZ5}$ as a cycle-by-cycle event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A is forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B is forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM2
  - TZSEL[OSHT6] = 1: enables $\overline{TZ6}$ as a one-shot event source for ePWM2
  - TZCTL[TZA] = 0: EPWM2A is put into a high-impedance state on a trip event.
  - TZCTL[TZB] = 3: EPWM2B ignores the trip event.

Note

When configuring the GPIOs and INPUT X-BAR/EPWM X-BAR options, be aware that a change in the X-BAR input selections can cause an unwanted event. Therefore, set up the GPIO and X-BAR input configurations before enabling the ePWM Trip-Zone. If a requirement is to change the GPIO/X-BAR configurations while the ePWM Trip-Zone is enabled, the user can turn off the TRIPs by clearing the TZSEL register and reconfiguring the TRIP selection (TZSEL) after the INPUT XBAR selection is changed.

19.9.3 Generating Trip Event Interrupts

Figure 19-43 and Figure 19-44 illustrate the trip-zone submodule control and interrupt logic, respectively. DCAEVT1/2 and DCBEVT1/2 signals are described in further detail in Section 19.11.

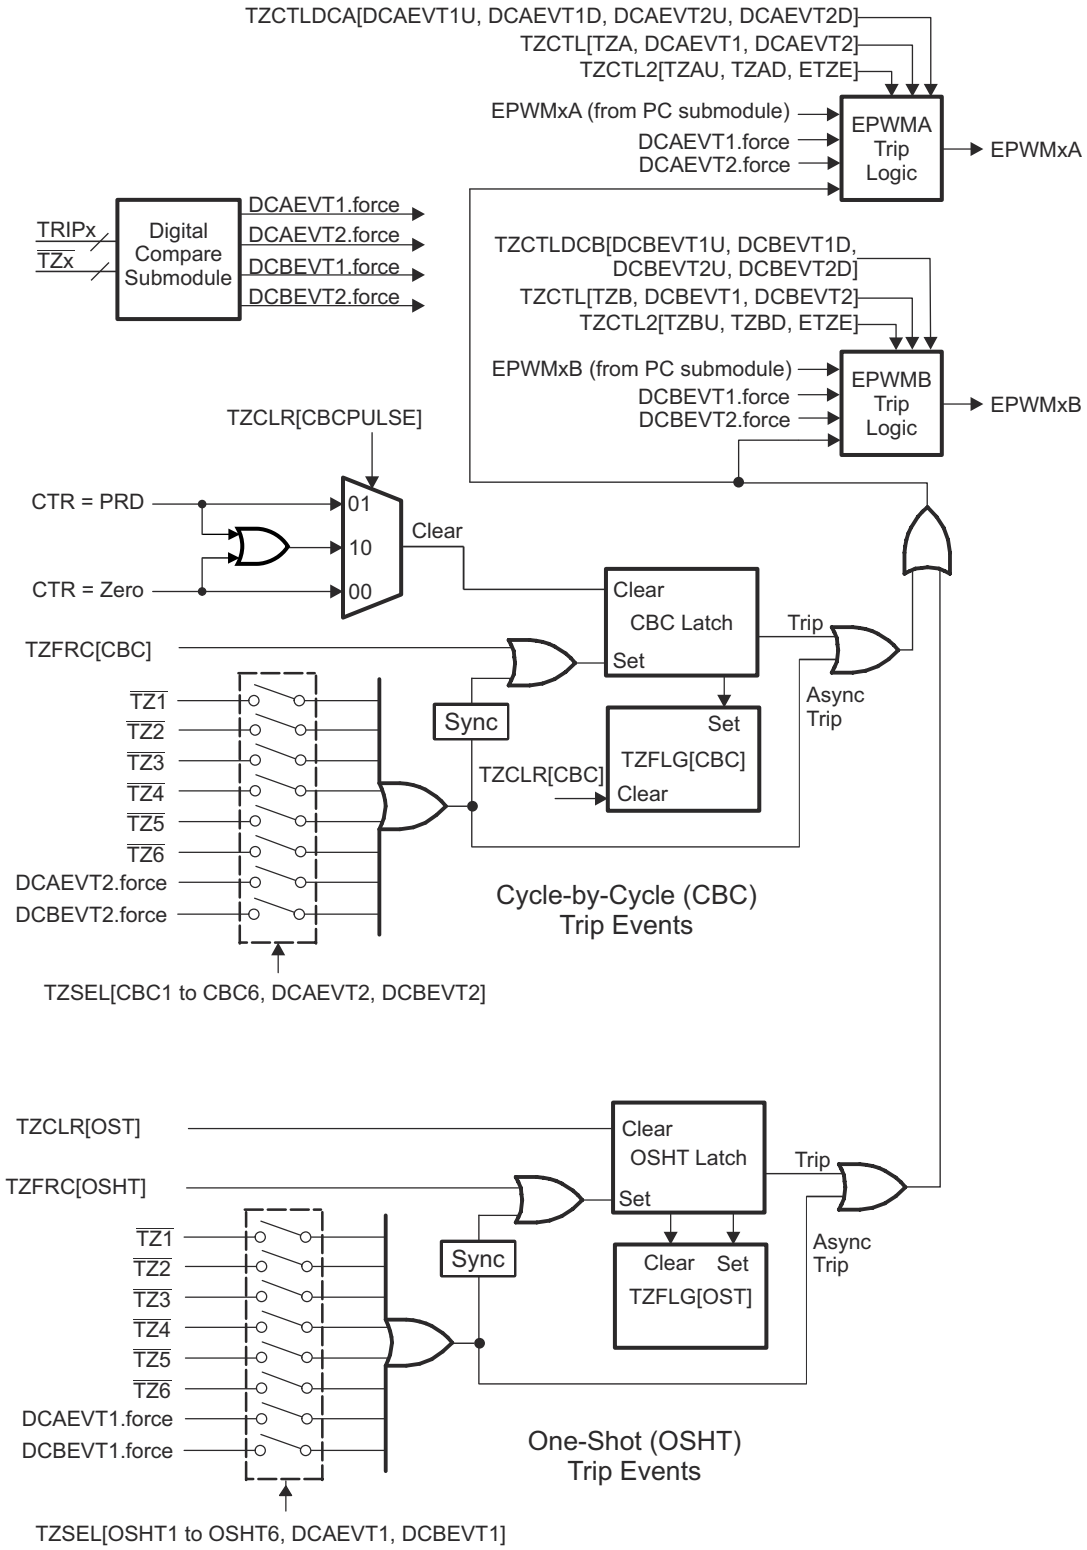

Figure 19-43. Trip-Zone Submodule Mode Control Logic

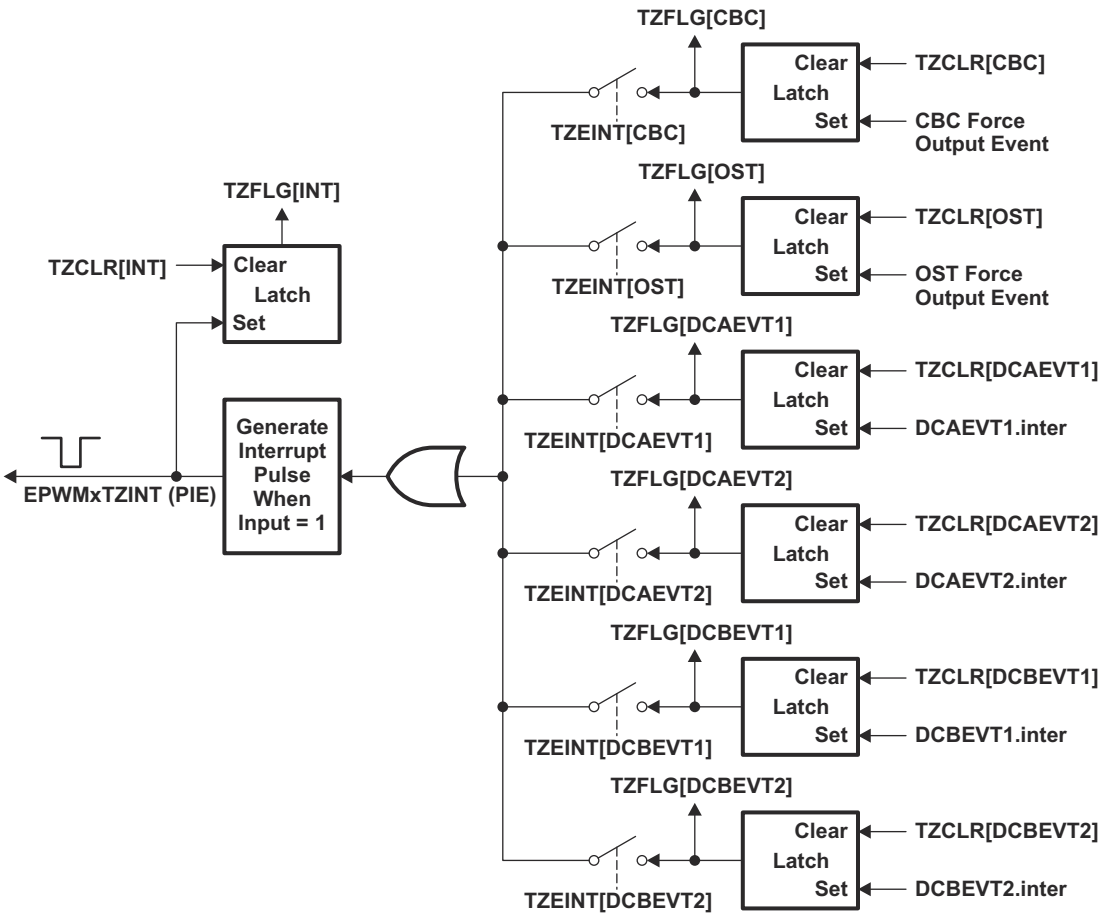

Figure 19-44. Trip-Zone Submodule Interrupt Logic

These individual flags for the CBC, OST and DCxEVTy can be used to detect the source of the EPWMxTZINT Interrupt. When multiple sources are used to generate the EPWMxTZINT interrupt, reading and clearing the flags takes different actions based on the specific event.

19.10 Event-Trigger (ET) Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base, counter-compare, and digital-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests and ADC start of conversion at:
  - Every event
  - Every second event
  - Up to every fifteenth event
- Provides full visibility of event generation using event counters and flags
- Allows software forcing of Interrupts and ADC start of conversion

The event-trigger submodule manages the events generated by the time-base submodule, the counter-compare submodule, and the digital-compare submodule to generate an interrupt to the CPU and a start of conversion pulse to the ADC when a selected event occurs.

Figure 19-45 illustrates the event-trigger submodule within the ePWM.

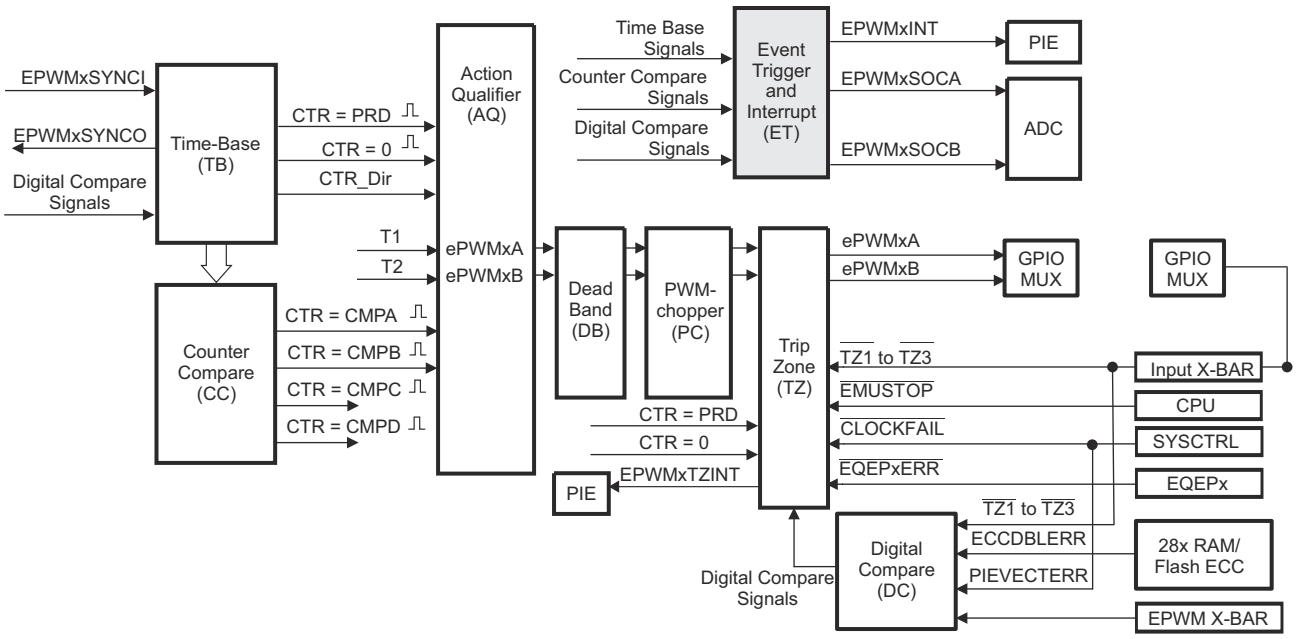

Figure 19-45. Event-Trigger Submodule

19.10.1 Operational Overview of the ePWM Event-Trigger Submodule

The event-trigger submodule monitors various event conditions (shown as inputs on the left side of Figure 19-46) and can be configured to prescale these events before issuing an Interrupt request or an ADC start of conversion. The event-trigger prescaling logic can issue Interrupt requests and ADC start of conversion at:

- Every event
- Every second event
- Up to every fifteenth event

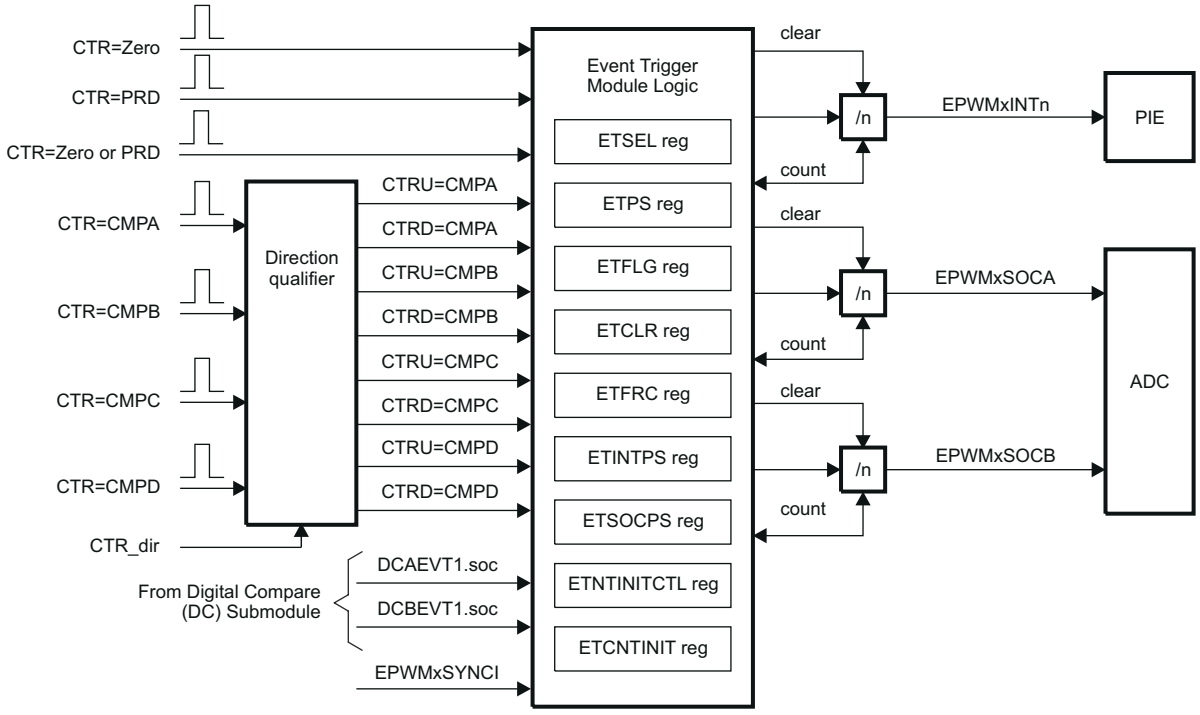

Figure 19-46. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs

- ETSEL - This selects which of the possible events trigger an interrupt or start an ADC conversion.
- ETPS - This programs the event prescaling options mentioned above.
- ETFLG - These are flag bits indicating status of the selected and prescaled events.
- ETCLR - These bits allow clearing the flag bits in the ETFLG register using software.
- ETFRC - These bits allow software forcing of an event. Useful for debugging or software intervention.
- ETINTPS - This programs the interrupt event prescaling options, supporting count and period up to 15 events.
- ETSOCPS - This programs the SOC event prescaling options, supporting count and period up to 15 events.
- ETCNTINITCTL - These bits enable ETCNTINIT initialization using SYNC event or using software force.
- ETCNTINIT - These bits allow initializing INT/SOCA/SOCB counters on SYNC events (or software force) with user programmed value.

A more detailed look at how the various register bits interact with the Interrupt and ADC start of conversion logic are shown in Figure 19-47, Figure 19-48, and Figure 19-49.

Figure 19-47 shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt.
- Generate an interrupt on every event.
- Generate an interrupt on every second event.
- Generate an interrupt on every third event.

The selection made on ETPS[INTPSSEL] bit determines whether ETINTPS register, INTCNT2 and INTPRD2 bit fields determine frequency of events (interrupt once every 0-15 events).

The event that can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) and (ETSEL[INTSELCMP]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCTR = 0x00).
- Time-base counter equal to period (TBCTR = TBPRD).
- Time-base counter equal to zero or period (TBCTR = 0x00 || TBCTR = TBPRD).
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.
- Time-base counter equal to the compare C register (CMPC) when the timer is incrementing.
- Time-base counter equal to the compare C register (CMPC) when the timer is decrementing.
- Time-base counter equal to the compare D register (CMPD) when the timer is incrementing.
- Time-base counter equal to the compare D register (CMPD) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter ETPS[INTCNT] or ETINTPS[INTCNT2] register bits based off of the selection made using ETPS[INTPSSEL]. That is, when the specified event occurs the ETPS[INTCNT] or ETINTPS[INTCNT2] bits are incremented until the bits reach the value specified by ETPS[INTPRD] or ETINTPS[INTPRD2] determined again by the selection made in ETPS[INTPSSEL]. When ETPS[INTCNT] = ETPS[INTPRD], the counter stops counting and the counter output is set. The counter is only cleared when an interrupt is sent to the interrupt controller.

When ETPS[INTCNT] reaches ETPS[INTPRD], the following behavior occurs. [The following behavior is also applicable to ETINTPS[INTCNT2] and ETINTPS[INTPRD2]:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter begins counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when the counter reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter holds the output high until the ENTFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing a 0 to the INTPRD bits automatically clears the counter (INTCNT = 0) and the counter output resets (so no interrupts are generated). For all other writes to INTPRD, INTCNT retains the previous value. INTCNT resets when INTCNT overflows. Writing a 1 to the ETFRC[INT] bit increments the event counter INTCNT. The counter behaves as previously described when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events are detected and the ETFRC[INT] bit is also ignored. The same applies to ETINTPS[INTCNT2] and ETINTPS[INTPRD2].

The previous definition means that an interrupt on every event, on every second event, or on every third event if using the INTCNT and INTPRD can be generated. An interrupt on every event up to 15 events if using the INTCNT2 and INTPRD2 can be generated.

The INTCNT2 value can be initialized with the value from ETCNTINIT[INTINIT] based on the selection made in ETCNTINITCTL[INTINITEN]. When ETCNTINITCTL[INTINITEN] is set, then initialization of INTCNT2 counter with contents of ETCNTINIT[INTINIT] on a SYNC event or software force is determined by ETCNTINITCTL[INTINITFRC].

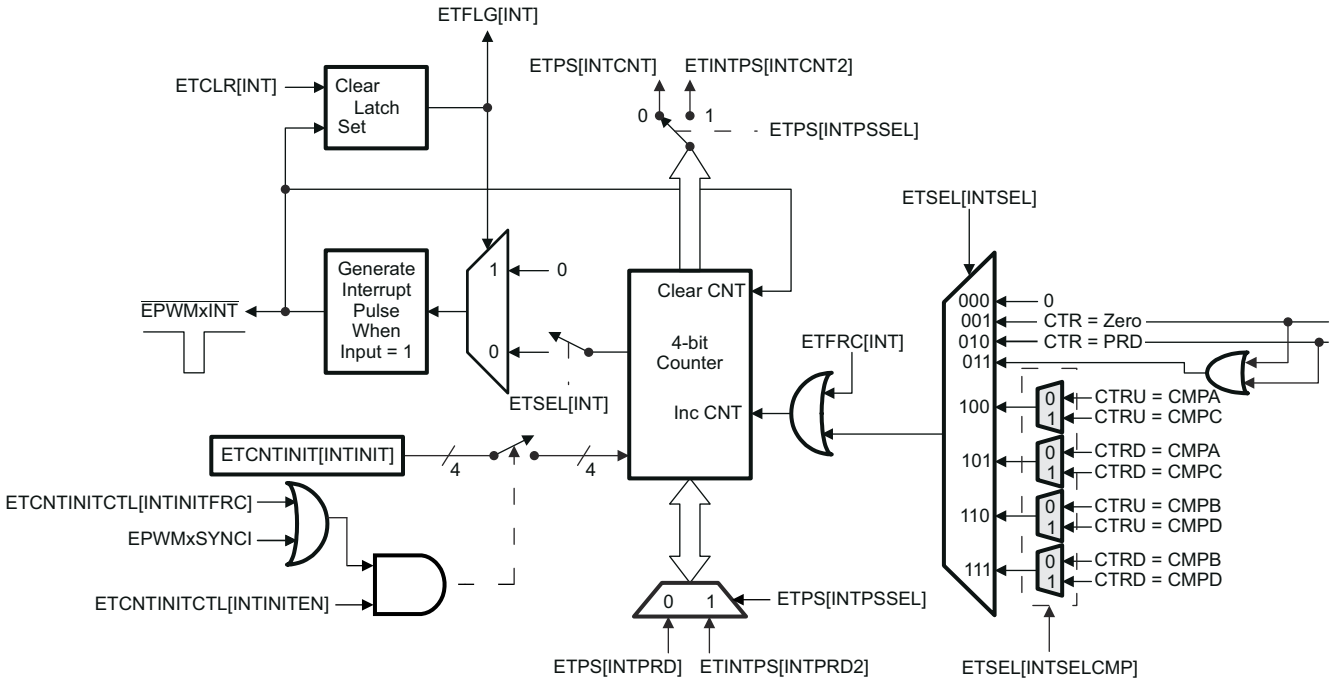

Figure 19-47. Event-Trigger Interrupt Generator

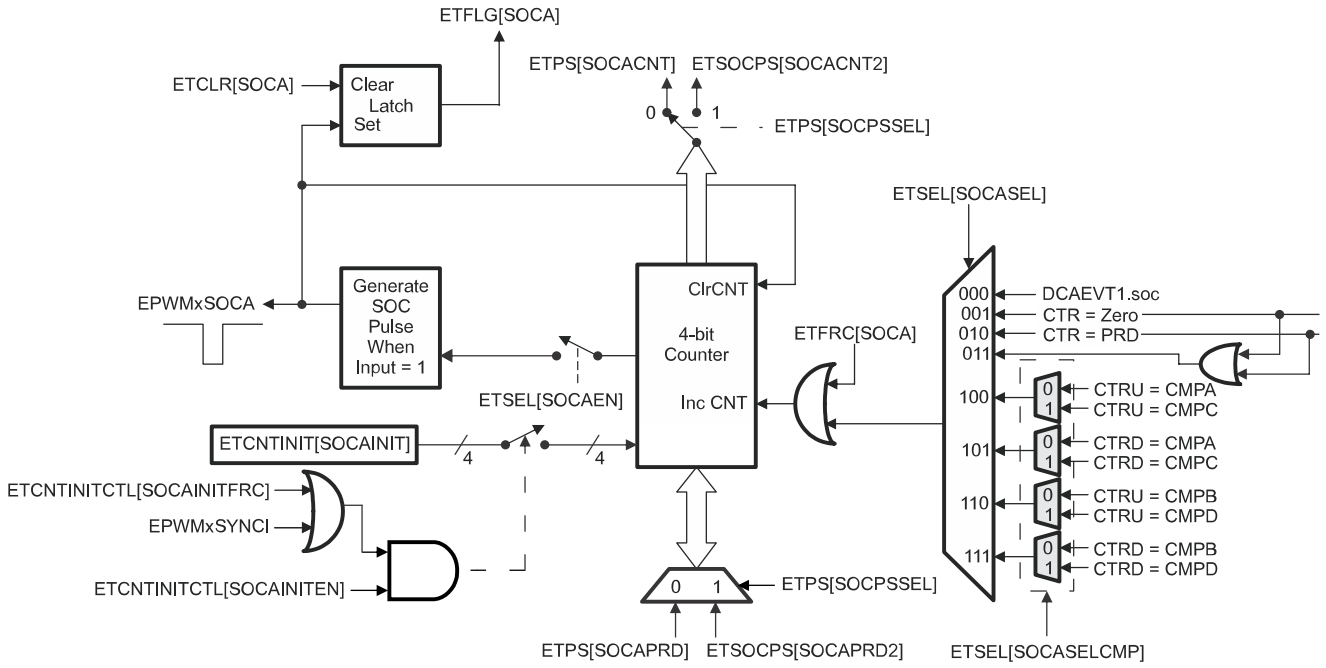
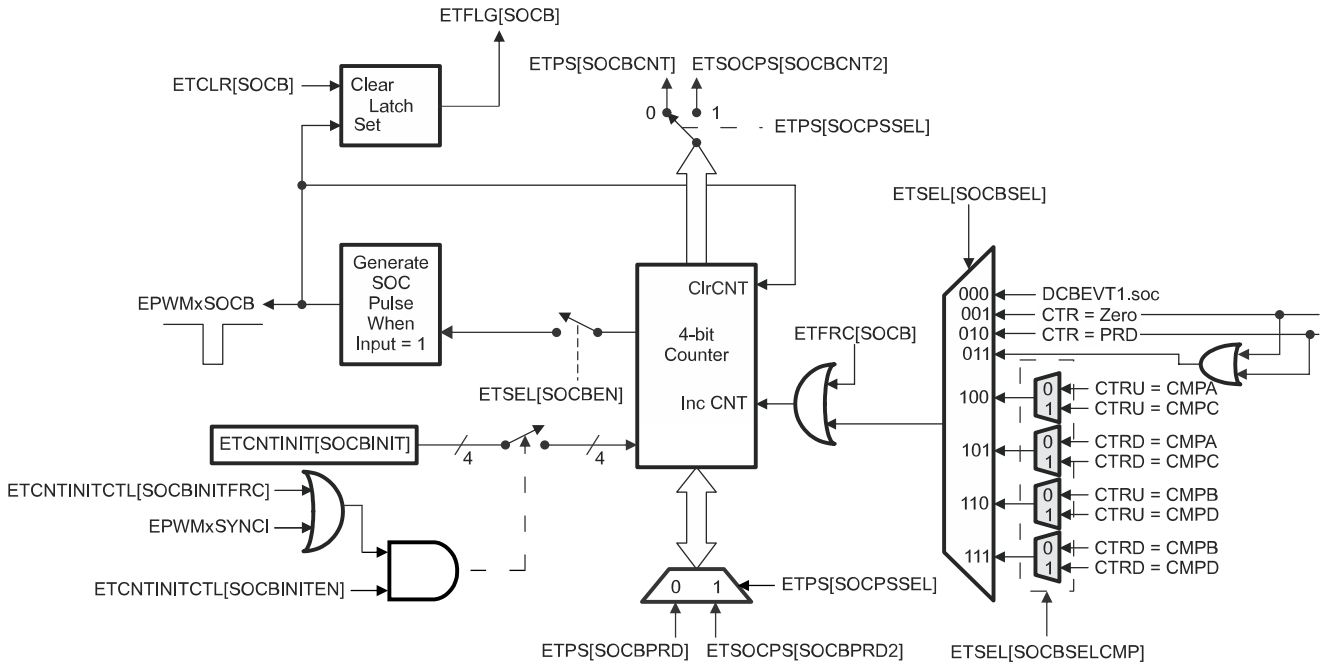
Figure 19-48 shows the operation of the event-trigger's start-of-conversion-A (SOCA) pulse generator. The enhancements include SOCASELCMP and SOCBSELCMP bit fields defined in the ETSEL register enable CMPC and CMPD events respectively to cause a start of conversion. The ETPS[SOCPSSEL] bit field determines whether SOCACNT2 and SOCAPRD2 take control or not. The ETPS[SOCACNT] counter and ETPS[SOCAPRD] period values behave similarly to the interrupt generator except that the pulses are continuously generated. That is, the pulse flag ETFLG[SOCA] is latched when a pulse is generated, but the interrupt generator does not stop further pulse generation. The enable and disable bit ETSEL[SOCAEN] stops pulse generation, but input events can still be counted until the period value is reached as with the interrupt generation logic. The event that triggers an SOCA and SOCB pulse can be configured separately in the ETSEL[SOCASEL] and ETSEL[SOCBSEL] bits. The possible events are the same events that can be specified for the interrupt generation logic with the addition of the DCAEVT1.soc and DCBEVT1.soc event signals from the digital compare (DC) submodule. The SOCACNT2 initialization scheme is very similar to the interrupt generator with respective enable, value initialize and SYNC or software force options.



NOTE: The DCAEVT1.soc signals are generated by the Digital Compare (DC) submodule in Section 19.11.

Figure 19-48. Event-Trigger SOCA Pulse Generator

Figure 19-49 shows the operation of the event-trigger's start-of-conversion-B (SOCB) pulse generator. The event-trigger's SOCB pulse generator operates the same way as the SOCA.



NOTE: The DCBEVT1.soc signals are generated by the Digital Compare (DC) submodule in Section 19.11.

Figure 19-49. Event-Trigger SOCB Pulse Generator

19.11 Digital Compare (DC) Submodule

Figure 19-50 illustrates where the digital compare (DC) submodule signals interface to other submodules in the ePWM system.

The eCAP input signals are sourced from the Input X-BAR signals as shown in Figure 19-51.

On this device, any of the GPIO pins can be flexibly mapped to be the trip-zone input and trip inputs to the trip-zone submodule and digital compare submodule. The Input X-BAR Input Select (INPUTxSELECT) register defines which GPIO pins gets assigned to be the trip-zone inputs / trip inputs.

The digital compare (DC) submodule compares signals external to the ePWM module (for instance, CMPSSx signals from the analog comparators) to directly generate PWM events/actions which then feed to the event-trigger, trip-zone, and time-base submodules. Additionally, blanking window functionality is supported to filter noise or unwanted pulses from the DC event signals.

Note

The user is responsible for driving the correct state on the selected pin before enabling the clock and configuring the trip input for the respective ePWM peripheral to avoid spurious latch of the TRIP signal.

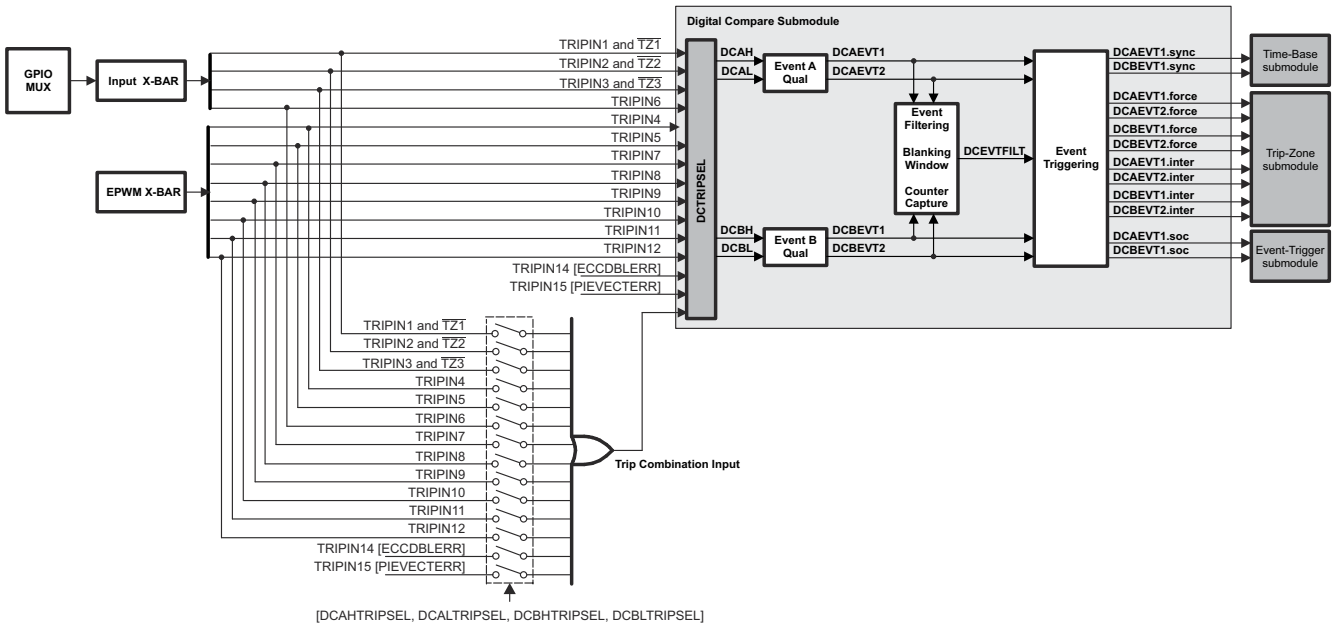


Figure 19-50. Digital-Compare Submodule High-Level Block Diagram

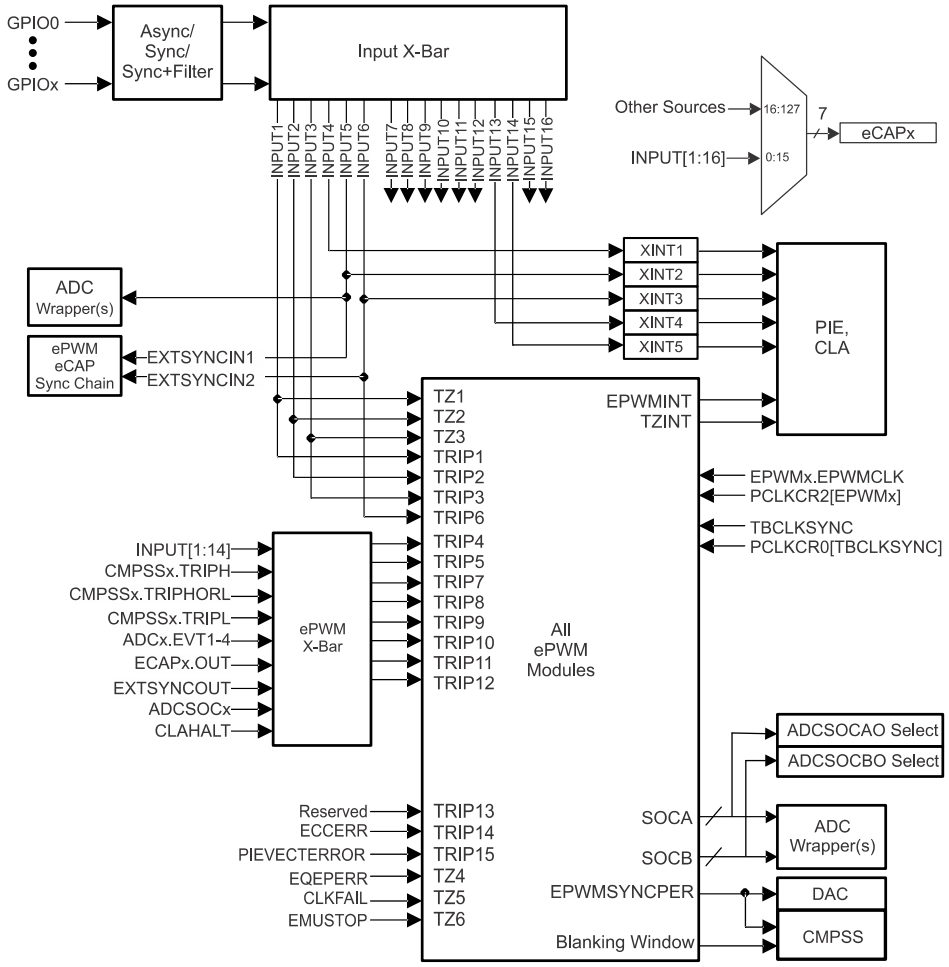

Figure 19-51. GPIO MUX-to-Trip Input Connectivity

19.11.1 Purpose of the Digital Compare Submodule

The key functions of the digital compare submodule are:

- Analog comparator (COMP) module outputs fed though the Input X-BAR, EPWM X-BAR, externally using the GPIO peripheral, interrupt controller signals, ECC error signals, TZ1, $\overline{TZ2}$, and $\overline{TZ3}$ inputs generate Digital Compare A High/Low (DCAH, DCAL) and Digital Compare B High/Low (DCBH, DCBL) signals.
- DCAH/L and DCBH/L signals trigger events that can then either be filtered or applied directly to the trip-zone, event-trigger, and time-base submodules to:
  - generate a trip zone interrupt
  - generate an ADC start of conversion
  - force an event
  - generate a synchronization event for synchronizing the ePWM module TBCTR.
- Event filtering (blanking window logic) can optionally blank the input signal to remove noise.

19.11.2 Enhanced Trip Action Using CMPSS

To allow multiple CMPSS at a time to affect DCA/BEVTx events and trip actions, there is a OR logic to bring together ALL trip inputs (up to 15) from sources external to the ePWM module and feed into DCAH, DCAL, DCBH, and DCBL as a “combinational input” using the DCTRIPSEL register. This is configured by selecting “Trip combination input” (value of 0xF) in the DCTRIPSEL register.

There is a discrete choice of which trip inputs to put through the combinational logic for generating the DCAH, DCAL, DCBH, and DCBL signals. This is achieved using the DCAHTRIPSEL, DCALTRIPSEL, DCBHTRIPSEL, and DCBLTRIPSEL register selections. Inputs selected for combinational input are passed through to the DCTRIPSEL register.

19.11.3 Using CMPSS to Trip the ePWM on a Cycle-by-Cycle Basis

When using the CMPSS to trip the ePWM on a cycle-by-cycle basis, steps can be taken to prevent an asserted comparator trip state in one PWM cycle from extending into the following cycle. The CMPSS can be used to signal a trip condition to the downstream ePWM modules. For applications like peak current mode control, only one trip event per PWM cycle is expected. Under certain conditions, it is possible for a sustained or late trip event (arriving near the end of a PWM cycle) to carry over into the next PWM cycle if precautions are not taken. If either the CMPSS Digital Filter or the ePWM Digital Compare (DC) submodule is configured to qualify the comparator trip signal, “N” number of clock cycles of qualification are introduced before the ePWM trip logic can respond to logic changes of the trip signal. Once an ePWM trip condition is qualified, the trip condition remains active for N clock cycles after the comparator trip signal has de-asserted. If a qualified comparator trip signal remains asserted within N clock cycles prior to the end of a PWM cycle, the trip condition is not cleared until after the following PWM cycle has started. Thus, the new PWM cycle detects a trip condition as soon as the cycle begins.

To avoid this undesired trip condition, the application can take steps to make sure that the qualified trip signal seen by the ePWM trip logic is deasserted prior to the end of each PWM cycle. This can be accomplished through various methods:

- Design the system such that a comparator trip is not asserted within N clock cycles prior to the end of the PWM cycle.
- Activate blanking of the comparator trip signal using the ePWM event filter at least two clock cycles prior to the PWMSYNCPER signal and continue blanking for at least N clock cycles into the next PWM cycle.
- If the CMPSS COMPxLATCH path is used, clear the COMPxLATCH at least N clock cycles prior to the end of the PWM cycle. The latch can be cleared by software (using COMPSTSCLR) or by generating an early PWMSYNCPER signal. The ePWM modules on this device include the ability to generate PWMSYNCPER upon a CMPC or CMPD match (using HRPCTL) for arbitrary PWMSYNCPER placement within the PWM cycle.

19.11.4 Operation Highlights of the Digital Compare Submodule

The following sections describe the operational highlights and configuration options for the digital compare submodule.

19.11.4.1 Digital Compare Events

As described in Section 19.11.1, trip zone inputs ($\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$) and CMPSSx signals from the analog comparator (COMP) module can be selected using the DCTRIPSEL bits to generate the Digital Compare A High and Low (DCAH/L) and Digital Compare B High and Low (DCBH/L) signals. Then, the configuration of the TZDCSEL register qualifies the actions on the selected DCAH/L and DCBH/L signals, which generate the DCAEVT1/2 and DCBEVT1/2 events (Event Qualification A and B).

Note

The $\overline{TZn}$ signals, when used as a DCEVT tripping functions, are treated as a normal input signal and can be defined to be active-high or active-low inputs. ePWM outputs are asynchronously tripped when either the $\overline{TZn}$, DCAEVTx.force, or DCBEVTx.force signals are active. For the condition to remain latched, a minimum of 3 * TBCLK sync pulse width is required. If pulse width is < 3*TBCLK sync pulse width, the trip condition can or can not get latched by CBC or OST latches.

The DCAEVT1/2 and DCBEVT1/2 events can then be filtered to provide a filtered version of the event signals (DCEVTFILT) or the filtering can be bypassed. Filtering is discussed further in Event Filtering. Either the DCAEVT1/2 and DCBEVT1/2 event signals or the filtered DCEVTFILT event signals can generate a force to the trip zone module, a TZ interrupt, an ADC SOC, or a PWM sync signal.

- **force signal:** DCAEVT1/2.force signals force trip zone conditions which either directly influence the output on the EPWMxA pin (using TZCTL, TZCTLDCA, TZCTLDCB register configurations) or, if the DCAEVT1/2 signals are selected as one-shot or cycle-by-cycle trip sources (using the TZSEL register), the DCAEVT1/2.force signals can effect the trip action using the TZCTL or TZCTL2 register configurations. The DCBEVT1/2.force signals behaves similarly, but affect the EPWMxB output pin instead of the EPWMxA output pin.

  The priority of conflicting actions on the TZCTL, TZCTL2, TZCTLDCA and TZCTLDCB registers is as follows (highest priority overrides lower priority):

  Output EPWMxA:
  - TZA (highest) -> DCAEVT1 -> DCAEVT2 (lowest)
  - TZAU (highest) -> DCAEVT1U -> DCAEVT2U (lowest)
  - TZAD (highest) -> DCAEVT1D -> DCAEVT2D (lowest)

  Output EPWMxB:
  - TZB (highest) -> DCBEVT1 -> DCBEVT2 (lowest)
  - TZBU (highest) -> DCBEVT1U -> DCBEVT2U (lowest)
  - TZBD (highest) -> DCBEVT1D -> DCBEVT2D (lowest)
- **interrupt signal:** DCAEVT1/2.interrupt signals generate trip zone interrupts to the interrupt controller. To enable the interrupt, set the DCAEVT1, DCAEVT2, DCBEVT1, or DCBEVT2 bits in the TZEINT register. Once one of these events occurs, an EPWMxTZINT interrupt is triggered, and the corresponding bit in the TZCLR register must be set to clear the interrupt.
- **soc signal:** The DCAEVT1.soc signal interfaces with the event-trigger submodule and can be selected as an event which generates an ADC start-of-conversion-A (SOCA) pulse using the ETSEL[SOCASEL] bit. Likewise, the DCBEVT1.soc signal can be selected as an event which generates an ADC start-of-conversion-B (SOCB) pulse using the ETSEL[SOCBSEL] bit.
- **sync signal:** The DCAEVT1.sync and DCBEVT1.sync events are ORed with the EPWMxSYNCI input signal and the TBCTL[SWFSYNC] signal to generate a synchronization pulse to the time-base counter.

Figure 19-52 and Figure 19-53 show how the DCxEVT1, DCxEVT2, or DCEVTFLT signals are processed to generate the digital compare A and B event force, interrupt, soc and sync signals.

In some of the applications like Phase Shifted Full Bridge (PSFB) Converters, it is required that different actions are taken on a CBC trip event and an OST trip event. This can be achieved using the DCxEVT1LAT.

- This latch can be cleared on CNT = 0, CTR = PRD, and CNT = 0 OR CTR = PRD events based on the setting of DCxCTL.EVTy.LATCLRSEL setting. This is similar to CBC latch clear mechanism.
- DCxEVTy.force signal can be chosen to be either the latched version or the unlatched version based on DCxCTL.EVTyLATSEL value.
- The status of DCxEVTyLAT signal can be accessed by reading DCxCTL.EVTyLAT field.

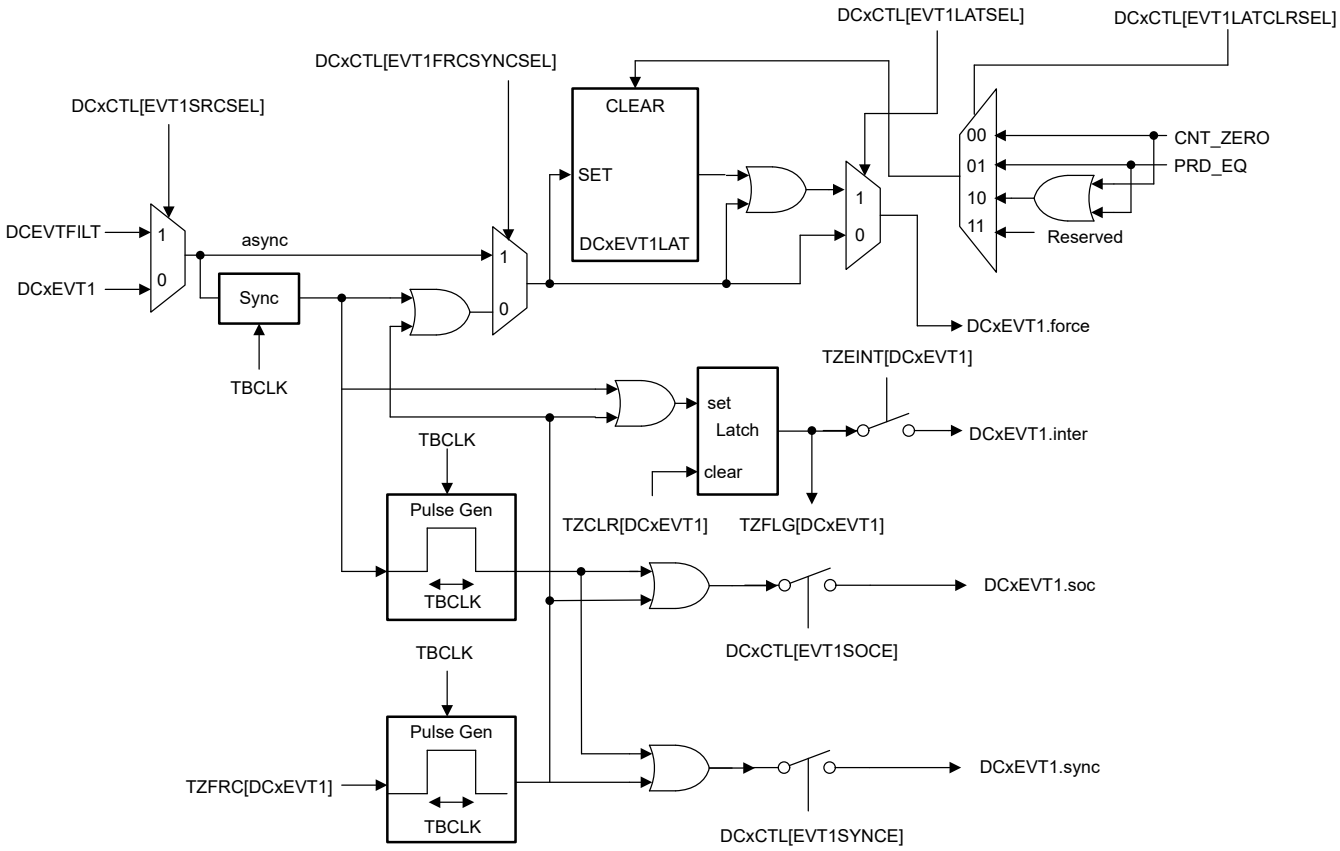

Figure 19-52. DCxEVT1 Event Triggering

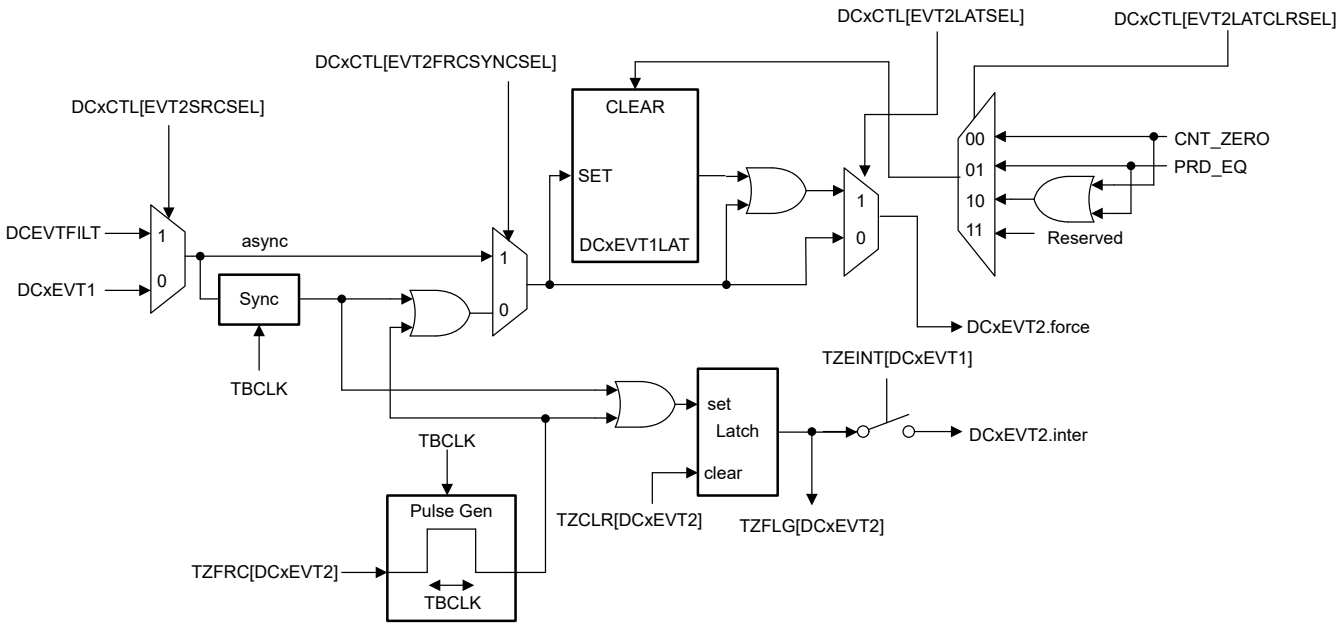

Figure 19-53. DCxEVT2 Event Triggering

19.11.4.2 Event Filtering

Blank Control Logic: The DCAEVT1/2 and DCBEVT1/2 events can be filtered using event filtering logic to remove noise by optionally blanking events for a certain period of time. This is useful for cases where the analog comparator outputs can be selected to trigger DCAEVT1/2 and DCBEVT1/2 events, and the blank control logic is used to filter out potential noise on the signal prior to tripping the PWM outputs or generating an interrupt or ADC start-of-conversion. Blank control logic is used to define a blanking window, which ignores all event occurrences on the signal while the window is active. The blanking window is configured in the DCFCTL, DCFOFFSET, and DCFWINDOW registers. The DCFCTL register enables the blanking window and aligns the blanking window to either a CTR = PRD pulse or a CTR = 0 pulse or both CTR = PRD and CTR = 0 as specified by DCFCTL[PULSESEL]. DCFCTL[SRCSEL] selects the DCxEVTy event source for the DCEVTFILT signal. An offset value in TBCLK counts is programmed into the DCFOFFSET register, which determines at what point after the CTR = PRD or CTR = 0 pulse the blanking window starts. The duration of the blanking window, in number of TBCLK counts after the offset counter expires, is written to the DCFWINDOW register by the application. Before and after the blanking window ends, events can generate soc, sync, interrupt, and force signals as before. Figure 19-54 shows the details of the event filtering logic.

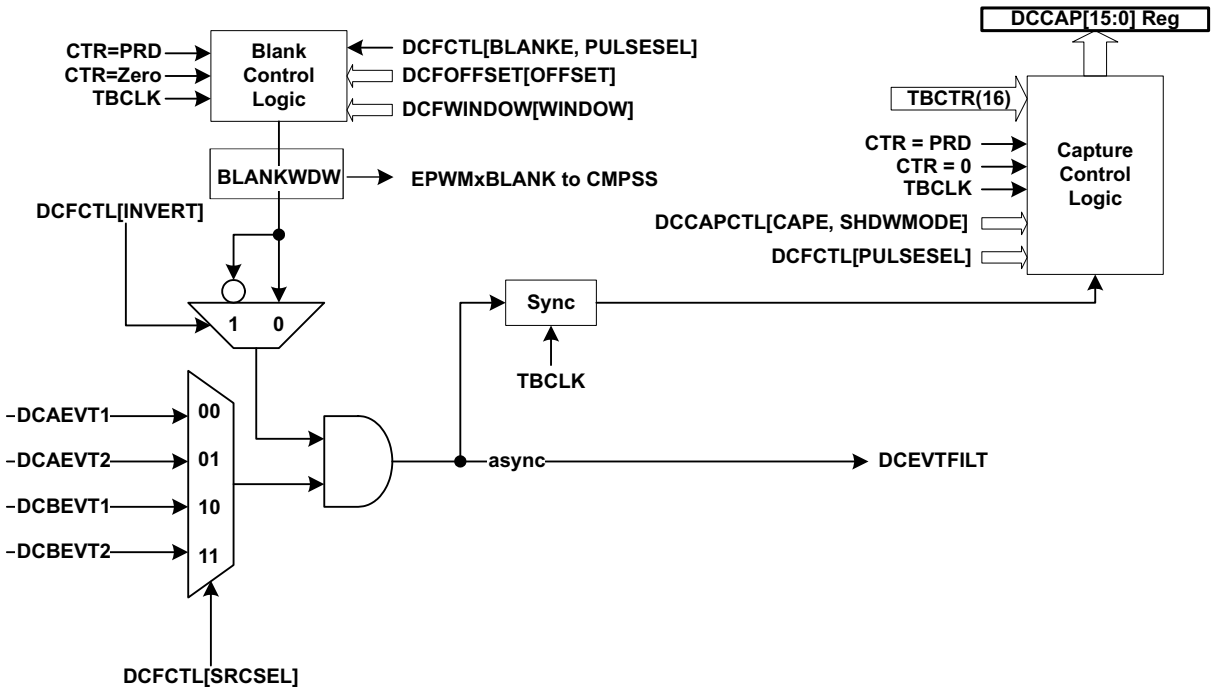

Figure 19-54. Event Filtering

Capture Control Logic: The event filtering can also capture the TBCTR value of the selected DCxEVTy event as configured in the DCCAPCTL register. When capture control logic is enabled, the selected DCxEVTy event triggers capture of the TBCTR to the active register. The CPU reads directly from the active register unless shadow mode is enabled by DCCAPCTL[SHDWMODE]. When shadow mode is enabled, the active register information is copied to shadow register on the event specified by DCFCCTL[PULSESEL], and the CPU reads from the shadow register. After the selected DCxEVTy event, no further capture events occur until the event specified by DCCAPCTL[CAPMODE]. The CAPMODE can be configured two ways: (1) no further capture events occur until the event defined by DCFCTL[PULSESEL] or (2) no further capture events occur until the compare-event flag at DCCAPCTL[CAPSTS] is cleared by DCCAPCTL[CAPCLR].

Note

You must configure the ePWM blanking window appropriately so that the Trip Input stays valid for at least 3 ePWM cycles after the blanking window has expired.

Figure 19-55 illustrates several timing conditions for the offset and blanking window within an ePWM period. Notice that if the blanking window crosses the CTR = 0 or CTR = PRD boundary, the next window still starts at the same offset value after the CTR = 0 or CTR = PRD pulse.

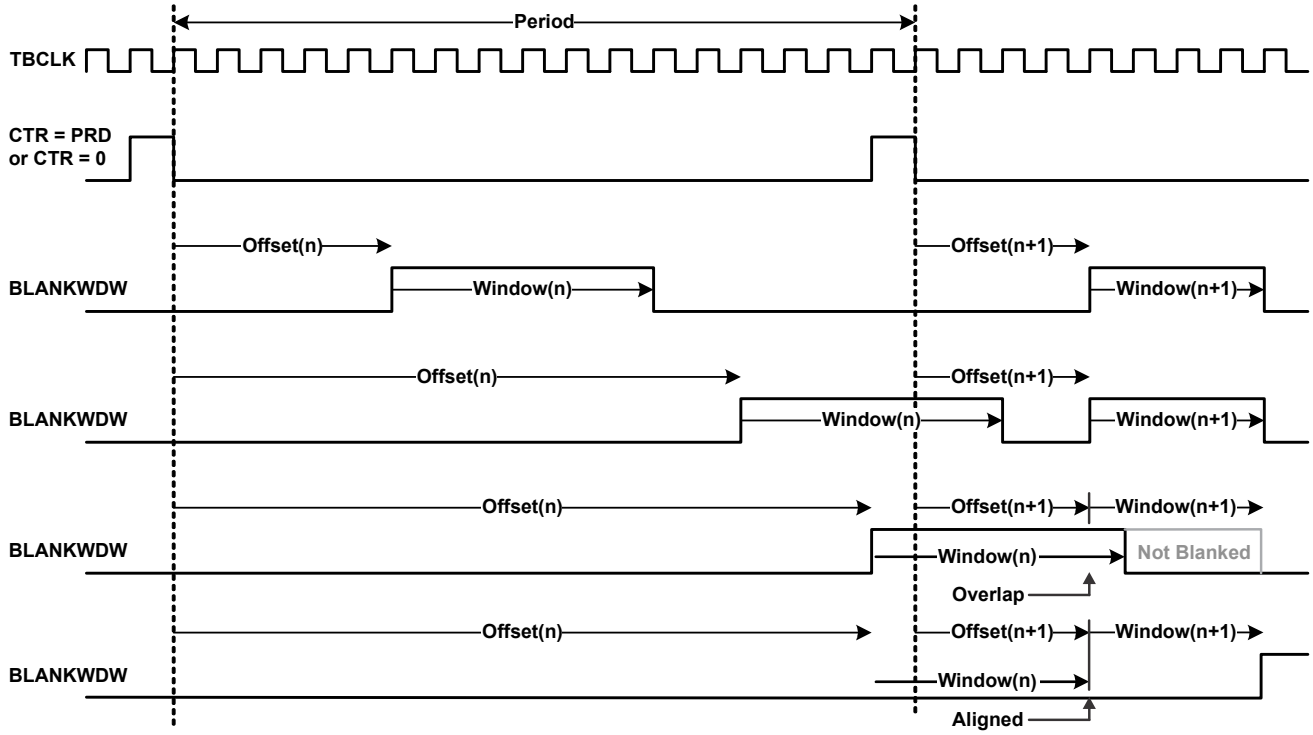

Figure 19-55. Blanking Window Timing Diagram

BLANKPULSEMIX Signals

The DCFCTL MUX (available for Blank Control Logic and Capture Control Logic) has new options that allows the mux to select the BLANKPULSEMIX signal. The BLANKPULSEMIX signal is used, if the signal is selected by DCFCTL[PULSESEL]

19.11.4.3 Valley Switching

Event filtering depicts the valley switching function along with the event filtering logic described in Event Filtering. This function can be used to achieve programmable valley switching without any additional external circuitry. This module provides an on-chip hardware mechanism that can:

- Capture the oscillation period
- Accurately delay the PWM switching instant
- Allow a programmable number of edges before the delay takes effect
- Provide multiple choices of triggers and events
- Allow easy adaptability for optimum performance under changing system/operating conditions

The DCxEVTy signal needs further processing to support valley switching. Here is a brief description of how valley switching function is enabled:

1. Select one of the DCxEVTy events as input to the valley switching block (DCFCTL[SRCSEL]) with an option to add the blanking window (Blank Control Logic). This is where the comparator output (or external input) above is selected as an input to the valley switching block.
2. Configure the edge filter to capture 'n' rising, falling or both edges through the edge selection logic (DCFCTL[EDGEMODE, EDGECOUNT]).
3. Select the correct event to reset and restart the edge filter (VCAPCTL[TRIGSEL]). Edge capturing event is triggered or armed by this selected edge.
4. Enable valley capture logic (VCAPCTL[VCAPE]).
5. Select the start edge that indicates the start of capture for oscillation period measurement (VCNTCFG[STARTEDGE]). This is where the 16-bit counter starts counting.
6. Select the stop edge (VCNTCFG[STOPEDGE]) that indicates the edge at which the 16-bit counter stops counting. The captured counter value (CNTVAL) provides oscillation period information.
   - The STOPEDGE value must always be greater than STARTEDGE value.
7. Configure and apply the captured delay (CNTVAL) to the edge filtered DCxEVTy signal. The CNTVAL value can be applied as is or applied in conjunction with a software programmed value (useful for offset adjustment) (SWVDELVAL) or only a fraction of the delay can be applied with or without SWVDELVAL. This is useful to correctly apply a delay corresponding to the valley point. (VCAPCTL[VDELAYDIV])
8. Configure VCAPCTL[EDGEFILTDLYSEL] to apply hardware delay based on the captured value above.

Once the counter is stopped, counter value is copied into CNTVAL register and counter is reset to zero. No further captures are done until the logic is triggered again by occurrence of event selected by VCAPCTL[TRIGSEL]. In this implementation, the software trigger is used as the source for VCAPCTL[TRIGSEL]. Upon occurrence of the trigger event, irrespective of the current status of the counter, the counter is reset and starts counting from zero upon occurrence of the STARTEDGE. Similarly, upon occurrence of the trigger event, the edge filter is reset and starts counting from zero upon occurrence of the STARTEDGE.

Output from the valley switching block (DCEVTFILT) is then used to synchronize the PWM time-base. The process is shown in Figure 19-56.

Note

A specific application example showcasing the usage of valley switching hardware and software is available in C2000Ware.

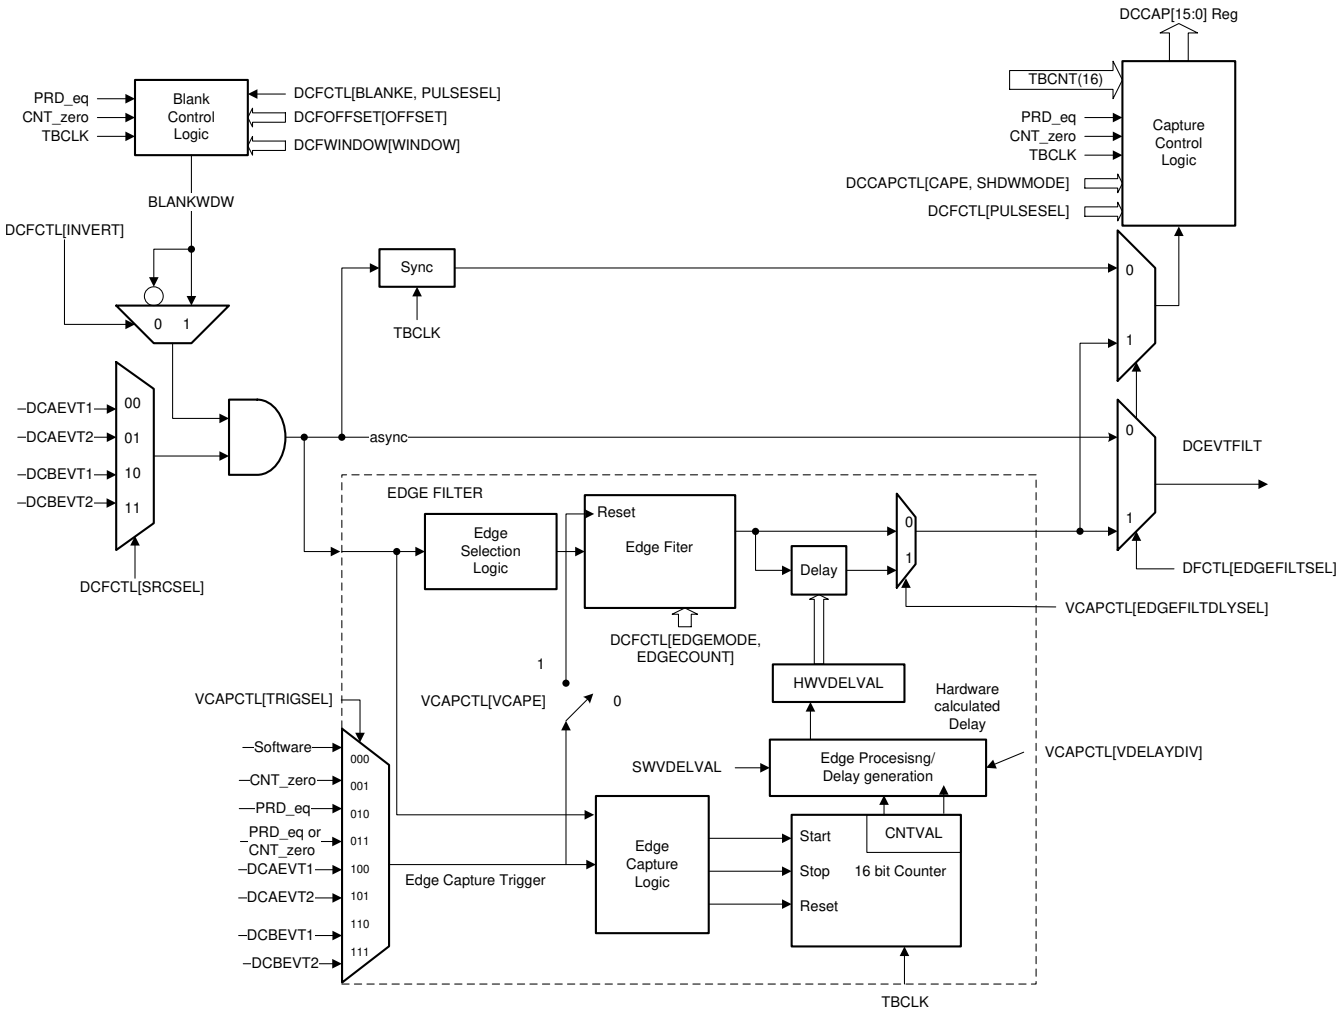

Figure 19-56. Valley Switching

19.12 ePWM Crossbar (X-BAR)

Figure 19-57 shows the architecture of the ePWM Crossbar (X-BAR). This module enables selection of various trigger sources into any of the eight dedicated EPWM trips inputs, namely the TRIP4, TRIP5, TRIP7, TRIP8, TRIP9, TRIP10, TRIP11, and TRIP12.

Note

Refer to the *Crossbar (X-BAR)* chapter for more information on the X-BAR modules, including X-BAR flags.

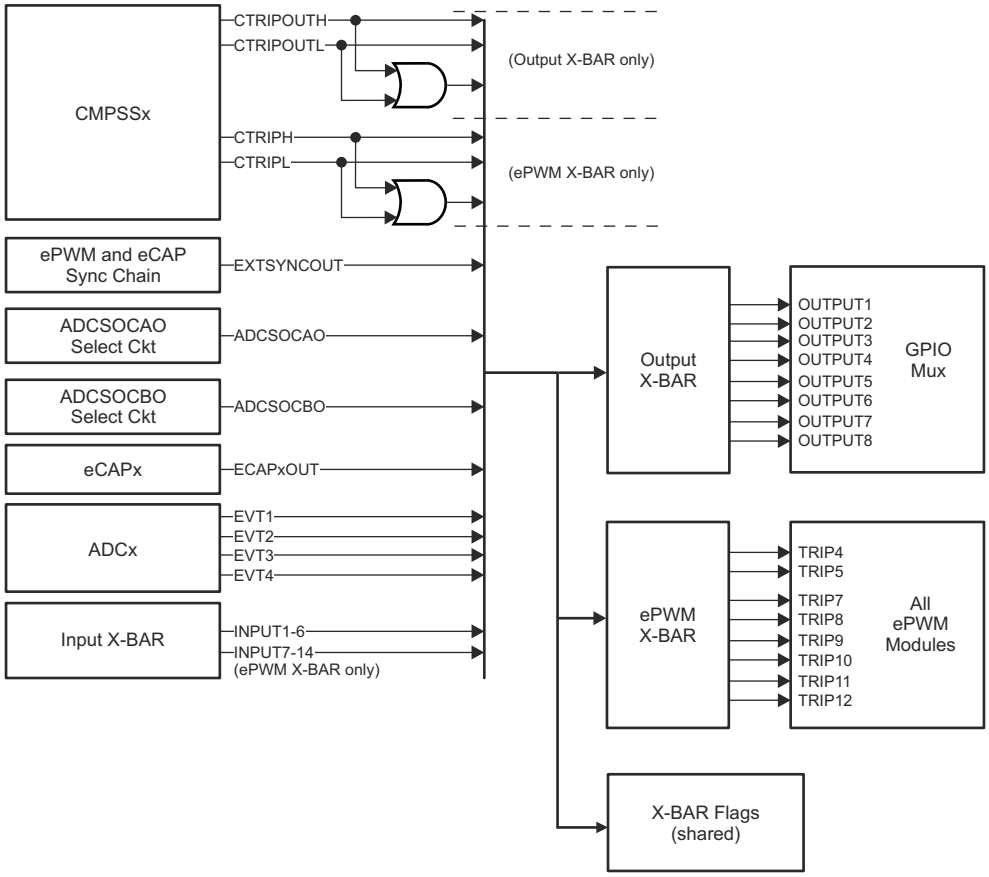

Figure 19-57. ePWM X-BAR

19.13 Applications to Power Topologies

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

19.13.1 Overview of Multiple Modules

Previously in this chapter, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in Figure 19-58. This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

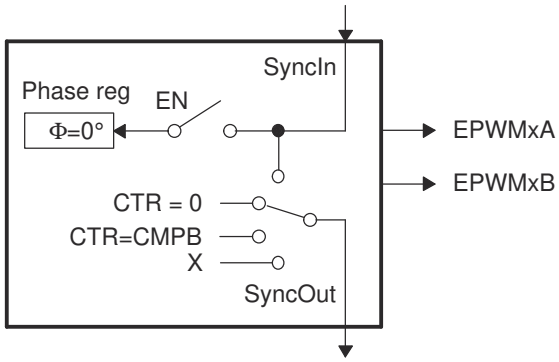

Figure 19-58. Simplified ePWM Module

19.13.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
  - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
  - Do nothing or ignore incoming sync strobe—enable switch open
  - Sync flow-through - SyncOut connected to SyncIn
  - Sync Source mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Sync Source mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides no sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
  - Sync flow-through - SyncOut connected to SyncIn
  - Sync Source mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Sync Source mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides no sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module can also choose to load the counter with a new phase value on a SyncIn strobe input or choose to ignore the value (that is, by the enable switch). Although various combinations are possible, the two most common—Sync Source module and Sync Receiver module modes—are shown in Figure 19-59.

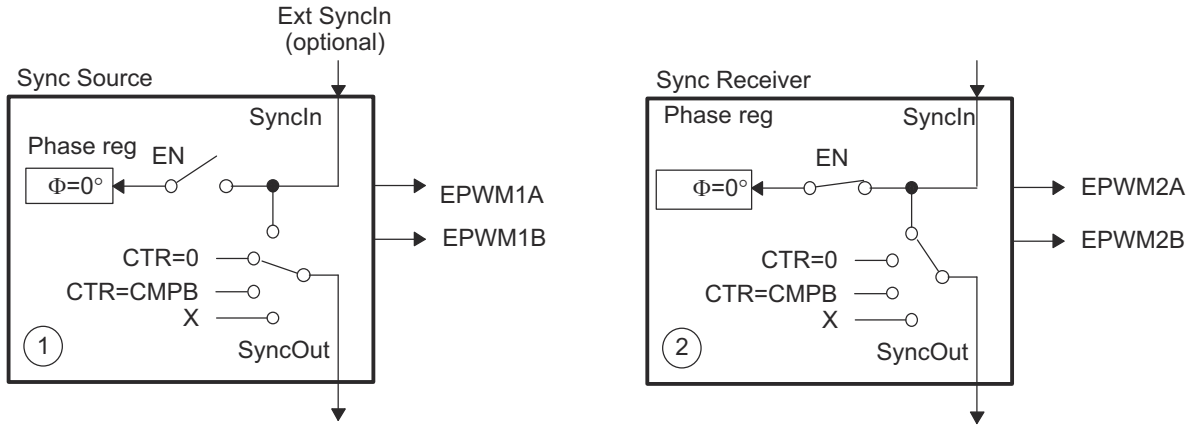

Figure 19-59. EPWM1 Configured as a Typical Sync Source, EPWM2 Configured as a Sync Receiver

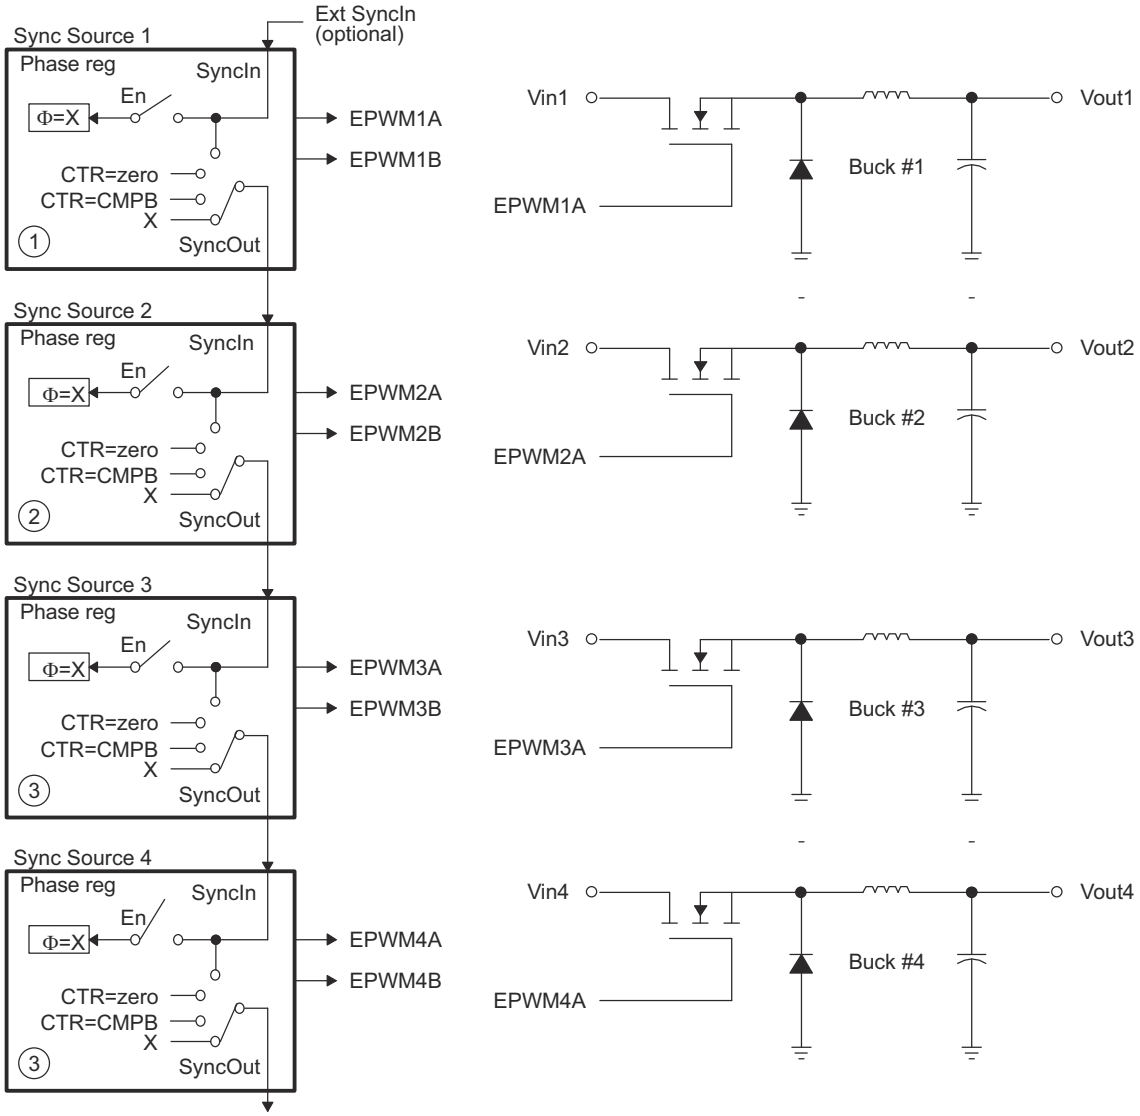
19.13.3 Controlling Multiple Buck Converters With Independent Frequencies

One of the simplest power converter topologies is the buck. A single ePWM module configured as a sync source can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. Figure 19-60 shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Sync Sources and no synchronization is used. Figure 19-61 shows the waveforms generated by the setup shown in Figure 19-60; note that only three waveforms are shown, although there are four stages.



A. φ = X indicates value in phase register is a "don't care"

Figure 19-60. Control of Four Buck Stages. Here $F_{PWM1} \neq F_{PWM2} \neq F_{PWM3} \neq F_{PWM4}$

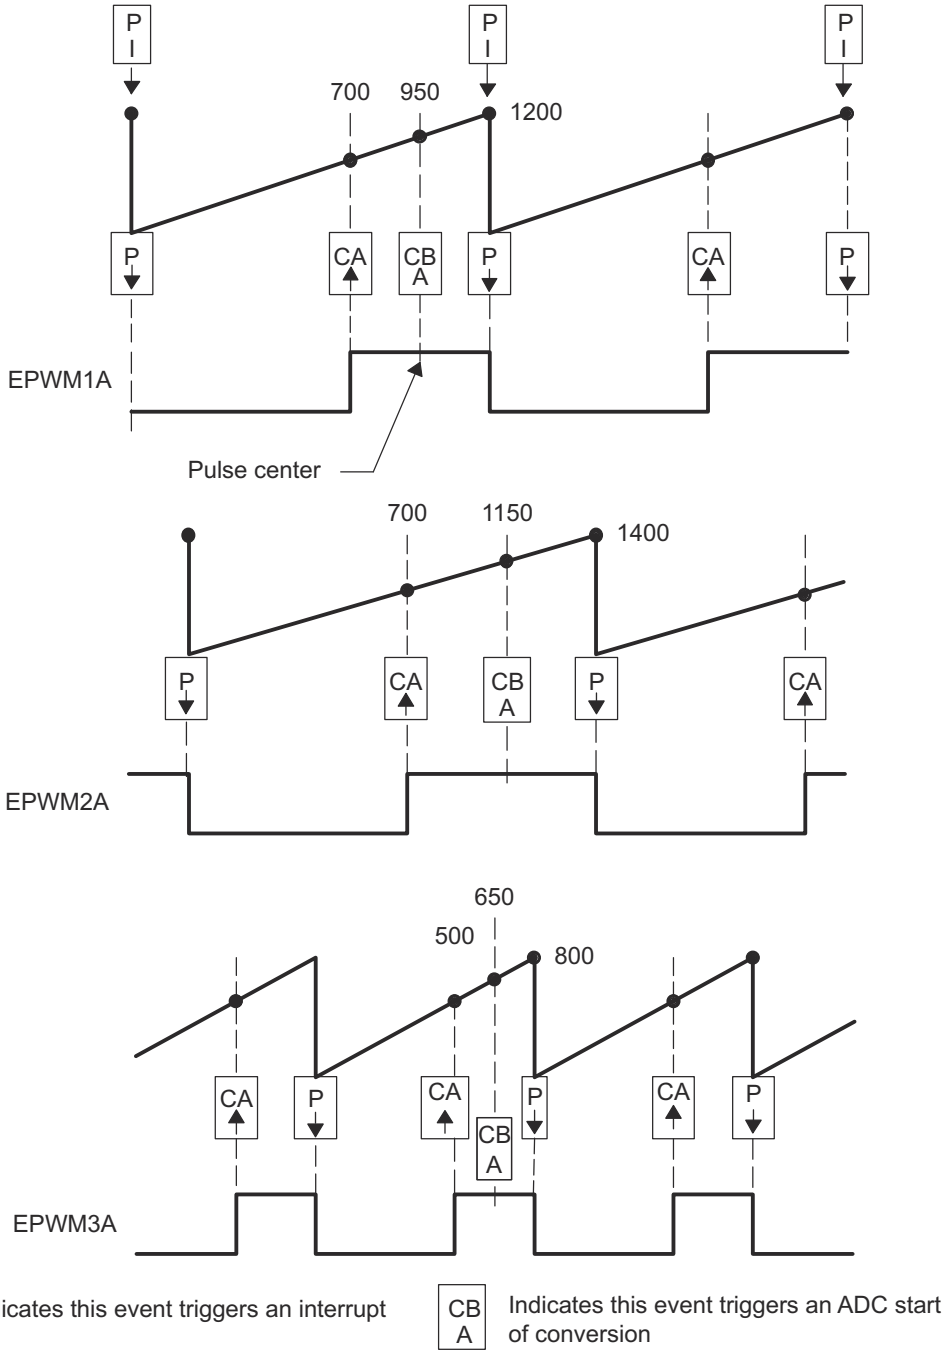


Figure 19-61. Buck Waveforms for Control of Four Buck Stages (Note: Only three bucks shown here)

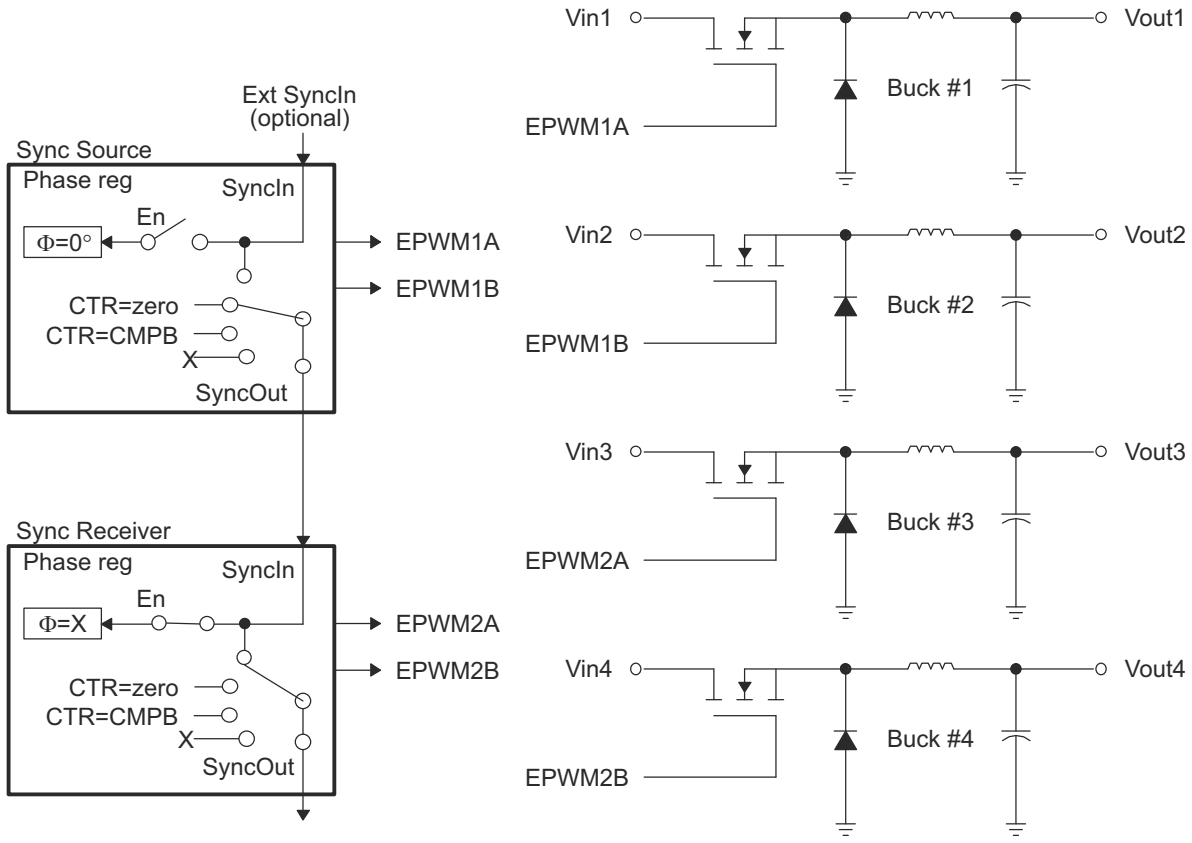
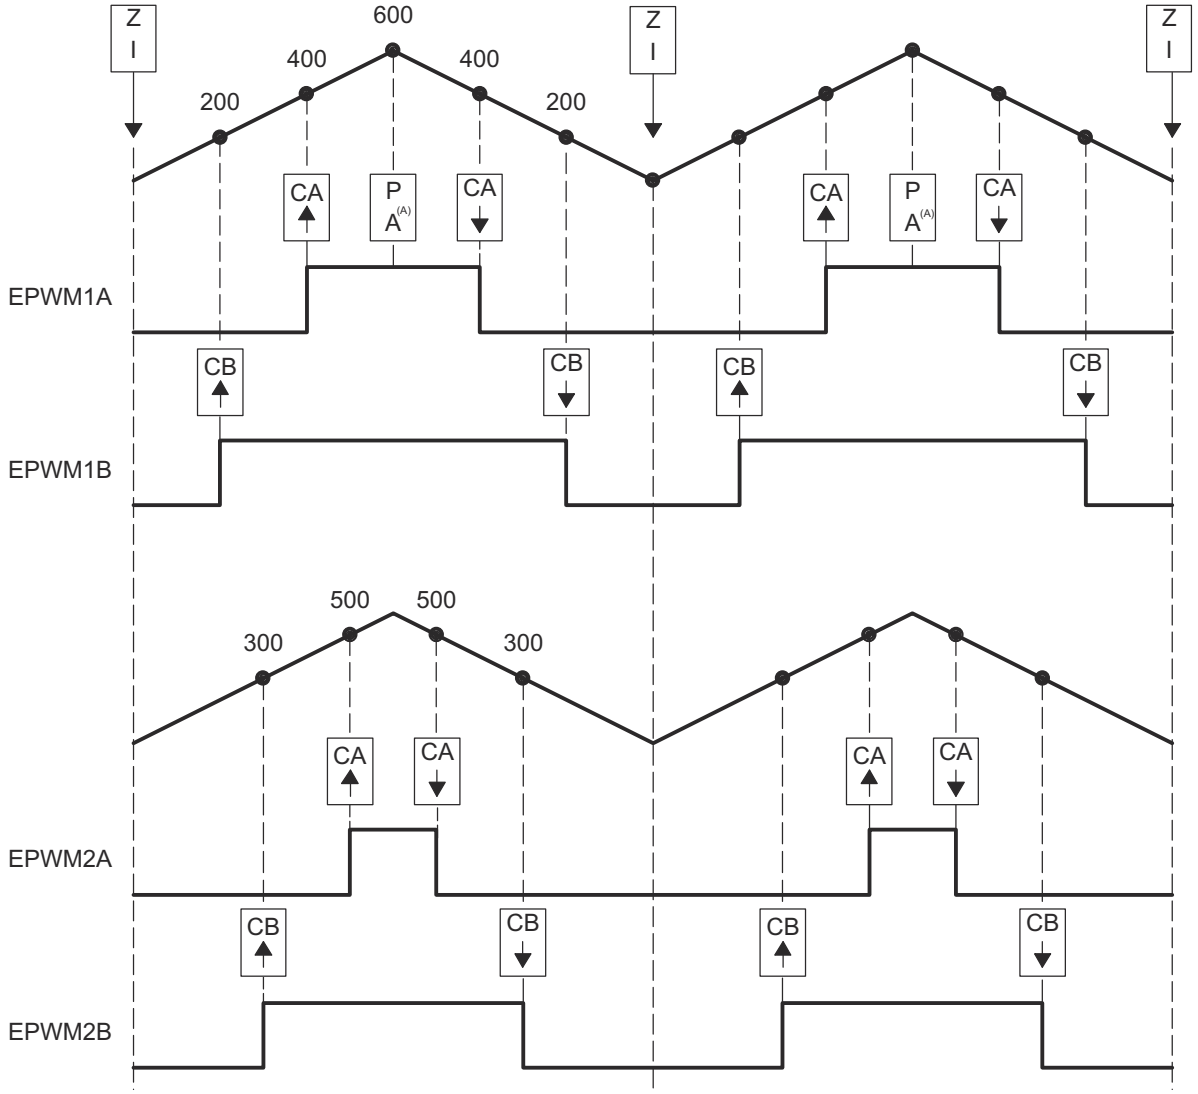
19.13.4 Controlling Multiple Buck Converters With Same Frequencies

If synchronization is a requirement, ePWM module 2 is configured as a sync receiver and operates at integer multiple (N) frequencies of module 1. The sync signal from sync source to sync receiver makes sure these modules remain locked. Figure 19-62 shows such a configuration; Figure 19-63 shows the waveforms generated by the configuration.



A. φ = X indicates value in phase register is a "don't care"

Figure 19-62. Control of Four Buck Stages. (Note: F_{PWM2} = N x F_{PWM1})



A. Starts ADC conversion.

Figure 19-63. Buck Waveforms for Control of Four Buck Stages (Note: $F_{PWM2} = F_{PWM1}$)

19.13.5 Controlling Multiple Half H-Bridge (HHB) Converters

Topologies that require control of multiple switching elements can also be addressed with these same ePWM modules. It is possible to control a Half-H bridge stage with a single ePWM module. This control can be extended to multiple stages. Figure 19-64 shows control of two synchronized Half-H bridge stages where stage 2 can operate at integer multiple (N) frequencies of stage 1. Figure 19-65 shows the waveforms generated by the configuration shown in Figure 19-64.

ePWM module 2 (sync receiver) is configured for Sync flow-through; if required, this configuration allows for a third Half-H bridge to be controlled by ePWM module 3 and also, most importantly, to remain in synchronization with sync source ePWM module 1.

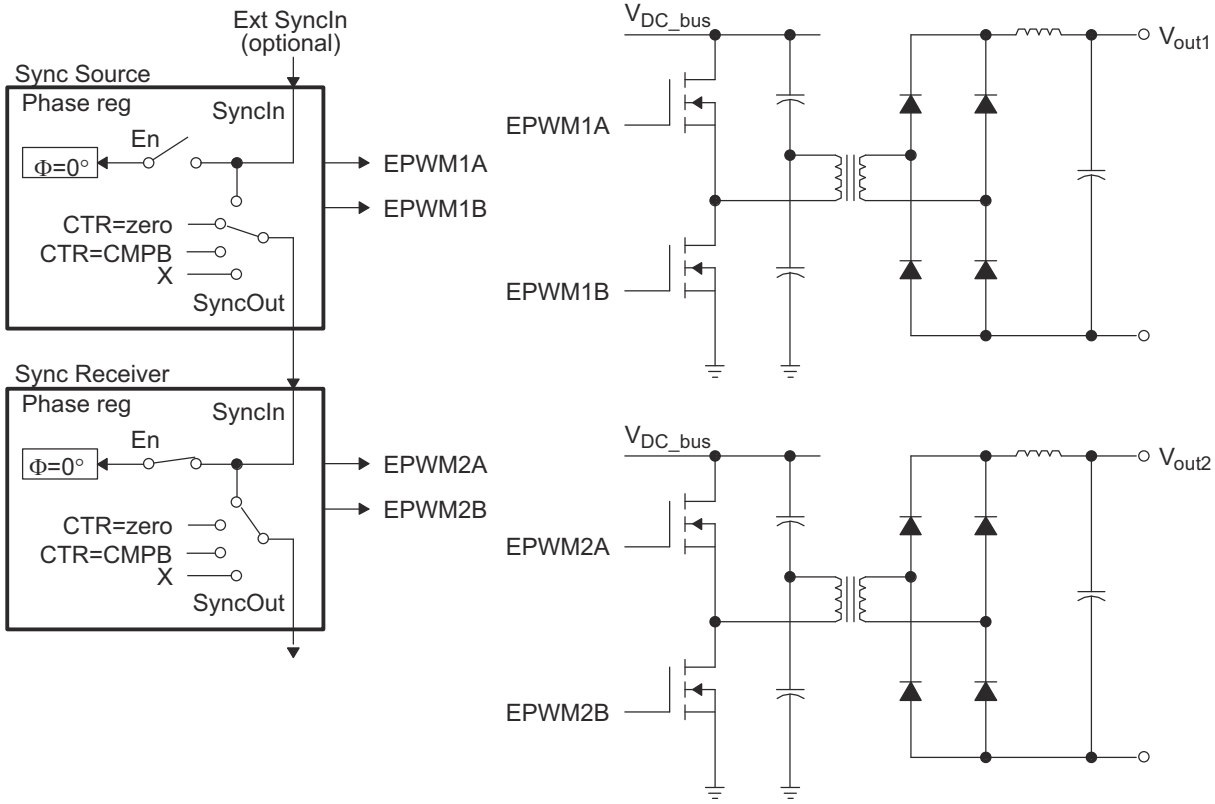


Figure 19-64. Control of Two Half-H Bridge Stages (F_{PWM2} = N x F_{PWM1})

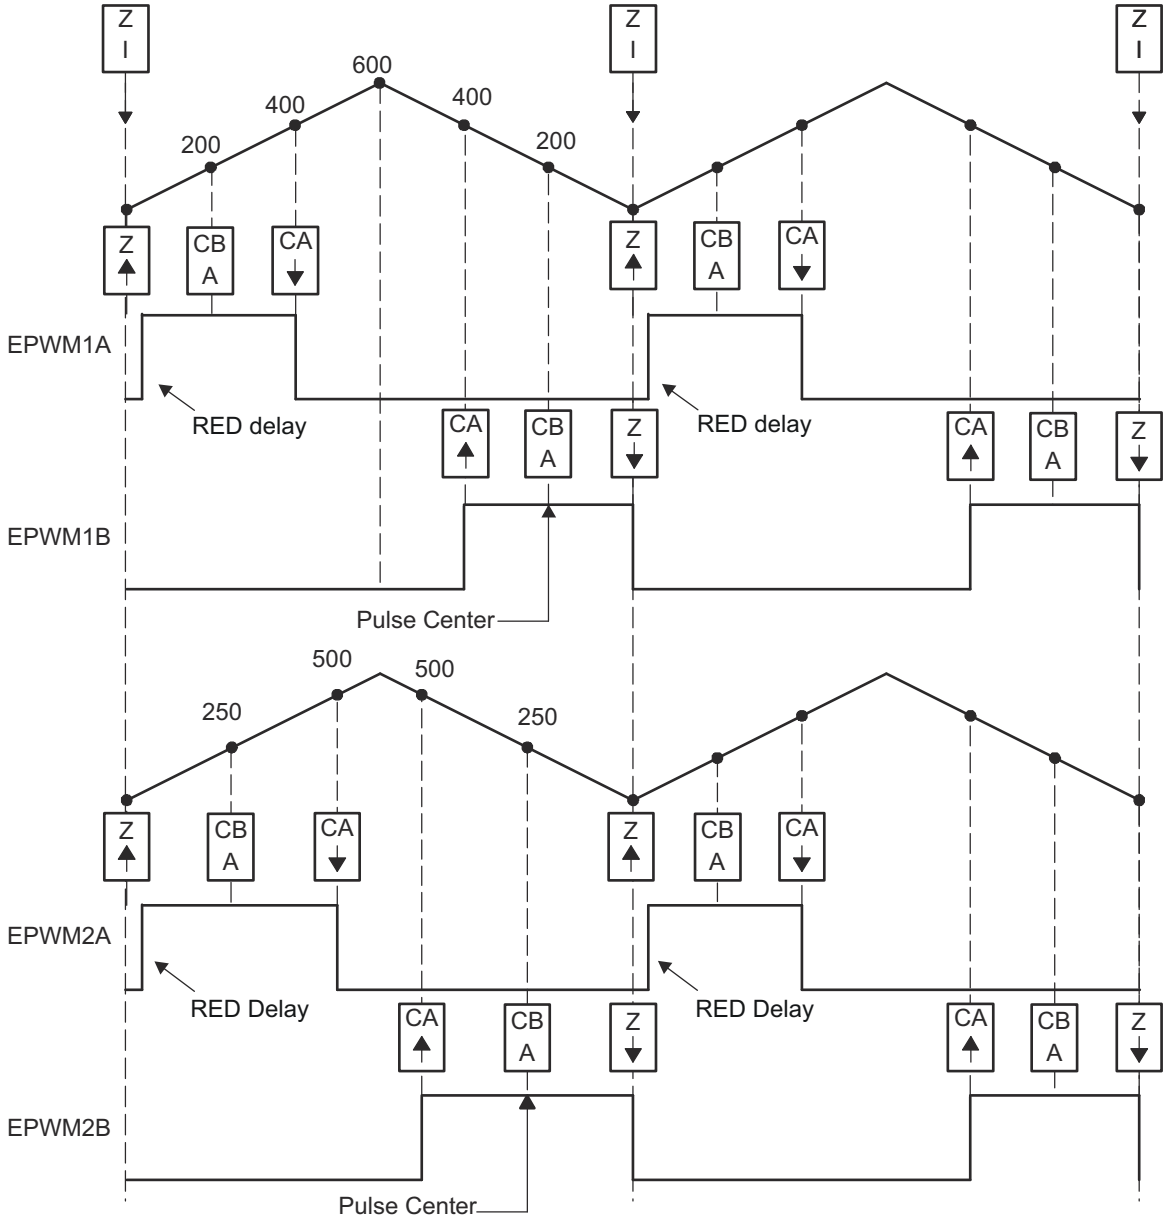

Figure 19-65. Half-H Bridge Waveforms for Control of Two Half-H Bridge Stages (Note: Here $F_{PWM2} = F_{PWM1}$)

19.13.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

The idea of multiple modules controlling a single power stage can be extended to the 3-phase inverter case. In such a case, six switching elements are controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A sync receivers configuration easily addresses this requirement. Figure 19-66 shows how six PWM modules control two independent 3-phase inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are sync sources as in Figure 19-66), or both inverters can be synchronized by using one sync source (module 1) and five sync receivers. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, and 3 (also all equal).

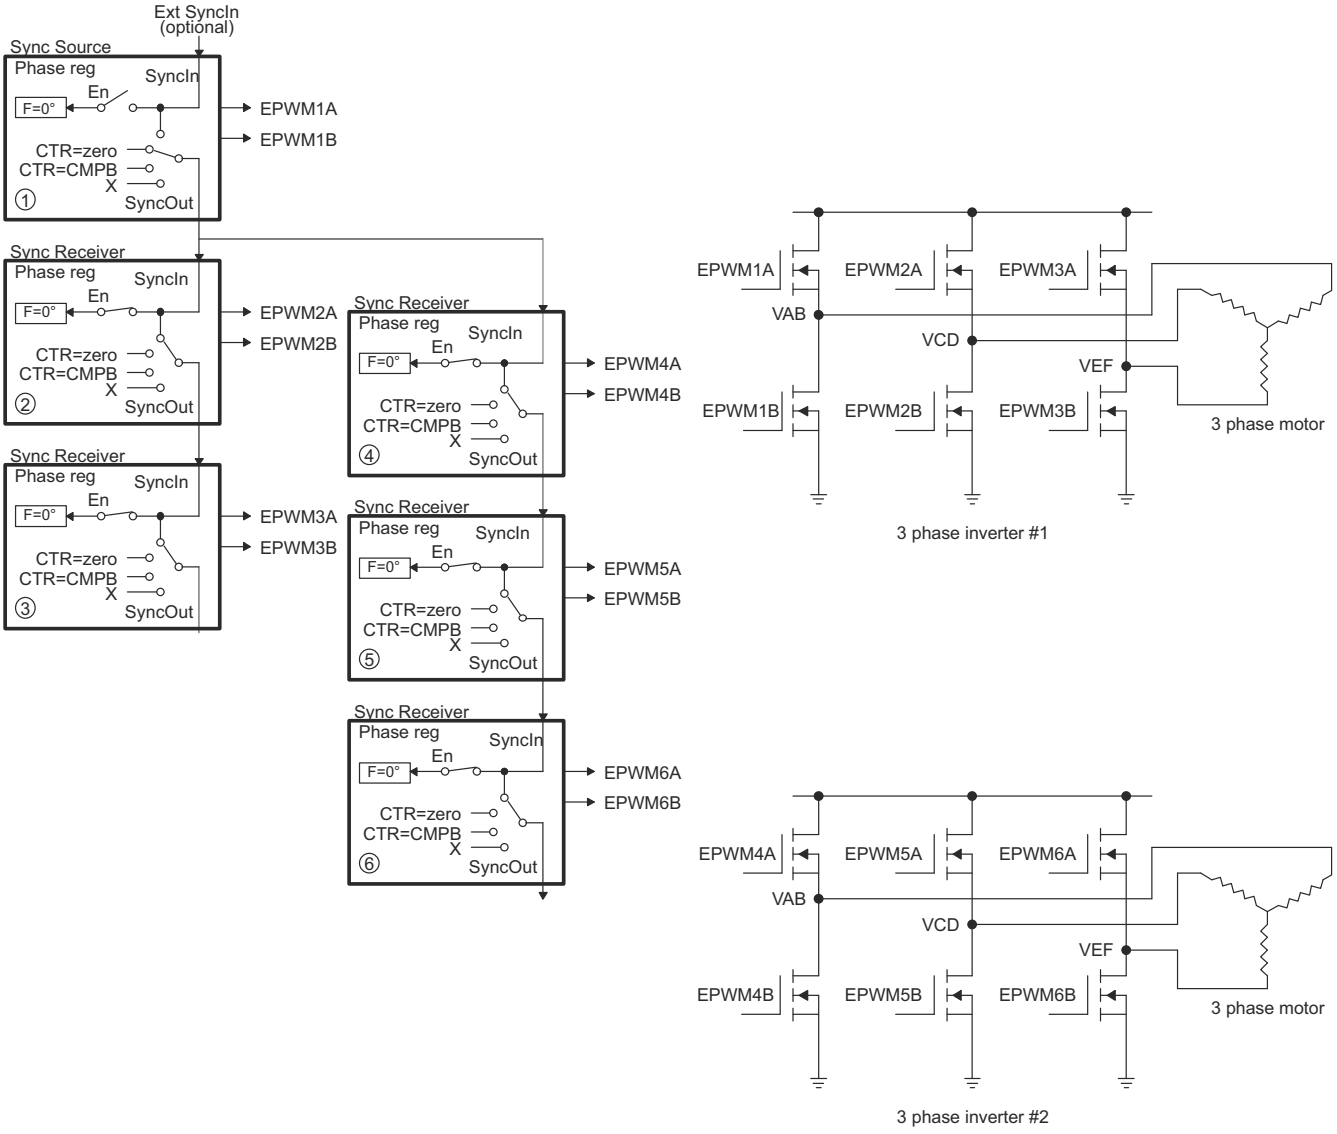

Figure 19-66. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control

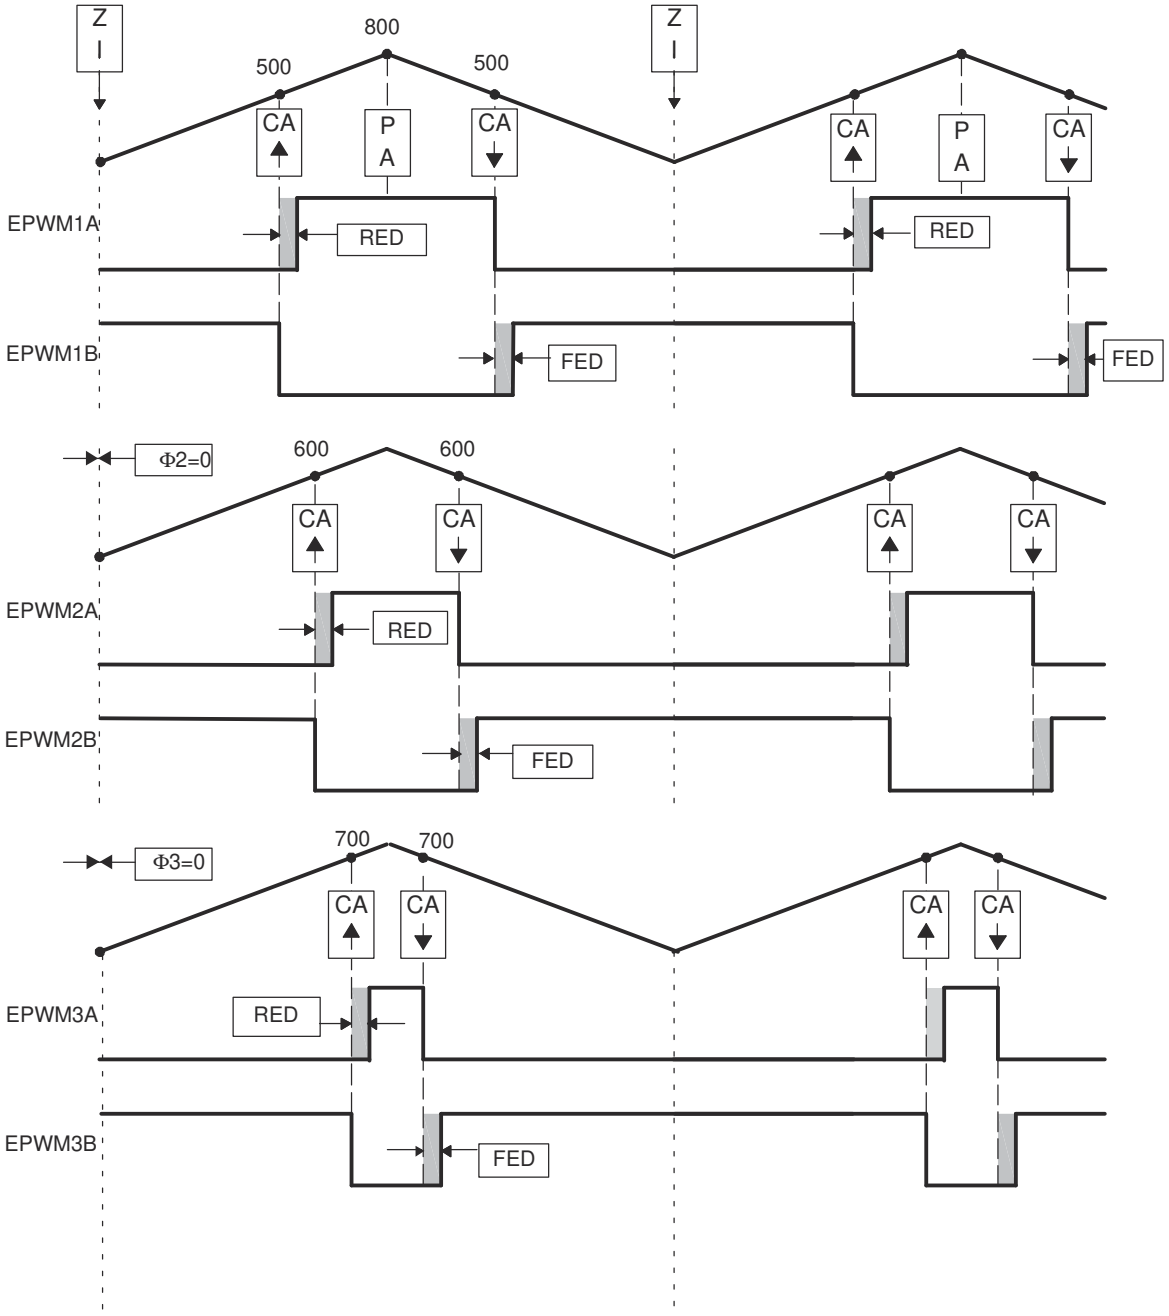

Figure 19-67. 3-Phase Inverter Waveforms for Control of Dual 3-Phase Inverter Stages (Only One Inverter Shown)

19.13.7 Practical Applications Using Phase Control Between PWM Modules

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of power topologies that rely on phase relationship between legs (or stages) for correct operation. As described in the time-base submodule section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCTR register. To illustrate this concept, Figure 19-68 shows a sync source and sync receiver module with a phase relationship of 120° (that is, the sync receiver leads the sync source).

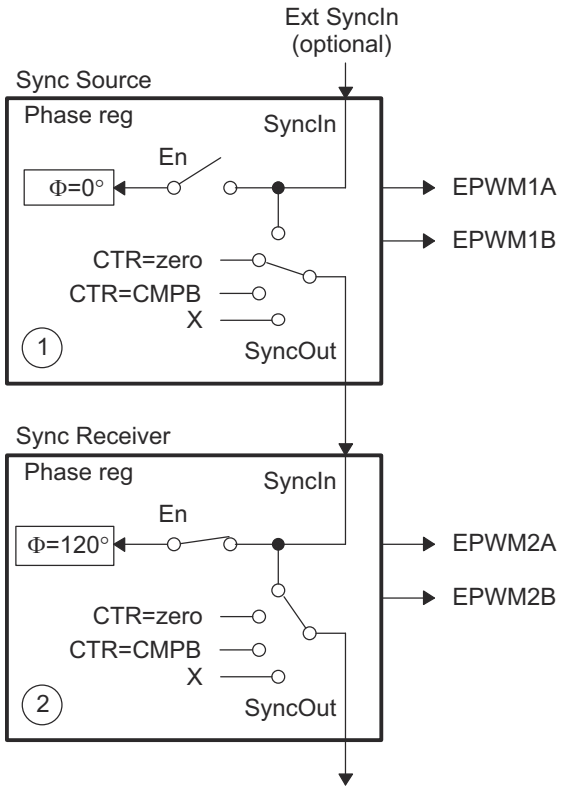

Figure 19-68. Configuring Two PWM Modules for Phase Control

Figure 19-69 shows the associated timing waveforms for this configuration. Here, TBPRD = 600 for both sync source and sync receiver. For the sync receiver, TBPHS = 200 (that is, 200/600 x 360° = 120°). Whenever the sync source generates a SyncIn pulse (CTR = PRD), the value of TBPHS = 200 is loaded into the sync receiver TBCTR register so the sync receiver time-base is always leading the sync source time-base by 120°.

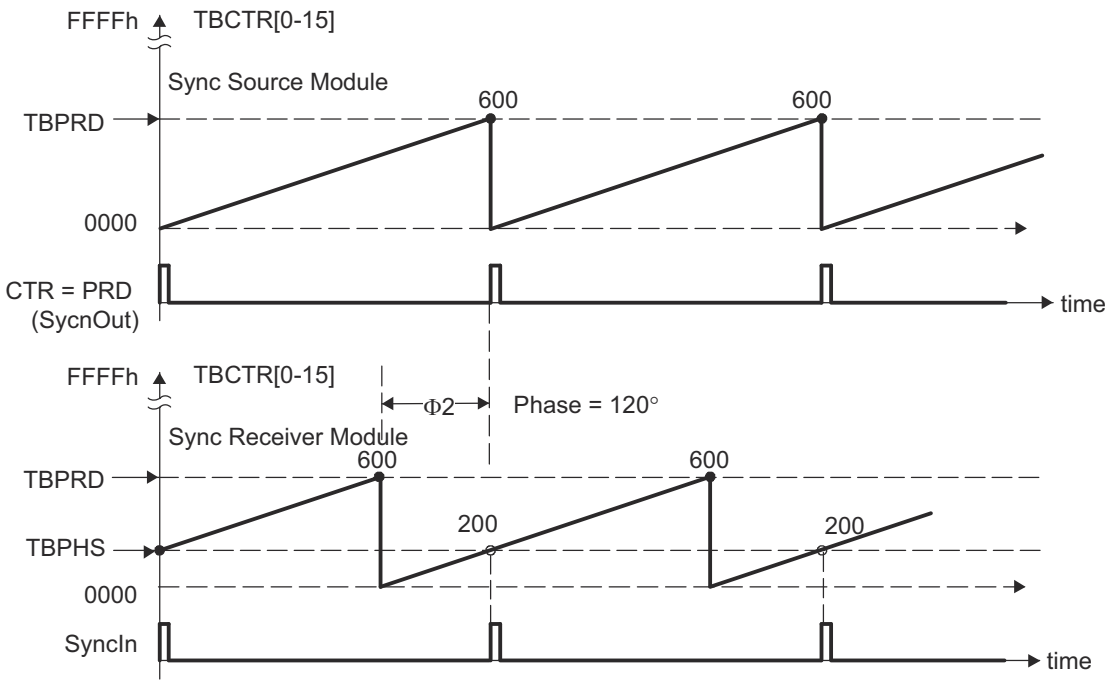

Figure 19-69. Timing Waveforms Associated with Phase Control Between Two Modules

19.13.8 Controlling a 3-Phase Interleaved DC/DC Converter

A popular power topology that makes use of phase-offset between modules is shown in Figure 19-70. This system uses three PWM modules, with module 1 configured as the sync source. To work, the phase relationship between adjacent modules must be F = 120°. This is achieved by setting the sync receiver TBPHS registers 2 and 3 with values of 1/3 and 2/3 of the period value, respectively. For example, if the period register is loaded with a value of 600 counts, then TBPHS (sync receiver 2) = 200 and TBPHS (sync receiver 3) = 400. Both sync receiver modules are synchronized to the sync source module 1.

This concept can be extended to four or more phases, by setting the TBPHS values appropriately. The following formula gives the TBPHS values for N phases:

$$TBPHS(N,M) = (TBPRD/N) \times (M - 1)$$

Where:

N = number of phases

M = PWM module number

For example, for the 3-phase case (N = 3), TBPRD = 600,

TBPHS(3,2) = (600/3) × (2 - 1) = 200 (that is, Phase value for Sync Receiver module 2)

TBPHS(3,3) = 400 (that is, Phase value for Sync Receiver module 3)

Figure 19-71 shows the waveforms for the configuration in Figure 19-70.

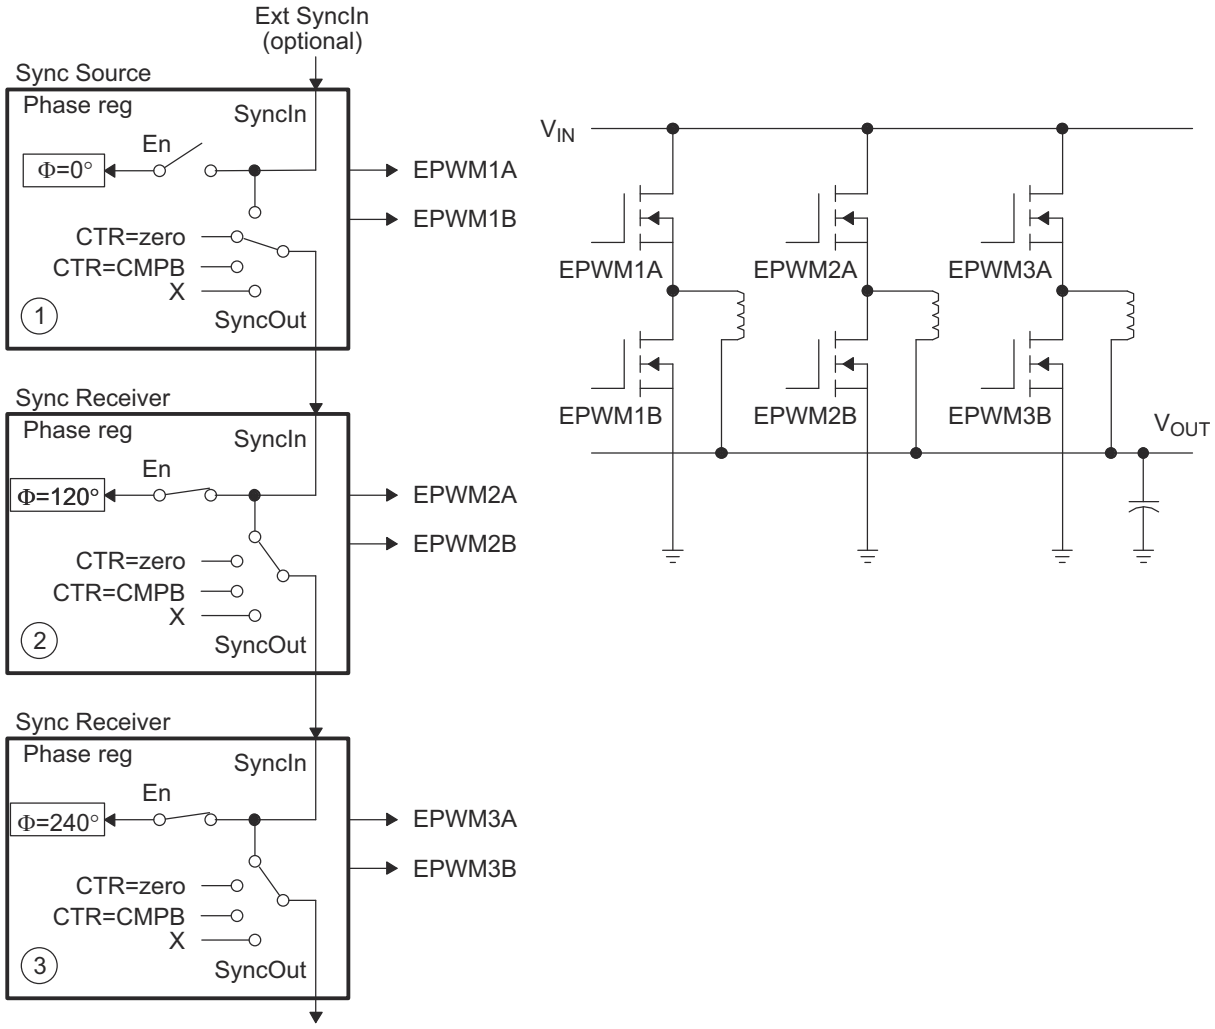

Figure 19-70. Control of 3-Phase Interleaved DC/DC Converter

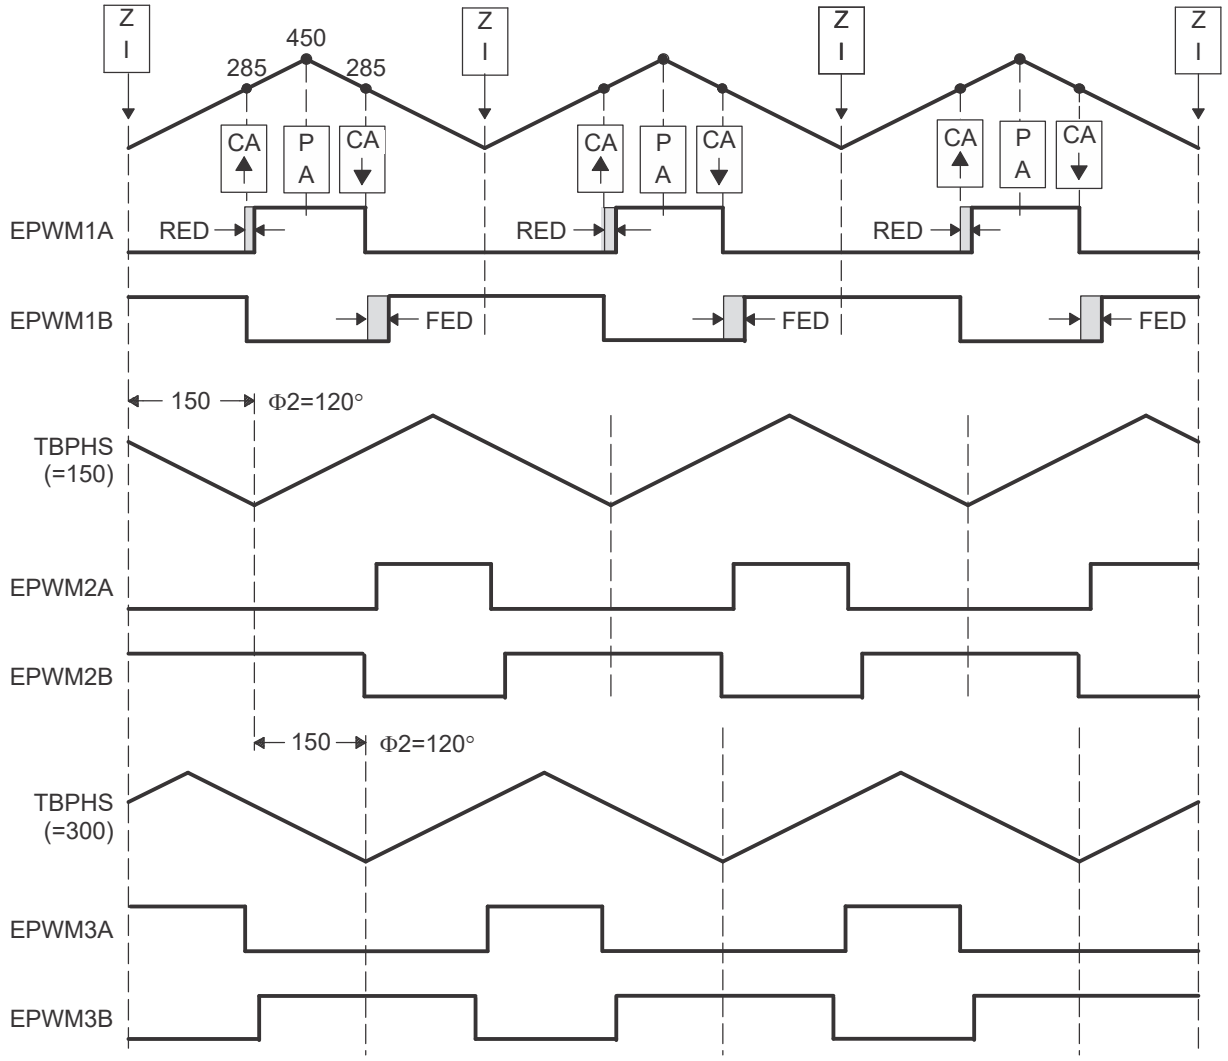

Figure 19-71. 3-Phase Interleaved DC/DC Converter Waveforms for Control of 3-Phase Interleaved DC/DC Converter

19.13.9 Controlling Zero Voltage Switched Full Bridge (ZVSFB) Converter

The example given in Figure 19-72 assumes a static or constant phase relationship between legs (modules). In such a case, control is achieved by modulating the duty cycle. It is also possible to dynamically change the phase value on a cycle-by-cycle basis. This feature lends to controlling a class of power topologies known as *phase-shifted full bridge*, or *zero voltage switched full bridge.* Here the controlled parameter is not duty cycle (this is kept constant at approximately 50 percent); instead it is the phase relationship between legs. Such a system can be implemented by allocating the resources of two PWM modules to control a single power stage, which in turn requires control of four switching elements. Figure 19-73 shows a sync source and sync receiver module combination synchronized together to control a full H-bridge. In this case, both sync source and sync receiver modules are required to switch at the same PWM frequency. The phase is controlled by using the sync receiver phase register (TBPHS). The sync source phase register is not used and therefore can be initialized to zero.

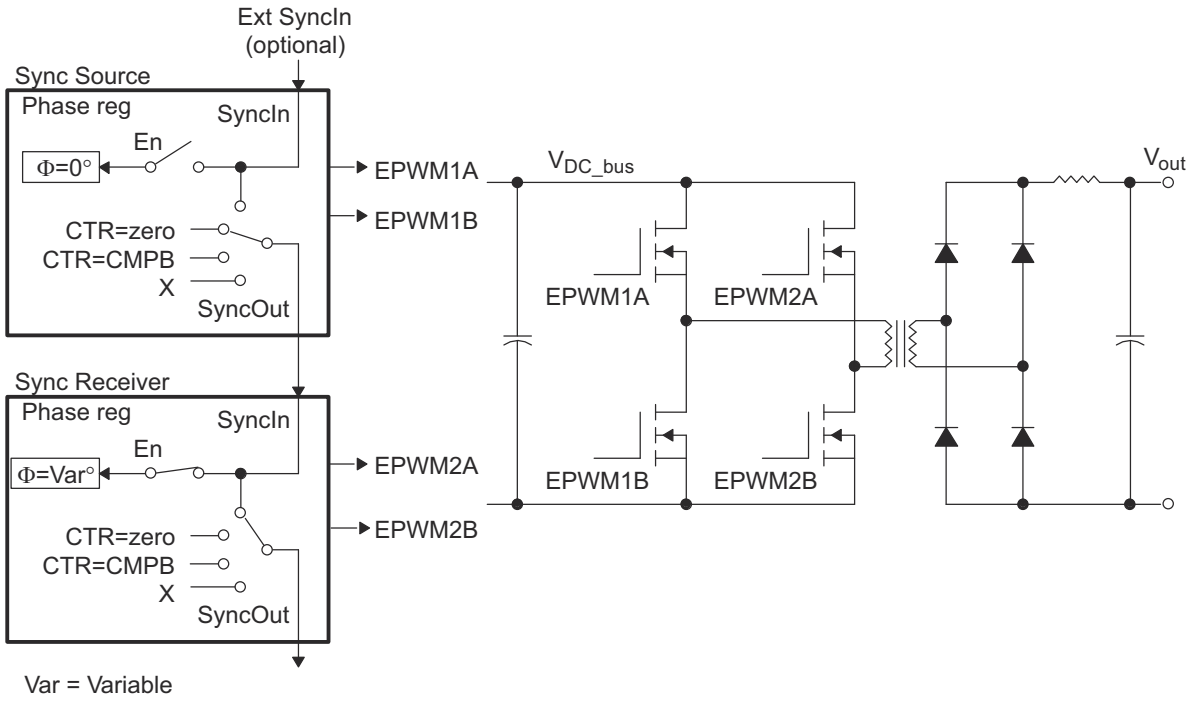

Figure 19-72. Control of Full-H Bridge Stage (F_{PWM2} = F_{PWM1})

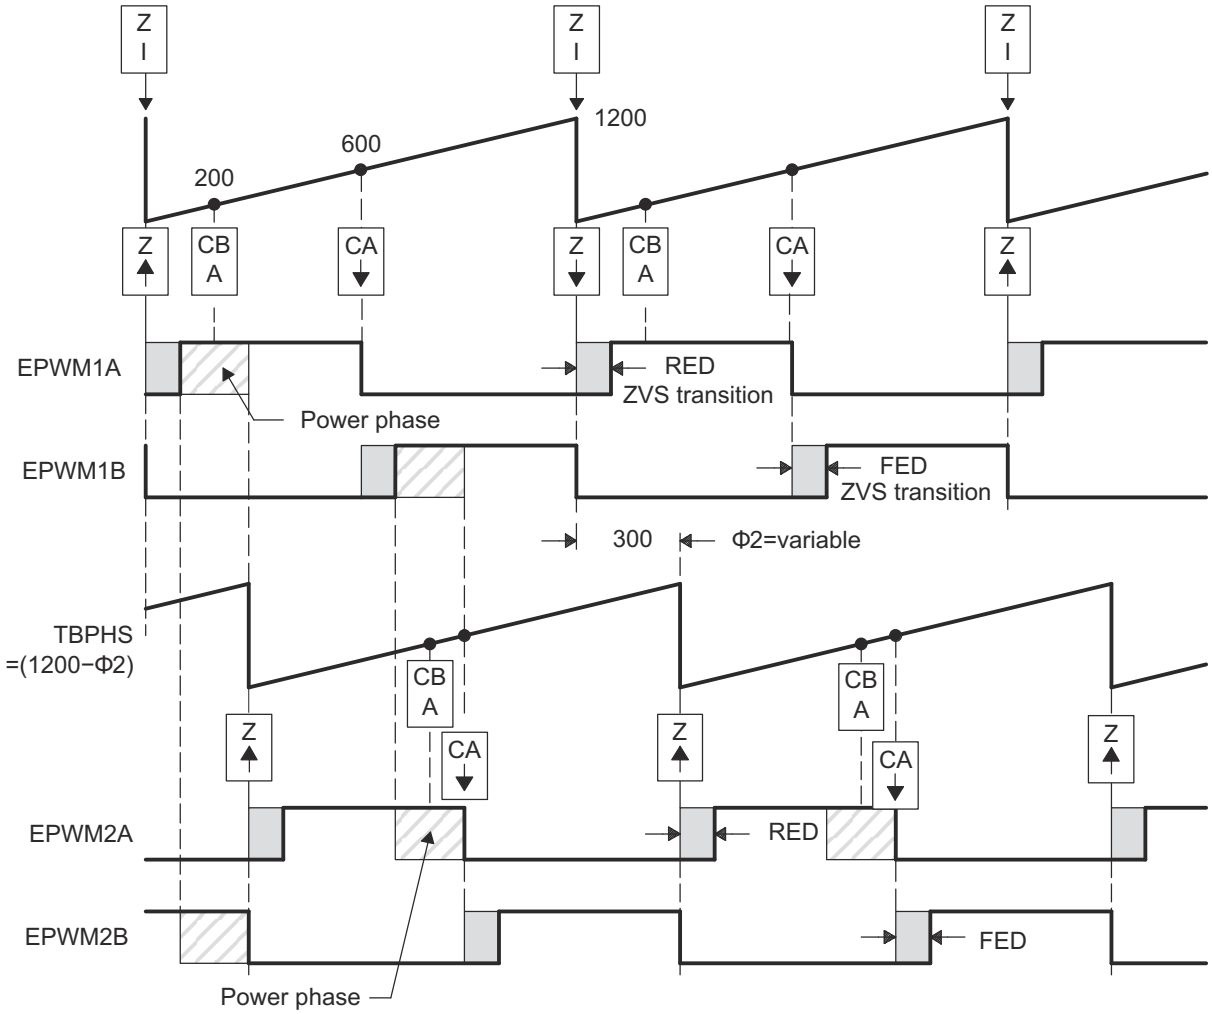

Figure 19-73. ZVS Full-H Bridge Waveforms

19.13.10 Controlling a Peak Current Mode Controlled Buck Module

Peak current control techniques offer a number of benefits like automatic over current limiting, fast correction for input voltage variations and reducing magnetic saturation. Figure 19-74 shows the use of ePWM1A along with the on-chip analog comparator for buck converter topology. The output current is sensed through a current sense resistor and fed to the positive terminal of the on-chip comparator. The internal programmable 12-bit DAC can be used to provide a reference peak current at the negative terminal of the comparator. Alternatively, an external reference can be connected at this input. The comparator output is an input to the Digital compare sub-module. The ePWM module is configured in such a way so as to trip the ePWM1A output as soon as the sensed current reaches the peak reference value. A cycle-by-cycle trip mechanism is used. Figure 19-75 shows the waveforms generated by the configuration.

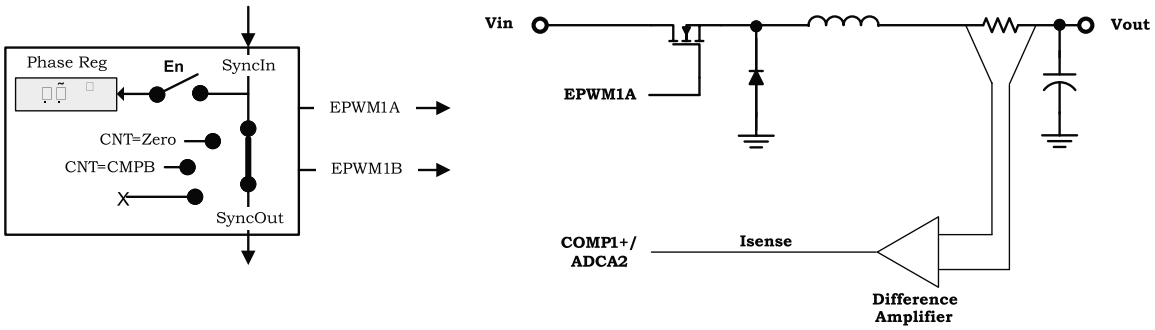

Figure 19-74. Peak Current Mode Control of Buck Converter

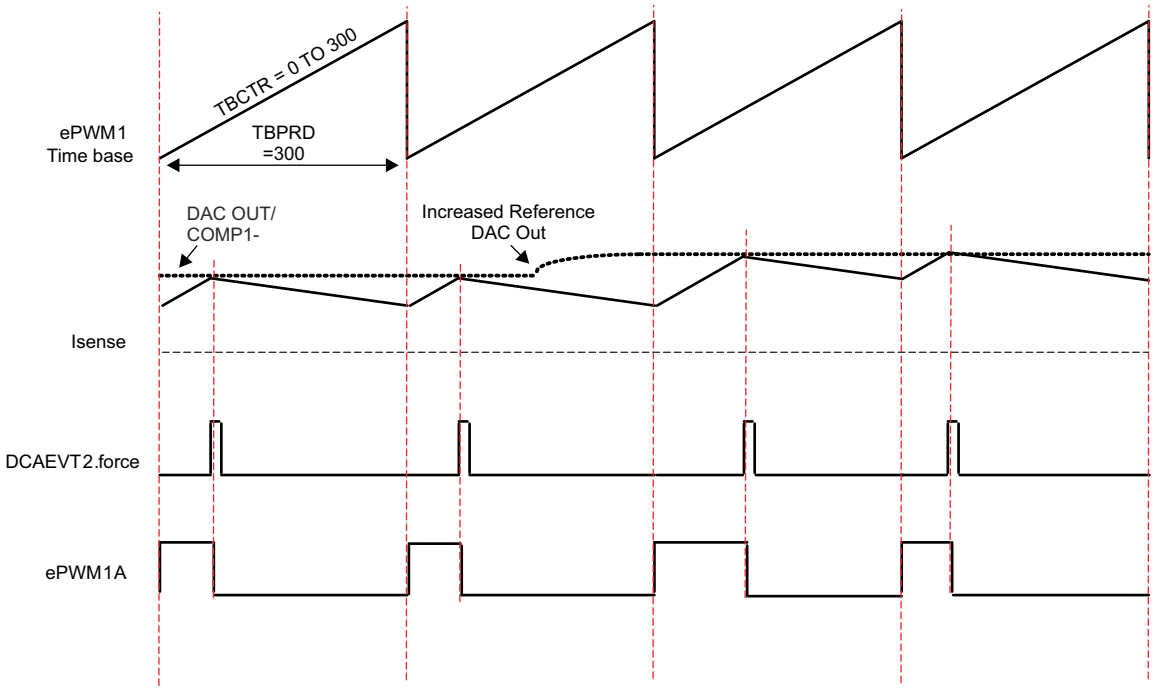

Figure 19-75. Peak Current Mode Control Waveforms for Control of Buck Converter

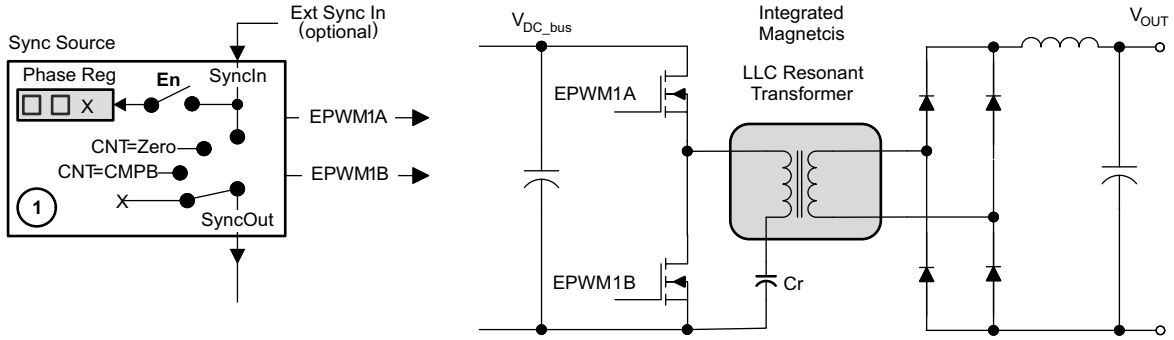
19.13.11 Controlling H-Bridge LLC Resonant Converter

Various topologies of resonant converters are well-known in the field of power electronics for many years. In addition to these, H-bridge LLC resonant converter topology has recently gained popularity in many consumer electronics applications where high efficiency and power density are required. In this example, single channel configuration of ePWM1 is detailed, yet the configuration can easily be extended to multichannel. Here the controlled parameter is not duty cycle (this is kept constant at approximately 50 percent); instead the parameter is frequency. Although the deadband is not controlled and kept constant as 300ns (that is, 30 at 100MHz TBCLK), the user can update the deadband in real time to enhance the efficiency by adjusting enough time delay for soft switching.



NOTE Θ = X indicates value in phase register is a “don’t care”

Figure 19-76. Control of Two Resonant Converter Stages

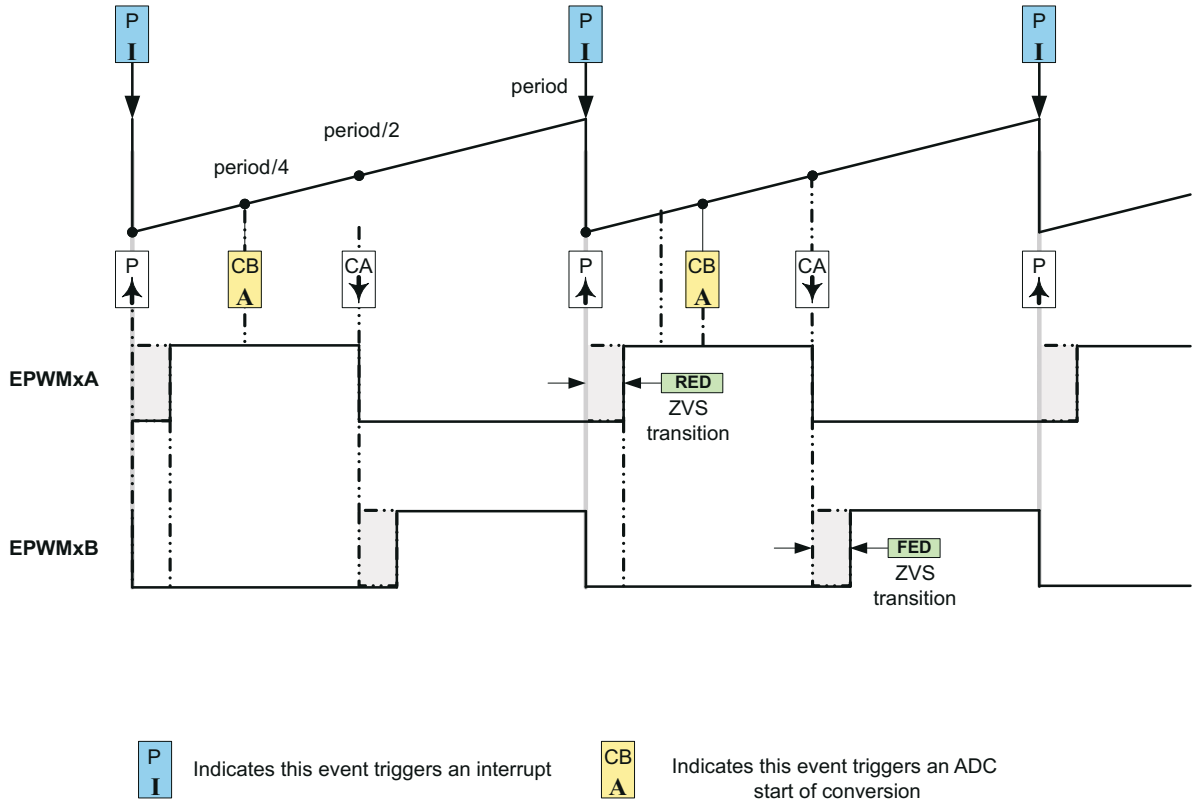


Figure 19-77. H-Bridge LLC Resonant Converter PWM Waveforms

19.14 Register Lock Protection

The register lock protection mechanism is added to protect the critical ePWM registers from being corrupted by accidental writes in case of runaway code. The register EPWMLOCK contains the definition of Lock bits (Table 19-14 shows the lock bits and the corresponding registers). This register also has a KEY field; writes to this register succeed only if the KEY field is written with a value of 0xa5a5. Refer to the register descriptions for more details.

Table 19-14. Lock Bits and Corresponding Registers

Bit Field	Definition	Registers Locked
HRLOCK	HRPWM Register Set Lock	HRCNFG, HRPWR, HRMSTEP, HRPCTL
GLLOCK	Global Load Register Set Lock	GLDCTL, GLDCFG
TZCFGLOCK	TripZone Register Set Lock	TZSEL, TZDCSEL, TZCTL, TZCTL2, TZCTLDCA, TZCTLDCB, TZEINT
TZCLRLOCK	TripZone Clear Register Set Lock	TZCLR, TZCBCCLR, TZOSTCLR, TZFRC
DCLOCK	Digital Compare Register Set Lock	DCTRIPSEL, DCACTL, DCBCTL, DCFCTL, DCCAPCTL, DCAHTRIPSEL, DCALTRIPSEL, DCBHTRIPSEL, DCBLTRIPSEL

Note

Due to the presence of the KEY field in the same register, only 32-bit writes succeed if the KEY matches. The 16-bit writes to the upper or lower half of this register are ignored.

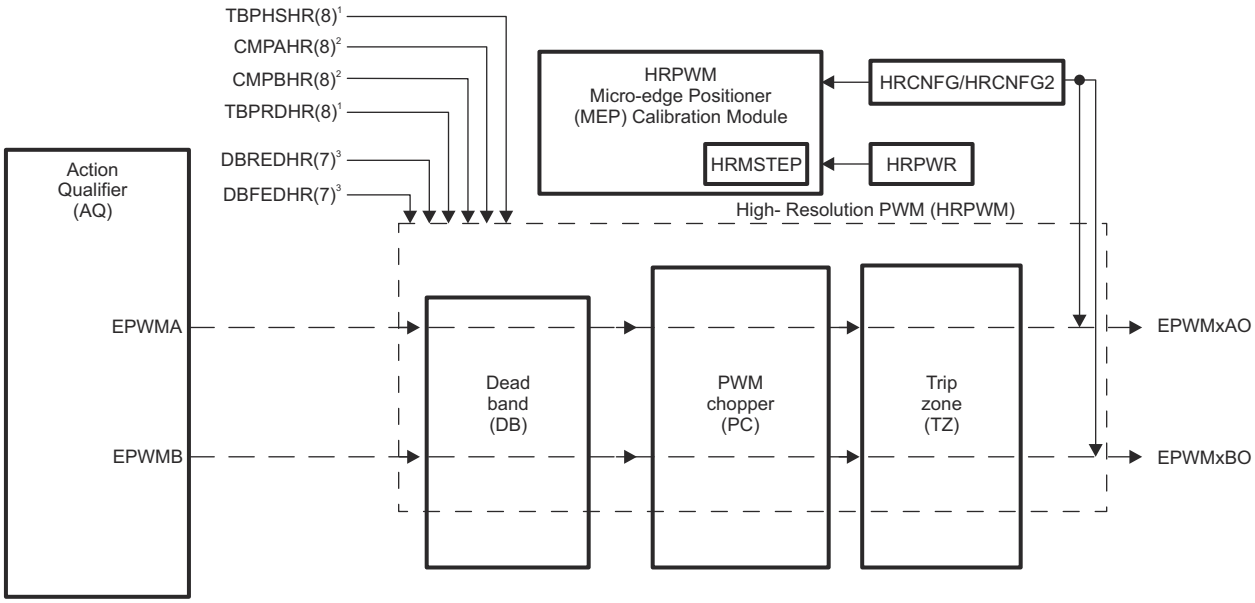
19.15 High-Resolution Pulse Width Modulator (HRPWM)

Figure 19-78 shows a block diagram of the HRPWM. This module extends the time resolution capabilities of the conventionally derived digital pulse width modulator (PWM). HRPWM is typically used when PWM resolution falls below approximately 9-10 bits. The key features of HRPWM are:

- Extended time resolution capability
- Used in both duty cycle and phase-shift control methods
- Finer time granularity control or edge positioning using extensions to the Compare A, Compare B and Phase registers
- Implemented using the A and B signal path of PWM, that is, on the EPWMxA and EPWMxB output
- Dead band high-resolution control for falling and rising edge delay in half cycle clocking operation
- Self-check diagnostics software mode to check if the micro edge positioner (MEP) logic is running how designed
- Enables high-resolution output swapping on the EPWMxA and EPWMxB output
- Enables high-resolution output on EPWMxB signal output using inversion of EPWMxA signal output
- Enables high-resolution period, duty and phase control on the EPWMxA and EPWMxB output on devices with an ePWM module

Note

See the device data sheet to determine if your device has an ePWM module with high-resolution period support.



A. From ePWM Time-base (TB) submodule
B. From ePWM counter-compare (CC) submodule
C. From ePWM Deadband (DB) submodule

Figure 19-78. HRPWM Block Diagram

The ePWM peripheral is used to perform a function mathematically equivalent to a digital-to-analog converter (DAC). As shown in Figure 19-79, the effective resolution for conventionally generated PWM is a function of PWM frequency (or period) and system clock frequency.

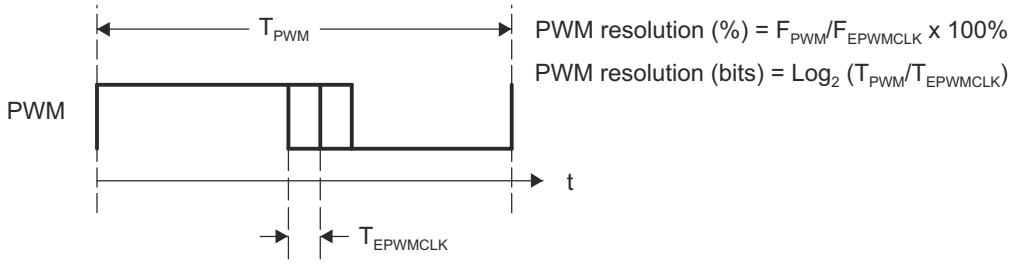


Figure 19-79. Resolution Calculations for Conventionally Generated PWM

If the required PWM operating frequency does not offer sufficient resolution in PWM mode, consider using HRPWM. As an example of improved performance offered by HRPWM, Table 19-15 shows resolution in bits for various PWM frequencies. These values assume a MEP step size of 180ps. See the device data sheet for typical and maximum performance specifications for the MEP.

Table 19-15. Resolution for PWM and HRPWM

PWM Frequency (kHz)	Regular Resolution (PWM) 100MHz EPWMCLK		High Resolution (HRPWM)	
	Bits	%	Bits	%
20	12.3	0.02	18.1	0.000
50	11	0.05	16.8	0.001
100	10	0.1	15.8	0.002
150	9.4	0.15	15.2	0.003
200	9	0.2	14.8	0.004
250	8.6	0.25	14.4	0.005
500	7.6	0.5	13.4	0.009
1000	6.6	1	12.4	0.018
1500	6.1	1.5	11.9	0.027
2000	5.6	2	11.4	0.036

Although each application can differ, typical low-frequency PWM operation (below 250kHz) does not require HRPWM. HRPWM capability is most useful for high-frequency PWM requirements of power conversion topologies such as:

- Single-phase buck, boost, and flyback
- Multiphase buck, boost, and flyback
- Phase-shifted full bridge
- Direct modulation of D-Class power amplifiers

19.15.1 Operational Description of HRPWM

The HRPWM is based on micro-edge positioner (MEP) technology. MEP logic is capable of positioning an edge very finely by sub-dividing one coarse system clock of a conventional PWM generator. The time step accuracy is on the order of 150ps. See the device data sheet for the typical MEP step size on a particular device. The HRPWM also has a self-check software diagnostics mode to check if the MEP logic is running as designed under all operating conditions. Details on software diagnostics and functions are in Section 19.15.1.7.

Figure 19-80 shows the relationship between one coarse system clock and edge position in terms of MEP steps, which are controlled using an 8-bit field in the Compare A extension register (CMPAHR). The same operating logic applies to CMPBHR as well.

To generate an HRPWM waveform, configure the ePWM registers to generate a conventional PWM of a given frequency and polarity. The HRPWM works together with the ePWM registers to extend edge resolution. Although many programming combinations are possible, only a few are needed and practical. These methods are described in Section 19.15.1.8.

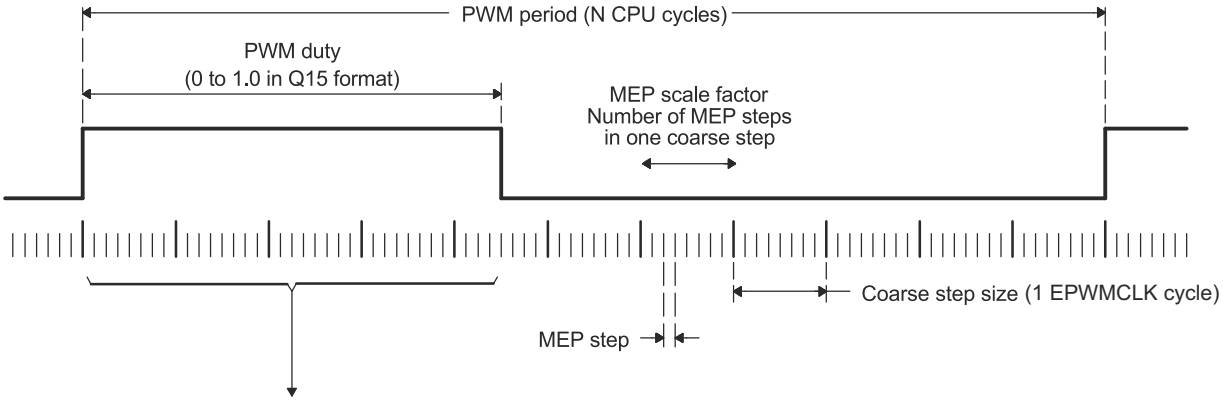

Figure 19-80. Operating Logic Using MEP

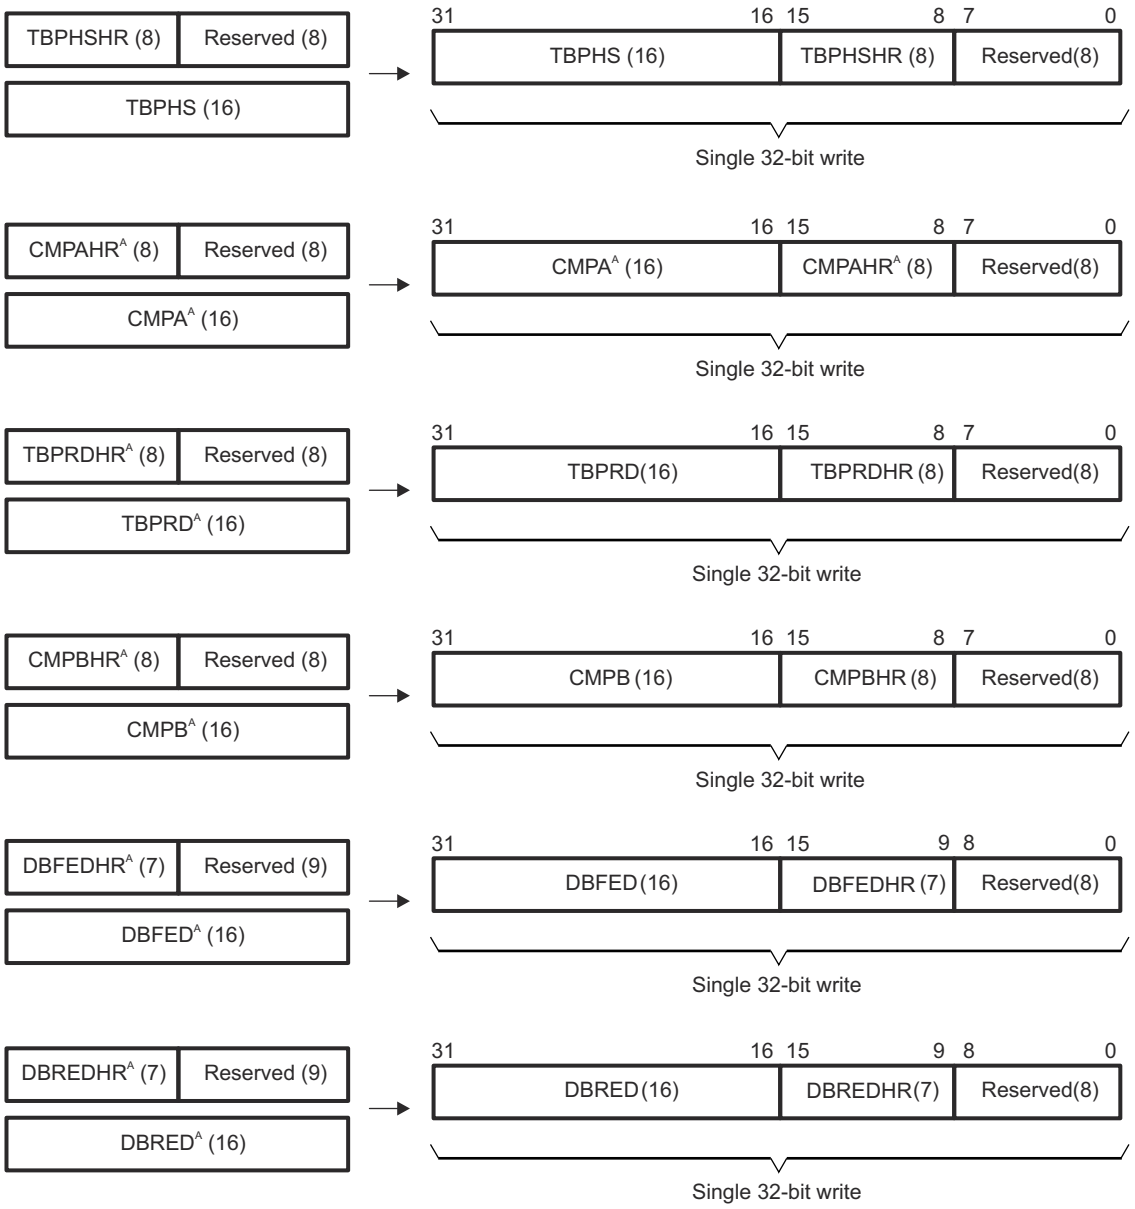
19.15.1.1 Controlling the HRPWM Capabilities

The MEP of the HRPWM is controlled by six extension registers. These HRPWM registers are concatenated with the 16-bit TBPHS, TBPRD, CMPA, CMPBM, DBREDM, and DBFEDM registers used to control PWM operation.

- TBPHSHR - Time Base Phase High Resolution Register
- CMPAHR - Counter Compare A High Resolution Register; CMPAHR is for use with the AQ output of Channel A, and is not related to CMPA
- TBPRDHR - Time Base Period High Resolution Register. (available on some devices)
- CMPBHR - Counter Compare B High Resolution Register; CMPBHR is for use with the AQ output of Channel B, and is not related to CMPB
- DBREDHR - Dead-band Generator Rising Edge Delay High Resolution Register
- DBFEDHR - Dead-band Generator Falling Edge Delay High Resolution Register



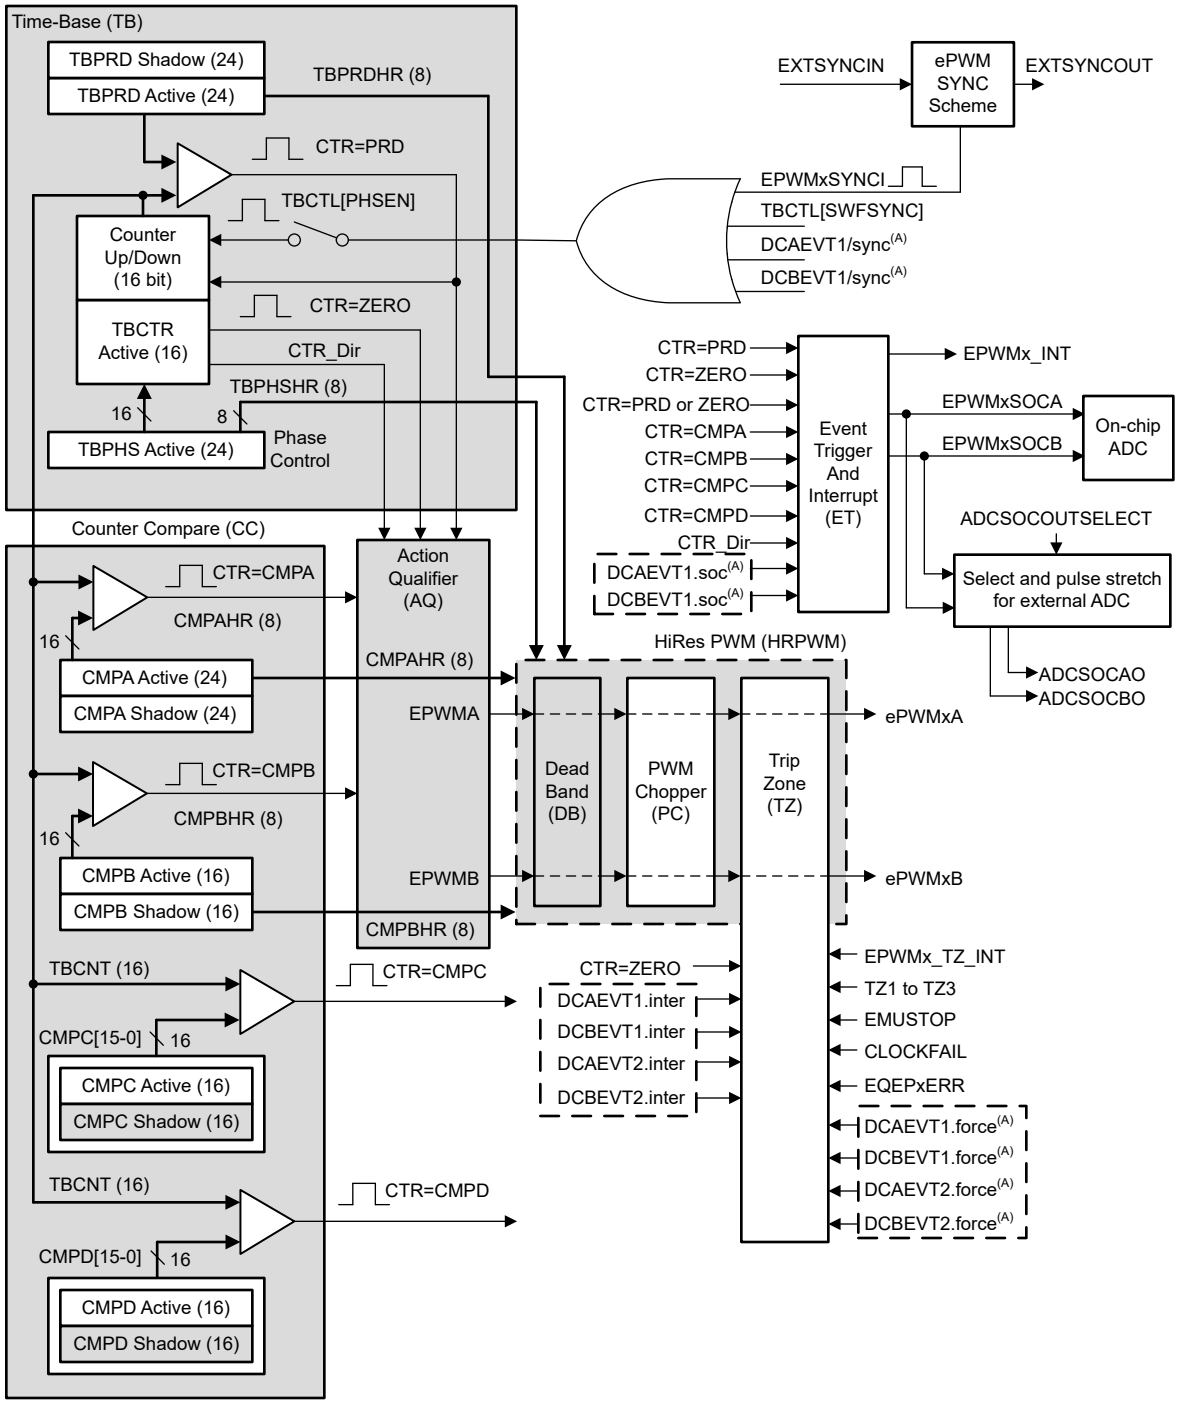
A. Dependent upon your device, these registers can be mirrored and can be written to at two different memory locations.

Figure 19-81. HRPWM Extension Registers and Memory Configuration

Note

HRPWM capabilities on Deadband Rising Edge Delay and Falling Edge Delay is applicable only during dead band half cycle clocking Operation. The number of MEP steps is half in size [bits 15:9] than duty and phase high-resolution registers for the same reason.

HRPWM capabilities are controlled using the Channel A and B PWM signal path. HRPWM support on the Dead band signal path is available by properly configuring the HRCNFG2 register. shows how the HRPWM interfaces with the 8-bit extension registers.



A. These events are generated by the ePWM Digital Compare (DC) submodule based on the levels of the TRIPIN inputs.

Figure 19-82. HRPWM System Interface

19.15.1.2 HRPWM Source Clock

Each HRPWM module is clocked from the respective EPWMxCLK. HRCAL has a separate clock. For example, HRPWM1 is sourced from EPWM1CLK while HRPWM2 is clocked from the EPWM2CLK. Figure 19-83 shows the HRCAL and HRPWM modules are sourced from the respective ePWM clock source.

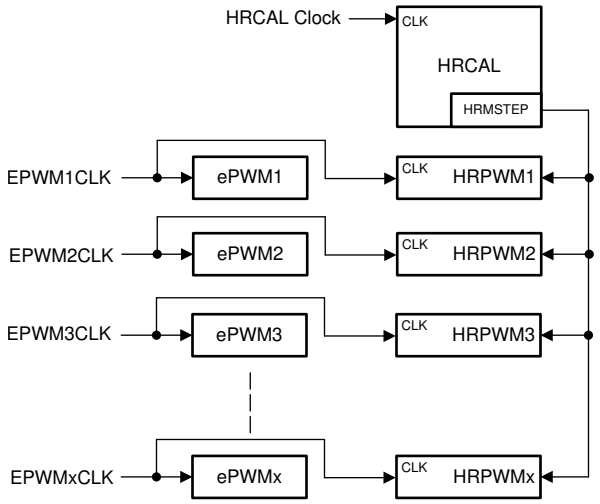


Figure 19-83. HRPWM and HRCAL Source Clock

19.15.1.3 Configuring the HRPWM

Once the ePWM has been configured to provide conventional PWM of a given frequency and polarity, the HRPWM is configured by programming the HRCNFG register in that particular ePWM module's register space. This register provides the following configuration options:

Edge Mode	The MEP can be programmed to provide precise position control on the rising edge (RE), falling edge (FE) or both edges (BE) at the same time. FE and RE are used for power topologies requiring duty cycle control (CMPA or CMPB high-resolution control), while BE is used for topologies requiring phase shifting, for example, phase shifted full bridge (TBPHS or TBPRD high-resolution control).
Control Mode	The MEP is programmed to be controlled either from the CMPAHR/CMPBHR register in case of duty cycle control or the TBPHSHR register (phase control). RE or FE control mode can be used with the CMPAHR or CMPBHR register. BE control mode can be used with the TBPHSHR register. When the MEP is controlled from the TBPRDHR register (period control), the duty cycle and phase can also be controlled using the respective high-resolution registers.
Shadow Mode	This mode provides the same shadowing (double buffering) option as in regular PWM mode. This option is valid only when operating from the CMPAHR, CMPBHR, and TBPRDHR registers and can be chosen to be the same as the regular load option for the CMPA/CMPB register. If TBPHSHR is used, then this option has no effect.
High-Resolution B Signal Control	The B signal path of an ePWM channel can generate a high-resolution output by outputting an inverted version of the high-resolution ePWMxA signal on the ePWMxB pin. A Type 2 or Type 4 HRPWM module can also enable high-resolution features on the B signal path independently of the A signal path as well.
Swap ePWMxA and ePWMxB Outputs	This mode enables the swapping of the high-resolution A and B outputs. The mode selection allows either A and B Outputs Unchanged or A Output Comes Out On B and B Output Comes Out On A.

Auto-conversion Mode

This mode is used in conjunction with the scale factor optimization (SFO) software only. For a type 4 HRPWM module, below is a description of the Auto-conversion Mode taking CMPAHR as an example. If auto-conversion is enabled, CMPAHR = fraction(PWMduty * PWMperiod)<<8. The scale factor optimization software calculates the MEP scale factor in the background code and automatically updates the HRMSTEP register with the calculated number of MEP steps per coarse step. The MEP Calibration Module then uses the values in the HRMSTEP and CMPAHR registers to automatically calculate the appropriate number of MEP steps represented by the fractional duty cycle and moves the high-resolution ePWM signal edge accordingly. If auto-conversion is disabled, the CMPAHR register behaves like a type 0 HRPWM module and CMPAHR = (fraction(PWMduty * PWMperiod) * MEP Scale Factor + 0.5)<<8). All calculations need to be performed by your code in this mode, and the HRMSTEP register is ignored. Auto-conversion for high-resolution period has the same behavior as auto-conversion for high-resolution duty cycle. Auto-conversion must always be enabled for high-resolution period mode.

Note

If the HRPWM module is configured in UP-DOWN counter mode, the shadow mode for the HRPWM registers must be set to load on both ZERO AND PERIOD. New values from the user are loaded to the shadow registers only at CTR = ZERO, but the shadow mode of for the registers must be set to both ZERO AND PERIOD. The CTR = PRD event is used for specific internal logic inside the HRPWM module.

Auto-conversion Mode performs the calculation for CMPBHR , DBREDHR, and DBFEDHR. The scale factor optimization software calculates the MEP scale factor in the background code and automatically updates the HRMSTEP register with the calculated number of MEP steps per coarse step. The MEP Calibration Module then uses the values in the HRMSTEP and CMPBHR or DBREDHR/DBFEDHR register to automatically calculate the appropriate number of MEP steps represented by the fractional components and moves the high-resolution ePWM signal edge accordingly. If auto-conversion is disabled, CMPBHR behaves the same as CMPAHR. CMPBHR = (fraction(PWMduty * PWMperiod) * MEP Scale Factor + 0.5)<<8).

You are expected to disable protection for both ePWM1 and HRPWM when the application requires access to either of these modules.

19.15.1.4 Configuring High-Resolution in Deadband Rising-Edge and Falling-Edge Delay

Once the ePWM has been configured to provide conventional PWM of a given frequency, polarity, and dead band enabled in half-cycle clocking mode, the high-resolution operation on dead band RED and FED lines are enabled by programming the HRCNFG2 register in that particular ePWM module register space. This register provides the following configuration options:

Edge Mode The MEP can be programmed to provide precise position control on the dead band rising edge (RED), dead band falling edge (FED), or both edges (rising edge of DBRED signal and falling edge of DBFED signal) at the same time.

Control Mode Selects the time event that loads the shadow value in the active register for DBRED and DBFED in high-resolution mode. Select the pulse to match the selection in the ePWM DBCTL[LOADREDMODE] and DBCTL[LOADFEDMODE] bits.

19.15.1.5 Principle of Operation

The MEP logic is capable of placing an edge in one of 255 (8 bits) discrete time steps (see the device data sheet for typical MEP step size). The MEP works with the TBM and CCM registers to be certain that time steps are applied and that edge placement accuracy is maintained over a wide range of PWM frequencies, system clock frequencies, and other operating conditions. Table 19-16 shows the typical range of operating frequencies supported by the HRPWM.

Table 19-16. Relationship Between MEP Steps, PWM Frequency, and Resolution

System (MHz)	MEP Steps Per EPWMCLK (1) (2) (3)	PWM Minimum (Hz) (4)	PWM Maximum (MHz)	Resolution at Maximum (Bits) (5)
60.0	93	916	3.00	10.9
70.0	79	1068	3.50	10.6
80.0	69	1221	4.00	10.4
90.0	62	1373	4.50	10.3
100.0	56	1526	5.00	10.1

(1) TBCLK = EPWMCLK.
(2) Table data based on a MEP time resolution of 180ps (this is an example value. See the device data sheet for MEP limits)
(3) MEP steps applied = $T_{EPWMCLK}$/180ps in this example.
(4) PWM minimum frequency is based on a maximum period value,(TBPRD = 65535). PWM mode is asymmetrical up-count.
(5) Resolution in bits is given for the maximum PWM frequency stated.

19.15.1.5.1 Edge Positioning

Note

The following example is presented using the [CMPA:CMPAHR] register combination. The theory of operation and equations are the same, if intending to use the [CMPBM:CMPBHRM] for duty cycle control.

In a typical power control loop, a digital controller issues a duty command, usually expressed in a per unit or percentage terms. Assume that for a particular operating point, the demanded duty cycle is 0.405 or 40.5% on time and the required converter PWM frequency is 1.25MHz. In conventional PWM generation with a system clock of 100MHz, the duty cycle choices are in the vicinity of 40.5%. As shown in Figure 19-84, a compare value of 32 counts (duty = 40%) is the closest to 40.5% that can be attained. This is equivalent to an edge position of 320ns instead of the desired 324ns. This data is shown in Table 19-17.

By utilizing the MEP, an edge position much closer to the desired point of 324ns can be achieved. Table 19-17 shows that in addition to the CMPA value, 22 steps of the MEP (CMPAHR register) positions the edge at 323.96ns, resulting in almost zero error. In this example, assume that the MEP has a step resolution of 180ps.

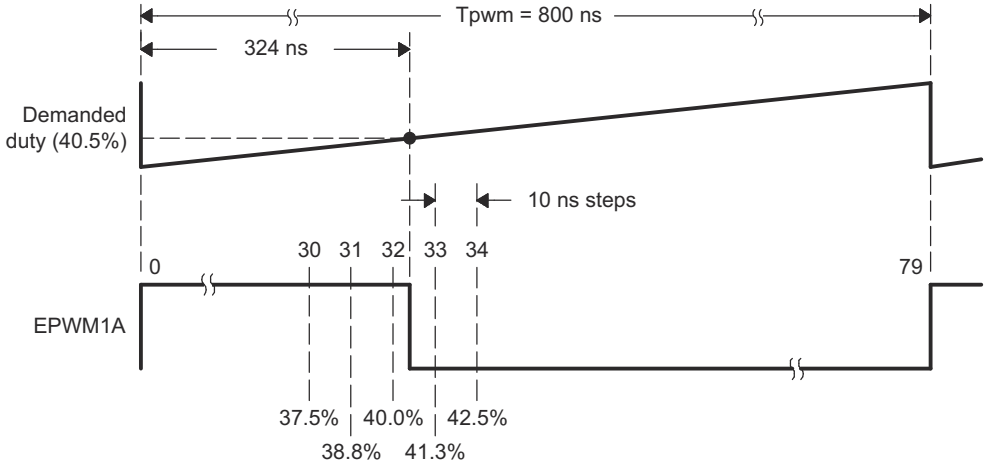

Figure 19-84. Required PWM Waveform for a Requested Duty = 40.5%

Table 19-17. CMPA versus Duty (left), and [CMPA:CMPAHR] versus Duty (right)

CMPA (count)(1) (2) (3)	Duty (%)	High Time (ns)	CMPA (count)	CMPAHR (count)	Duty (%)	High Time (ns)
28	***35.0***	280	32	18	***40.405***	323.24
29	***36.3***	290	32	19	***40.428***	323.42
30	***37.5***	300	32	20	***40.450***	323.60
31	***38.8***	310	32	21	***40.473***	323.78
32	***40.0***	320	32	22	***40.495***	323.96
33	***41.3***	330	32	23	***40.518***	324.14
34	***42.5***	340	32	24	***40.540***	324.32
			32	25	***40.563***	324.50
Required			32	26	***40.585***	324.68
32.40	***40.5***	324	32	27	***40.608***	324.86

(1) Assumed MEP step size for the above example = 180ps. See the device-specific data sheet for typical and maximum MEP values.
(2) TBCLK = 100MHz, 10ns
(3) For a PWM Period register value of 80 counts, PWM Period = 80 × 10ns = 800ns, PWM frequency = 1/800ns = 1.25MHz

19.15.1.5.2 Scaling Considerations

The mechanics of how to position an edge precisely in time has been demonstrated using the resources of the standard CMPA and MEP (CMPAHR) registers. In a practical application, however, it is necessary to seamlessly provide the CPU a mapping function from a per-unit (fractional) duty cycle to a final integer (non-fractional) representation that is written to the [CMPA:CMPAHR] register combination.

To do this, first examine the scaling or mapping steps involved. It is common in control software to express duty cycle in a per-unit or percentage basis. This has the advantage of performing all needed math calculations without concern for the final absolute duty cycle, expressed in clock counts or high time in nanoseconds (ns). Furthermore, it makes the code more transportable across multiple converter types running different PWM frequencies.

To implement the mapping scheme, a two-step scaling procedure is required.

Assumptions for this example:

TBCLK	=	10ns (100MHz)
PWM frequency	=	1.25MHz (1/800ns)
Required PWM duty cycle, **PWMDuty**	=	0.405 (40.5%)
PWM period in terms of coarse steps, **PWMPeriod** (800ns/10ns)	=	80
Number of MEP steps per coarse step at 180ps (10ns/180ps), **MEP_ScaleFactor**	=	55
Value to keep CMPAHR within the range of 1-255 and fractional rounding constant (default value)	=	0.5 (0080h in Q8 format)

Step 1: Percentage Integer Duty value conversion for CMPA register

CMPA register value	=	int(**PWMDuty***PWMPeriod**); int means integer part
	=	int(0.405 * 80)
	=	int(32.4)
CMPA register value	=	32 (20h)

Step 2: Fractional value conversion for CMPAHR register

CMPAHR	=	(frac(**PWMDuty***PWMPeriod**)*MEP_ScaleFactor** + 0.5) <<8); frac means fractional part
	=	(frac(32.4) * 55 + 0.5) <<8; Shifting is to move the value to the high byte of CMPAHR.
	=	(0.4 * 55 + 0.5) <<8
	=	(22 + 0.5) <<8
	=	22.5 * 256; Shifting left by 8 is the same as multiplying by 256.
	=	5760 (1680h)
CMPAHR	=	1680h CMPAHR value = 1600h (lower 8 bits are ignored by hardware).

Note

If the AUTOCONV bit (HRCNFG.6) is set and the MEP_ScaleFactor is in the HRMSTEP register, then CMPAHR / CMPBHR register value = frac (PWMDuty*PWMperiod<<8). The rest of the conversion calculations are performed automatically in hardware, and the correct MEP-scaled signal edge appears on the ePWM channel output. If AUTOCONV is not set, the above calculations must be performed by software.

The MEP scale factor (MEP_ScaleFactor) varies with the system clock and DSP operating conditions. TI provides an MEP scale factor optimizing (SFO) software C function, which uses the built in diagnostics in each HRPWM and returns the best scale factor for a given operating point.

The scale factor varies slowly over a limited range so the optimizing C function can be run very slowly in a background loop.

The CMPA, CMPB, CMPAHR and CMPBHR registers are configured in memory so that the 32-bit data capability of the CPU can write this as a single concatenated value, that is, [CMPA:CMPAHR], [CMPB:CMPBHR], and so on.

The mapping scheme has been implemented in both C and assembly, as shown in Section 19.15.1.8. The actual implementation takes advantage of the 32-bit CPU architecture and is somewhat different from the steps shown in Section 19.15.1.5.2.

For time-critical control loops where every cycle counts, the assembly version is recommended. This is a cycle optimized function (11 EPWMCLK cycles) that takes a Q15 duty value as input and writes a single [CMPA:CMPAHR] value.

19.15.1.5.3 Duty Cycle Range Limitation

In high-resolution mode, the MEP is not active for 100% of the PWM period and becomes operational:

- Three EPWMCLK cycles after the period starts when high-resolution period (TBPRDHR) control is not enabled.
- When high-resolution period (TBPRDHR) control is enabled using the HRPCTL register:
  - In up-count mode: three EPWMCLK cycles after the period starts until three EPWMCLK cycles before the period ends.
  - In up-down count mode: when counting up, three cycles after CTR = 0 until three cycles before CTR = PRD, and when counting down, three cycles after CTR = PRD until three cycles before CTR = 0.
- When using DBREDHR or DBFEDHR, DBRED or DBFED (the register corresponding to the edge with high-resolution displacement) must be greater than or equal to 7.

Duty cycle range limitations are illustrated in Figure 19-85 to Figure 19-88. This limitation imposes a duty cycle limit on the MEP. For example, precision edge control is not available all the way down to 0% duty cycle. When high-resolution period control is disabled, regular PWM duty control is fully operational down to 0% duty cycle despite the unavailability of HRPWM features in the first three cycles. In most applications, this cannot be an issue as the controller regulation point is usually not designed to be close to 0% duty cycle. To better understand the useable duty cycle range, see Table 19-18. When high-resolution period control is enabled (HRPCTL[HRPE] = 1), the duty cycle must not fall within the restricted range; otherwise, there can be undefined behavior on the ePWMxA output.

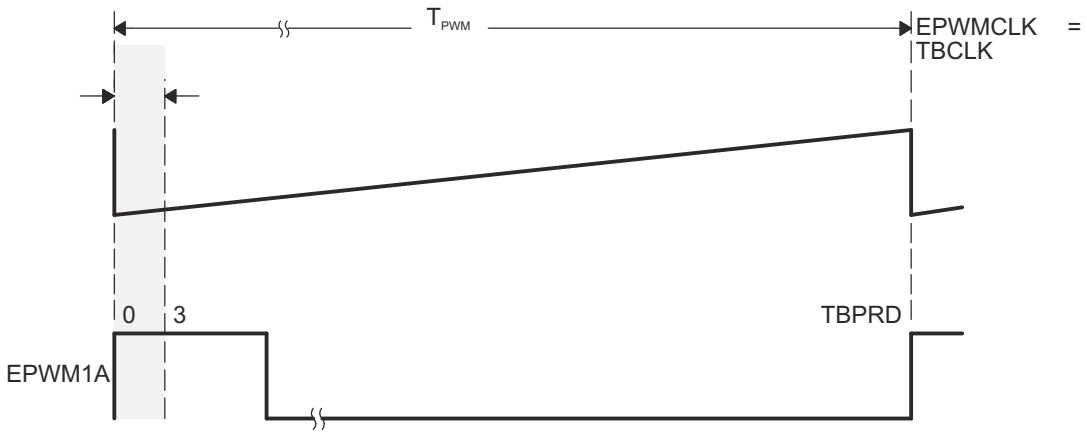

Figure 19-85. Low % Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 0)

Table 19-18. Duty Cycle Range Limitation for Three EPWMCLK/TBCLK Cycles

PWM Frequency(1) (kHz)	3 Cycles Minimum Duty	3 Cycles Maximum Duty(2)
200	0.6%	99.4%
400	1.2%	98.8%
600	1.8%	98.2%
800	2.4%	97.6%
1000	3%	97%
1200	3.6%	96.4%
1400	4.2%	95.8%
1600	4.8%	95.2%
1800	5.4%	94.6%
2000	6%	94%

(1) EPWMCLK = TBCLK = 100MHz
(2) This limitation applies only if high-resolution period (TBPRDHR) control is enabled.

If the application demands HRPWM operation below the minimum duty cycle limitation, then the HRPWM can be configured to operate in count-down mode with the rising edge position (REP) controlled by the MEP when high-resolution period is disabled (HRPCTL[HRPE] = 0). This is illustrated in Figure 19-86. In this configuration, the minimum duty cycle limitation is no longer an issue. However, there is a maximum duty limitation with same percent numbers as given in Table 19-18.

CAUTION

If the application has enabled high-resolution period control (HRPCTL[HRPE] = 1), the duty cycle must not fall within the restricted range; otherwise, there can be undefined behavior on the ePWM output.

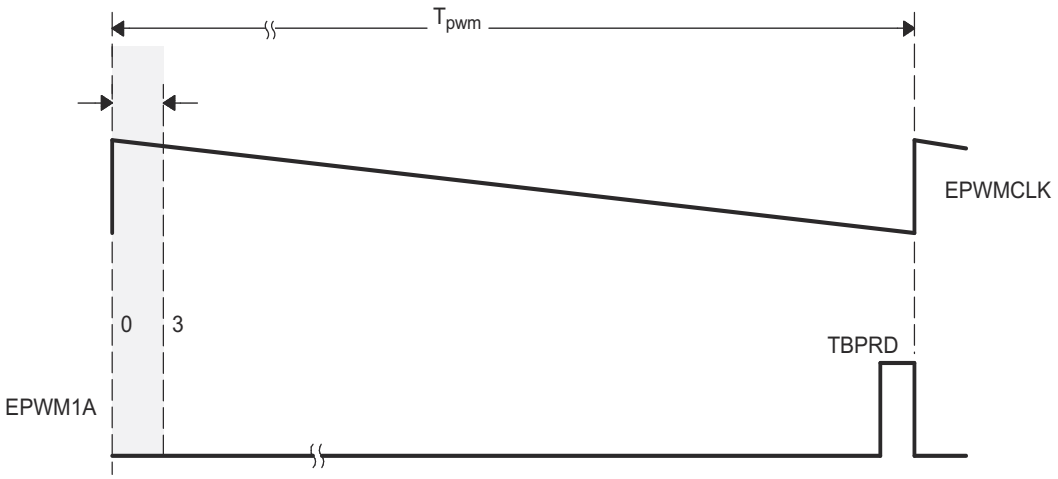

Figure 19-86. High % Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 0)

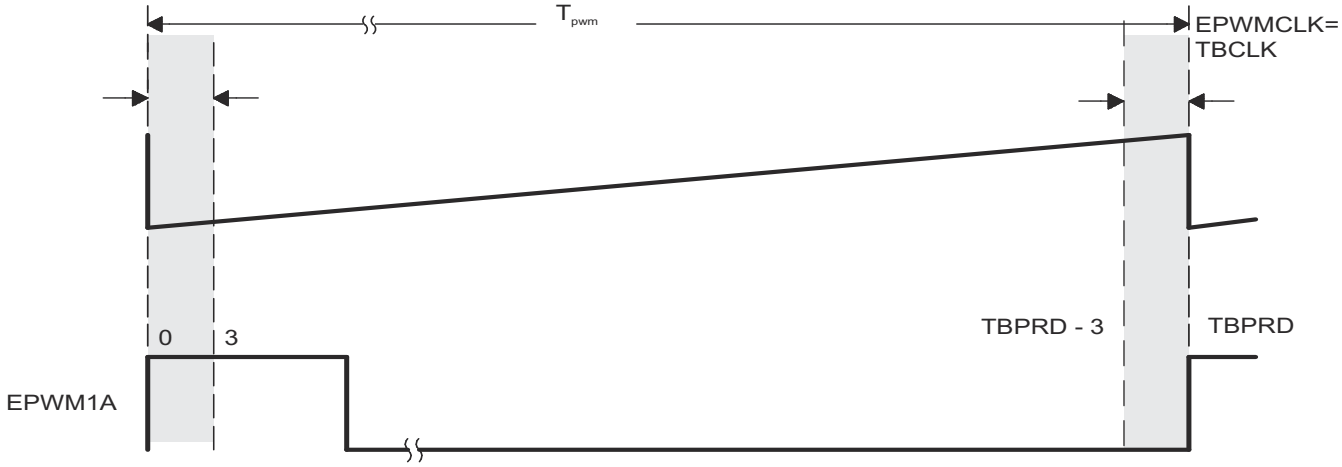

Figure 19-87. Up-Count Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 1)

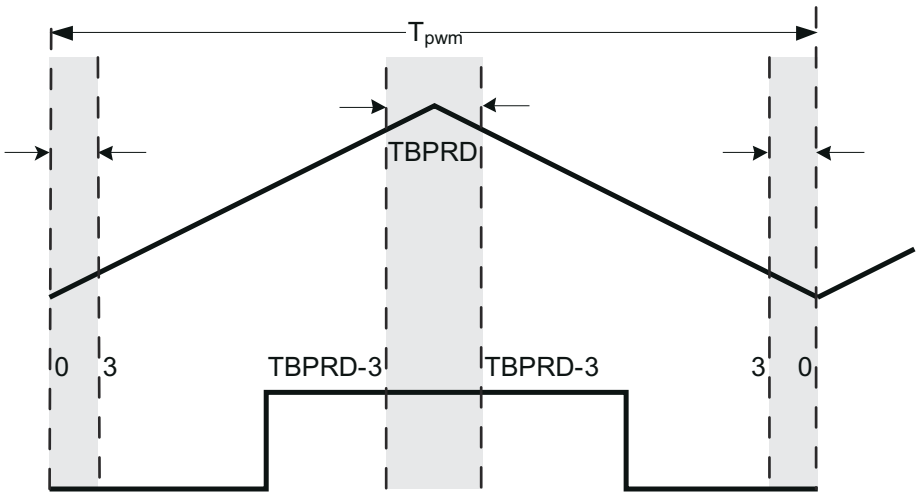

Figure 19-88. Up-Down Count Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 1)

19.15.1.5.4 High-Resolution Period

High-resolution period control using the MEP logic is supported on devices with a Type 1 ePWM module or greater.

Note

When high-resolution period control is enabled, on ePWMxA only, and not ePWMxB output and conversely, the non high-resolution output has ±1 TBCLK cycle jitter in up-count mode and ±2 TBCLK cycle jitter in up-down count mode.

The scaling procedure described for duty cycle in Section 19.15.1.5.2 applies for high-resolution period as well:

Assumptions for this example:

TBCLK	= 10ns (100MHz)
Required PWM frequency	= 175kHz (period of 571.428)
Number of MEP steps per coarse step at 180ps (10ns/180ps), (MEP_ScaleFactor)	= 55
Value to keep TBPRDHR within range of 1-255 and fractional rounding constant (default value)	= 0.5 (0080h in Q8 format)

Problem:

In up-count mode:

- If TBPRD = 571, then PWM frequency = 174.82kHz (period = (571+1)* T_{TBCLK}).
- If TBPRD = 570, then PWM frequency = 175.13kHz (period = (570+1)* T_{TBCLK}).

In up-down count mode:

- If TBPRD = 286, then PWM frequency = 174.82kHz (period = (286*2)* T_{TBCLK}).
- If TBPRD = 285, then PWM frequency = 175.44kHz (period = (285*2)* T_{TBCLK}).

Solution:

With 55 MEP steps per coarse step at 180ps each:

Step 1: Percentage Integer Period value conversion for TBPRD register

Integer period value	= 571 * T_{TBCLK}
	= int (571.428) * T_{TBCLK}
	= int (PWMperiod) * T_{TBCLK}
In up-count mode:	
TBPRD	= 570 (TBPRD = period value - 1)
	= 023Ah
In up-down count mode:	= 285 (TBPRD = period value/2)
TBPRD	= 011Dh

Step 2: Fractional value conversion for TBPRDHR register

In up-count mode:

TBPRDHR register value	= (frac(PWMperiod) * MEP_ScaleFactor + 0.5)
If auto-conversion enabled and HRMSTEP =	
MEP_ScaleFactor value (55):	= frac (PWMperiod) << 8 (Shifting is to move the value to the high byte of TBPRDHR)
TBPRDHR register value	= frac (571.428) << 8
	= 0.428 × 256
	= 6D00h
The auto-conversion then automatically performs the calculation, such that TBPRDHR MEP delay is scaled by hardware to:	= ((TBPRDHR(15:0) >> 8) × HRMSTEP + 80h) << 8
	= (006Dh × 55 + 80h) >> 8
	= (17EBh) >> 8
Period MEP delay	= 0017h MEP Steps

In up-down count mode:

TBPRDHR register value	= (frac(PWMperiod) * MEP_ScaleFactor + 0.5)
If auto-conversion enabled and HRMSTEP =	
MEP_ScaleFactor value (55):	= frac (PWMperiod / 2) << 8 (Shifting is to move the value to the high byte of TBPRDHR)
TBPRDHR register value	= frac (285.714) << 8
	= 0.714 × 256
	= B600h
The auto-conversion then automatically performs the calculation, such that TBPRDHR MEP delay is scaled by hardware to:	= ((TBPRDHR(15:0) >> 8) × HRMSTEP + 80h) << 8
	= (00B6h × 55 + 80h) >> 8
	= (279Ah) >> 8
Period MEP delay	= 0027h MEP Steps

19.15.1.5.4.1 High-Resolution Period Configuration

To use high-resolution period, the ePWMx module must be initialized in the exact order presented.

The following steps use CMPA with shadow registers and the corresponding HRCNFG bits for high-resolution operation on EPWMxA. For high-resolution operation on EPWMxB, make the appropriate substitutions with the B channel fields.

1. Enable ePWMx clock
2. Enable HRPWM clock
3. Disable TBCLKSYNC
4. Configure ePWMx registers - AQ, TBPRD, CC, and so on.
   - ePWMx can only be configured for up-count or up-down count modes. High-resolution period is not compatible with down-count mode.
   - TBPRD and CC registers must be configured for shadow loads.
   - CMPCTL[LOADAMODE]
     - In up-count mode: CMPCTL[LOADAMODE] = 1 (load on CTR = PRD)
     - In up-down count mode: CMPCTL[LOADAMODE] = 2 (load on CTR = 0 or CTR = PRD)
5. Configure the HRCNFG register such that:
   - HRCNFG[HRLOAD] = 2 (load on either CTR = 0 or CTR = PRD)
   - HRCNFG[AUTOCONV] = 1 (Enable auto-conversion)
   - HRCNFG[EDGMODE] = 3 (MEP control on both edges)
6. For TBPHS:TBPHSHR synchronization with high-resolution period, set both HRPCTL[TBPSHRLOADE] = 1 and TBCTL[PHSEN] = 1. In up-down count mode these bits must be set to 1 regardless of the contents of TBPHSHR.
7. Enable high-resolution period control (HRPCTL[HRPE] = 1)
8. Enable TBCLKSYNC
9. TBCTL[SWFSYNC] = 1
10. HRMSTEP must contain an accurate MEP scale factor (# of MEP steps per EPWMCLK coarse step) because auto-conversion is enabled. The MEP scale factor can be acquired using the SFO() function described in Section 19.15.2 .
11. To control high-resolution period, write to the TBPRDHR(M) registers.

Note

When high-resolution period mode is enabled, an EPWMxSYNC pulse introduces ±1-2 cycle jitter to the PWM (±1 cycle in up-count mode and ±2 cycle in up-down count mode). Otherwise, the jitter occurs on every PWM cycle with the synchronization pulse.

When a software synchronization pulse can be issued only once during high-resolution period initialization. If a software sync pulse is applied while the PWM is running, the jitter appears on the PWM output at the time of the sync pulse.

19.15.1.6 Deadband High-Resolution Operation

Note

In up-count mode, the dead-band module is not available when any high-resolution mode is enabled.

Assumptions for this example:

System clock	= 10ns (100MHz)
Deadband enabled in half-cycle mode, TBCLK = EPWMCLK	
Required PWM frequency	1.33MHz (1/750ns)
Required PWM duty cycle	0.5 (50%)
Required Deadband Rising-Edge Delay	5% over duty
Required Deadband Rising-Edge Delay in ns	(0.05 * 375ns) = 18.75ns

Note

Similar to the duty cycle restrictions when using HRPWM, the DBRED and DBFED values must be greater than 3 to use high-resolution deadband.

Deadband delay values as a function of DBFED and DBRED:

When half-cycle clocking is enabled, the formula to calculate the falling-edge delay (FED) and rising-edge delay (RED) becomes:

FED = DBFED * TBCLK / 2

RED = DBRED * TBCLK / 2

DBRED and DBFED calculated values:

Required Deadband Rising-Edge Delay in ns = 18.75ns

DBRED = RED / (TBCLK / 2)

DBRED = 18.75ns/5ns

DBRED Required = 3.75ns

With 55 MEP steps per coarse step at 180ps each:

Step 1: Integer Deadband value conversion for DBREDM register

Integer DBRED value	= int (RED / (TBCLK / 2))
	= int (3.75)
DBRED	= 3

Step 2: Fractional value conversion for Deadband high-resolution register DBREDHR

DBREDHR register value	= (frac(DBRED Required) * MEP_ScaleFactor + 0.5) << 8 (Shifting is to move the value to the high byte of DBREDHR)
	= (frac (3.75) * 55 + 0.5) << 8
	= (0.75 * 55 + 0.5) << 8
	= (41.75) * 256 Shifting left by 8 is the same as multiplying by 256.
DBREDHR value	= 29C0h MEP Steps
	Hardware ignores lower 9 bits in the above calculated DBREDHR value

Note

If the AUTOCONV bit (HRCNFG.6) is set and the MEP_ScaleFactor is in the HRMSTEP register, then DBREDHR:DBRED = frac((required DB value) < <8). The rest of the conversion calculations are performed automatically in hardware, and the correct MEP-scaled signal edge appears on the ePWM channel output. If AUTOCONV is not set, the above calculations must be performed by software.

19.15.1.7 Scale Factor Optimizing Software (SFO)

The micro edge positioner (MEP) logic is capable of placing an edge in one of 255 discrete time steps. As previously mentioned, the size of these steps is on the order of 150ps (see the device data sheet for typical MEP step size on your device). The MEP step size varies based on worst-case process parameters, operating temperature, and voltage. MEP step size increases with decreasing voltage and increasing temperature and decreases with increasing voltage and decreasing temperature. Applications that use the HRPWM feature can use the TI-supplied MEP scale factor optimization (SFO) software function. The SFO function helps to dynamically determine the number of MEP steps per EPWMCLK period while the HRPWM is in operation.

To utilize the MEP capabilities effectively, the correct value for the MEP scaling factor needs to be known by the software. To accomplish this, the HRPWM module has built in self-check and diagnostic capabilities that can be used to determine the optimum MEP scale factor value for any operating condition. TI provides a C-callable library containing one SFO function that utilizes this hardware and determines the optimum MEP scale factor. As such, MEP control and diagnostics registers are reserved for TI use.

A detailed description of the SFO library - SFO_TI_Build_V8.lib software can be found in SFO Library Software - SFO TI_Build_V8.lib.

19.15.1.8 HRPWM Examples Using Optimized Assembly Code

The best way to understand how to use the HRPWM capabilities is through two real examples:

1. Simple buck converter using asymmetrical PWM (count-up) with active high polarity.
2. DAC function using simple R+C reconstruction filter.

The following examples all have initialization and configuration code written in C. To make these easier to understand, the #defines shown below are used.

Example 19-2 assumes MEP step size of 150ps and does not use the SFO library.

Example 19-2. #Defines for HRPWM Header Files

```
// HRPWM (High Resolution PWM) //
================================
// HRCNFG
#define HR_Disable 0x0
#define HR_REP 0x1          // Rising Edge position
#define HR_FEP 0x2          // Falling Edge position
#define HR_BEP 0x3          // Both Edge position #define HR_CMP 0x0 // CMPAHR controlled
#define HR_PHS 0x1          // TBPHSHR controlled #define HR_CTR_ZERO 0x0 // CTR = Zero event
#define HR_CTR_PRD 0x1      // CTR = Period event
#define HR_CTR_ZERO_PRD 0x2 // CTR = ZERO or Period event
#define HR_NORM_B  0x0      // Normal ePWMxB output
#define HR_INVERT_B 0x1     // ePWMxB is inverted ePWMxA output
```

19.15.1.8.1 Implementing a Simple Buck Converter

In this example, the PWM requirements are:

- PWM frequency = 1MHz (that is, TBPRD = 100)
- PWM mode = asymmetrical, up-count
- Resolution = 12.7 bits (with a MEP step size of 150ps)

Figure 19-89 and Figure 19-90 show the required PWM waveform. As explained previously, configuration for the ePWM1 module is almost identical to the normal case except that the appropriate MEP options need to be enabled/selected.

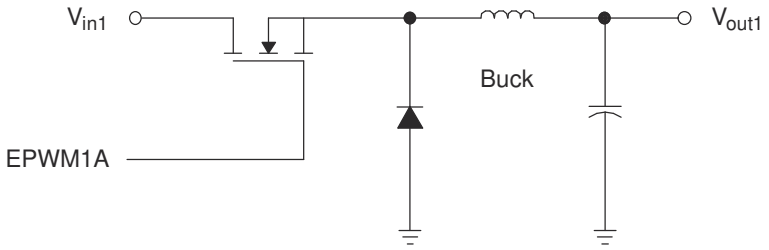

Figure 19-89. Simple Buck Controlled Converter Using a Single PWM

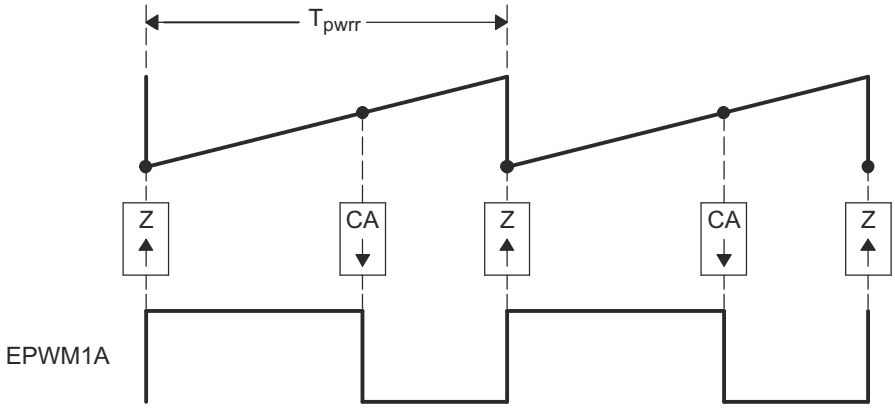

Figure 19-90. PWM Waveform Generated for Simple Buck Controlled Converter

The example code shown consists of two main parts:

- Initialization code (executed once)
- Run time code (typically executed within an ISR)

Example 19-3 shows the Initialization code. The first part is configured for conventional PWM. The second part sets up the HRPWM resources.

This example assumes MEP step size of 150ps and does not use the SFO library.

Example 19-4 shows an assembly example of run-time code for the HRPWM buck converter.

Example 19-3. HRPWM Buck Converter Initialization Code

```
void HrBuckDrvCnf(void)
 {
// Config for conventional PWM first
EPwm1Regs.TBCTL.bit.PRDLD = TB_IMMEDIATE;         // set Immediate load
EPwm1Regs.TBPRD = 100;                            // Period set for 1000kHz PWM
hrbuck_period = 200;                              // Used for Q15 to Q0 scaling
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;           // EPWM1 is the Sync Source

EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1;
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
// Note: ChB is initialized here only for comparison purposes, it is not required

EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;     // optional
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;       // optional
EPwm1Regs.AQCTLA.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;                // optional
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;              // optional
// Now configure the HRPWM resources
EALLOW;                                           // Note these registers are protected
                                                  // and act only on ChA
EPwm1Regs.HRCNFG.all = 0x0;                       // clear all bits first
EPwm1Regs.HRCNFG.bit.EDGMODE = HR_FEP;            // Control Falling Edge Position
EPwm1Regs.HRCNFG.bit.CTLMODE = HR_CMP;            // CMPAHR controls the MEP
EPwm1Regs.HRCNFG.bit.HRLOAD = HR_CTR_ZERO;        // Shadow load on CTR=Zero
EDIS;
MEP_ScaleFactor = 66*256;                         // Start with typical Scale Factor
                                                  // value for 100MHz
                                                  // Note: Use SFO functions to update
                                                     MEP_ScaleFactor dynamically
}
```

Example 19-4. HRPWM Buck Converter Run-Time Code

```
EPWM1_BASE .set 0x6800
CMPAHR1 .set EPWM1_BASE+0x8
;=============================================
HRBUCK_DRV; (can execute within an ISR or loop)
;=============================================
     MOVW DP, #_HRBUCK_In
     MOVL XAR2,@_HRBUCK_In       ; Pointer to Input Q15 Duty (XAR2)
     MOVL XAR3,#CMPAHR1          ; Pointer to HRPWM CMPA reg (XAR3)

; Output for EPWM1A (HRPWM)
     MOV T,*XAR2 ; T <= Duty
     MPYU ACC,T,@_hrbuck_period  ; Q15 to Q0 scaling based on Period
     MOV T,@_MEP_ScaleFactor     ; MEP scale factor (from optimizer s/w)
     MPYU P,T,@AL                ; P <= T * AL, Optimizer scaling
     MOVH @AL,P                  ; AL <= P, move result back to ACC
     ADD ACC, #0x080             ; MEP range and rounding adjustment
     MOVL *XAR3,ACC              ; CMPA:CMPAHR(31:8) <= ACC

; Output for EPWM1B (Regular Res) Optional - for comparison purpose only
     MOV *+XAR3[2],AH            ; Store ACCH to regular CMPB
```

19.15.1.8.2 Implementing a DAC Function Using an R+C Reconstruction Filter

In this example, the PWM requirements are:

- PWM frequency = 400kHz (that is, TBPRD = 250)
- PWM mode = Asymmetrical, Up-count
- Resolution = 14 bits (MEP step size = 150ps)

Figure 19-91 and Figure 19-92 show the DAC function and the required PWM waveform. As explained previously, configuration for the ePWM1 module is almost identical to the normal case except that the appropriate MEP options need to be enabled/selected.

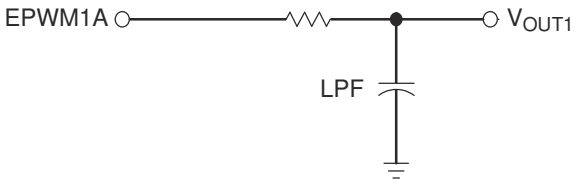

Figure 19-91. Simple Reconstruction Filter for a PWM-based DAC

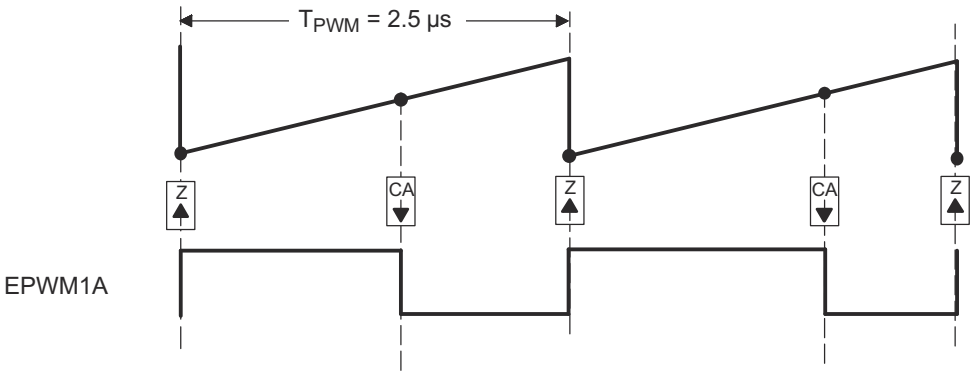

Figure 19-92. PWM Waveform Generated for the PWM DAC Function

The example code shown consists of two main parts:

- Initialization code (executed once)
- Run time code (typically executed within an ISR)

This example assumes a typical MEP_SP and does not use the SFO library.

Example 19-5 shows the Initialization code. The first part is configured for conventional PWM. The second part sets up the HRPWM resources.

Example 19-6 shows an assembly example of run-time code that can execute in a high-speed ISR loop.

Example 19-5. PWM DAC Function Initialization Code

```
void HrPwmDacDrvCnf(void)
{
// Config for conventional PWM first
EPwm1Regs.TBCTL.bit.PRDLD = TB_IMMEDIATE;      // Set Immediate load
EPwm1Regs.TBPRD = 250;                         // Period set for 400kHz PWM
hrDAC_period = 250;                            // Used for Q15 to Q0 scaling
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;        // EPWM1 is the Sync Source

EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1;
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
// Note: ChB is initialized here only for comparison purposes, it is not required

EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // optional
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;    // optional

EPwm1Regs.AQCTLA.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;             // optional
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;           // optional
// Now configure the HRPWM resources
EALLOW;                                        // Note these registers are protected
                                               // and act only on ChA.
EPwm1Regs.HRCNFG.all = 0x0;                    // Clear all bits first
EPwm1Regs.HRCNFG.bit.EDGMODE = HR_FEP;         // Control falling edge position
EPwm1Regs.HRCNFG.bit.CTLMODE = HR_CMP;         // CMPAHR controls the MEP.
EPwm1Regs.HRCNFG.bit.HRLOAD = HR_CTR_ZERO;     // Shadow load on CTR=Zero.
EDIS;
MEP_ScaleFactor = 66*256;                      // Start with typical Scale Factor
                                               // value for 100MHz.
                                               // Use SFO functions to update MEP_ScaleFactor
                                               // dynamically.
}
```

Example 19-6. PWM DAC Function Run-Time Code

```
EPWM1_BASE .set 0x6800
CMPAHR1 .set EPWM1_BASE+0x8
;================================================
HRPWM_DAC_DRV; (can execute within an ISR or loop)
;================================================

; Output for EPWM1A (HRPWM
      MOV T,*XAR2                      ; T <= duty
      MPY ACC,T,@_hrDAC_period         ; Q15 to Q0 scaling based on period
      ADD ACC,@_HrDAC_period<<15       ; Offset for bipolar operation
      MOV T,@_MEP_ScaleFactor          ; MEP scale factor (from optimizer s/w)
      MPYU P,T,@AL                     ; P <= T * AL, optimizer scaling
      MOVH @AL,P                       ; AL <= P, move result back to ACC
      ADD ACC, #0x080                  ; MEP range and rounding adjustment
      MOVL *XAR3,ACC                   ; CMPA:CMPAHR(31:8) <= ACC

; Output for EPWM1B (Regular Res) Optional - for comparison purpose only
      MOV *+XAR3[2],AH                 ; Store ACCH to regular CMPB
```

19.15.2 SFO Library Software - SFO_TI_Build_V8.lib

Table 19-19 lists several features of the SFO_TI_Build_V8.lib library.

Table 19-19. SFO Library Features

	SFO_TI_Build_V8.lib	Unit
Completion-checking?	Yes	Function return value
Typical cycles required for SFO() to update MEP_ScaleFactor if called repetitively without interrupts	130,000	EPWMCLK cycles

19.15.2.1 Scale Factor Optimizer Function - int SFO()

This routine drives the micro-edge positioner (MEP) calibration module to run SFO diagnostics and determine the appropriate MEP scale factor (number of MEP steps per coarse EPWMCLK step) for a device at any given time.

If EPWMCLK = TBCLK = 100MHz and assuming the MEP step size is 150ps, the typical scale factor value at 100MHz = 66 MEP steps per TBCLK unit (10ns)

The function returns a MEP scale factor value:

MEP_ScaleFactor = Number of MEP steps per EPWMCLK

Constraints when using this function:

- SFO() can be used with a minimum EPWMCLK = TBCLK = 50MHz. MEP diagnostics logic uses EPWMCLK and not TBCLK, so the EPWMCLK restriction is an important constraint. Below 50MHz with device process variation, the MEP step size can decrease under cold temperature and high core voltage conditions to such a point that 255 MEP steps do not span an entire EPWMCLK cycle.
- At any time, SFO() can be called to run SFO diagnostics on the MEP calibration module.

Usage:

- SFO() can be called at any time in the background while the ePWM channels are running in HRPWM mode. The scale factor result obtained can be applied to all ePWM channels running in HRPWM mode because the function makes use of the diagnostics logic in the MEP calibration module (which runs independently of ePWM channels).
- This routine returns a 1 when calibration is finished and a new scale factor has been calculated or returns a 0 if calibration is still running. The routine returns a 2 if there is an error, and the MEP_ScaleFactor is greater than the maximum 255 fine steps per coarse EPWMCLK cycle. In this case, the HRMSTEP register maintains the last MEP scale factor value less than 256 for auto conversion.
- All ePWM modules operating in HRPWM incur only a 3 EPWMCLK cycle minimum duty cycle limitation when high-resolution period control is not used. If high-resolution period control is enabled, there is an additional duty cycle limitation 3-EPWMCLK cycles before the end of the PWM period (see Section 19.15.1.5.3).
- The SFO() function also updates the HRMSTEP register with the scale factor result. If the HRCNFG[AUTOCONV] bit is set, the application software is responsible only for setting CMPAHR = fraction(PWMduty*PWMperiod) << 8 or CMPBHR = fraction(PWMduty*PWMperiod) << 8 or TBPRDHR = fraction (PWMperiod) while running SFO() in the background. The MEP Calibration Module then uses the values in the HRMSTEP and CMPAHR/CMPBHR/TBPRDHR register to automatically calculate the appropriate number of MEP steps represented by the fractional duty cycle or period and move the high-resolution ePWM signal edge accordingly.
- If the HRCNFG[AUTOCONV] bit is clear, the HRMSTEP register is ignored. The application software needs to perform the necessary calculations manually so that:
  - CMPAHR = (fraction(PWMduty * PWMperiod) * MEP Scale Factor) << 8 + 0x080.
  - Similar behavior applies for TBPHSHR, CMPBHR, DBREDHR, and DBFEDHR. Auto-conversion must be enabled when using TBPRDHR.

The following code snippet shows how to use the HRPWM DUTY using driverlib functions.

```
float32_t dutyFine = 85.62;
float32_t count = (dutyFine * (float32_t)(EPWM_TIMER_TBPRD << 8))/100;
uint32_t compCount = (count);
HRPWM_setCounterCompareValue(EPWM1_BASE, HRPWM_COUNTER_COMPARE_A, compCount);
HRPWM_setCounterCompareValue(EPWM1_BASE, HRPWM_COUNTER_COMPARE_B, compCount);
```

The routine can be run as a background task in a slow loop requiring negligible CPU cycles. The repetition rate at which an SFO function needs to be executed depends on the application's operating environment. As with all digital CMOS devices, temperature and supply voltage variations have an effect on MEP operation. However, in most applications these parameters vary slowly and therefore is often sufficient to execute the SFO function once every 5 to 10 seconds. If more rapid variations are expected, then execution can be performed more frequently to match the application. Note there is no high limit restriction on the SFO function repetition rate; hence, the SFO function can execute as quickly as the background loop is capable.

While using the HRPWM feature, HRPWM logic is not active for the first 3 EPWMCLK cycles of the PWM period (and the last 3 EPWMCLK cycles of the PWM period if TBPRDHR is used). While running the application in this configuration, if high-resolution period control is disabled (HRPCTL[HRPE = 0]) and the CMPA/CMPB register value is less than 3 cycles, then the CMPAHR/CMPBHR register must be cleared to zero. If high-resolution period control is enabled (HRPCTL[HRPE = 1]), the CMPA register value must not fall below 3 or above TBPRD-3.This can avoid any unexpected transitions on the PWM signal.

19.15.2.2 Software Usage

The software library function SFO(), calculates the MEP scale factor for the HRPWM-supported ePWM modules. The scale factor is an integer value in the range 1-255, and represents the number of micro step edge positions available for a system clock period. The scale factor value is returned in an integer variable called MEP_ScaleFactor. For example, see Table 19-20.

Table 19-20. Factor Values

Software Function call	Functional Description	Updated Variables
SFO()	Returns MEP scale factor in the HRMSTEP register	MEP_ScaleFactor and HRMSTEP register.

To use the HRPWM feature of the ePWMs, it is recommended that the SFO function be used as described here.

Step 1. Add "Include" Files

The SFO_V8.h file needs to be included as follows. This include file is mandatory while using the SFO library function. For the SFO() to operate, the appropriate (Device)_Device.h and (Device)_Epwm_defines.h must be included in the project. These include files are optional if customized header files are used in the end applications.

Example 19-7. A Sample of How to Add "Include" Files

```
#include "F28x7x_Device.h"         // F28x7x Headerfile
#include "F28x7x_EPwm_defines.h"   // init defines
#include "SFO_V8.h"                // SFO lib functions (needed for HRPWM)
```

Step 2. Element Declaration

Declare an integer variable for the scale factor value as shown below.

Example 19-8. Declaring an Element

```
int MEP_ScaleFactor = 0;   //scale factor value
volatile struct EPWM_REGS *ePWM[] = {0, &EPwm1Regs, &EPwm2Regs, &EPwm3Regs,
&EPwm4Regs};
```

Step 3. MEP_ScaleFactor Initialization

The SFO() function does not require a starting scale factor value in MEP_ScaleFactor. Prior to using the MEP_ScaleFactor variable in application code, SFO() can be called to drive the MEP calibration module to calculate an MEP_ScaleFactor value.

As part of the one-time initialization code prior to using MEP_ScaleFactor, include the following:

Example 19-9. Initializing With a Scale Factor Value

```
MEP_ScaleFactor initialized using function SFO ()
while (SFO() == 0) {} // MEP_ScaleFactor calculated by MEP Cal Module
```

Step 4. Application Code

While the application is running, fluctuations in both device temperature and supply voltage can be expected. To be sure that good Scale Factors are used for each ePWM module, the SFO function can be re-run periodically as part of a slower back-ground loop. Some examples of this are shown here.

Note

See the HRPWM_SFO example in the device-specific C/C++ header files and peripheral examples available from the TI website.

Example 19-10. SFO Function Calls

```
main ()
 {
 int status;
    // User code
    // ePWM1, 2, 3, 4 are running in HRPWM mode
    // The status variable returns 1 once a new MEP_ScaleFactor has been
    // calculated by the MEP Calibration Module running SFO
    // diagnostics.
status = SFO();
if(status==2) {ESTOP0;}   // The function returns a 2 if MEP_ScaleFactor is greater
                          // than the maximum 255 allowed (error condition)
 }
```

19.16.3 EPWM Examples

NOTE: These examples are located in the C2000Ware installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/epwm

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

19.16.3.1 ePWM Trip Zone

FILE: epwm_ex1_trip_zone.c

This example configures ePWM1 and ePWM2 as follows

- ePWM1 has TZ1 as one shot trip source
- ePWM2 has TZ1 as cycle by cycle trip source

Initially tie TZ1 high. During the test, monitor ePWM1 or ePWM2 outputs on a scope. Pull TZ1 low to see the effect.

External Connections

- ePWM1A is on GPIO0
- ePWM2A is on GPIO2
- TZ1 is on GPIO12

This example also makes use of the Input X-BAR. GPIO12 (the external trigger) is routed to the input X-BAR, from which it is routed to TZ1.

The TZ-Event is defined such that ePWM1A will undergo a One-Shot Trip and ePWM2A will undergo a Cycle-By-Cycle Trip.

19.16.3.2 ePWM Up Down Count Action Qualifier

FILE: epwm_ex2_updown_aq.c

This example configures ePWM1, ePWM2, ePWM3 to produce a waveform with independent modulation on ePWMxA and ePWMxB.

The compare values CMPA and CMPB are modified within the ePWM's ISR.

The TB counter is in up/down count mode for this example.

View the ePWM1A/B(GPIO0 & GPIO1), ePWM2A/B(GPIO2 &GPIO3) and ePWM3A/B(GPIO4 & GPIO5) waveforms on oscilloscope.

19.16.3.3 ePWM Synchronization

FILE: epwm_ex3_synchronization.c

This example configures ePWM1, ePWM2, ePWM3 and ePWM4 as follows
- ePWM1 without phase shift as sync source
- ePWM2 with phase shift of 300 TBCLKs
- ePWM3 with phase shift of 600 TBCLKs
- ePWM4 with phase shift of 900 TBCLKs

External Connections
- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B
- GPIO6 EPWM4A
- GPIO7 EPWM4B

Watch Variables
- None.

19.16.3.4 ePWM Digital Compare

FILE: epwm_ex4_digital_compare.c

This example configures ePWM1 as follows
- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND

External Connections
- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TZ1, pull this pin low to trip the ePWM

Watch Variables
- None.

19.16.3.5 ePWM Digital Compare Event Filter Blanking Window

FILE: epwm_ex5_digital_compare_event_filter.c

This example configures ePWM1 as follows

- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND
- ePWM1 with DCBEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND
- DCBEVT1 uses the filtered version of DCBEVT1
- The DCFILT signal uses the blanking window to ignore the DCBEVT1 for the duration of DC Blanking window

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1, pull this pin low to trip the ePWM

Watch Variables

- None.

19.16.3.6 ePWM Valley Switching

FILE: epwm_ex6_valley_switching.c

This example configures ePWM1 as follows

- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- ePWM1 with DCBEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- DCBEVT1 uses the filtered version of DCBEVT1
- The DCFILT signal uses the valley switching module to delay the
- DCFILT signal by a software defined DELAY value.

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1 (Output Pin, toggled through software)

Watch Variables

- None.

19.16.3.7 ePWM Digital Compare Edge Filter

FILE: epwm_ex7_edge_filter.c

This example configures ePWM1 as follows

- ePWM1 with DCBEVT2 forcing the ePWM output LOW as a CBC source
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCBEVT2
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- The DCBEVT2 is the source for DCFILT
- The DCFILT will count edges of the DCBEVT2 and generate a signal to to trip the ePWM on the 4th edge of DCBEVT2

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1 (Output Pin, toggled through software)

Watch Variables

- None.

19.16.3.8 ePWM Deadband

FILE: epwm_ex8_deadband.c

This example configures ePWM1 through ePWM6 as follows

- ePWM1 with Deadband disabled (Reference)
- ePWM2 with Deadband Active High
- ePWM3 with Deadband Active Low
- ePWM4 with Deadband Active High Complimentary
- ePWM5 with Deadband Active Low Complimentary
- ePWM6 with Deadband Output Swap (switch A and B outputs)

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B
- GPIO6 EPWM4A
- GPIO7 EPWM4B
- GPIO8 EPWM5A
- GPIO9 EPWM5B
- GPIO10 EPWM6A
- GPIO11 EPWM6B

Watch Variables

- None.

19.16.3.9 ePWM DMA

FILE: epwm_ex9_dma.c

This example configures ePWM1 and DMA as follows:

- ePWM1 is set up to generate PWM waveforms
- DMA5 is set up to update the CMPAHR, CMPA, CMPBHR and CMPB every period with the next value in the configuration array. This allows the user to create a DMA enabled fifo for all the CMPx and CMPxHR registers to generate unconventional PWM waveforms.
- DMA6 is set up to update the TBPHSHR, TBPHS, TBPRDHR and TBPRD every period with the next value in the configuration array.
- Other registers such as AQCTL can be controlled through the DMA as well by following the same procedure. (Not used in this example)

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B

Watch Variables

- None.

19.16.3.10 ePWM Chopper

FILE: epwm_ex10_chopper.c

This example configures ePWM1, ePWM2, ePWM3 and ePWM4 as follows

- ePWM1 with Chopper disabled (Reference)
- ePWM2 with chopper enabled at 1/8 duty cycle
- ePWM3 with chopper enabled at 6/8 duty cycle
- ePWM4 with chopper enabled at 1/2 duty cycle with One-Shot Pulse enabled

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B
- GPIO6 EPWM4A
- GPIO7 EPWM4B

Watch Variables

- None.

19.16.3.11 EPWM Configure Signal

FILE: epwm_ex11_configure_signal.c

This example configures ePWM1, ePWM2, ePWM3 to produce signal of desired frequency and duty. It also configures phase between the configured modules.

Signal of 10kHz with duty of 0.5 is configured on ePWMxA & ePWMxB with ePWMxB inverted. Also, phase of 120 degree is configured between ePWM1 to ePWM3 signals.

During the test, monitor ePWM1, ePWM2, and/or ePWM3 outputs on an oscilloscope.

- ePWM1A is on GPIO0
- ePWM1B is on GPIO1
- ePWM2A is on GPIO2
- ePWM2B is on GPIO3
- ePWM3A is on GPIO4
- ePWM3B is on GPIO5

19.16.3.12 Realization of Monoshot mode

FILE: epwm_ex12_monoshot_mode.c

This example showcases how to generate monoshot PWM output based on external trigger, that is, generating just a single pulse output on receipt of an external trigger. And the next pulse is generated only when the next trigger comes. The example utilizes external synchronization and T1 action qualifier event features to achieve the desired output.

ePWM1 is used to generate the monoshot output and ePWM2 is used an external trigger for that. No external connections are required as ePWM2A is fed as the trigger using Input X-BAR automatically.

ePWM1 is configured to generated a single pulse of 0.5 µs when received an external trigger. This is achieved by enabling the phase synchronization feature and configuring EPWMxSYNCI as EXTSYNCIN1. And this EPWMxSYNCI is also configured as T1 event of action qualifier to set output HIGH while CTR = PRD action is used to set output LOW.

ePWM2 is configured to generate a 100 KHz signal with a duty of 1% (to simulate a rising edge trigger) which is routed to EXTSYNCIN1 using Input XBAR.

Observe GPIO0 (EPWM1A : Monoshot Output) and GPIO2(EPWM2 : External Trigger) on oscilloscope.

NOTE : In the following example, the ePWM timer is still running in a continuous mode rather than a one-shot mode thus for more reliable implementation, refer to CLB based one shot PWM implementation demonstrated in "clb_ex17_one_shot_pwm" example

19.16.3.13 EPWM Action Qualifier (epwm_up_aq)

FILE: epwm_ex13_up_aq.c

This example configures ePWM1, ePWM2, ePWM3 to produce an waveform with independent modulation on EPWMxA and EPWMxB.

The compare values CMPA and CMPB are modified within the ePWM's ISR.

The TB counter is in up count mode for this example.

View the EPWM1A/B(GPIO0 & GPIO1), EPWM2A/B(GPIO2 & GPIO3) and EPWM3A/B(GPIO4 & GPIO5) waveforms via an oscilloscope.

19.16.4 HRPWM Examples

NOTE: These examples are located in the C2000Ware installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/hrpwm

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

19.16.4.1 HRPWM Duty Control with SFO

FILE: hrpwm_ex1_duty_sfo.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();
- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections
- Monitor ePWM1/2 A/B pins on an oscilloscope.

19.16.4.2 HRPWM Slider

FILE: hrpwm_ex2_slider.c

This example modifies the MEP control registers to show edge displacement due to HRPWM. Control blocks of the respective ePWM module channel A and B have fine edge movement due to HRPWM logic.

Monitor ePWM1 A/B pins on an oscilloscope.

19.16.4.3 HRPWM Period Control

FILE: hrpwm_ex3_prd_updown_sfo.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up-Down count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

19.16.4.4 HRPWM Duty Control with UPDOWN Mode

FILE: hrpwm_ex4_duty_updown_sfo.c

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

19.16.4.5 HRPWM Slider Test

FILE: hrpwm_ex5_slider_qformat.c

This example modifies the MEP control registers to show edge displacement due to HRPWM. Control blocks of the respective ePWM module channel A and B will have fine edge movement due to HRPWM logic. Load the hrpwm_slider.gel file. Select the HRPWM_eval from the GEL menu. A FineDuty slider graphics will show up in CCS. Load the program and run. Use the Slider to and observe the EPWM edge displacement for each slider step change. This explains the MEP control on the EPwmxA channels.

Monitor ePWM1 & ePWM2 A/B pins on an oscilloscope.

19.16.4.6 HRPWM Duty Up Count

FILE: hrpwm_ex6_duty_sfo_qformat.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)

- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

To run this example:

1. Run this example at maximum SYSCLKOUT
2. Activate Real time mode
3. Run the code

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

Watch Variables

- status - Example run status
- updateFine - Set to 1 use HRPWM capabilities and observe in fine MEP steps(default) Set to 0 to disable HRPWM capabilities and observe in coarse SYSCLKOUT cycle steps

19.16.4.7 HRPWM Period Up-Down Count

FILE: hrpwm_ex7_prd_updown_sfo_qformat.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up-Down count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

To run this example:

1. Run this example at maximum SYSCLKOUT
2. Activate Real time mode
3. Run the code

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

Watch Variables

- updateFine - Set to 1 use HRPWM capabilities and observe in fine MEP steps(default) Set to 0 to disable HRPWM capabilities and observe in coarse SYSCLKOUT cycle steps

19.17 EPWM Registers

This section describes the EPWM Registers.

19.17.1 EPWM Base Address Table

Table 19-23. EPWM Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
EPwm1Regs	EPWM_REGS	EPWM1_BASE	0x0000_4000	YES	YES	YES	YES
EPwm2Regs	EPWM_REGS	EPWM2_BASE	0x0000_4100	YES	YES	YES	YES
EPwm3Regs	EPWM_REGS	EPWM3_BASE	0x0000_4200	YES	YES	YES	YES
EPwm4Regs	EPWM_REGS	EPWM4_BASE	0x0000_4300	YES	YES	YES	YES
EPwm5Regs	EPWM_REGS	EPWM5_BASE	0x0000_4400	YES	YES	YES	YES
EPwm6Regs	EPWM_REGS	EPWM6_BASE	0x0000_4500	YES	YES	YES	YES
EPwm7Regs	EPWM_REGS	EPWM7_BASE	0x0000_4600	YES	YES	YES	YES
EPwm8Regs	EPWM_REGS	EPWM8_BASE	0x0000_4700	YES	YES	YES	YES
EPwm9Regs	EPWM_REGS	EPWM9_BASE	0x0000_4800	YES	YES	YES	YES
EPwm10Regs	EPWM_REGS	EPWM10_BASE	0x0000_4900	YES	YES	YES	YES
EPwm11Regs	EPWM_REGS	EPWM11_BASE	0x0000_4A00	YES	YES	YES	YES
EPwm12Regs	EPWM_REGS	EPWM12_BASE	0x0000_4B00	YES	YES	YES	YES

19.17.2 EPWM_REGS Registers

Table 19-24 lists the memory-mapped registers for the EPWM_REGS registers. All register offset addresses not listed in Table 19-24 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. Table 19-25 shows the codes that are used for access types in this section.

Table 19-25. EPWM_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
WOnce	W Once	Write Write once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

19.17.2.1 TBCTL Register (Offset = 0h) [Reset = 0083h]

TBCTL is shown in Figure 19-93 and described in Table 19-26.

Return to the Summary Table.

Time Base Control Register

Figure 19-93. TBCTL Register

15	14	13	12	11	10	9	8
FREE_SOFT		PHSDIR	CLKDIV			HSPCLKDIV	
R/W-0h		R/W-0h	R/W-0h			R/W-1h	
7	6	5	4	3	2	1	0
HSPCLKDIV	SWFSYNC	RESERVED		PRDLD	PHSEN	CTRMODE	
R/W-1h	R-0/W1S-0h	R-0h		R/W-0h	R/W-0h	R/W-3h	

Table 19-26. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events 00: Stop after the next time-base counter increment or decrement 01: Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period (TBCTR = TBPRD) - Down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) - Up-down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) 1x: Free run Reset type: SYSRSn
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0: Count down after the synchronization event. 1: Count up after the synchronization event. Reset type: SYSRSn
12-10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value (TBCLK = EPWMCLK/(HSPCLKDIV * CLKDIV): 000: /1 (default on reset) 001: /2 010: /4 011: /8 100: /16 101: /32 110: /64 111: /128 Reset type: SYSRSn

Table 19-26. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. TBCLK = EPWMCLK / (HSPCLKDIV x CLKDIV). This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager (EV) peripheral. 000: /1 001: /2 (default on reset) 010: /4 011: /6 100: /8 101: /10 110: /12 111: /14 Reset type: SYSRSn
6	SWFSYNC	R-0/W1S	0h	Software Forced Sync Pulse 0: Writing a 0 has no effect and reads always return a 0. 1: Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to affect EPWMxSYNCO by setting the EPWMSYNCOUTEN.SWEN bit. Reset type: SYSRSn
5-4	RESERVED	R	0h	Reserved
3	PRDLD	R/W	0h	Active Period Reg Load from Shadow Select 0: The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode (Shadow register bypassed): A write or read to the TBPRD register accesses the active register. Reset type: SYSRSn
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0: Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS). 1: Allow Counter to be loaded from the Phase register (TBPHS) and shadow to active load events when an EPWMxSYNCI input signal occurs or a software-forced sync signal, see bit 6. Reset type: SYSRSn
1-0	CTRMODE	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00: Up-count mode 01: Down-count mode 10: Up-down count mode 11: Freeze counter operation (default on reset) Reset type: SYSRSn

19.17.2.2 TBCTL2 Register (Offset = 1h) [Reset = 0000h]

TBCTL2 is shown in Figure 19-94 and described in Table 19-27.

Return to the Summary Table.

7	6	5	4	3	2	1	0
LOADREDMODE		IN_MODE		POLSEL		OUT_MODE	
R/W-0h		R/W-0h		R/W-0h		R/W-0h	

Table 19-35. DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0: Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1: Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2. Reset type: SYSRSn
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control (S8 switch) 0: Rising edge delay applied to InA/InB as selected by S4 switch (IN-MODE bits) on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch (INMODE bits) on B signal path only. 1: Rising edge delay and falling edge delay applied to source selected by S4 switch (INMODE bits) and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid. Reset type: SYSRSn
13-12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00: OutA and OutB signals are as defined by OUT-MODE bits. 01: OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path). 10: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = B-path as defined by OUT-MODE bits. 11: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path). Reset type: SYSRSn
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0: Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate 'FED dead-band action.' 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy). Reset type: SYSRSn

Table 19-35. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	SHDWDBREDMODE	R/W	0h	RED Dead-Band Load Mode 0: Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate 'RED dead-band action.' 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy). Reset type: SYSRSn
9-8	LOADFEDMODE	R/W	0h	Active DBFED Load from Shadow Select Mode 00: Load on Counter = 0 (CNT_eq) 01: Load on Counter = Period (PRD_eq) 10: Load on either Counter = 0, or Counter = Period 11: Freeze (no loads possible) Note: has no effect in Immediate mode. Reset type: SYSRSn
7-6	LOADREDMODE	R/W	0h	Active DBRED Load from Shadow Select Mode 00: Load on Counter = 0 (CNT_eq) 01: Load on Counter = Period (PRD_eq) 10: Load on either Counter = 0, or Counter = Period 11: Freeze (no loads possible) Note: has no effect in Immediate mode. Reset type: SYSRSn
5-4	IN_MODE	R/W	0h	Dead-Band Input Mode Control Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 00: EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 01: EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 10: EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 11: EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal. Reset type: SYSRSn
3-2	POLSEL	R/W	0h	Polarity Select Control Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes. 00: Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default). 01: Active low complementary (ALC) mode. EPWMxA is inverted. 10: Active high complementary (AHC). EPWMxB is inverted. 11: Active low (AL) mode. Both EPWMxA and EPWMxB are inverted. Reset type: SYSRSn

Table 19-35. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00: DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01: Apath = InA (delay is by-passed for A signal path) Bpath = FED (Falling Edge Delay in B signal path) 10: Apath = RED (Rising Edge Delay in A signal path) Bpath = InB (delay is by-passed for B signal path) 11: DBM is fully enabled (i.e. both RED and FED active) Reset type: SYSRSn

19.17.2.11 DBCTL2 Register (Offset = Dh) [Reset = 0000h]

DBCTL2 is shown in Figure 19-103 and described in Table 19-36.

Bit	Field	Type	Reset	Description
15-14	RESERVED	R/W	0h	Reserved
13	RESERVED	R-0	0h	Reserved
12-11	HRLOADB	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPBHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 01: Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 10: Load on either CTR = Zero or CTR = PRD 11: Reserved Reset type: SYSRSn
10	CTLMODEB	R/W	0h	Control Mode Bits Selects the register (CMP/TBPRD or TBPHS) that controls the MEP: 0: CMPBHR(8) or TBPRDHR(8) Register controls the edge position (i.e., this is duty or period control mode). (Default on Reset) 1: TBPHSHR(8) Register controls the edge position (i.e., this is phase control mode). Reset type: SYSRSn
9-8	EDGMODEB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position (MEP) logic: 00: HRPWM capability is disabled (default on reset) 01: MEP control of rising edge (CMPBHR) 10: MEP control of falling edge (CMPBHR) 11: MEP control of both edges (TBPHSHR or TBPRDHR) Reset type: SYSRSn
7	SWAPAB	R/W	0h	Swap ePWM A & B Output Signals This bit enables the swapping of the A & B signal outputs. The selection is as follows: 0: ePWMxA and ePWMxB outputs are unchanged. 1: ePWMxA signal appears on ePWMxB output and ePWMxB signal appears on ePWMxA output. Reset type: SYSRSn

Table 19-42. HRCNFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	AUTOCONV	R/W	0h	Auto Convert Delay Line Value Selects whether the fractional duty cycle/period/phase in the CMPAHR/TBPRDHR/TBPHSHR register is automatically scaled by the MEP scale factor in the HRMSTEP register or manually scaled by calculations in application software. The SFO library function automatically updates the HRMSTEP register with the appropriate MEP scale factor. 0: Automatic HRMSTEP scaling is disabled. 1: Automatic HRMSTEP scaling is enabled. If application software is manually scaling the fractional duty cycle, or phase (i.e. software sets CMPAHR = (fraction(PWMduty * PWMperiod) * MEP Scale Factor)<<8 + 0x080 for duty cycle), then this mode must be disabled. Reset type: SYSRSn
5	SELOUTB	R/W	0h	EPWMxB Output Select Bit This bit selects which signal is output on the ePWMxB channel output. The inversion will take the high resolution mode into account and the inverted signal will contain any high resolution modification. The inversion takes place as the last step in modifying the ePWMxB signal. 0: ePWMxB output is normal. 1: ePWMxB output is inverted version of ePWMxA signal. Reset type: SYSRSn
4-3	HRLOAD	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 01: Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 10: Load on either CTR = Zero or CTR = PRD 11: Reserved Reset type: SYSRSn
2	CTLMODE	R/W	0h	Control Mode Bits Selects the register (CMP/TBPRD or TBPHS) that controls the MEP: 0: CMPAHR(8) or TBPRDHR(8) Register controls the edge position (i.e., this is duty or period control mode). (Default on Reset) 1: TBPHSHR(8) Register controls the edge position (i.e., this is phase control mode). Reset type: SYSRSn
1-0	EDGMODE	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position (MEP) logic: 00: HRPWM capability is disabled (default on reset) 01: MEP control of rising edge (CMPAHR) 10: MEP control of falling edge (CMPAHR) 11: MEP control of both edges (TBPHSHR or TBPRDHR) Reset type: SYSRSn

19.17.2.18 HRPWR Register (Offset = 21h) [Reset = 0000h]

HRPWR is shown in Figure 19-110 and described in Table 19-43.

Return to the Summary Table.

HRPWM Power Register
This register is only accessible on EPWM modules with HRPWM capabilities.

15-7	RESERVED	R-0	0h	Reserved
6-4	PWMSYNCSELX	R/W	0h	Extended selection bits for EPWMSYNCPER 000: EPWMSYNCPER is defined by PWMSYNCSEL - > default condition (compatible with previous EPWM versions) 001: Reserved 010: Reserved 011: Reserved 100: CTR = CMPC, Count direction Up 101: CTR = CMPC, Count direction Down 110: CTR = CMPD, Count direction Up 111: CTR = CMPD, Count direction Down Reset type: SYSRSn
3	RESERVED	R/W	0h	Reserved
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize ePWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple ePWM modules operating at the same frequency to be phase aligned with high-resolution. 0: Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1: Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled. Reset type: SYSRSn
1	PWMSYNCSEL	R/W	0h	PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 1 CTR = zero: Time-base counter equal to zero (TBCTR = 0x00) Reset type: SYSRSn

Table 19-46. HRPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	HRPE	R/W	0h	High Resolution Period Enable Bit 0: High resolution period feature disabled. In this mode the ePWM behaves as a Type 4 ePWM. 1: High resolution period enabled. In this mode the HRPWM module can control high-resolution of both the duty and frequency. When high-resolution period is enabled, TBCTL[CTRMODE] = 0,1 (down-count mode) is not supported. Reset type: SYSRSn

19.17.2.22 TRREM Register (Offset = 2Eh) [Reset = 0000h]

TRREM is shown in Figure 19-114 and described in Table 19-47.

Return to the Summary Table.

HRPWM High Resolution Remainder Register
This register is only accessible on EPWM modules with HRPWM capabilities.

Table 19-47. TRREM Register Field Descriptions

Bit	Field	Type	Reset	Description
15-11	RESERVED	R-0	0h	Reserved
10-0	TRREM	R/W	0h	HRPWM Remainder Bits: This 11-bit value keeps track of the remainder portion of the HRPWM algorithm calculations. This value keeps track of the remainder portion of the HRPWM hardware calculations. Notes: 1. The lower 8-bits of the TRREM register can be automatically initialized with the TBPHSHR value on a SYNCIN or TBCTL[SWFSYNC] event or DC event (if enabled). The user can also write a value with the CPU. 2. Priority of TRREM register updates: Sync (software or hardware) TBPHSHR copied to TRREM : Highest Priority HRPWM Hardware (updates TRREM register): Next priority CPU Write To TRREM Register: Lowest Priority 3. Bit 10 of TRREM register is not used in asymmetrical mode. This bit can be forced to zero. TRREM will be initialized to 0x0 and 0x100 in Up and Up-down modes respectively. Asymmetrical Mode: TRREM[7:0] = TBPHSHR[15:8] TRREM[10,9,8] = 0,0,0 Symmetrical Mode: TRREM[7:0] = TBPHSHR[15:8] TRREM[10,9,8] = 0,0,1 Reset type: SYSRSn

19.17.2.23 GLDCTL Register (Offset = 34h) [Reset = 0000h]

GLDCTL is shown in Figure 19-115 and described in Table 19-48.

Return to the Summary Table.

19.17.2.36 TBPHS Register (Offset = 60h) [Reset = 00000000h]

TBPHS is shown in Figure 19-128 and described in Table 19-61.

Return to the Summary Table.

Time Base Phase High

Figure 19-128. TBPHS Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TBPHS																TBPHSHR															
R/W-0h																R/W-0h															

Table 19-61. TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TBPHS	R/W	0h	Phase Offset Register These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal. - If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. - If TBCTL[PHSEN] = 1, then the time-base counter (TBCTR) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCI) or by a software forced synchronization. Reset type: SYSRSn
15-0	TBPHSHR	R/W	0h	Phase Offset (High Resolution) Register. TBPHSHR must not be used. Instead TRREM (HRPWM remainder register) must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero Reset type: SYSRSn

19.17.2.37 TBPRDHR Register (Offset = 62h) [Reset = 0000h]

TBPRDHR is shown in Figure 19-129 and described in Table 19-62.

Return to the Summary Table.

R/W-0h							
7	6	5	4	3	2	1	0
TBPRDHR							
R/W-0h							

Table 19-62. TBPRDHR Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPRDHR	R/W	0h	Period High Resolution Bits The upper 8-bits contain the high-resolution portion of the period value. The TBPRDHR register is not affected by the TBCTL[PRDLD] bit. Reads from this register always reflect the shadow register. Likewise writes are also to the shadow register. The TBPRDHR register is only used when the high resolution period feature is enabled. This register is only available with ePWM modules which support high-resolution period control. The lower 8 bits in this register are ignored - writes are ignored and reads return zero Reset type: SYSRSn

19.17.2.38 TBPRD Register (Offset = 63h) [Reset = 0000h]

TBPRD is shown in Figure 19-130 and described in Table 19-63.

Return to the Summary Table.

Time Base Period Register

7	6	5	4	3	2	1	0
TBPRD							
R/W-0h							

Table 19-63. TBPRD Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPRD	R/W	0h	Time Base Period Register These bits determine the period of the time-base counter. This sets the PWM frequency. Shadowing of this register is enabled and disabled by the TBCTL[PRDLD] bit. By default this register is shadowed. - If TBCTL[PRDLD] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the active register will be loaded from the shadow register when the time-base counter equals zero. - If TBCTL[PRDLD] = 1, then the shadow is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - The active and shadow registers share the same memory map address. Reset type: SYSRSn

19.17.2.39 CMPA Register (Offset = 6Ah) [Reset = 00000000h]

CMPA is shown in Figure 19-131 and described in Table 19-64.

Return to the Summary Table.

Counter Compare A Register

Figure 19-131. CMPA Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMPA																CMPAHR															
R/W-0h																R/W-0h															

Table 19-64. CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CMPA	R/W	0h	Compare A Register The value in the active CMPA register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a 'time-base counter equal to counter compare A' event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: - Do nothing the event is ignored. - Clear: Pull the EPWMxA and/or EPWMxB signal low - Set: Pull the EPWMxA and/or EPWMxB signal high - Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. - If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. - Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. - If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - In either mode, the active and shadow registers share the same memory map address. Reset type: SYSRSn
15-0	CMPAHR	R/W	0h	Compare A HRPWM Extension Register The UPPER 8-bits contain the high-resolution portion (most significant 8-bits) of the counter-compare A value. CMPA:CMPAHR can be accessed in a single 32-bit read/write. Shadowing is enabled and disabled by the CMPCTL[SHDWAMODE] bit as described for the CMPA register. The lower 8 bits in this register are ignored Reset type: SYSRSn

19.17.2.40 CMPB Register (Offset = 6Ch) [Reset = 00000000h]

CMPB is shown in Figure 19-132 and described in Table 19-65.

Return to the Summary Table.

Compare B Register

Figure 19-132. CMPB Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMPB																CMPBHR															
R/W-0h																R/W-0h															

Table 19-65. CMPB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CMPB	R/W	0h	Compare B Register The value in the active CMPB register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a 'time-base counter equal to counter compare B' event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: - Do nothing the event is ignored. - Clear: Pull the EPWMxA and/or EPWMxB signal low - Set: Pull the EPWMxA and/or EPWMxB signal high - Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWBMODE] bit. By default this register is shadowed. - If CMPCTL[SHDWBMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADBMODE] bit field determines which event will load the active register from the shadow register. - Before a write, the CMPCTL[SHDWBFULL] bit can be read to determine if the shadow register is currently full. - If CMPCTL[SHDWBMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - In either mode, the active and shadow registers share the same memory map address. Reset type: SYSRSn
15-0	CMPBHR	R/W	0h	Compare B High Resolution Bits The lower 8 bits in this register are ignored Reset type: SYSRSn

19.17.2.41 CMPC Register (Offset = 6Fh) [Reset = 0000h]

CMPC is shown in Figure 19-133 and described in Table 19-66.

Return to the Summary Table.

Counter Compare C Register

6	DCBEVT2	R	0h	Latched Status Flag for Digital Compare Output B Event 2 0: Indicates no trip event has occurred on DCBEVT2 1: Indicates a trip event has occurred for the event defined for DCBEVT2 Reset type: SYSRSn
5	DCBEVT1	R	0h	Latched Status Flag for Digital Compare Output B Event 1 0: Indicates no trip event has occurred on DCBEVT1 1: Indicates a trip event has occurred for the event defined for DCBEVT1 Reset type: SYSRSn
4	DCAEVT2	R	0h	Latched Status Flag for Digital Compare Output A Event 2 0: Indicates no trip event has occurred on DCAEVT2 1: Indicates a trip event has occurred for the event defined for DCAEVT2 Reset type: SYSRSn
3	DCAEVT1	R	0h	Latched Status Flag for Digital Compare Output A Event 1 0: Indicates no trip event has occurred on DCAEVT1 1: Indicates a trip event has occurred for the event defined for DCAEVT1 Reset type: SYSRSn
2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event 0: No one-shot trip event has occurred. 1: Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn

Table 19-77. TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event 0: No cycle-by-cycle trip event has occurred. 1: Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x00) if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn
0	INT	R	0h	Latched Trip Interrupt Status Flag 0: Indicates no interrupt has been generated. 1: Indicates an EPWMx_TZINT PIE interrupt was generated because of a trip condition. No further EPWMx_TZINT PIE interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn

19.17.2.53 TZCBCFLG Register (Offset = 94h) [Reset = 0000h]

TZCBCFLG is shown in Figure 19-145 and described in Table 19-78.

Table 19-85. ETPS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	SOCBCNT	R	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Counter Register These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred. Reset type: SYSRSn
13-12	SOCBPRD	R/W	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Period Select These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCBEN] = 1). The SOCB pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCB] = 1). Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 00: Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 01: Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 0,1 10: Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 1,0 11: Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 1,1 Reset type: SYSRSn
11-10	SOCACNT	R	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Counter Register These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred. Reset type: SYSRSn

Table 19-85. ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	SOCAPRD	R/W	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Period Select These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCAEN] = 1). The SOCA pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCA] = 1). Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 00: Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 01: Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 0,1 10: Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 1,0 11: Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 1,1 Reset type: SYSRSn
7-6	RESERVED	R-0	0h	Reserved
5	SOCPSSEL	R/W	0h	EPWMxSOC A/B Pre-Scale Selection Bits 0: Selects ETPS [SOCACNT/SOCBCNT] and [SOCAPRD/SOCBPRD] registers to determine frequency of events (SOC pulse once every 0-3 events). 1: Selects ETSOCPS [SOCACNT2/SOCBCNT2] and [SOCAPRD2/SOCBPRD2] registers to determine frequency of events (SOC pulse once every 0-15 events). Reset type: SYSRSn
4	INTPSSEL	R/W	0h	EPWMxINTn Pre-Scale Selection Bits 0: Selects ETPS [INTCNT, and INTPRD] registers to determine frequency of events (interrupt once every 0-3 events). 1: Selects ETINTPS [INTCNT2, and INTPRD2] registers to determine frequency of events (interrupt once every 0-15 events). Reset type: SYSRSn
3-2	INTCNT	R	0h	ePWM Interrupt Event (EPWMx_INT) Counter Register These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred. Reset type: SYSRSn

Table 19-85. ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	INTPRD	R/W	0h	ePWM Interrupt (EPWMx_INT) Period Select These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 00: Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored. 01: Generate an interrupt on the first event INTCNT = 01 (first event) 10: Generate interrupt on ETPS[INTCNT] = 1,0 (second event) 11: Generate interrupt on ETPS[INTCNT] = 1,1 (third event) Reset type: SYSRSn

7	6	5	4	3	2	1	0
RESERVED						SHDWMODE	CAPE
R-0-0h						R/W-0h	R/W-0h

Table 19-97. DCCAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CAPMODE	R/W	0h	Counter Capture Mode 0: When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs, further trip (capture) events are ignored until the next PRD_eq or CNT_zero event (as selected by the PULSESEL bit in the DCFCTL register) re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCCAPCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCCAPCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event (whichever is selected by PULSESEL bit in DCFCTL register). CPU reads of this register will return the shadow register value. 1: When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs - it will set the CAPSTS flag and further trip (capture) events are ignored until this bit is cleared. CAPSTS can be cleared by writing to CAPCLR bit in DCCAPCTL register and it re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCCAPCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCCAPCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event (whichever is selected by PULSESEL bit in DCFCTL register). CPU reads of this register will return the shadow register value. Reset type: SYSRSn
14	CAPCLR	R-0/W1S	0h	DC Capture Latched Status Clear Flag 0: Writing a 0 has no effect. 1: Writing a 1 will clear this CAPSTS (set) condition. Reset type: SYSRSn
13	CAPSTS	R	0h	Latched Status Flag for Capture Event 0: No DC capture event occurred. 1: A DC capture event has occurred. Reset type: SYSRSn
12-2	RESERVED	R-0	0h	Reserved

Table 19-97. DCCAPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SHDWMODE	R/W	0h	TBCTR Counter Capture Shadow Select Mode 0: Enable shadow mode. The DCCAP active register is copied to shadow register on a TBCTR = TBPRD or TBCTR = zero event as defined by the DCFCTL[PULSESEL] bit. CPU reads of the DCCAP register will return the shadow register contents. 1: Active Mode. In this mode the shadow register is disabled. CPU reads from the DCCAP register will always return the active register contents. Reset type: SYSRSn
0	CAPE	R/W	0h	TBCTR Counter Capture Enable/Disable 0: Disable the time-base counter capture. 1: Enable the time-base counter capture. Reset type: SYSRSn

19.17.2.73 DCFOFFSET Register (Offset = C9h) [Reset = 0000h]

DCFOFFSET is shown in Figure 19-165 and described in Table 19-98.

Return to the Summary Table.

DCFOFFSET							
R/W-0h							

Table 19-98. DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCFOFFSET	R/W	0h	Blanking Window Offset These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted. Reset type: SYSRSn

19.17.2.74 DCFOFFSETCNT Register (Offset = CAh) [Reset = 0000h]

DCFOFFSETCNT is shown in Figure 19-166 and described in Table 19-99.

Return to the Summary Table.

Table 19-103. DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture To enable time-base counter capture, set the DCCAPCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter (TBCTR) on the low to high edge transition of a filtered (DCEVTFLT) event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCCAP is enabled and disabled by the DCCAPCTL[SHDWMODE] bit. By default this register is shadowed. - If DCCAPCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. - If DCCAPCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address. Reset type: SYSRSn

19.17.2.79 DCAHTRIPSEL Register (Offset = D2h) [Reset = 0000h]

DCAHTRIPSEL is shown in Figure 19-171 and described in Table 19-104.

Chapter 20

Enhanced Capture (eCAP)

This chapter describes the enhanced capture (eCAP) module, which is used in systems where accurate timing of external events is important.

The enhanced capture (eCAP) module is a Type 2 eCAP. See the *C2000 Real-Time Control Peripheral Reference Guide* for a list of all devices with an eCAP module of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

20.1 Introduction

20.1.1 Features

The features of the eCAP module include:

- Speed measurements of rotating machinery (for example, toothed sprockets sensed by way of Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

The eCAP module features described in this chapter include:

- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single-shot capture of up to four event time-stamps
- Continuous mode capture of time stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- When not used in capture mode, the eCAP module can be configured as a single-channel PWM output

The capture functionality of the Type 1 eCAP is enhanced from the Type 0 eCAP with the following added features:

- Event filter reset bit
  - Writing a 1 to ECCTL2[CTRFILTRESET] clears the event filter, the modulo counter, and any pending interrupts flags. Resetting the bit is useful for initialization and debug. Note that this is not applicable for signal monitoring interrupts, which do not get affected by the event filter reset bit.
- Modulo counter status bits
  - The modulo counter (ECCTL2 [MODCNTRSTS]) indicates which capture register is loaded next. In the Type 0 eCAP, to know the current state of the modulo counter was not possible
- DMA trigger source
  - eCAPxDMA was added as a DMA trigger. CEVT[1-4] can be configured as the source for eCAPxDMA.
- Input multiplexer
  - ECCTL0 [INPUTSEL] selects one of 128 input signals, which are detailed in Section 20.3.
- EALLOW protection
  - EALLOW protection was added to critical registers. To maintain software compatibility with Type-0, configure DEV_CFG_REGS.ECAPTYPE to make these registers unprotected.

The capture functionality of the Type 2 eCAP is enhanced from the Type 1 eCAP with the following added features:

- Added ECAPxSYNCINSEL register
  - ECAPxSYNCINSEL register is added for each eCAP to select an external SYNCIN. Every eCAP can have a separate SYNCIN signal.

20.1.2 ECAP Related Collateral

- *Leveraging High Resolution Capture (HRCAP) for Single Wire Data Transfer Application Report*

20.2 Description

The eCAP module represents one complete capture channel that can be instantiated multiple times, depending on the target device. In the context of this guide, one eCAP channel has the following independent key resources:

- Capture inputs can be connected using the Input X-BAR
- 128:1 input multiplexer
- Output X-BAR is used to configure output in APWM mode
- 32-bit time base (counter)
- 4 x 32-bit time-stamp capture registers (CAP1-CAP4)
- Four-stage sequencer (modulo4 counter) that is synchronized to external events, eCAP pin rising/falling edges.
- Modulo counter status register (MODCNTRSTS) to indicate sequencer state
- Independent edge polarity (rising/falling edge) selection for all four events
- Input capture signal prescaling (from 2-62 or bypass)
- One-shot compare register (two bits) to freeze captures after 1-4 time-stamp events
- Control for continuous time-stamp captures using a four-deep circular buffer (CAP1-CAP4) scheme
- Ability to reset event filter, modulo counter, and interrupt flags
- Interrupt capabilities on any of the four capture events
- EALLOW protection to control registers

20.3 Configuring Device Pins for the eCAP

The Input X-BAR connects the device pins to the module as input. Any GPIO on the device can be configured as an input. The GPIO input qualification can be set to synchronous or asynchronous mode by setting the GPxQSELn register bits. Using synchronized inputs can help with noise immunity but affects the eCAP accuracy by ±2 cycles. The internal pull-ups can be configured in the GPyPUD register. Since the GPIO mode is used, the GPyINV register can invert the signals.

New to the Type 1 eCAP module, a 128:1 input multiplexer must also be configured (see Figure 20-3). This multiplexer can select a variety of inputs detailed in Table 20-1 by configuring ECCTL0.INPUTSEL.

The Output X-BAR must be used to connect output signals to the OUTPUTXBARx output locations. The GPIO mux must then be configured to connect the OUTPUTXBARx lines to any of several IO pins with the GPIO mux. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux, GPIO settings, and XBAR configuration.

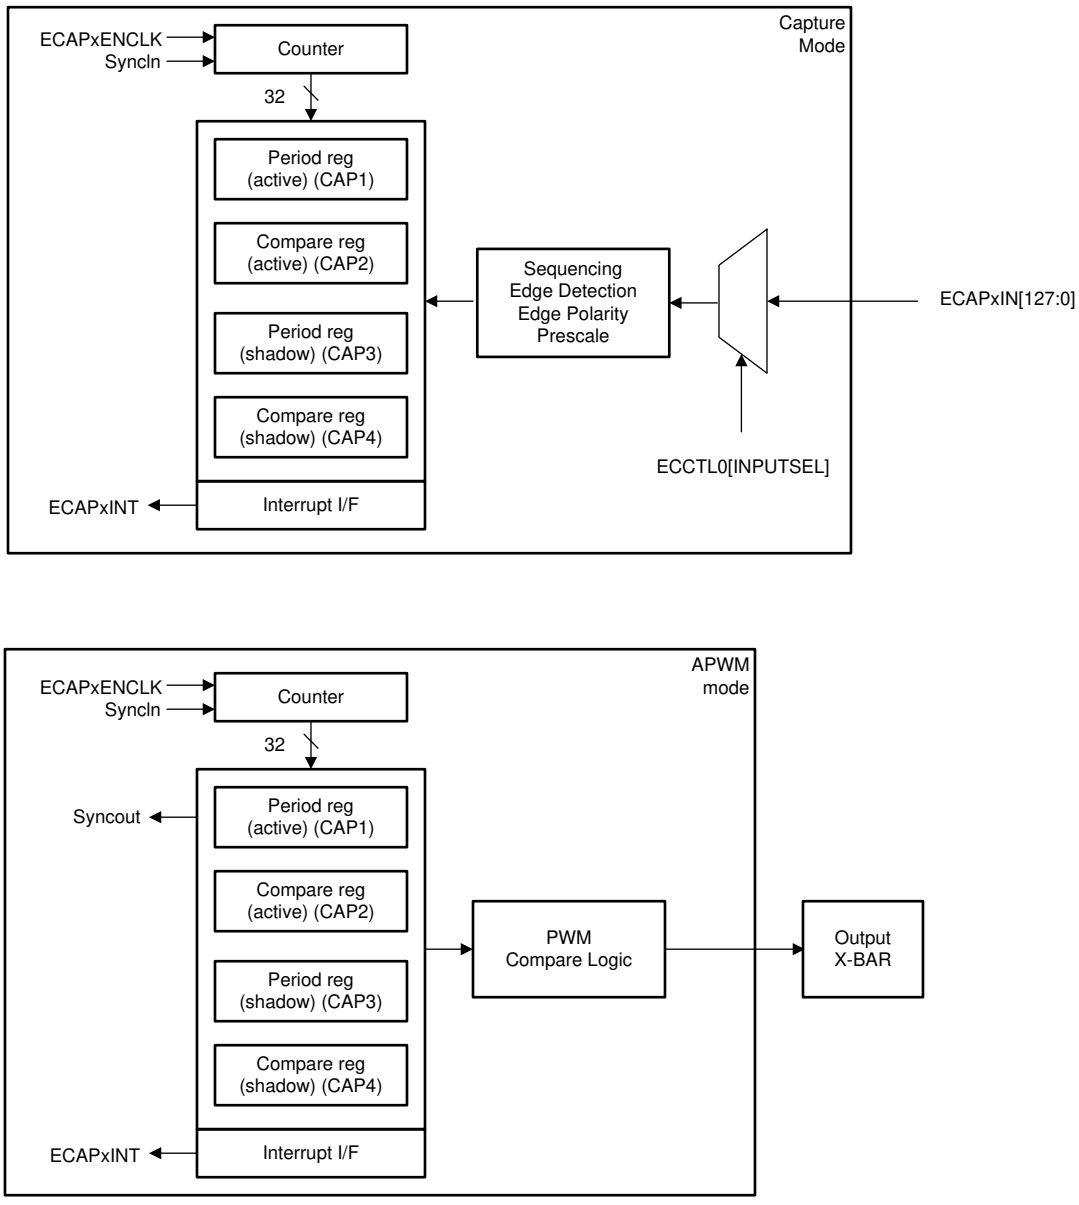
Note

ECAPxIN has to be at least 2 × SYSCLK-cycles wide to be properly captured by the eCAP module; otherwise, the input pulse can get missed from sampling by the SYSCLK.

20.4 Capture and APWM Operating Mode

Use the eCAP module resources to implement a single-channel PWM generator (with 32-bit capabilities) when the eCAP module is not being used for input captures. The counter operates in count-up mode, providing a time-base for asymmetrical pulse width modulation (PWM) waveforms. The CAP1 and CAP2 registers become the active period and compare registers, respectively, while CAP3 and CAP4 registers become the period and compare shadow registers, respectively. Figure 20-1 is a high-level view of both the capture and auxiliary pulse-width modulator (APWM) modes of operation.

Figure 20-2 further descries the output of the eCAP in APWM mode based on the CMP and PRD values.



A. A single pin is shared between CAP and APWM functions. In capture mode, the pin is an input; in APWM mode, the pin is an output.

B. In APWM mode, writing any value to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

Figure 20-1. Capture and APWM Modes of Operation

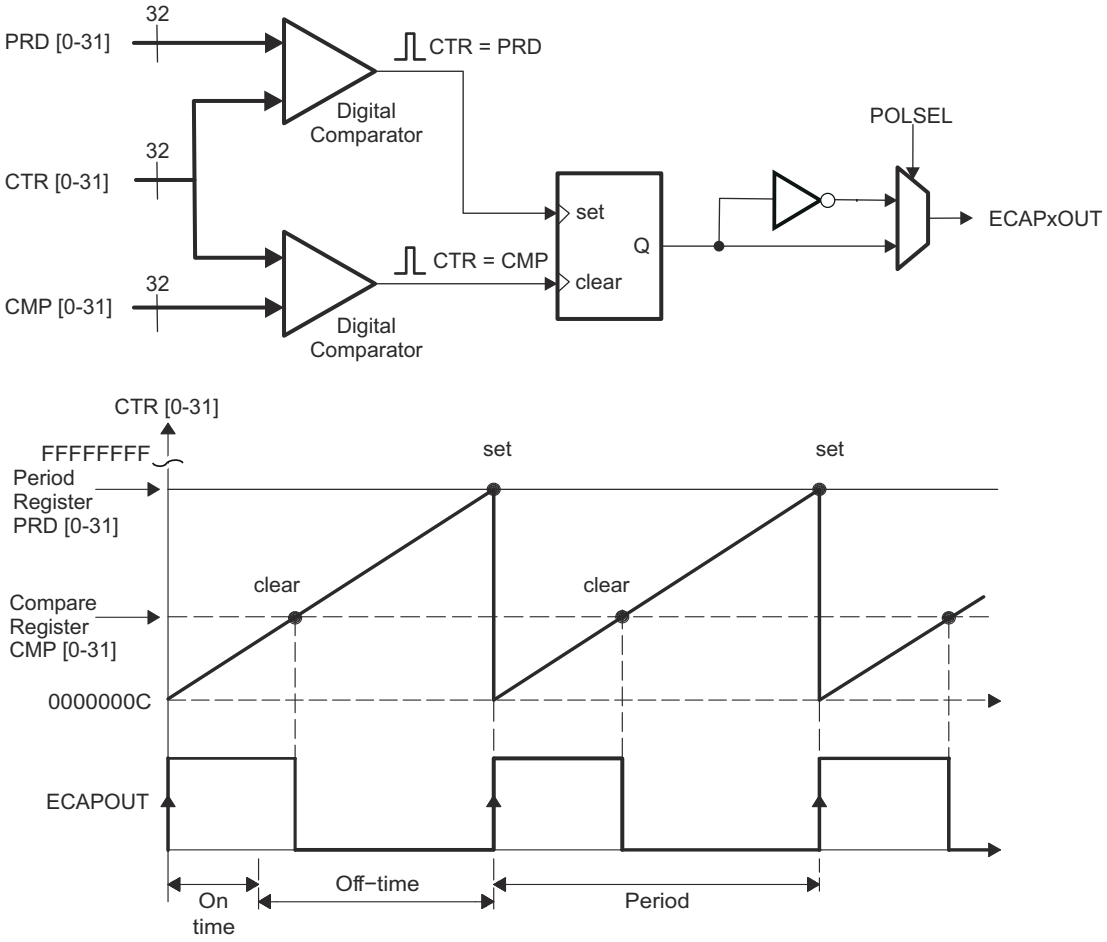


Figure 20-2. Counter Compare and PRD Effects on the eCAP Output in APWM Mode

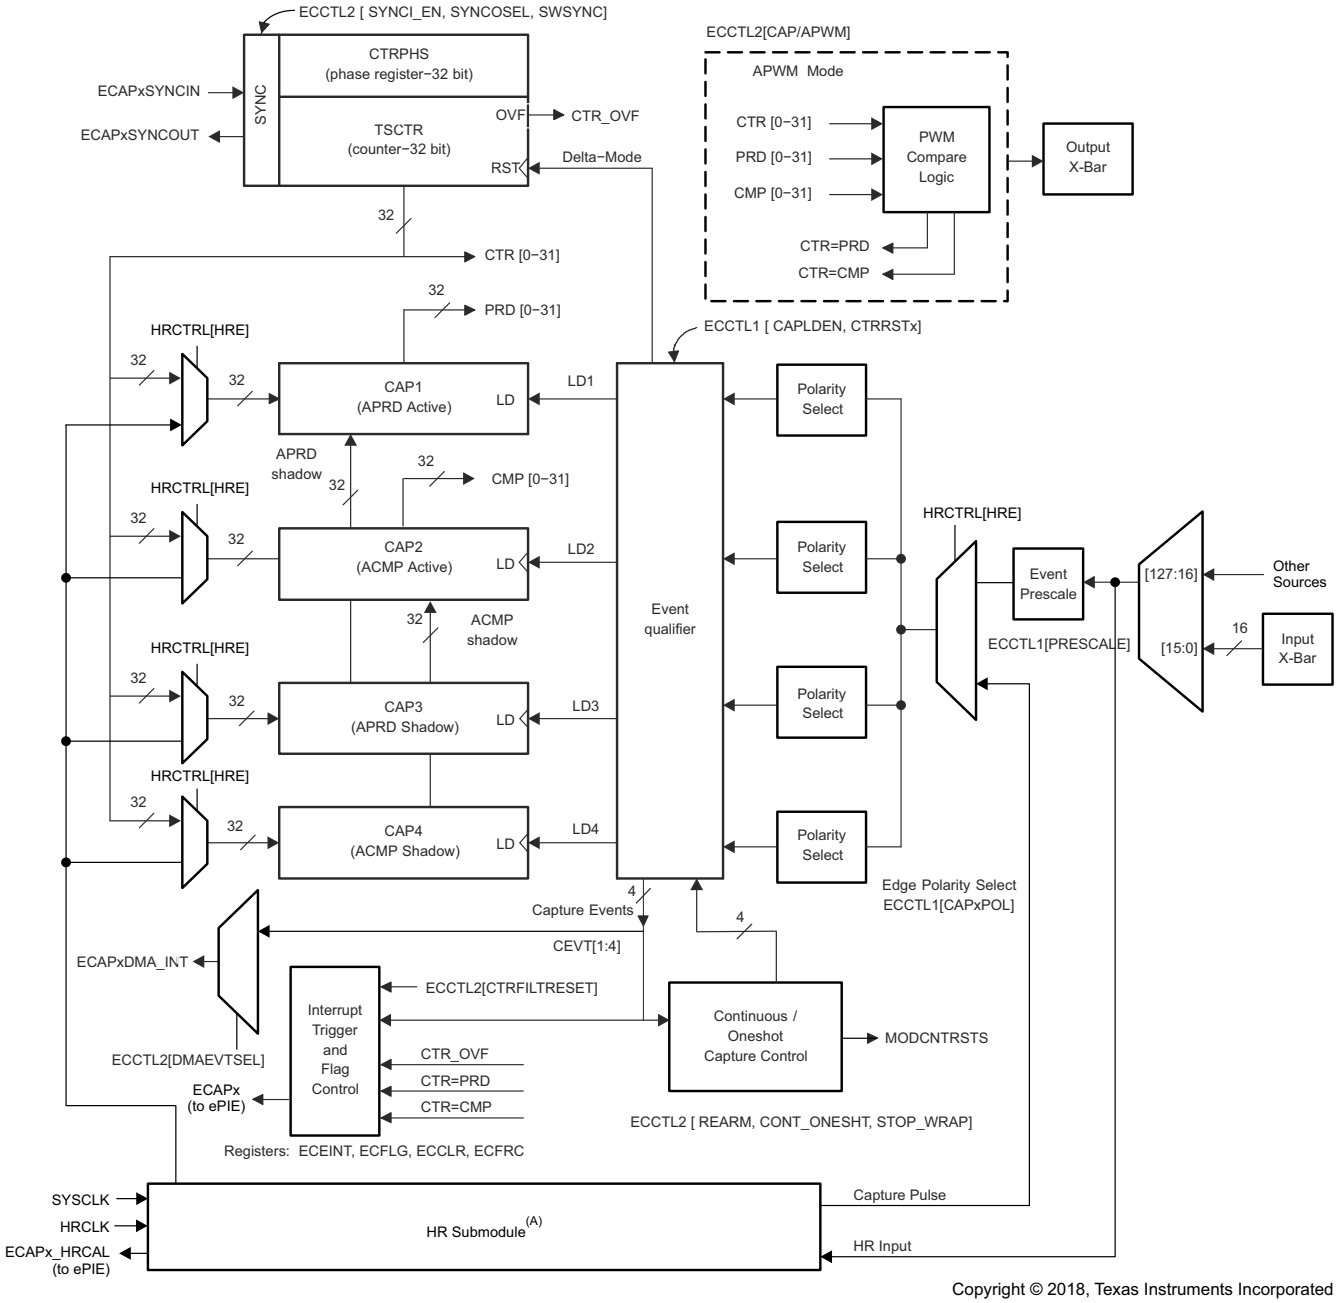
20.5 Capture Mode Description

Figure 20-3 shows the various components that implement the capture function.

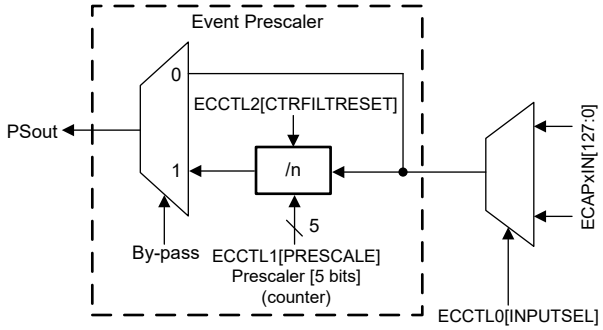


A. The HRCAP submodule is not available on all eCAP modules; in this case, the high-resolution muxes and hardware are not implemented.

Figure 20-3. eCAP Block Diagram

20.5.1 Event Prescaler

An input capture signal (pulse train) can be prescaled by N = 2-62 (in multiples of 2) or can bypass the prescaler. This is useful when very high frequency signals are used as inputs. Figure 20-4 shows a functional diagram and Figure 20-5 shows the operation of the prescale function. The event prescaler can be reset by setting the ECCTL2.CTRFILTRESET register bit.



A. When a prescale value of 1 is chosen (ECCTL1[13:9] = 0,0,0,0,0), the input capture signal bypasses the prescale logic completely.
B. The first Rise edge after Prescale configuration change is not passed to Capture logic, prescaler value takes into effect on the second rising edge after the configuration.

Figure 20-4. Event Prescale Control

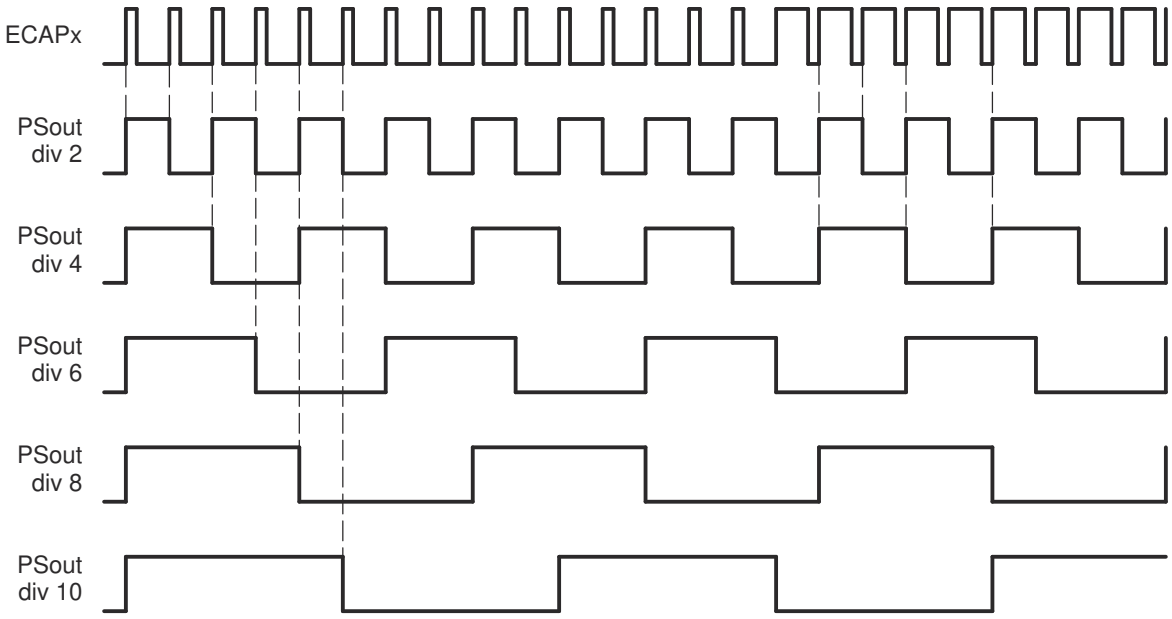


Figure 20-5. Prescale Function Waveforms

20.5.2 Edge Polarity Select and Qualifier

Functionality and features include:

- Four independent edge polarity (rising edge/falling edge) selection muxes are used, one for each capture event.
- Each edge (up to 4) is event qualified by the Modulo4 sequencer.
- The edge event is gated to the respective CAPx register by the Mod4 counter. The CAPx register is loaded on the falling edge.

20.5.3 Continuous/One-Shot Control

Operation of eCAP in Continuous/One-Shot mode:

- The Mod4 (2-bit) counter is incremented using edge qualified events (CEVT1-CEVT4).
- The Mod4 counter continues counting (0->1->2->3->0) and wraps around unless stopped.
- During one-shot operation, a 2-bit stop register (STOP_WRAP) is used to compare the Mod4 counter output, and when equal, stops the Mod4 counter and inhibits further loads of the CAP1-CAP4 registers. In this mode, if TSCCTR counter is configured to reset on capture event (CEVTx) by configuring ECCTL1.CTRRSTx bit, the operation still keeps resetting the TSCCTR counter on capture event (CEVTx) after the STOP_WRAP value is reached and re-arm (REARM) has not occurred.

The continuous/one-shot block controls the start, stop and reset (zero) functions of the Mod4 counter, using a mono-shot type of action that can be triggered by the stop-value comparator and re-armed using software control.

Once armed, the eCAP module waits for 1-4 (defined by stop-value) capture events before freezing both the Mod4 counter and contents of CAP1-4 registers (time stamps).

Re-arming prepares the eCAP module for another capture sequence. Also, re-arming clears (to zero) the Mod4 counter and permits loading of CAP1-4 registers again, providing the CAPLDEN bit is set.

In continuous mode, the Mod4 counter continues to run (0->1->2->3->0, the one-shot action is ignored, and capture values continue to be written to CAP1-4 in a circular buffer sequence.

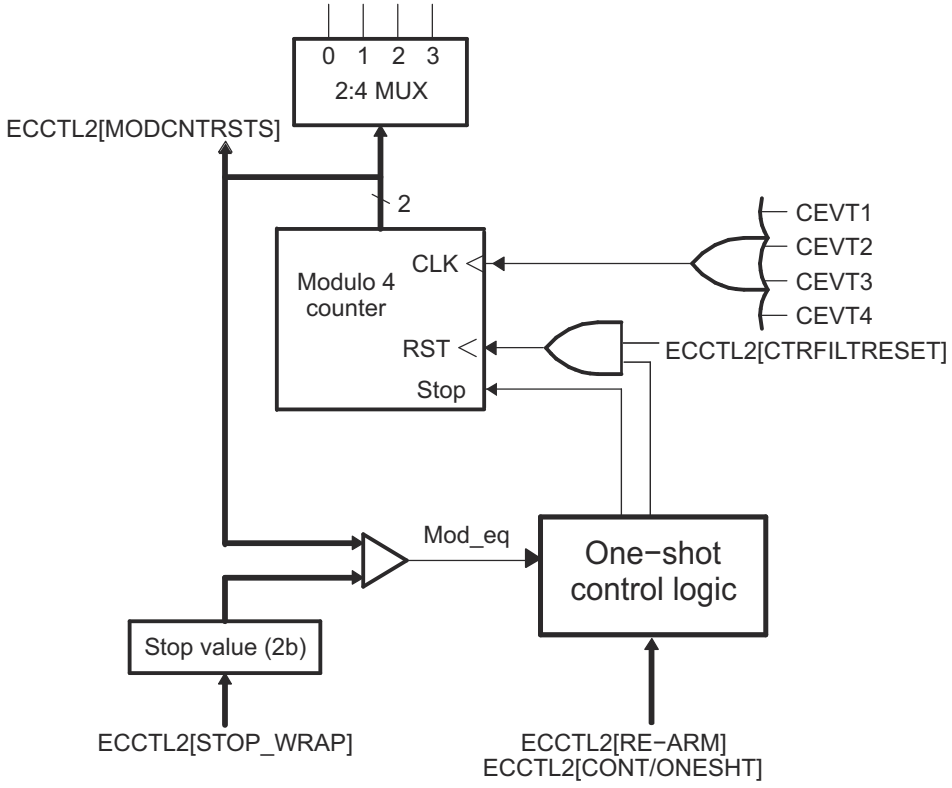

Figure 20-6. Details of the Continuous/One-shot Block

20.5.4 32-Bit Counter and Phase Control

This counter provides the time-base for event captures, and is clocked using the system clock.

A phase register is provided to achieve synchronization with other counters using a hardware and software forced sync. This is useful in APWM mode when a phase offset between modules is needed.

On any of the four event loads, an option to reset the 32-bit counter is given. This is useful for time difference capture. The 32-bit counter value is captured first, then the counter value is reset to 0 by any of the LD1-LD4 signals.

20.5.5 CAP1-CAP4 Registers

These 32-bit registers are supplied by the 32-bit counter timer bus, CTR[0-31], and are loaded (capture a time-stamp) when the respective LD inputs are strobed.

Control bit CAPLDEN can inhibit loading of the capture registers. During one-shot operation, this bit is cleared (loading is inhibited) automatically when a stop condition occurs, StopValue = Mod4.

CAP1 and CAP2 registers become the active period and compare registers, respectively, in APWM mode.

CAP3 and CAP4 registers become the respective shadow registers (APRD and ACMP) for CAP1 and CAP2 during APWM operation.

20.5.6 eCAP Synchronization

eCAP modules can be synchronized with each other by selecting a common SYNCIN source. SYNCIN source for eCAP can be either software sync-in or external sync-in. The external sync-in signal can come from eCAP, X-Bar or EPWM. The SWSYNC of the eCAP module is logical ORed with the SYNC signal as shown in Figure 20-7. The SYNC signal is defined by the selection of ECAPxSYNCINSEL[SEL] as shown in Figure 20-8.

Note

ECAPxSYNCOUT going to the ECAPSYNCIN multiplexer is disabled. For example, ECAP1SYNCOUT cannot be a sync in to ECAP1, but ECAP1SYNCOUT can be a sync in to ECAP2, ECAP3, and so on.

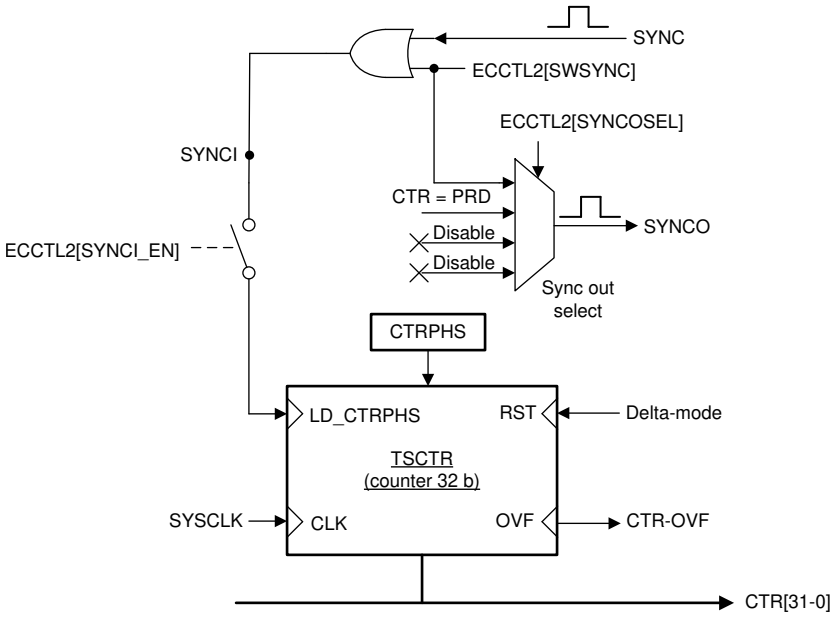

Figure 20-7. Details of the Counter and Synchronization Block

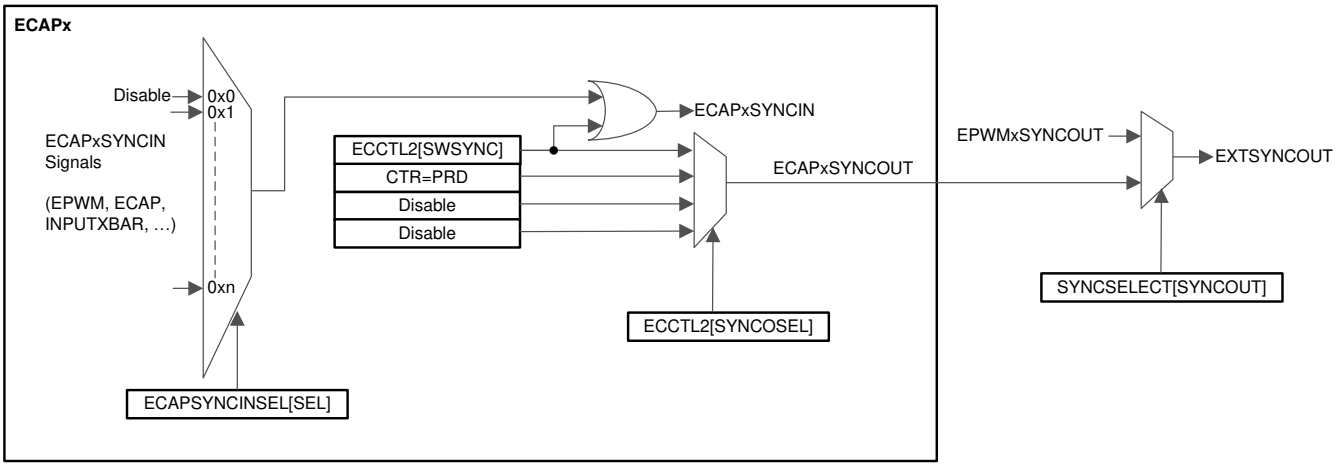

Figure 20-8. eCAP Synchronization Scheme

20.5.6.1 Example 1 - Using SWSYNC with ECAP Module

Implement the following steps to use SWSYNC with ECAP1 and ECAP2.

- Configure ECAP[1..2].ECAPSYNCINSEL.SEL = 0x0 to disable external SYNCIN coming to eCAP1.
- Configure ECAP[1..2].ECCTL2.SWSYNC = 0x1, to force Software Synchronization of the TSCTR counter.

To use SWSYNC with other eCAP modules, make sure that the previous eCAP chain is not generating a SYNCOUT signal that interferes with the software synchronization.

20.5.7 Interrupt Control

Operation and features of the eCAP interrupt control include (see Figure 20-9):

- An interrupt can be generated on capture events (CEVT1-CEVT4, CTROVF) or APWM events (CTR = PRD, CTR = CMP).
- A counter overflow event (FFFFFFFF->00000000) is also provided as an interrupt source (CTROVF).
- The capture events are edge and sequencer-qualified (ordered in time) by the polarity select and Mod4 gating, respectively.
- One of these events can be selected as the interrupt source (from the eCAPx module) going to the PIE.
- Seven interrupt events (CEVT1, CEVT2, CEVT3, CEVT4, CNTOVF, CTR=PRD, CTR=CMP) can be generated.
- The interrupt enable register (ECEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (ECFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated to the PIE only if any of the interrupt events are enabled, the flag bit is 1, and the INT flag bit is 0. The interrupt service routine must clear the global interrupt flag bit and the serviced event using the interrupt clear register (ECCLR) before any other interrupt pulses are generated. All interrupt flags are cleared upon an event filter reset by writing a 1 to ECCTL2[CLRFILTRESET]. To force an interrupt event, use the interrupt force register (ECFRC). This is useful for test purposes.

Note

The CEVT1, CEVT2, CEVT3, CEVT4 flags are only active in capture mode (ECCTL2[CAP/APWM == 0]). The CTR=PRD, CTR=CMP flags are only valid in APWM mode (ECCTL2[CAP/APWM == 1]). CNTOVF flag is valid in both modes.

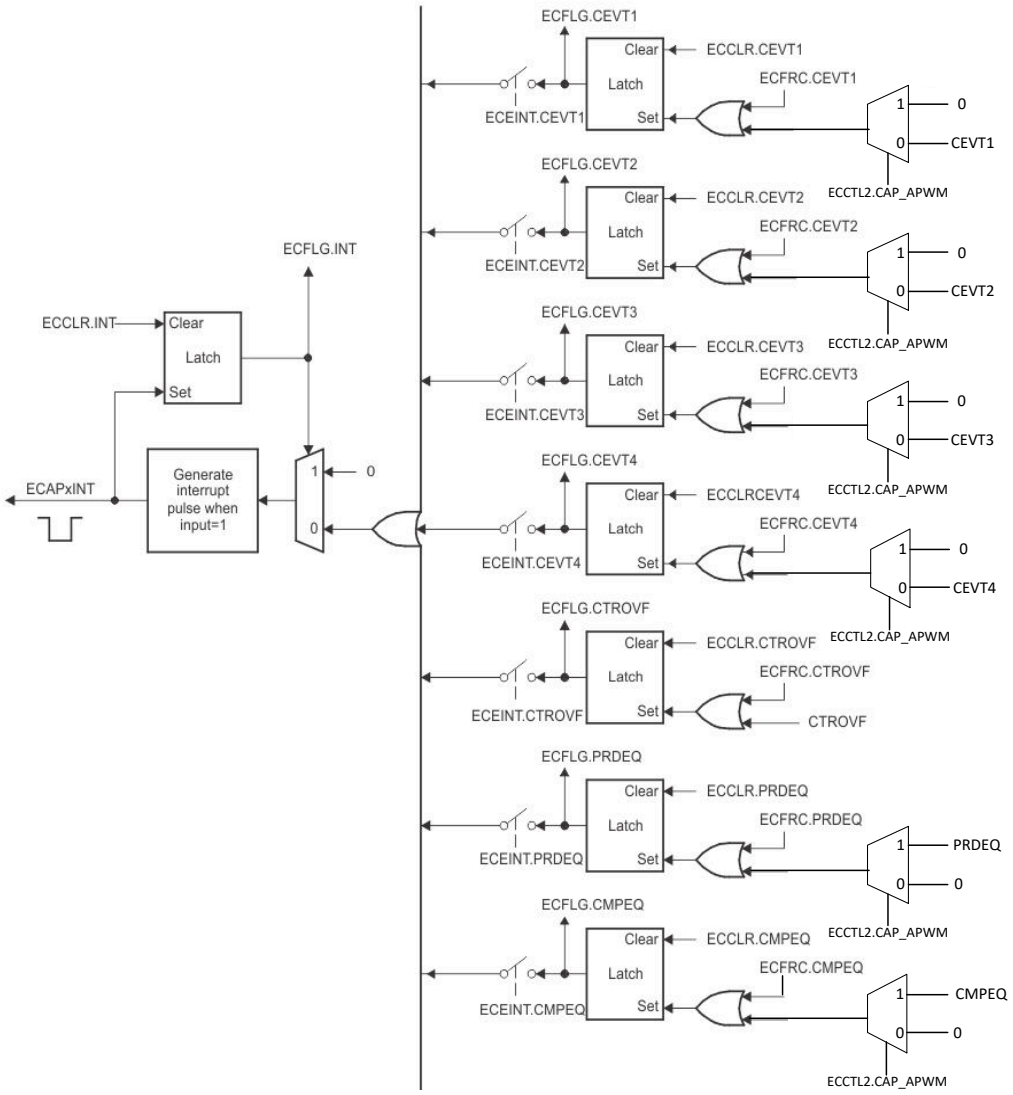

Figure 20-9. Interrupts in eCAP Module

20.5.8 DMA Interrupt

On Type 0 eCAP modules, the CPU was required to begin data transfers using DMA. New to the Type 1 eCAP, a separate DMA Trigger (ECAP_DMA_INT) enables continuous transfer of capture data from eCAP registers to on-chip memory using DMA. Any one of the four available interrupt events (CEVT1, CEVT2, CEVT3, and CEVT4) can be selected as the trigger source for ECAP_DMA_INT using ECCTL2 [DMAEVTSEL].

20.5.9 Shadow Load and Lockout Control

In capture mode, this logic inhibits (locks out) any shadow loading of CAP1 or CAP2 from APRD and ACMP registers, respectively.

In APWM mode, shadow loading is active and two choices are permitted:

- Immediate - APRD or ACMP are transferred to CAP1 or CAP2 immediately upon writing a new value.
- On period equal, CTR[31:0] = PRD[31:0].

20.5.10 APWM Mode Operation

Main operating highlights of the APWM section:

- The time-stamp counter bus is made available for comparison by way of 2 digital (32-bit) comparators.
- When CAP1/2 registers are not used in capture mode, the contents can be used as Period and Compare values in APWM mode.
- Double buffering is achieved using shadow registers APRD and ACMP (CAP3/4). The shadow register contents are transferred over to CAP1/2 registers, either immediately upon a write, or on a CTR = PRD trigger.
- In APWM mode, writing to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.
- During initialization, write to the active registers for both period and compare. This automatically copies the initial values into the shadow values. For subsequent compare updates during run-time, use the shadow registers.

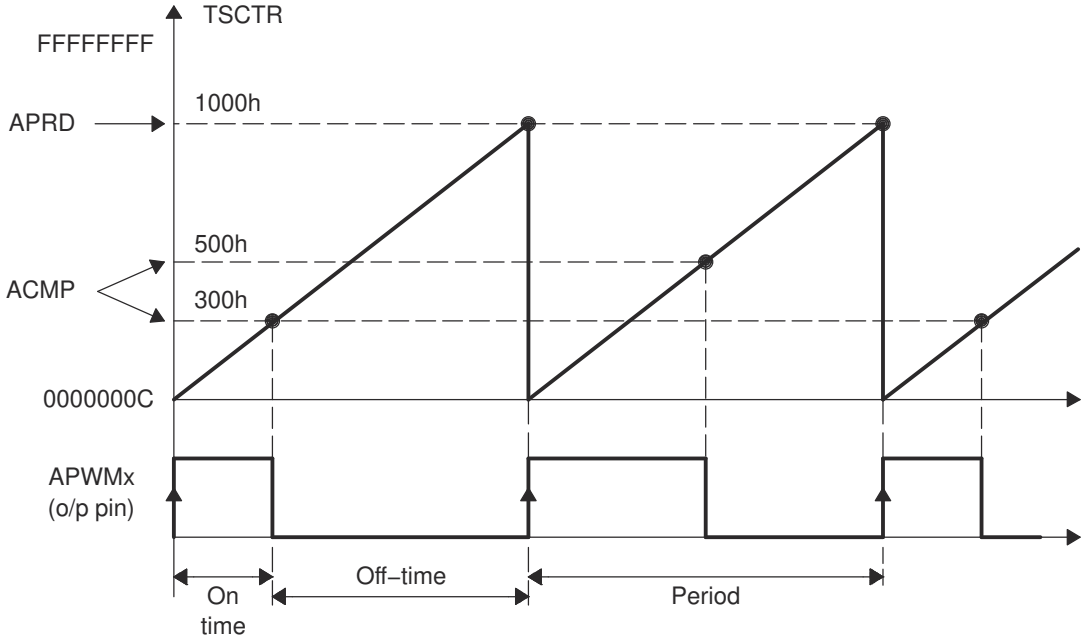

Figure 20-10. PWM Waveform Details Of APWM Mode Operation

The behavior of APWM active high mode (APWMPOL == 0) is as follows:

CMP = 0x00000000, output low for duration of period (0% duty)

CMP = 0x00000001, output high 1 cycle

CMP = 0x00000002, output high 2 cycles

CMP = PERIOD, output high except for 1 cycle (<100% duty)

CMP = PERIOD+1, output high for complete period (100% duty)

CMP > PERIOD+1, output high for complete period

The behavior of APWM active low mode (APWMPOL == 1) is as follows:

CMP = 0x00000000, output high for duration of period (0% duty)

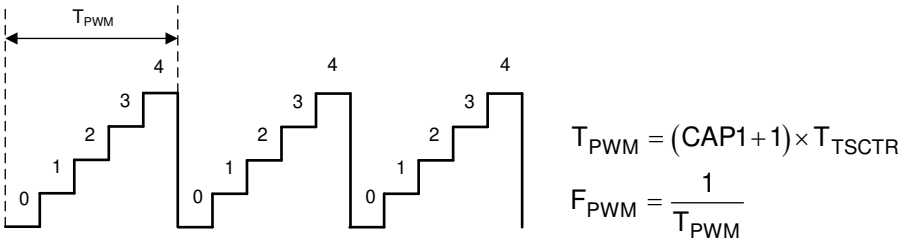
CMP = 0x00000001, output low 1 cycle

CMP = 0x00000002, output low 2 cycles

CMP = PERIOD, output low except for 1 cycle (<100% duty)

CMP = PERIOD+1, output low for complete period (100% duty)

CMP > PERIOD+1, output low for complete period



$$T_{PWM} = (CAP1 + 1) \times T_{TSCTR}$$

$$F_{PWM} = \frac{1}{T_{PWM}}$$

Figure 20-11. Time-Base Frequency and Period Calculation

20.6 Application of the eCAP Module

The following sections provide applications examples to show how to operate the eCAP module.

20.6.1 Example 1 - Absolute Time-Stamp Operation Rising-Edge Trigger

Figure 20-12 shows an example of continuous capture operation (Mod4 counter wraps around). In this figure, TSCTR counts-up without resetting and capture events are qualified on the rising edge only, this gives period (and frequency) information.

On an event, the TSCTR contents (time-stamp) is first captured, then Mod4 counter is incremented to the next state. When the TSCTR reaches FFFFFFFF (maximum value), the Mod4 counter wraps around to 00000000 (not shown in Figure 20-12), if this occurs, the CTROVF (counter overflow) flag is set, and an interrupt (if enabled) occurs. Captured Time-stamps are valid at the point indicated by the diagram (after the fourth event); hence, event CEVT4 can conveniently be used to trigger an interrupt and the CPU can read data from the CAPx registers.

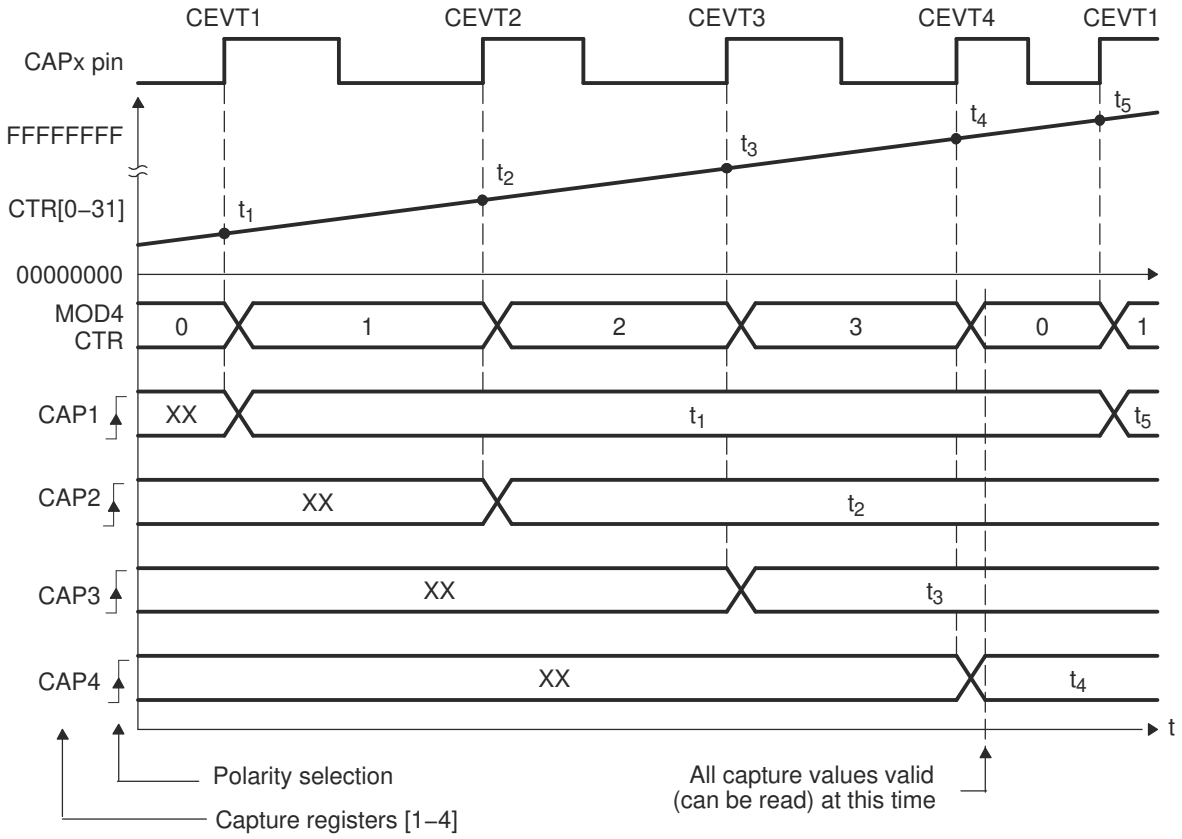


Figure 20-12. Capture Sequence for Absolute Time-stamp and Rising-Edge Detect

20.6.2 Example 2 - Absolute Time-Stamp Operation Rising- and Falling-Edge Trigger

In Figure 20-13, the eCAP operating mode is almost the same as in the previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information, that is: Period1 = $t_3 - t_1$, Period2 = $t_5 - t_3$, …and so on. Duty Cycle1 (on-time %) = $(t_2 - t_1)$ / Period1 x 100%, and so on. Duty Cycle1 (off-time %) = $(t_3 - t_2)$ / Period1 x 100%, and so on.

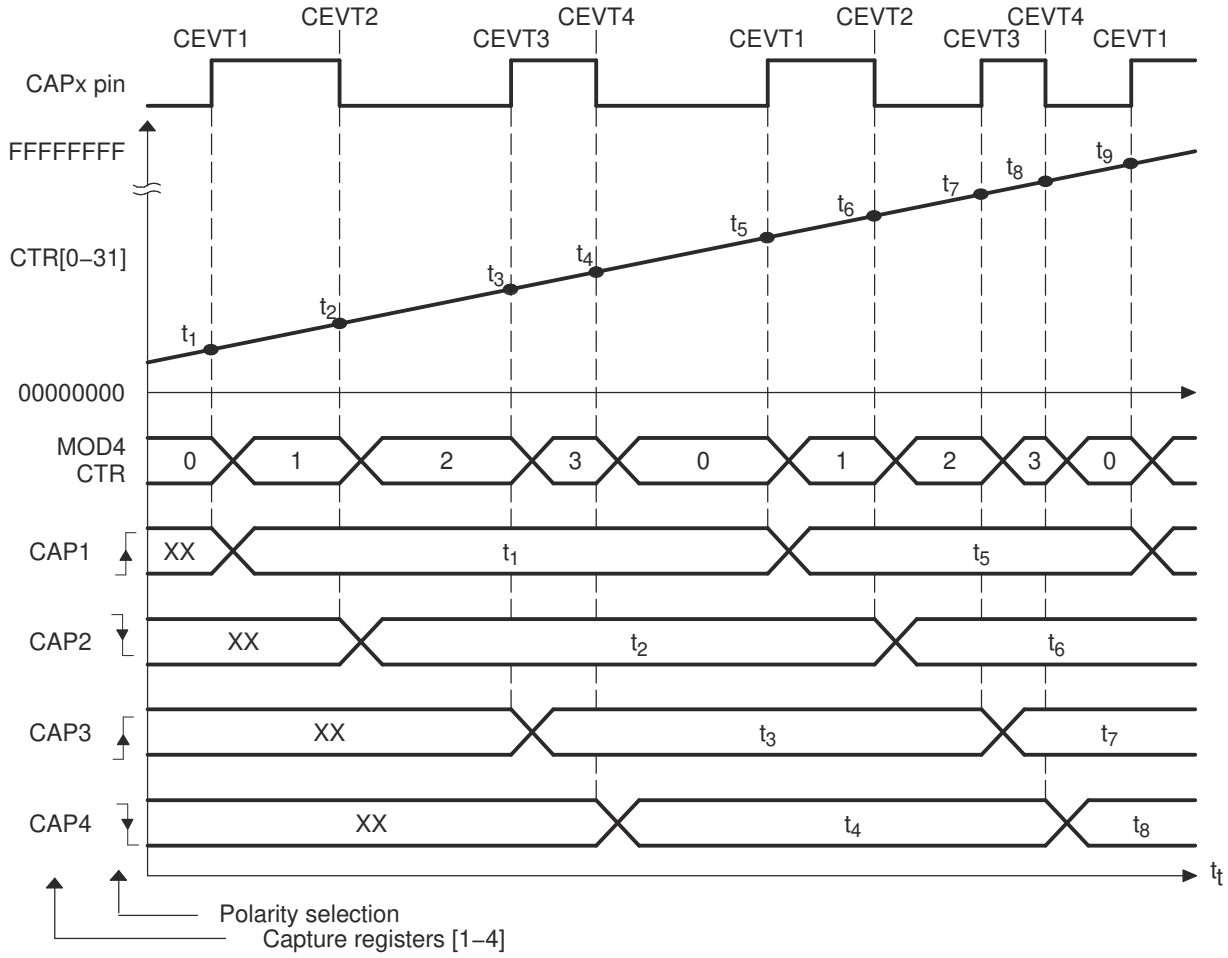

Figure 20-13. Capture Sequence for Absolute Time-stamp with Rising- and Falling-Edge Detect

20.6.3 Example 3 - Time Difference (Delta) Operation Rising-Edge Trigger

Figure 20-14 shows how the eCAP module can be used to collect delta timing data from pulse train waveforms. Here Continuous Capture mode (TSCTR counts-up without resetting, and Mod4 counter wraps around) is used. In Delta-time mode, TSCTR is reset back to zero on every valid event. Here capture events are qualified as rising edge only. On an event, TSCTR contents (Time-Stamp) is captured first, and then TSCTR is reset to zero. The Mod4 counter then increments to the next state. If TSCTR reaches FFFFFFFF (maximum value), before the next event, the Mod4 counter wraps around to 00000000 and continues, a CNTOVF (counter overflow) flag is set, and an interrupt (if enabled) occurs. The advantage of Delta-time mode is that the CAPx contents directly give timing data without the need for CPU calculations, that is, Period1 = T_1, Period2 = T_2, and so on. As shown in Figure 20-14, the CEVT1 event is a good trigger point to read the timing data, T_1, T_2, T_3, T_4 are all valid here.

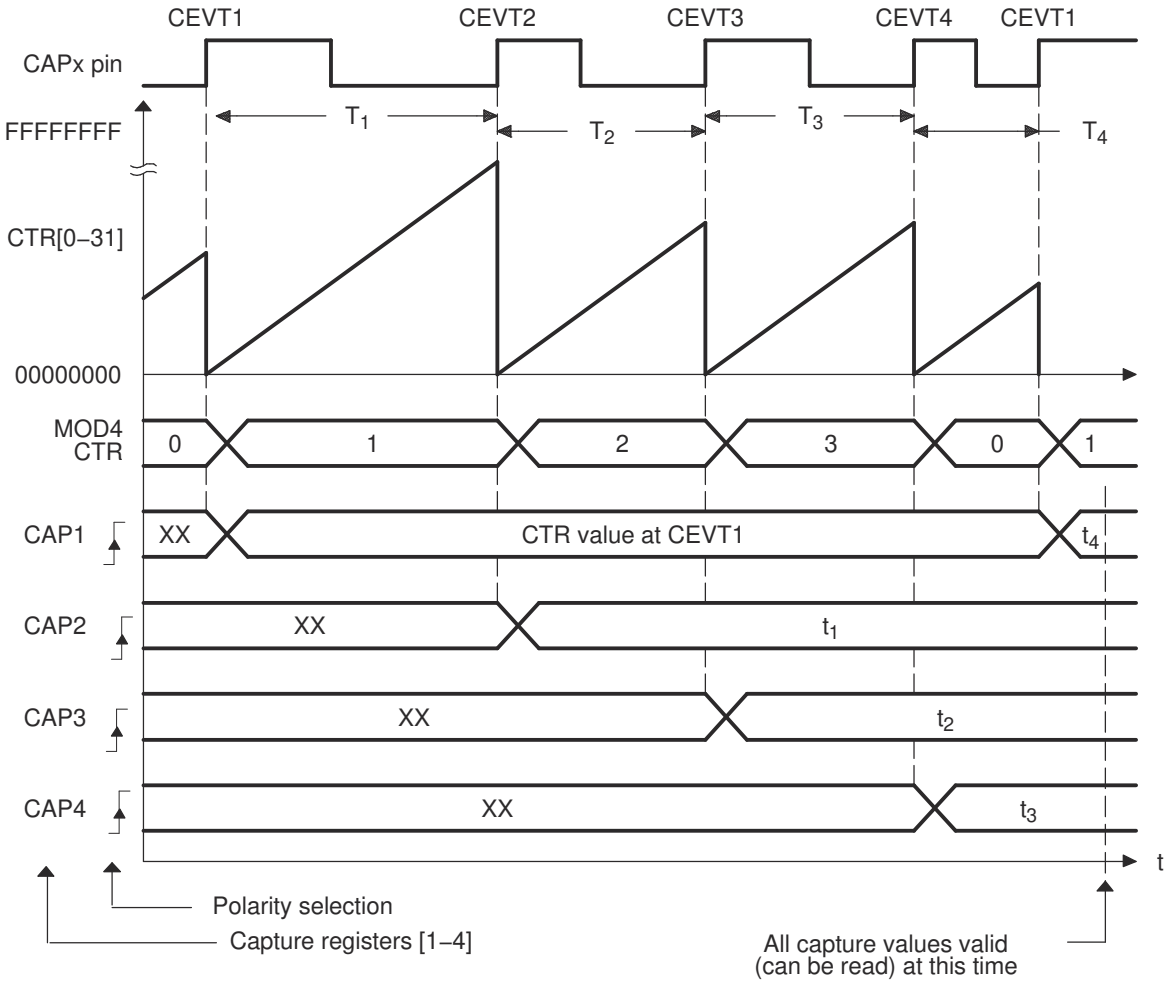

Figure 20-14. Capture Sequence for Delta Mode Time-stamp and Rising Edge Detect

20.6.4 Example 4 - Time Difference (Delta) Operation Rising- and Falling-Edge Trigger

In Figure 20-15, the eCAP operating mode is almost the same as in previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information, that is: Period1 = T_1+T_2, Period2 = T_3+T_4, and so on. Duty Cycle1 (on-time %) = T_1 / Period1 x 100%, Duty Cycle1 (off-time %) = T_2 / Period1 x 100%, and so on.

During initialization, write to the active registers for both period and compare. This action automatically copies the init values into the shadow values. For subsequent compare updates during run-time, the shadow registers must be used.

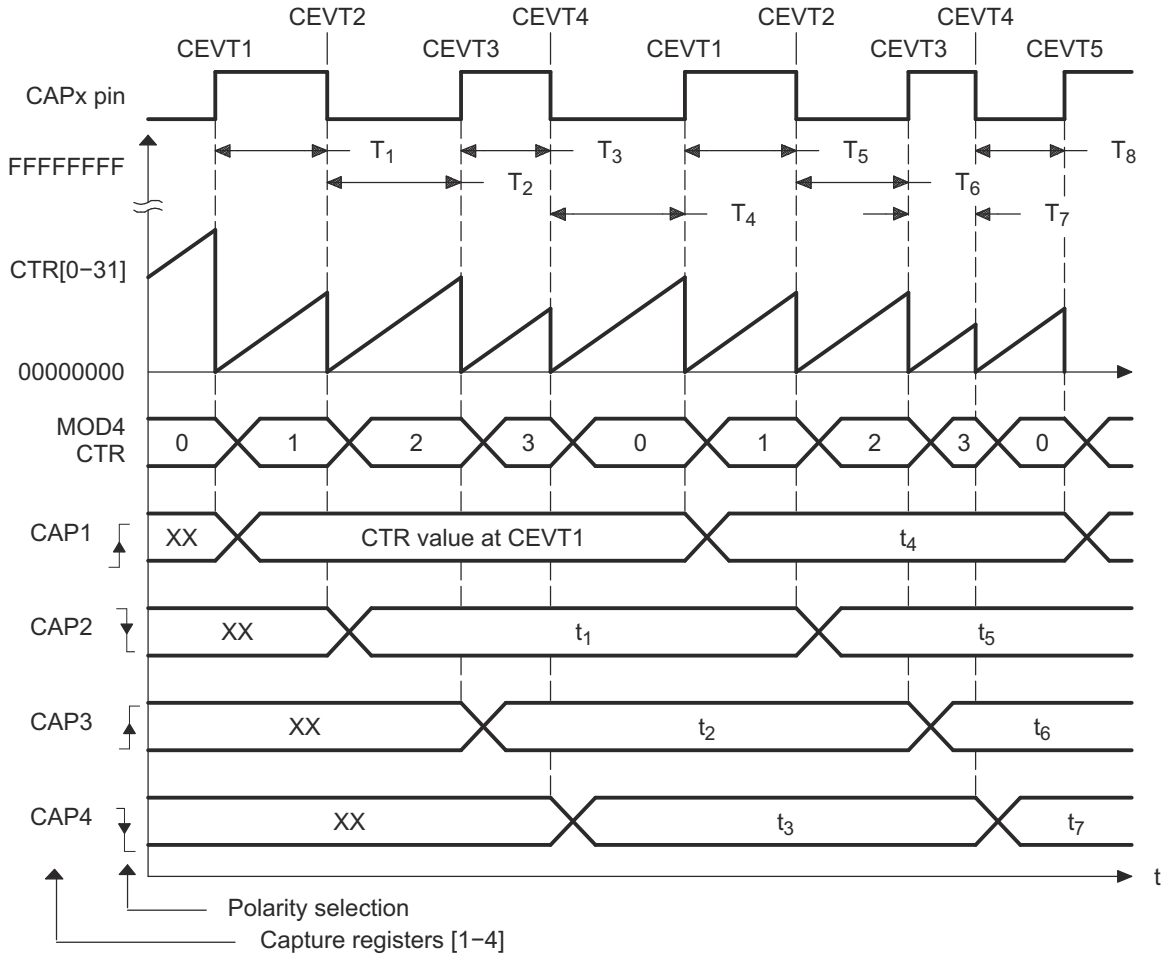

Figure 20-15. Capture Sequence for Delta Mode Time-stamp with Rising- and Falling-Edge Detect

20.7 Application of the APWM Mode

In this example, the eCAP module is configured to operate as a PWM generator. Here, a very simple single-channel PWM waveform is generated from the APWMx output pin. The PWM polarity is active high, which means that the compare value (CAP2 reg is now a compare register) represents the on-time (high level) of the period. Alternatively, if the APWMPOL bit is configured for active low, then the compare value represents the off-time.

20.7.1 Example 1 - Simple PWM Generation (Independent Channels)

20.8.2 ECAP Examples

NOTE: These examples are located in the C2000Ware installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/ecap

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

20.8.2.1 eCAP APWM Example

FILE: ecap_ex1_apwm.c

This program sets up the eCAP module in APWM mode. The PWM waveform will come out on GPIO5. The frequency of PWM is configured to vary between 5Hz and 10Hz using the shadow registers to load the next period/compare values.

20.8.2.2 eCAP Capture PWM Example

FILE: ecap_ex2_capture_pwm.c

This example configures ePWM3A for:

- Up count mode
- Period starts at 500 and goes up to 8000
- Toggle output on PRD

eCAP1 is configured to capture the time between rising and falling edge of the ePWM3A output.

External Connections

- eCAP1 is on GPIO16
- ePWM3A is on GPIO4
- Connect GPIO4 to GPIO16.

Watch Variables

- *ecap1PassCount* - Successful captures.
- *ecap1IntCount* - Interrupt counts.

20.8.2.3 eCAP APWM Phase-shift Example

FILE: ecap_ex3_apwm_phase_shift.c

This program sets up the eCAP1 and eCAP2 modules in APWM mode to generate the two phase-shifted PWM outputs of same duty and frequency value The frequency, duty and phase values can be programmed of choice by updating the defined macros. By default 10 Khz frequency, 50% duty and 30% phase shift values are used. eCAP2 output leads the eCAP1 output by 30% GPIO5 and GPIO6 are used as eCAP1/2 outputs and can be probed using analyzer/CRO to observe the waveforms.

20.9 ECAP Registers

This Section describes the ECAP Registers.

20.9.1 ECAP Base Address Table

Table 20-3. ECAP Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
ECap1Regs	ECAP_REGS	ECAP1_BASE	0x0000_5200	YES	YES	YES	YES
ECap2Regs	ECAP_REGS	ECAP2_BASE	0x0000_5240	YES	YES	YES	YES

20.9.2 ECAP_REGS Registers

Table 20-4 lists the memory-mapped registers for the ECAP_REGS registers. All register offset addresses not listed in Table 20-4 should be considered as reserved locations and the register contents should not be modified.

Table 20-4. ECAP_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	TSCTR	Time-Stamp Counter		Go
2h	CTRPHS	Counter Phase Offset Value Register		Go
4h	CAP1	Capture 1 Register		Go
6h	CAP2	Capture 2 Register		Go
8h	CAP3	Capture 3 Register		Go
Ah	CAP4	Capture 4 Register		Go
12h	ECCTL0	Capture Control Register 0	EALLOW	Go
14h	ECCTL1	Capture Control Register 1	EALLOW	Go
15h	ECCTL2	Capture Control Register 2	EALLOW	Go
16h	ECEINT	Capture Interrupt Enable Register	EALLOW	Go

18h	ECCLR	Capture Interrupt Clear Register		Go
19h	ECFRC	Capture Interrupt Force Register	EALLOW	Go
1Eh	ECAPSYNCINSEL	SYNC source select register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 20-5 shows the codes that are used for access types in this section.

Table 20-5. ECAP_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

20.9.2.1 TSCTR Register (Offset = 0h) [Reset = 00000000h]

TSCTR is shown in Figure 20-17 and described in Table 20-6.

Return to the Summary Table.

Time-Stamp Counter

Figure 20-17. TSCTR Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W-0h		R/W-0h	R/W-0h	R-0/W1S-0h	R/W-3h		R/W-0h

Table 20-14. ECCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	MODCNTRSTS	R	0h	This bit field reads current status on modulo counter 00b (R) = CAP1 register gets loaded on next capture event. 01b (R) = CAP2 register gets loaded on next capture event. 10b (R) = CAP3 register gets loaded on next capture event. 11b (R) = CAP4 register gets loaded on next capture event. Reset type: CPU1.SYSRSn
13-12	DMAEVTSEL	R/W	0h	DMA event select 00b (R/W) = DMA interrupt source is CEVT1 01b (R/W) = DMA interrupt source is CEVT2 10b (R/W) = DMA interrupt source is CEVT3 11b (R/W) = DMA interrupt source is CEVT4 Note: ECCTL1.CAPLDEN also needs to be set to '1' for ECAPxDMA_INT to be generated Reset type: CPU1.SYSRSn
11	CTRFILTRESET	R-0/W1C	0h	Reset Bit 0h (R) = No effect 1h (W) = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF , HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured. Reset type: CPU1.SYSRSn
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. Reset type: SYSRSn 0h (R/W) = Output is active high (Compare value defines high time) 1h (R/W) = Output is active low (Compare value defines low time)
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select Reset type: SYSRSn 0h (R/W) = ECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1h (R/W) = ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output

Table 20-14. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SWSYNC	R-0/W1S	0h	Software-forced Counter (TSCTR) Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. Reset type: SYSRSn 0h (R/W) = Writing a zero has no effect. Reading always returns a zero 1h (R/W) = Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero.
7-6	SYNCO_SEL	R/W	0h	Sync-Out Select Reset type: SYSRSn 0h (R/W) = sync out signal is SWSYNC 1h (R/W) = Select CTR = PRD event to be the sync-out signal. Note: Selection CTR = PRD is meaningful only in APWM mode 2h (R/W) = Disable sync out signal 3h (R/W) = Disable sync out signal
5	SYNCI_EN	R/W	0h	Counter (TSCTR) Sync-In select mode Reset type: SYSRSn 0h (R/W) = Disable sync-in option 1h (R/W) = Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	R/W	0h	Time Stamp (TSCTR) Counter Stop (freeze) Control Reset type: SYSRSn 0h (R/W) = TSCTR stopped 1h (R/W) = TSCTR free-running
3	REARM	R-0/W1S	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode Reset type: SYSRSn 0h (R/W) = Has no effect (reading always returns a 0) 1h (R/W) = Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero 2) Unfreezes the Mod4 counter 3) Enables capture register loads
2-1	STOP_WRAP	R/W	3h	Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped (frozen) - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. Reset type: SYSRSn 0h (R/W) = Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 1h (R/W) = Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 2h (R/W) = Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 3h (R/W) = Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control (applicable only in capture mode) Reset type: SYSRSn 0h (R/W) = Operate in continuous mode 1h (R/W) = Operate in one-Shot mode

20.9.2.10 ECEINT Register (Offset = 16h) [Reset = 0000h]

ECEINT is shown in Figure 20-26 and described in Table 20-15.

Return to the Summary Table.

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows:
- Disable global interrupts
- Stop eCAP counter
- Disable eCAP interrupts
- Configure peripheral registers
- Clear spurious eCAP interrupt flags
- Enable eCAP interrupts
- Start eCAP counter
- Enable global interrupts

Chapter 21

Enhanced Quadrature Encoder Pulse (eQEP)

The enhanced Quadrature Encoder Pulse (eQEP) module described here is a Type 2 eQEP. See the *C2000 Real-Time Control Peripheral Reference Guide* for a list of all devices with a module of the same type to determine the differences between types and for a list of device-specific differences within a type.

The enhanced quadrature encoder pulse (eQEP) module is used for direct interface with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine for use in a high-performance motion and position-control system.

21.1 Introduction

An incremental encoder disk is patterned with a track of slots along the periphery, as shown in Figure 21-1. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark and light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position, and zero reference

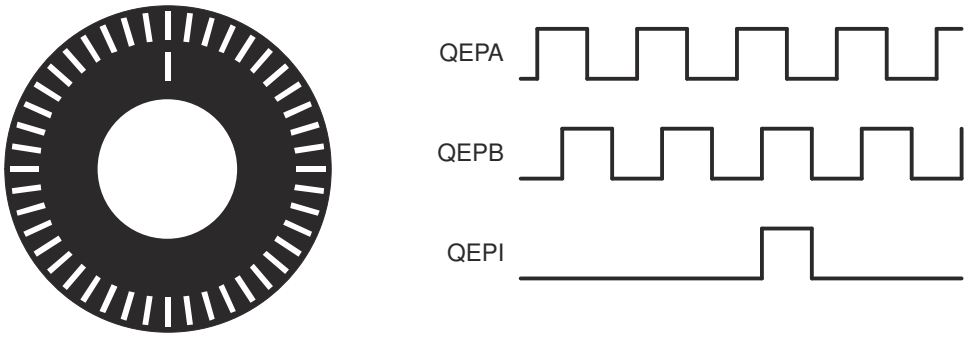

Figure 21-1. Optical Encoder Disk

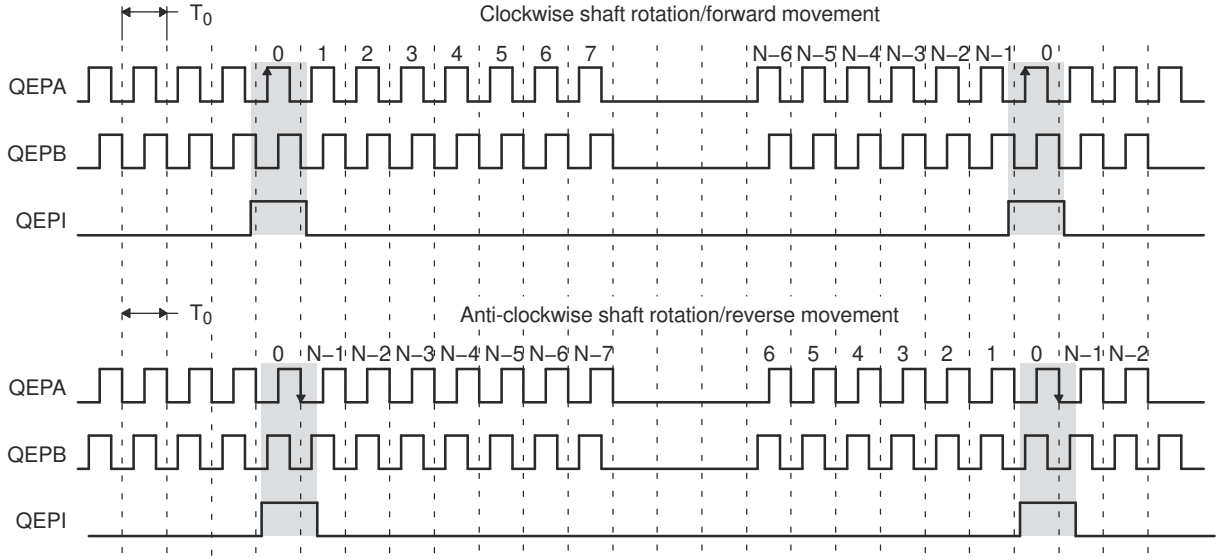
To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is detected with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90° out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel and conversely, as shown in Figure 21-2.



Legend: N = lines per revolution

Figure 21-2. QEP Encoder Output Signal for Forward/Reverse Movement

The encoder wheel typically makes one revolution for every revolution of the motor, or the wheel can be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder

directly coupled to a motor running at 5000 revolutions-per-minute (rpm) results in a frequency of 166.6kHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

Quadrature encoders from different manufacturers come with two forms of index pulse (gated index pulse or ungated index pulse) as shown in Figure 21-3. A nonstandard form of index pulse is ungated. In the ungated configuration, the index edges are not necessarily coincident with A and B signals. The gated index pulse is aligned to any of the four quadrature edges and width of the index pulse and can be equal to a quarter, half, or full period of the quadrature signal.

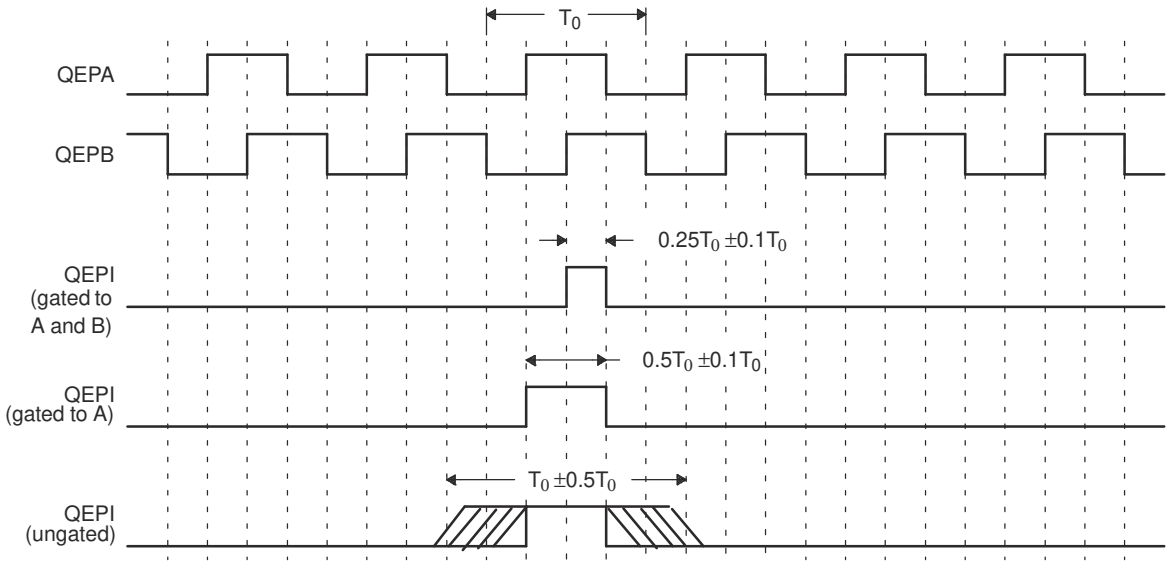


Figure 21-3. Index Pulse Example

Some typical applications of shaft encoders include robotics and computer input in the form of a mouse. Inside your mouse you can see where the mouse ball spins a pair of axles (a left/right, and an up/down axle). These axles are connected to optical shaft encoders that effectively tell the computer how fast and in what direction the mouse is moving.

General Issues: Estimating velocity from a digital position sensor is a cost-effective strategy in motor control. Two different first order approximations for velocity can be written as:

$$v(k) \approx \frac{x(k) - x(k-1)}{T} = \frac{\Delta X}{T} \quad (25)$$

$$v(k) \approx \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad (26)$$

where:

- v(k) = Velocity at time instant k
- x(k) = Position at time instant k
- x(k-1) = Position at time instant k-1
- T = Fixed unit time or inverse of velocity calculation rate
- ΔX = Incremental position movement in unit time
- t(k) = Time instant "k"
- t(k-1) = Time instant "k-1"
- X = Fixed unit position
- ΔT = Incremental time elapsed for unit position movement

Equation 25 is the conventional approach to velocity estimation and requires a time base to provide a unit time event for velocity calculation. Unit time is basically the inverse of the velocity calculation rate.

The encoder count (position) is read once during each unit time event. The quantity [x(k) - x(k-1)] is formed by subtracting the previous reading from the current reading. Then the velocity estimate is computed by multiplying by the known constant 1/T (where T is the constant time between unit time events and is known in advance).

Estimation based on Equation 25 has an inherent accuracy limit directly related to the resolution of the position sensor and the unit time period T. For example, consider a 500 line-per-revolution quadrature encoder with a velocity calculation rate of 400Hz. When used for position, the quadrature encoder gives a four-fold increase in resolution; in this case, 2000 counts-per-revolution. The minimum rotation that can be detected is, therefore, 0.0005 revolutions, which gives a velocity resolution of 12rpm when sampled at 400Hz. While this resolution can be satisfactory at moderate or high speeds, for example 1% error at 1200rpm, this resolution clearly proves inadequate at low speeds. In fact, at speeds below 12rpm, the speed estimate is erroneously zero much of the time.

At low speed, Equation 26 provides a more accurate approach. It requires a position sensor that outputs a fixed interval pulse train, such as the aforementioned quadrature encoder. The width of each pulse is defined by motor speed for a given sensor resolution. Equation 26 can be used to calculate motor speed by measuring the elapsed time between successive quadrature pulse edges. However, this method suffers from the opposite limitation, as does Equation 25. A combination of relatively large motor speeds and high sensor resolution makes the time interval ΔT small, and thus more greatly influenced by the timer resolution. This can introduce considerable error into high-speed estimates.

For systems with a large speed range (that is, speed estimation is needed at both low and high speeds), one approach is to use Equation 26 at low speed and have the DSP software switch over to Equation 25 when the motor speed rises above some specified threshold.

21.2 Configuring Device Pins

The GPIO mux registers must be configured to connect this peripheral to the device pins. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

For proper operation of the eQEP module, input GPIO pins must be configured using the GPxQSELn registers for synchronous input mode (with or without qualification). The asynchronous mode cannot be used for eQEP input pins. The internal pullups can be configured in the GPyPUD register.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux and settings.

21.3 Description

This section provides the eQEP inputs, memory map, and functional description.

21.3.1 EQEP Inputs

The eQEP inputs include two pins for quadrature-clock mode or direction-count mode, an index (or 0 marker), and a strobe input. The eQEP module requires that the QEPA, QEPB, and QEPI inputs are synchronized to SYSCLK prior to entering the module. The application code can enable the synchronous GPIO input feature on any eQEP-enabled GPIO pins (see the *General-Purpose Input/Output (GPIO)* chapter for more details).

- **QEPA/XCLK and QEPB/XDIR:** These two pins can be used in quadrature-clock mode or direction-count mode.
  - Quadrature-clock Mode: The eQEP encoders provide two square wave signals (A and B) 90 electrical degrees out of phase. This phase relationship is used to determine the direction of rotation of the input shaft and number of eQEP pulses from the index position to derive the relative position information. For forward or clockwise rotation, QEPA signal leads QEPB signal and conversely. The quadrature decoder uses these two inputs to generate quadrature-clock and direction signals.
  - Direction-count Mode: In direction-count mode, direction and clock signals are provided directly from the external source. Some position encoders have this type of output instead of quadrature output. The QEPA pin provides the clock input and the QEPB pin provides the direction input.
- **QEPI: Index or Zero Marker:** The eQEP encoder uses an index signal to assign an absolute start position from which position information is incrementally encoded using quadrature pulses. This pin is connected to the index output of the eQEP encoder to optionally reset the position counter for each revolution. This signal can be used to initialize or latch the position counter on the occurrence of a desired event on the index pin.
- **QEPS: Strobe Input:** This general-purpose strobe signal can initialize or latch the position counter on the occurrence of a desired event on the strobe pin. This signal is typically connected to a sensor or limit switch to notify that the motor has reached a defined position.

Input signals to the eQEP (QEPA, QEPB, QEPI and QEPS) can come from multiple sources; that is, device pin, CMPSSx, or PWMXBARx. One typical use case is if SinCos transducers are used in the motor control system to estimate the position of motor shaft and Index signal is coming from traditional rotary encoder, source of the eQEP signals (QEPA, QEPB and QEPI) can be configured as output of CMPSSx that decodes the Sin, Cos, and Index signals. Figure 21-4 illustrates the use case.

Selection of the source of Input signals (QEPA, QEPB, and QEPI) is user-configurable through the QEPSRCSEL register as shown in Table 21-1.

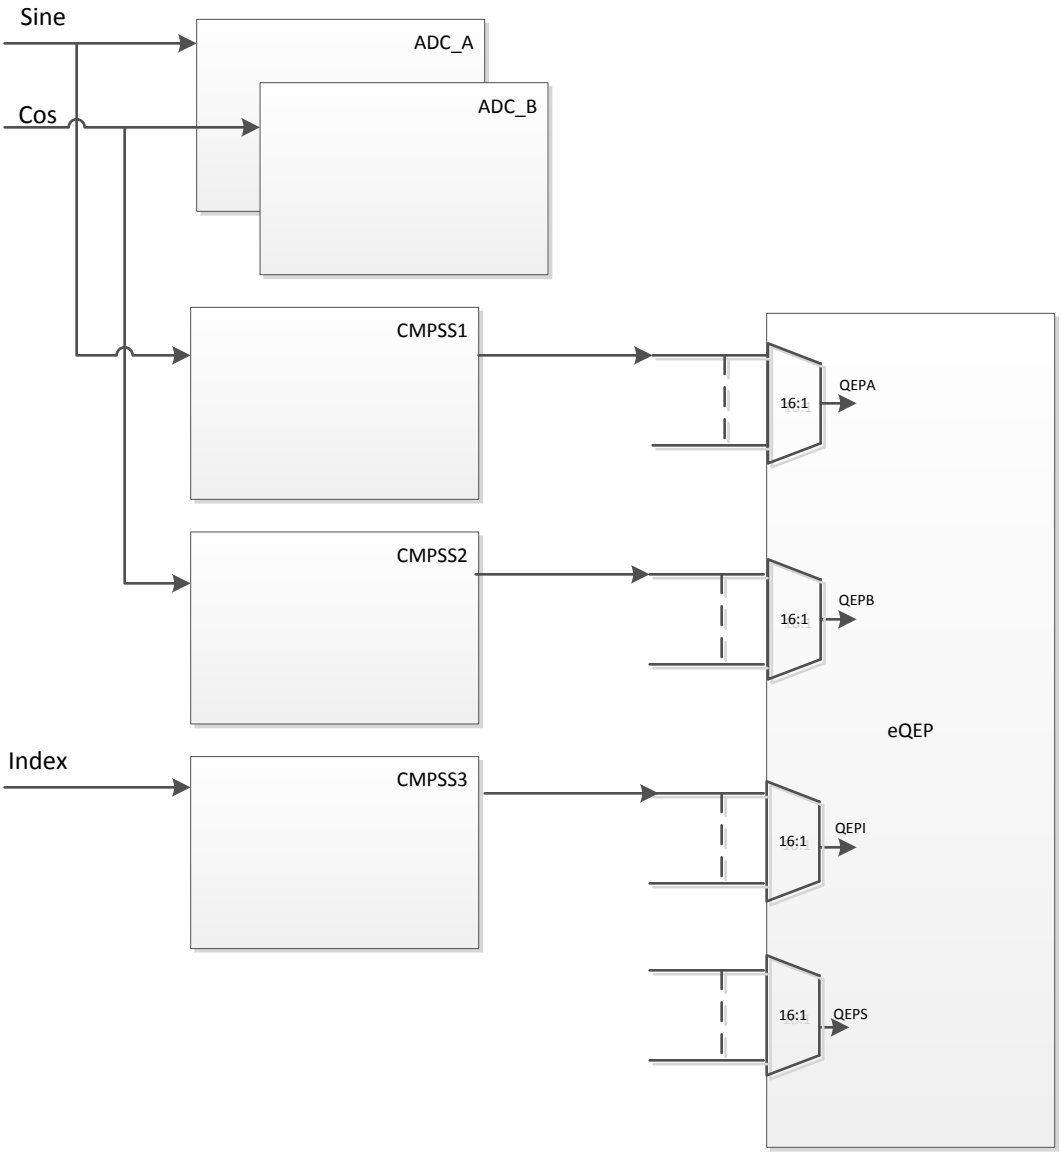

Figure 21-4. Using eQEP to Decode Signals from SinCos Transducer

Note

Configuration of QEPSRCSEL register to select the source of QEPA, QEPB, and QEPI signals can lead to unexpected transition on these signals, which can cause an undesirable outcome if eQEP is already running. Make sure that the eQEP is disabled before configuring the QEPSRCSEL register for input signals.

21.3.2 Functional Description

The eQEP peripheral contains the following major functional units (as shown in Figure 21-5):

- Programmable input qualification for each pin (part of the GPIO MUX)
- Quadrature decoder unit (QDU)
- Position counter and control unit for position measurement (PCCU)
- Quadrature edge-capture unit for low-speed measurement (QCAP)
- Unit time base for speed/frequency measurement (UTIME)
- Watchdog timer for detecting stalls (QWDOG)
- Quadrature Mode Adapter (QMA)

21.4 Quadrature Decoder Unit (QDU)

Figure 21-6 shows a functional block diagram of the QDU.

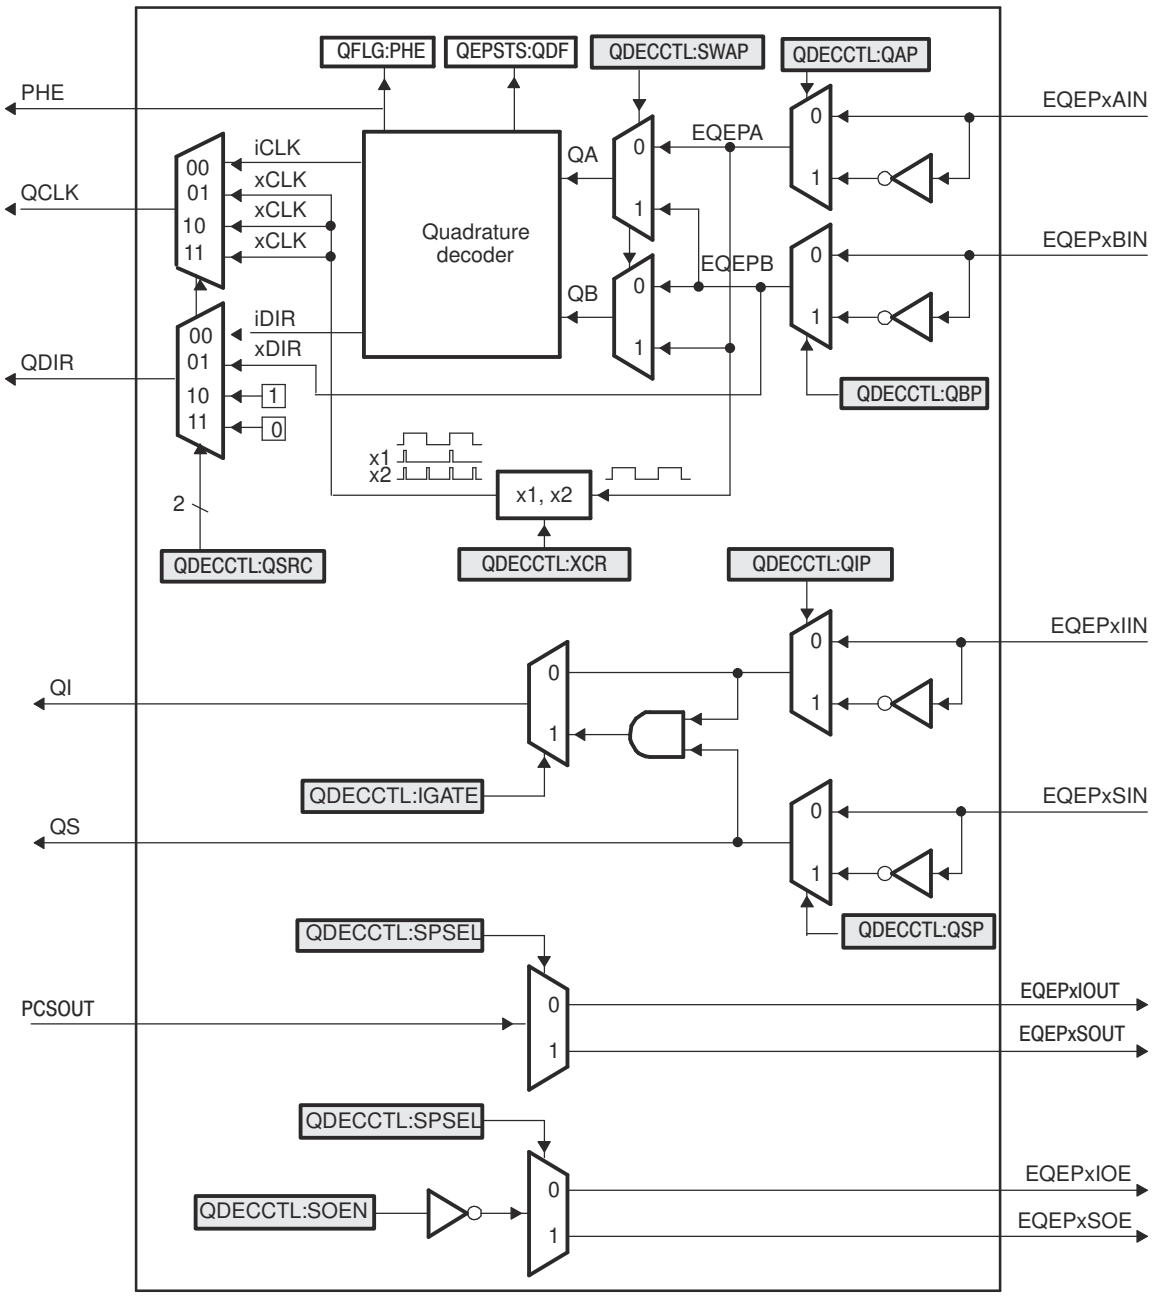

Figure 21-6. Functional Block Diagram of Decoder Unit

21.4.1 Position Counter Input Modes

Clock and direction input to the position counter is selected using QDECCTL[QSRC] bits, based on interface input requirement as follows:

- Quadrature-count mode
- Direction-count mode
- UP-count mode
- DOWN-count mode

21.4.1.1 Quadrature Count Mode

The quadrature decoder generates the direction and clock to the position counter in quadrature count mode.

Direction Decoding

The direction decoding logic of the eQEP circuit determines which one of the sequences (QEPA, QEPB) is the leading sequence and accordingly updates the direction information in the QEPSTS[QDF] bit. Table 21-3 and Figure 21-7 show the direction decoding logic in truth table and state machine form. Both edges of the QEPA and QEPB signals are sensed to generate count pulses for the position counter. Therefore, the frequency of the clock generated by the eQEP logic is four times that of each input sequence. Figure 21-8 shows the direction decoding and clock generation from the eQEP input signals.

Table 21-3. Quadrature Decoder Truth Table

	QA↑	UP	Increment
	QB↑	TOGGLE	Increment or Decrement

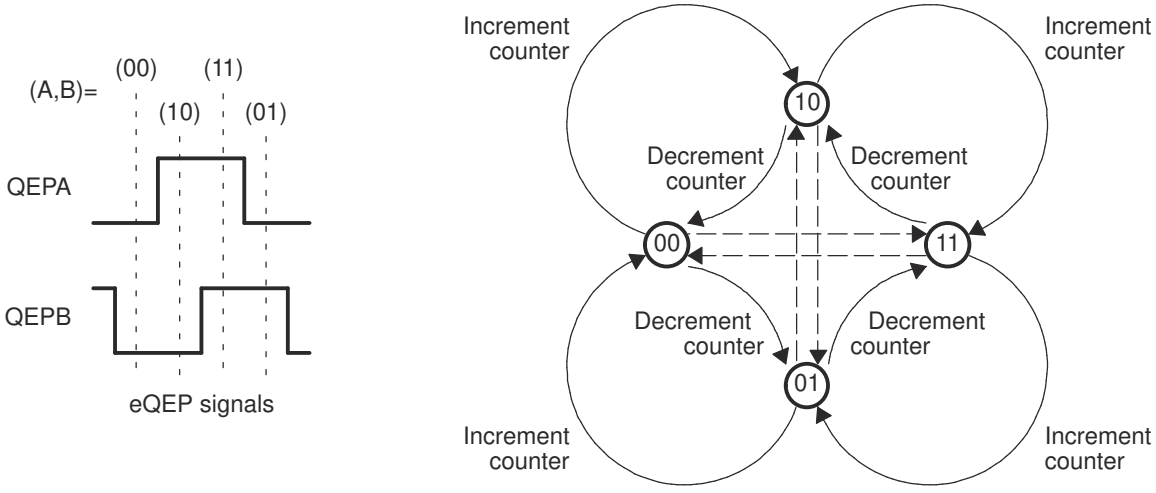

Figure 21-7. Quadrature Decoder State Machine

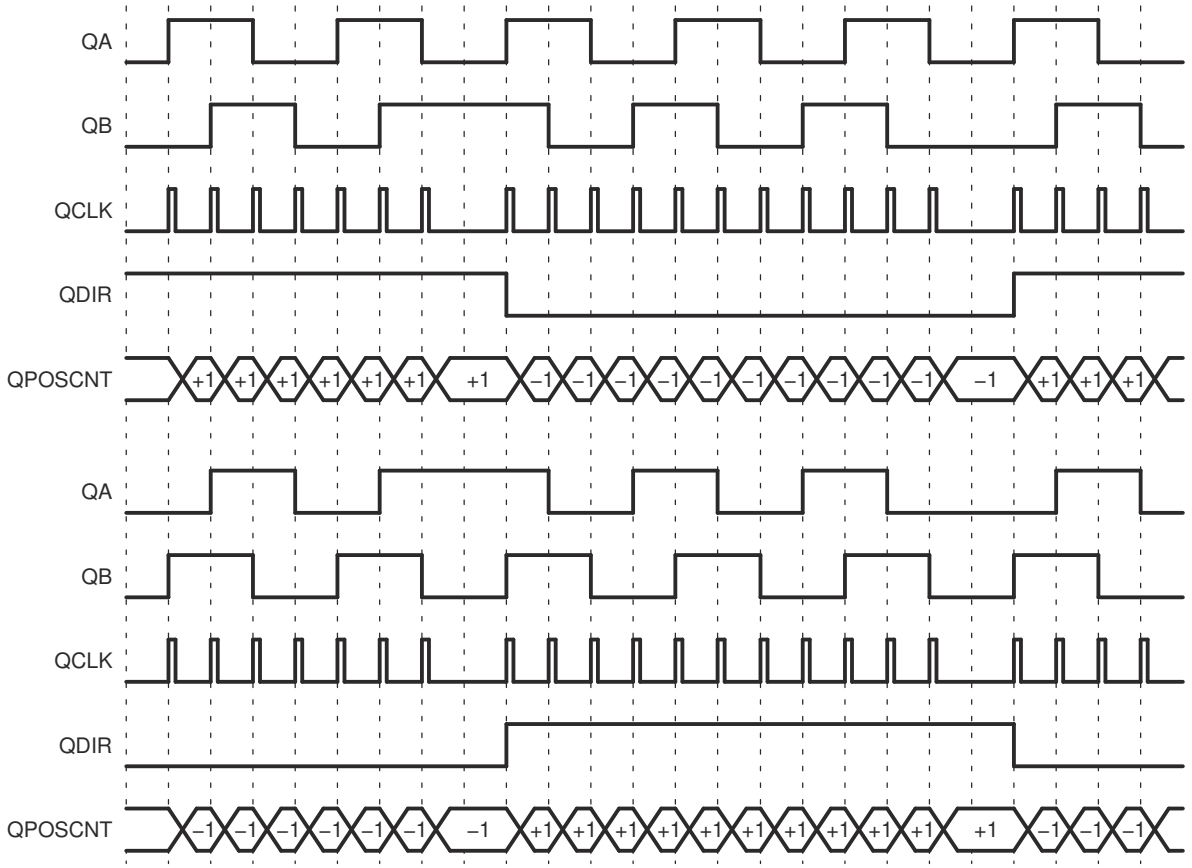

Figure 21-8. Quadrature-clock and Direction Decoding

Phase Error Flag In normal operating conditions, quadrature inputs QEPA and QEPB is 90 degrees out of phase. The phase error flag (PHE) is set in the QFLG register and the QPOSCNT value can be incorrect and offset by multiples of 1 or 3. That is, when edge transition is detected simultaneously on the QEPA and QEPB signals to optionally generate interrupts. State transitions marked by dashed lines in Figure 21-7 are invalid transitions that generate a phase error.

Count Multiplication The eQEP position counter provides 4x times the resolution of an input clock by generating a quadrature-clock (QCLK) on the rising/falling edges of both eQEP input clocks (QEPA and QEPB) as shown in Figure 21-8.

Reverse Count In normal quadrature count operation, QEPA input is applied to the QA input of the quadrature decoder and the QEPB input is applied to the QB input of the quadrature decoder. Reverse counting is enabled by setting the SWAP bit in the QDECCTL register. This swaps the input to the quadrature decoder; thereby, reversing the counting direction.

21.4.1.2 Direction-Count Mode

Some position encoders provide direction and clock outputs, instead of quadrature outputs. In such cases, direction-count mode can be used. The QEPA input provides the clock for the position counter and the QEPB input has the direction information. The position counter is incremented on every rising edge of a QEPA input when the direction input is high, and decremented when the direction input is low.

21.4.1.3 Up-Count Mode

The counter direction signal is hard-wired for up-count and the position counter is used to measure the frequency of the QEPA input. Clearing the QDECCTL[XCR] bit enables clock generation to the position counter on both edges of the QEPA input; thereby, increasing the measurement resolution by a factor of 2x. In up-count mode, we recommend that the application not configure QEPB as a GPIO mux option, or make sure that a signal edge is not generated on the QEPB input.

21.4.1.4 Down-Count Mode

The counter direction signal is hardwired for a down-count and the position counter is used to measure the frequency of the QEPA input. Clearing the QDECCTL[XCR] bit enables clock generation to the position counter on both edges of a QEPA input, thereby increasing the measurement resolution by a factor of 2x. In down-count mode, the application must not configure QEPB as a GPIO mux option or make sure that a signal edge is not generated on the QEPB input.

21.4.2 eQEP Input Polarity Selection

Each eQEP input can be inverted using QDECCTL[8:5] control bits. As an example, setting the QDECCTL[QIP] bit inverts the index input.

21.4.3 Position-Compare Sync Output

The enhanced eQEP peripheral includes a position-compare unit that is used to generate the position-compare sync signal on compare match between the position-counter register (QPOSCNT) and the position- compare register (QPOSCMP). This sync signal can be output using an index pin or strobe pin of the EQEP peripheral.

Setting the QDECCTL[SOEN] bit enables the position-compare sync output and the QDECCTL[SPSEL] bit selects either an eQEP index pin or an eQEP strobe pin.

21.5 Position Counter and Control Unit (PCCU)

The position-counter and control unit provides two configuration registers (QEPCTL and QPOSCTL) for setting up position-counter operational modes, position-counter initialization/latch modes and position-compare logic for sync signal generation.

21.5.1 Position Counter Operating Modes

Position-counter data can be captured in different manners. In some systems, the position counter is accumulated continuously for multiple revolutions and the position-counter value provides the position information with respect to the known reference. An example of this is the quadrature encoder mounted on the motor controlling the print head in the printer. Here the position counter is reset by moving the print head to the home position and then the position counter provides absolute position information with respect to home position.

In other systems, the position counter is reset on every revolution using index pulse, and the position counter provides a rotor angle with respect to the index pulse position.

The position counter can be configured to operate in following four modes

- Position-Counter Reset on Index Event
- Position-Counter Reset on Maximum Position
- Position-Counter Reset on the first Index Event
- Position-Counter Reset on Unit Time Out Event (Frequency Measurement)

In all the above operating modes, the position counter is reset to 0 on overflow and to the QPOSMAX register value on underflow. Overflow occurs when the position counter counts up after the QPOSMAX value. Underflow occurs when the position counter counts down after 0. The Interrupt flag is set to indicate overflow/underflow in QFLG register.

21.5.1.1 Position Counter Reset on Index Event (QEPCTL[PCRM] = 00)

If the index event occurs during the forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOSMAX register on the next eQEP clock.

The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in QEPSTS registers, the eQEP peripheral also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for index event reset operation.

For example, if the first reset operation occurs on the falling edge of QEPB during the forward direction, then all the subsequent reset must be aligned with the falling edge of QEPB for the forward rotation and on the rising edge of QEPB for the reverse rotation as shown in Figure 21-9.

The position-counter value is latched to the QPOSILAT register and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker. The position-counter error flag (QEPSTS[PCEF]) and error interrupt flag (QFLG[PCE]) are set if the latched value is not equal to 0 or QPOSMAX. The position-counter error flag (QEPSTS[PCEF]) is updated on every index event marker and an interrupt flag (QFLG[PCE]) is set on error that can be cleared only through software.

The index event latch configuration QEPCTL[IEL] must be configured to 00 or 11 when pcrm = 0 and the position counter error flag/interrupt flag are generated only in index event reset mode. The position counter value is latched into the IPOSLAT register on every index marker.

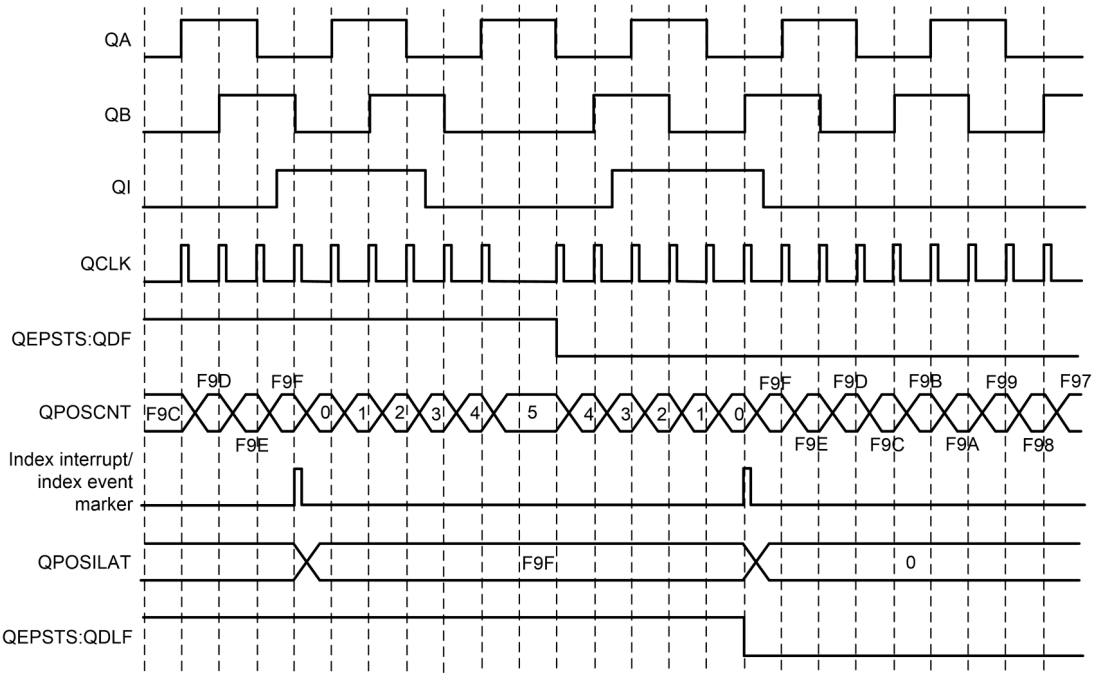

Figure 21-9. Position Counter Reset by Index Pulse for 1000-Line Encoder (QPOSMAX = 3999 or 0xF9F)

Note

In case of a boundary condition where the time period between the Index Event and the previous QCLK edge is less than SYSCLK period, then QPOSCNT gets reset to zero or QPOSMAX in the same SYSCLK cycle and does not wait for the next QCLK edge to occur.

21.5.1.2 Position Counter Reset on Maximum Position (QEPCTL[PCRM] = 01)

If the position counter is equal to QPOSMAX, then the position counter is reset to 0 on the next eQEP clock for forward movement and position counter overflow flag is set. If the position counter is equal to ZERO, then the position counter is reset to QPOSMAX on the next QEP clock for reverse movement and position-counter underflow flag is set. Figure 21-10 shows the position-counter reset operation in this mode.

The first index marker fields (QEPSTS[FIDF] and QEPSTS[FIMF]) are not applicable in this mode.

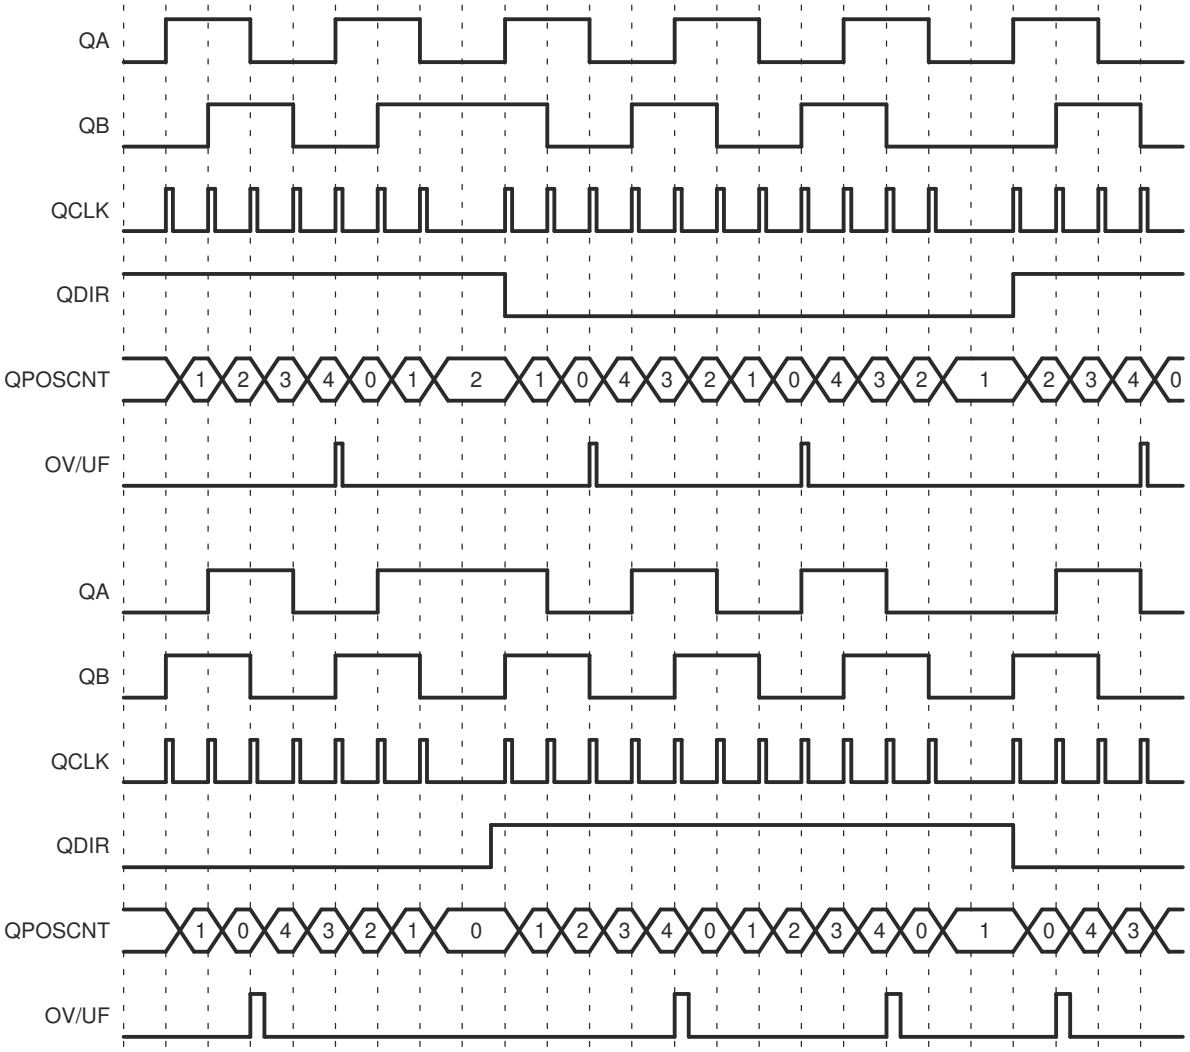

Figure 21-10. Position Counter Underflow/Overflow (QPOSMAX = 4)

21.5.1.3 Position Counter Reset on the First Index Event (QEPCTL[PCRM] = 10)

If the index event occurs during forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOSMAX register on the next eQEP clock. Note that this is done only on the first occurrence and subsequently the position-counter value is not reset on an index event; rather, the position-counter value is reset based on the maximum position as described in Section 21.5.1.2.

The first index marker fields (QEPSTS[FIDF] and QEPSTS[FIMF]) are not applicable in this mode.

21.5.1.4 Position Counter Reset on Unit Time-out Event (QEPCTL[PCRM] = 11)

In this mode, QPOSCNT is set to 0 or QPOMAX, depending on the direction mode selected by QDECCTL[QSRC] bits on a unit time event. This is useful for frequency measurement.

21.5.2 Position Counter Latch

The eQEP index and strobe input can be configured to latch the position counter (QPOSCNT) into QPOSILAT and QPOSSLAT, respectively, on occurrence of a definite event on these pins.

21.5.2.1 Index Event Latch

In some applications, it is not desirable to reset the position counter on every index event and instead it can be required to operate the position counter in full 32-bit mode (QEPCTL[PCRM] = 01 and QEPCTL[PCRM] = 10 modes).

In such cases, the eQEP position counter can be configured to latch on the following events and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker.

- Latch on Rising edge (QEPCTL[IEL] = 01)
- Latch on Falling edge (QEPCTL[IEL] = 10)
- Latch on Index Event Marker (QEPCTL[IEL] = 11)

This is particularly useful as an error checking mechanism to check if the position counter accumulated the correct number of counts between index events. As an example, the 1000-line encoder must count 4000 times when moving in the same direction between the index events.

The index event latch interrupt flag (QFLG[IEL]) is set when the position counter is latched to the QPOSILAT register. The index event latch configuration bits (QEPCTL[IEL]) are ignored when QEPCTL[PCRM] = 00.

Latch on Rising Edge (QEPCTL[IEL] = 01)	The position-counter value (QPOSCNT) is latched to the QPOSILAT register on every rising edge of an index input.
Latch on Falling Edge (QEPCTL[IEL] = 10)	The position-counter value (QPOSCNT) is latched to the QPOSILAT register on every falling edge of index input.
Latch on Index Event Marker/Software Index Marker (QEPCTL[IEL] = 11	The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and the direction on the first index event marker (QEPSTS[FIDF]) in the QEPSTS registers. The eQEP peripheral also remembers the quadrature edge on the first index marker so that the same relative quadrature transition is used for latching the position counter (QEPCTL[IEL] = 11).

Figure 21-11 shows the position counter latch using an index event marker.

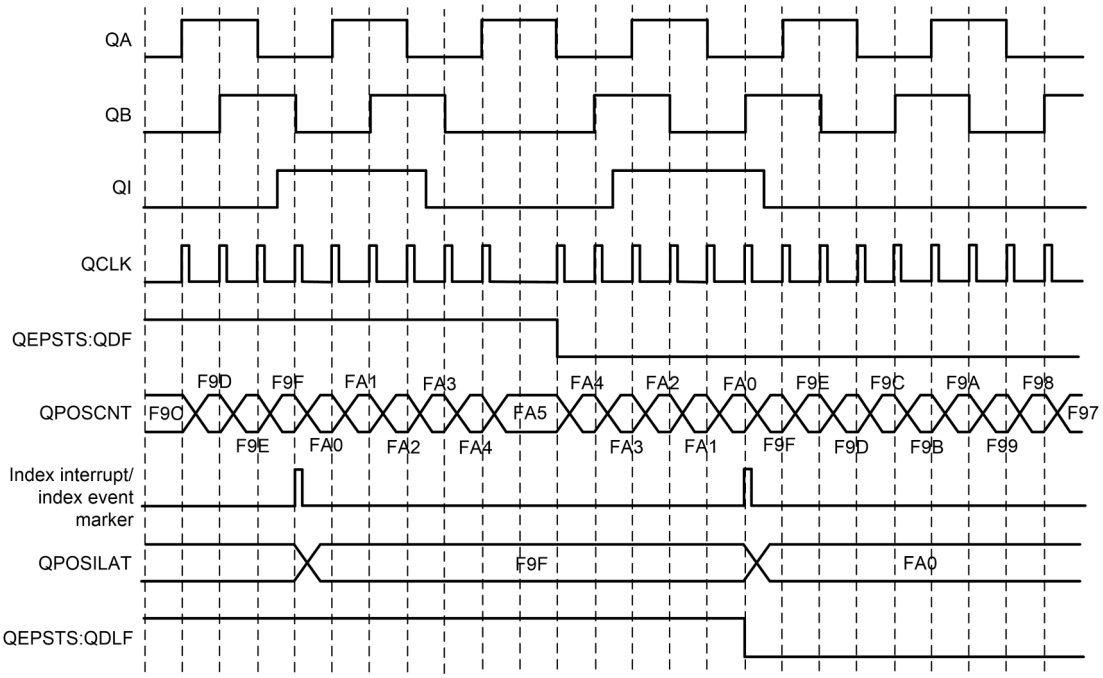

Figure 21-11. Software Index Marker for 1000-line Encoder (QEPCTL[IEL] = 1)

21.5.2.2 Strobe Event Latch

The position-counter value is latched to the QPOSSLAT register on the rising edge of the strobe input by clearing the QEPCTL[SEL] bit.

If the QEPCTL[SEL] bit is set, then the position-counter value is latched to the QPOSSLAT register on the rising edge of the strobe input for forward direction, and on the falling edge of the strobe input for reverse direction as shown in Figure 21-12.

The strobe event latch interrupt flag (QFLG[SEL) is set when the position counter is latched to the QPOSSLAT register.

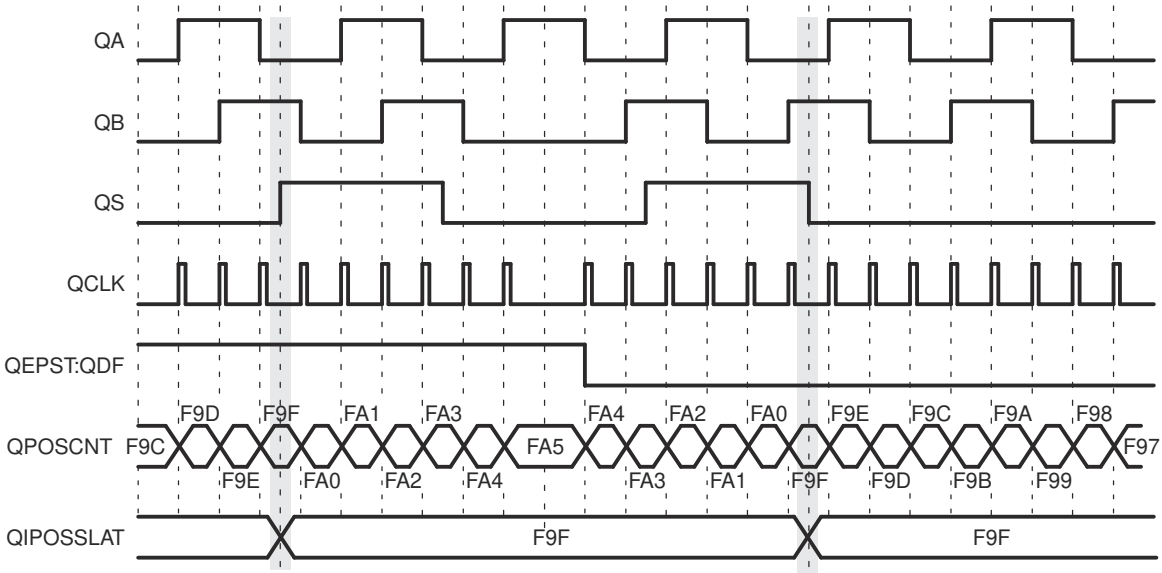

Figure 21-12. Strobe Event Latch (QEPCTL[SEL] = 1)

There is an added feature on Type 2.0 eQEP where position-counter value can also be latched on ADCSOCA and ADCSOSCB events by configuring the register QEPSTROBESEL.STROBESEL as shown in Figure 21-13. To use the ADCSOCA/B events for the QS signal, configuration of the QEPSRCSEL.QEPSSEL to be non-zero is needed..

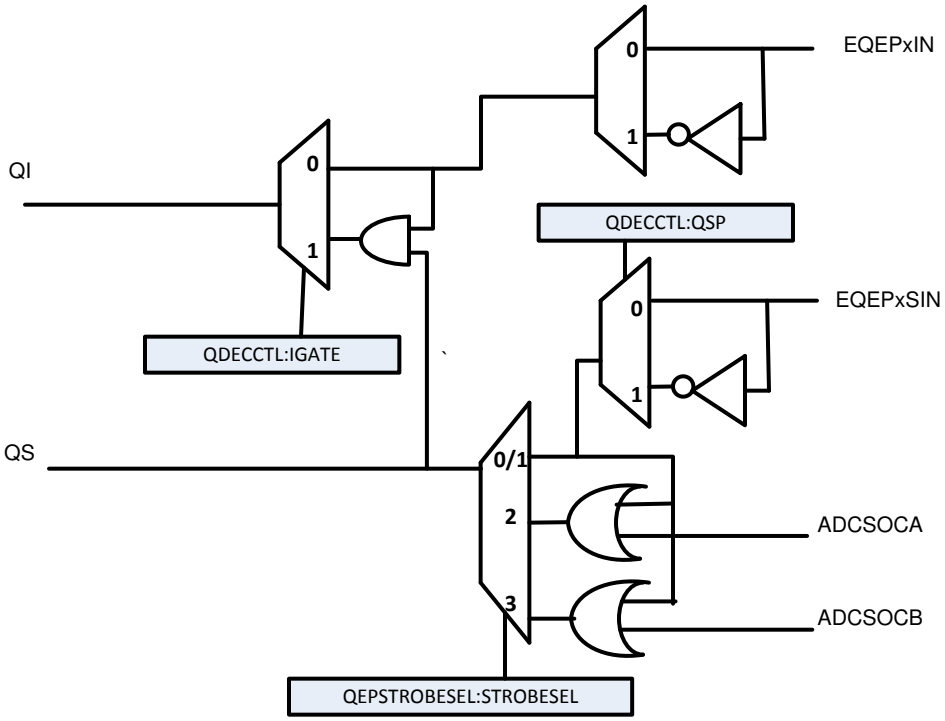

Figure 21-13. Latching Position Counter on ADCSOCA/ADCSOCB Event

21.5.3 Position Counter Initialization

The position counter can be initialized using the following events:

- Index event
- Strobe event
- Software initialization

Index Event Initialization (IEI)	The QEPI index input can be used to trigger the initialization of the position counter at the rising or falling edge of the index input. If the QEPCTL[IEI] bits are 10, then the position counter (QPOSCNT) is initialized with a value in the QPOSINIT register on the rising edge of index input. Conversely, if the QEPCTL[IEI] bits are 11, initialization is on the falling edge of the index input.
Strobe Event Initialization (SEI)	If the QEPCTL[SEI] bits are 10, then the position counter is initialized with a value in the QPOSINIT register on the rising edge of strobe input. If QEPCTL[SEL] bits are 11, then the position counter is initialized with a value in the QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.
Software Initialization (SWI)	The position counter can be initialized in software by writing a 1 to the QEPCTL[SWI] bit. This bit is not automatically cleared. While the bit is still set, if a 1 is written to the bit again, the position counter is re-initialized.

21.5.4 eQEP Position-compare Unit

The eQEP peripheral includes a position-compare unit that is used to generate a sync output and interrupt on a position-compare match. Figure 21-14 shows a diagram. The position-compare (QPOSCMP) register is shadowed and shadow mode can be enabled or disabled using the QPOSCTL[PSSHDW] bit. If the shadow mode is not enabled, the CPU writes directly to the active position compare register.

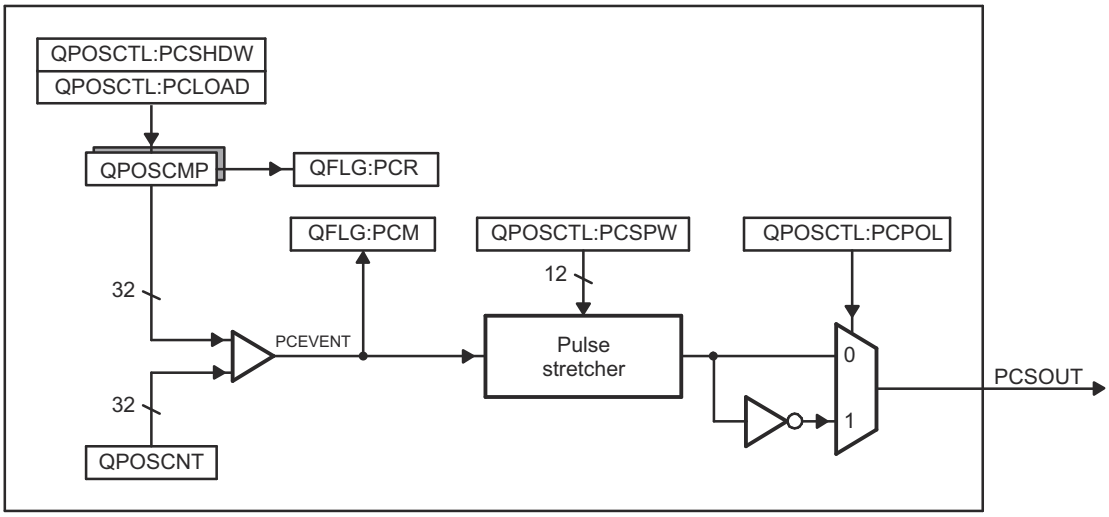

Figure 21-14. eQEP Position-compare Unit

In shadow mode, you can configure the position-compare unit (QPOSCTL[PCLOAD]) to load the shadow register value into the active register on the following events, and to generate the position-compare ready (QFLG[PCR]) interrupt after loading.

- Load on compare match
- Load on position-counter zero event

The position-compare match (QFLG[PCM]) is set when the position-counter value (QPOSCNT) matches with the active position-compare register (QPOSCMP) and the position-compare sync output of the programmable pulse width is generated on compare-match to trigger an external device.

For example, if QPOSCMP = 2, the position-compare unit generates a position-compare event on 1 to 2 transitions of the eQEP position counter for forward counting direction and on 3 to 2 transitions of the eQEP position counter for reverse counting direction (see Figure 21-15).

See the register section for the layout of the eQEP Position-Compare Control Register (QPOSCTL) and description of the QPOSCTL bit fields.

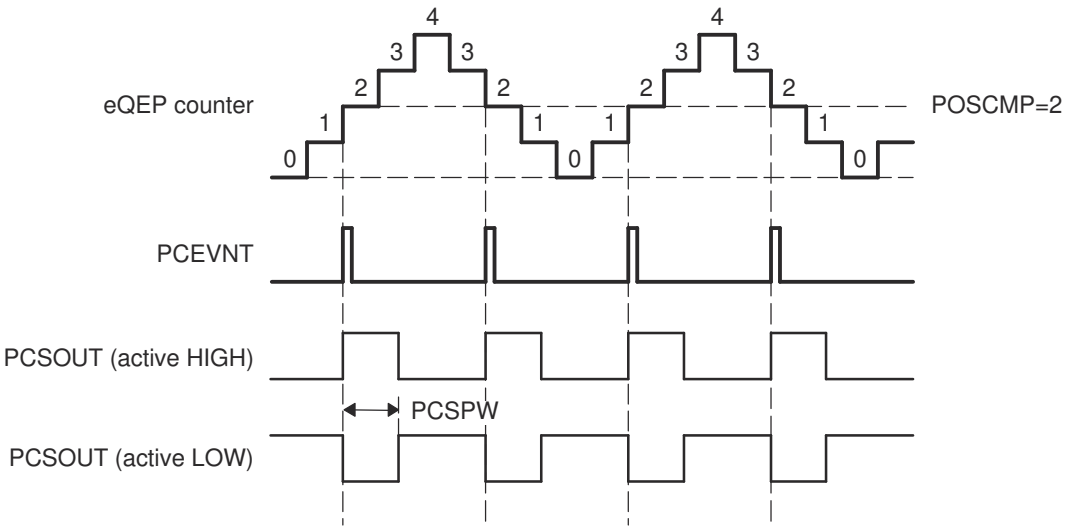

Figure 21-15. eQEP Position-compare Event Generation Points

The pulse stretcher logic in the position-compare unit generates a programmable position-compare sync pulse output on the position-compare match. In the event of a new position-compare match while a previous position-compare pulse is still active, then the pulse stretcher generates a pulse of specified duration from the new position-compare event as shown in Figure 21-16.

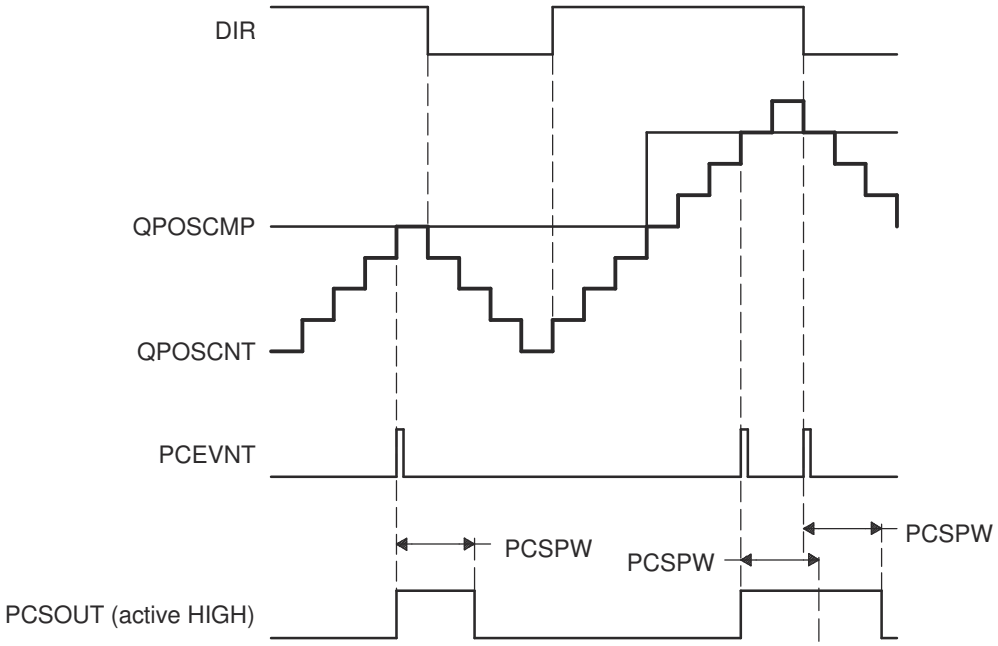

Figure 21-16. eQEP Position-compare Sync Output Pulse Stretcher

21.6 eQEP Edge Capture Unit

The eQEP peripheral includes an integrated edge capture unit to measure the elapsed time between the unit position events as shown in Figure 21-17. This feature is typically used for low-speed measurement using the following formula:

$$v(k) = \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad (27)$$

where:

- X = Unit position is defined by integer multiple of quadrature edges (see Figure 21-18)
- ΔT = Elapsed time between unit position events
- v(k) = Velocity at time instant "k"

The eQEP capture timer (QCTMR) runs from prescaled SYSCLKOUT and the prescaler is programmed by the QCAPCTL[CCPS] bits. The capture timer (QCTMR) value is latched into the capture period register (QCPRD) on every unit position event and then the capture timer is reset, a flag is set in QEPSTS:UPEVNT to indicate that new value is latched into the QCPRD register. Software can check this status flag before reading the period register for low speed measurement, and clear the flag by writing 1.

Time measurement (ΔT) between unit position events is correct if the following conditions are met:

- No more than 65,535 counts have occurred between unit position events.
- No direction change between unit position events.

If the QEP capture timer overflows between unit position events, then the timer sets the QEP capture overflow flag (QEPSTS[COEF]) in the status register and the QCPRDLAT register is set to 0xFFFF. If direction change occurs between the unit position events, then the error flag is set in the status register (QEPSTS[CDEF]) and the QCPRDLAT register is set to 0xFFFF.

The Capture Timer (QCTMR) and Capture Period register (QCPRD) can be configured to latch on the following events:

- CPU read of QPOSCNT register
- Unit time-out event

If the QEPCTL[QCLM] bit is cleared, then the capture timer and capture period values are latched into the QCTMRLAT and QCPRDLAT registers, respectively, when the CPU reads the position counter (QPOSCNT).

If the QEPCTL[QCLM] bit is set, then the position counter, capture timer, and capture period values are latched into the QPOSLAT, QCTMRLAT and QCPRDLAT registers, respectively, on unit time out.

Figure 21-19 shows the capture unit operation along with the position counter.

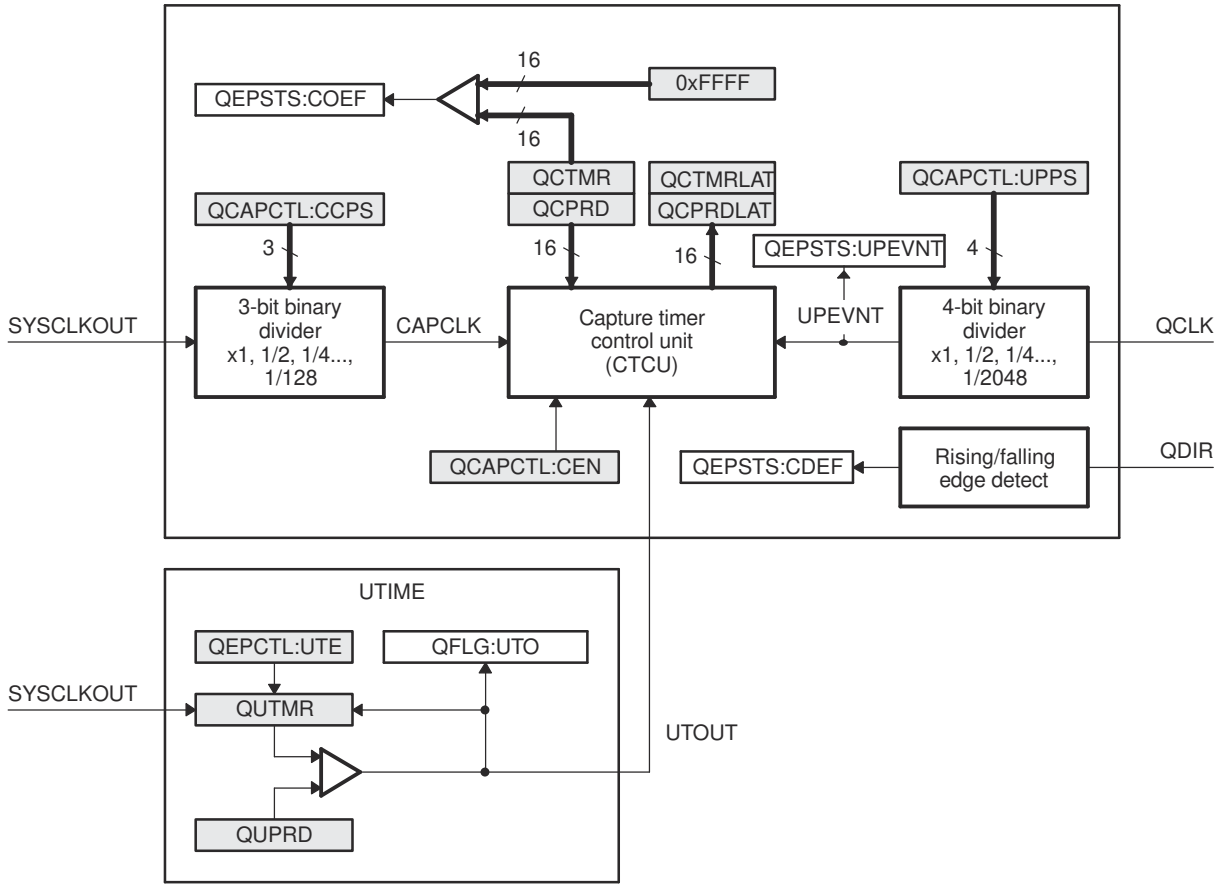

Figure 21-17. eQEP Edge Capture Unit

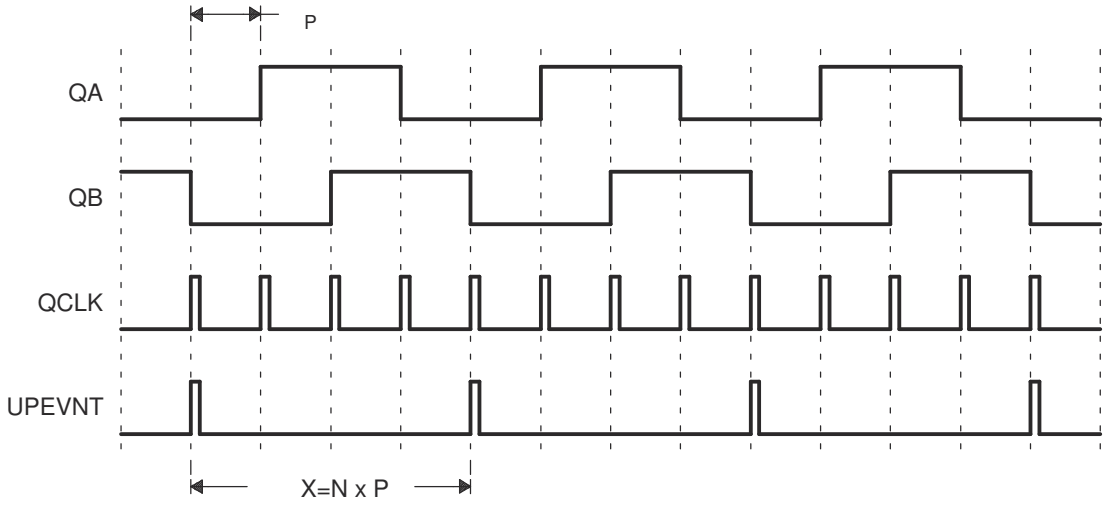
CAUTION

The QCAPCTL[UPPS] prescaler cannot be modified dynamically (such as switching the unit event prescaler from QCLK/4 to QCLK/8). Doing so can result in undefined behavior. The QCAPCTL[CPPS] prescaler can be modified dynamically (such as switching CAPCLK prescaling mode from SYSCLK/4 to SYSCLK/8) only after the capture unit is disabled.



N = Number of quadrature periods selected using QCAPCTL[UPPS] bits

Figure 21-18. Unit Position Event for Low Speed Measurement (QCAPCTL[UPPS] = 0010)

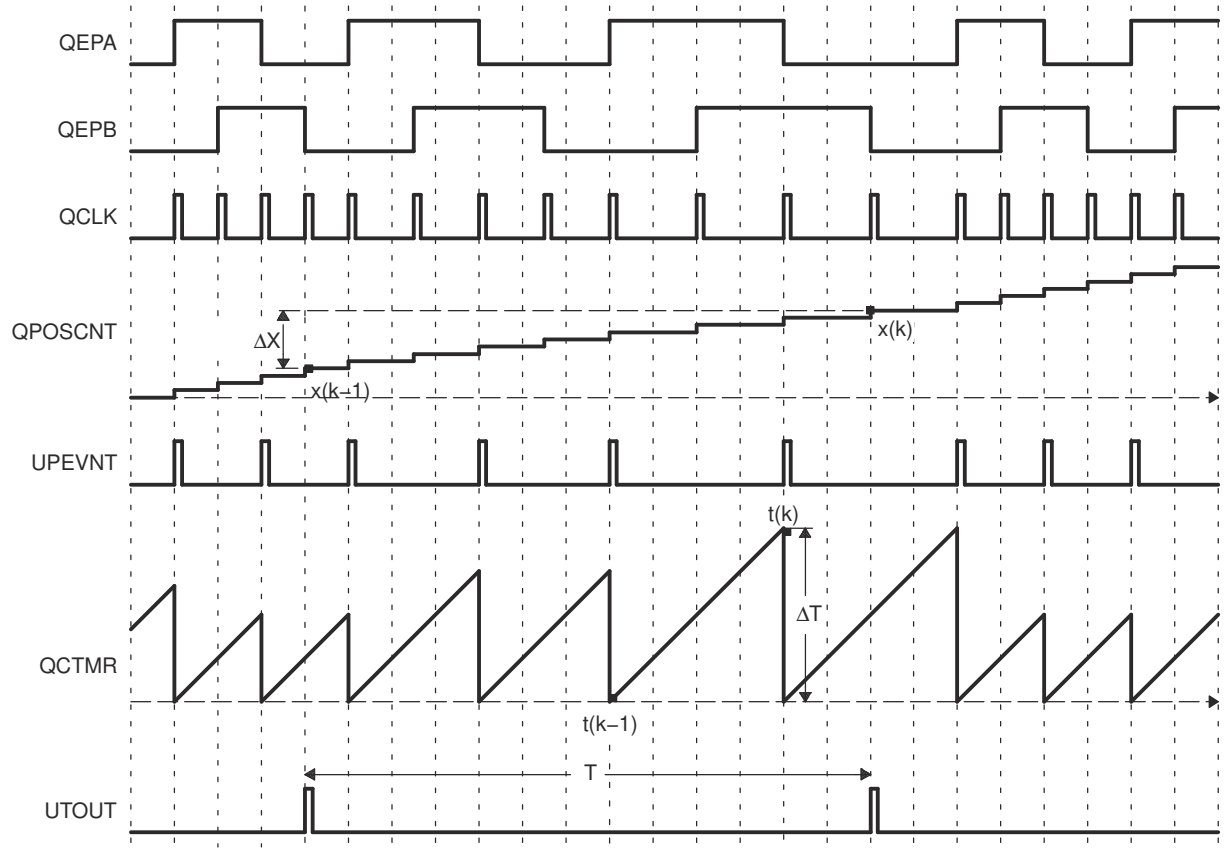


Figure 21-19. eQEP Edge Capture Unit - Timing Details

Velocity calculation equation:

$$v(k) = \frac{x(k) - x(k-1)}{T} = \frac{\Delta X}{T} \text{ o} \quad (28)$$

where:

- v(k) = Velocity at time instant k
- x(k) = Position at time instant k
- x(k-1) = Position at time instant k-1
- T = Fixed unit time or inverse of velocity calculation rate
- ΔX = Incremental position movement in unit time
- X = Fixed unit position
- ΔT = Incremental time elapsed for unit position movement
- t(k) = Time instant "k"
- t(k-1) = Time instant "k-1"

Unit time (T) and unit period (X) are configured using the QUPRD and QCAPCTL[UPPS] registers. Incremental position output and incremental time output is available in the QPOSLAT and QCPRDLAT registers.

Parameter	Relevant Register to Configure or Read the Information
T	Unit Period Register (QUPRD)
ΔX	Incremental Position = QPOSLAT(k) - QPOSLAT(K-1)
X	Fixed-unit position defined by sensor resolution and QCAPCTL[UPPS] bits
ΔT	Capture Period Latch (QCPRDLAT)

21.7 eQEP Watchdog

The eQEP peripheral contains a 16-bit watchdog timer (Figure 21-20) that monitors the quadrature clock to indicate proper operation of the motion-control system. The eQEP watchdog timer is clocked from SYSCLKOUT/64 and the quadrature clock event (pulse) resets the watchdog timer. If no quadrature clock event is detected until a period match (QWDPRD = QWDTMR), then the watchdog timer times out and the watchdog interrupt flag is set (QFLG[WTO]). The time-out value is programmable through the watchdog period register (QWDPRD).

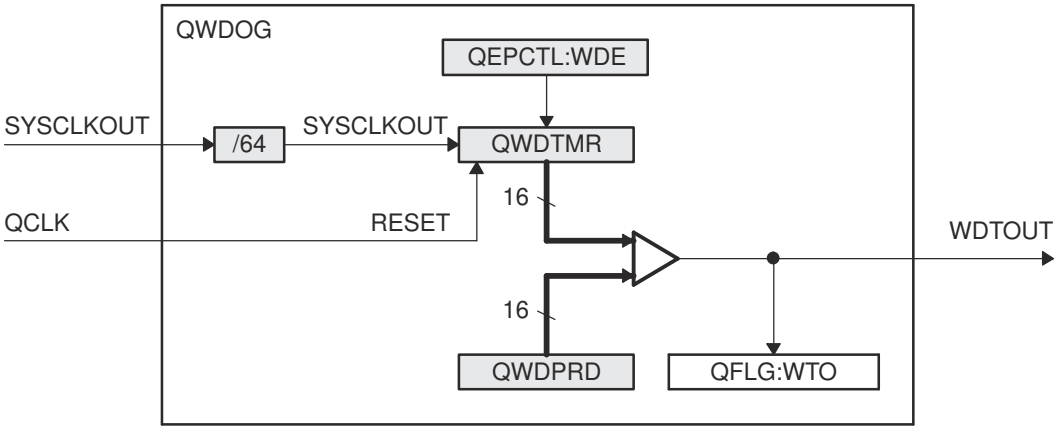

Figure 21-20. eQEP Watchdog Timer

21.8 eQEP Unit Timer Base

The eQEP peripheral includes a 32-bit timer (QUTMR) that is clocked by SYSCLKOUT to generate periodic interrupts for velocity calculations, see Figure 21-21. Whenever the unit timer (QUTMR) matches the unit period register (QUPRD), the eQEP peripheral resets the unit timer (QUTMR) and also generates the unit time out interrupt flag (QFLG[UTO]). The unit timer gets reset whenever timer value equals to configured period value.

The eQEP peripheral can be configured to latch the position counter, capture timer, and capture period values on a unit time out event so that latched values are used for velocity calculation as described in Section 21.6.

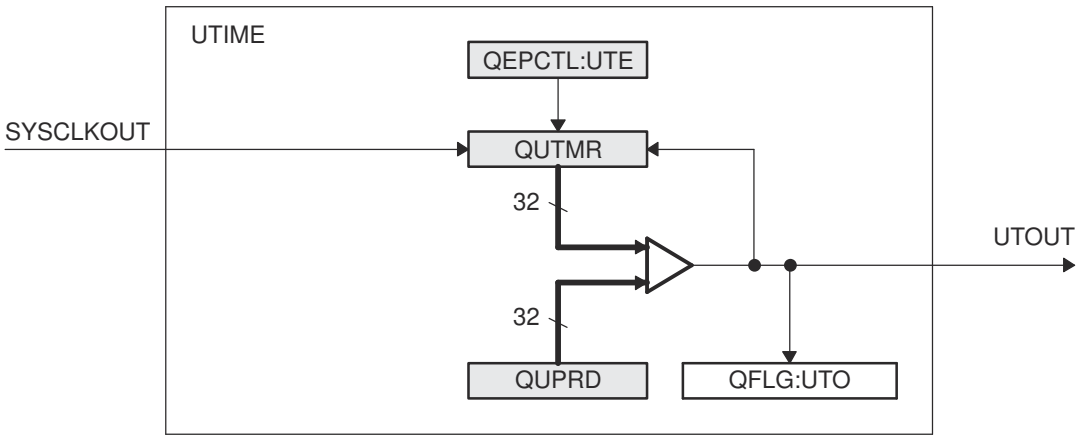

Figure 21-21. eQEP Unit Timer Base

21.9 QMA Module

The QEP Mode Adapter (QMA) is designed to extend the C2000™ eQEP module capabilities to support the additional modes described. Figure 21-22 depicts how the QMA module is integrated into to the eQEP module.

At reset, by default QMA logic is bypassed and the EQEPA and EQEPB inputs from the pins go directly into the eQEP module. When QMA module is enabled by configuring the QMACTRL[MODE] register, the EQEPA and EQEPB input are processed by this module and modified version of EQEPA and EQEPB signals are sent to the eQEP module. The QMA module requires the eQEP module to be configured in the Direction-Count mode and generates a clock signal on EQEPA input and direction signal on EQEPB input as needed for the proper operation of the intended mode.

- The xCLKMOD block inside the QMA module looks at the transitions on external EQEPA and EQEPB signals to generate the clock signal on the EQEPA input to the eQEP module.
- The xDIRMOD block inside the QMA module looks at the transitions on external EQEPA and EQEPB signals to generate the direction signal on the EQEPB input to the eQEP module.

The QMA module has error detection logic to detect illegal transitions on EQEPA and EQEPB input signals. The QMA module's error and interrupt are integrated inside the eQEP module as described in Section 21.10. In addition, the QMACTRL register configuration can be locked using the QMALOCK register. Refer to the register description for more details.

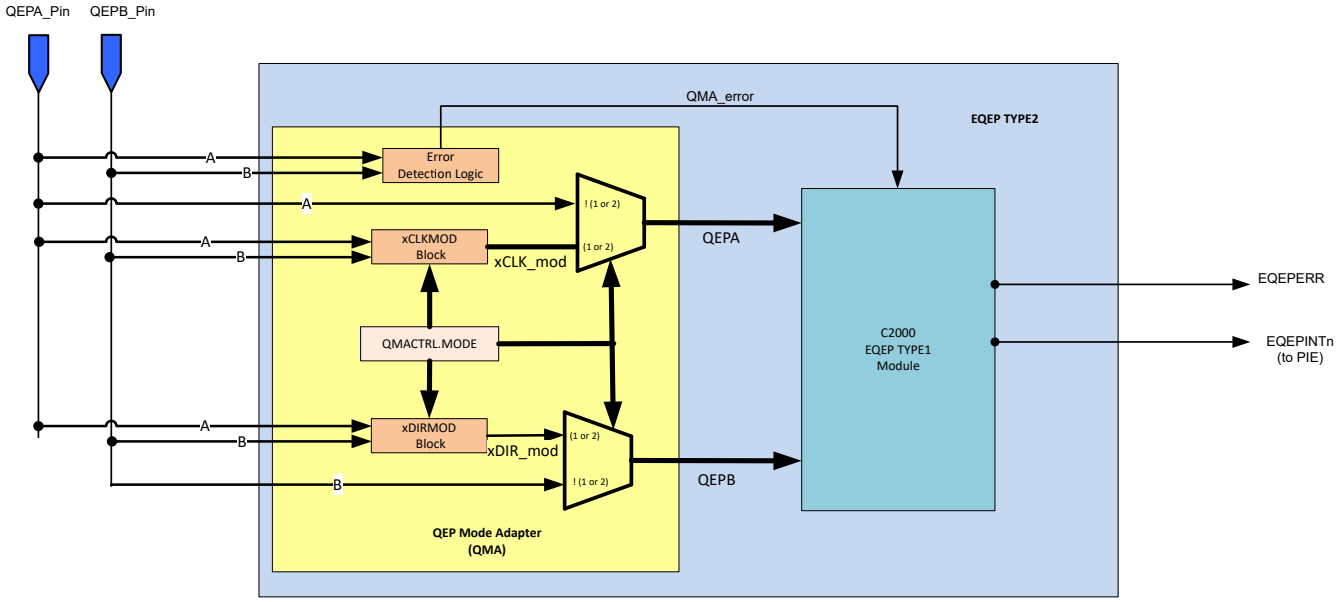

Figure 21-22. QMA Module Block Diagram

21.9.1 Modes of Operation

The QMA module can be operated in the following modes by configuring the QMACTRL register:

- QMA Mode-1 (QMACTRL[MODE] = 1)
- QMA Mode-2 (QMACTRL[MODE] = 2)

21.9.1.1 QMA Mode-1 (QMACTRL[MODE] = 1)

This mode is used when the default state of EQEPA and EQEPB inputs is high. In this mode, outputs of QMA correspond to the following as shown in Figure 21-23:

- EQEPA Output of QMA is the AND of EQEPA and EQEPB inputs coming from the pin
- EQEPB Output of QMA is the direction signal generated by QMA based on EQEPA and EQEPB inputs

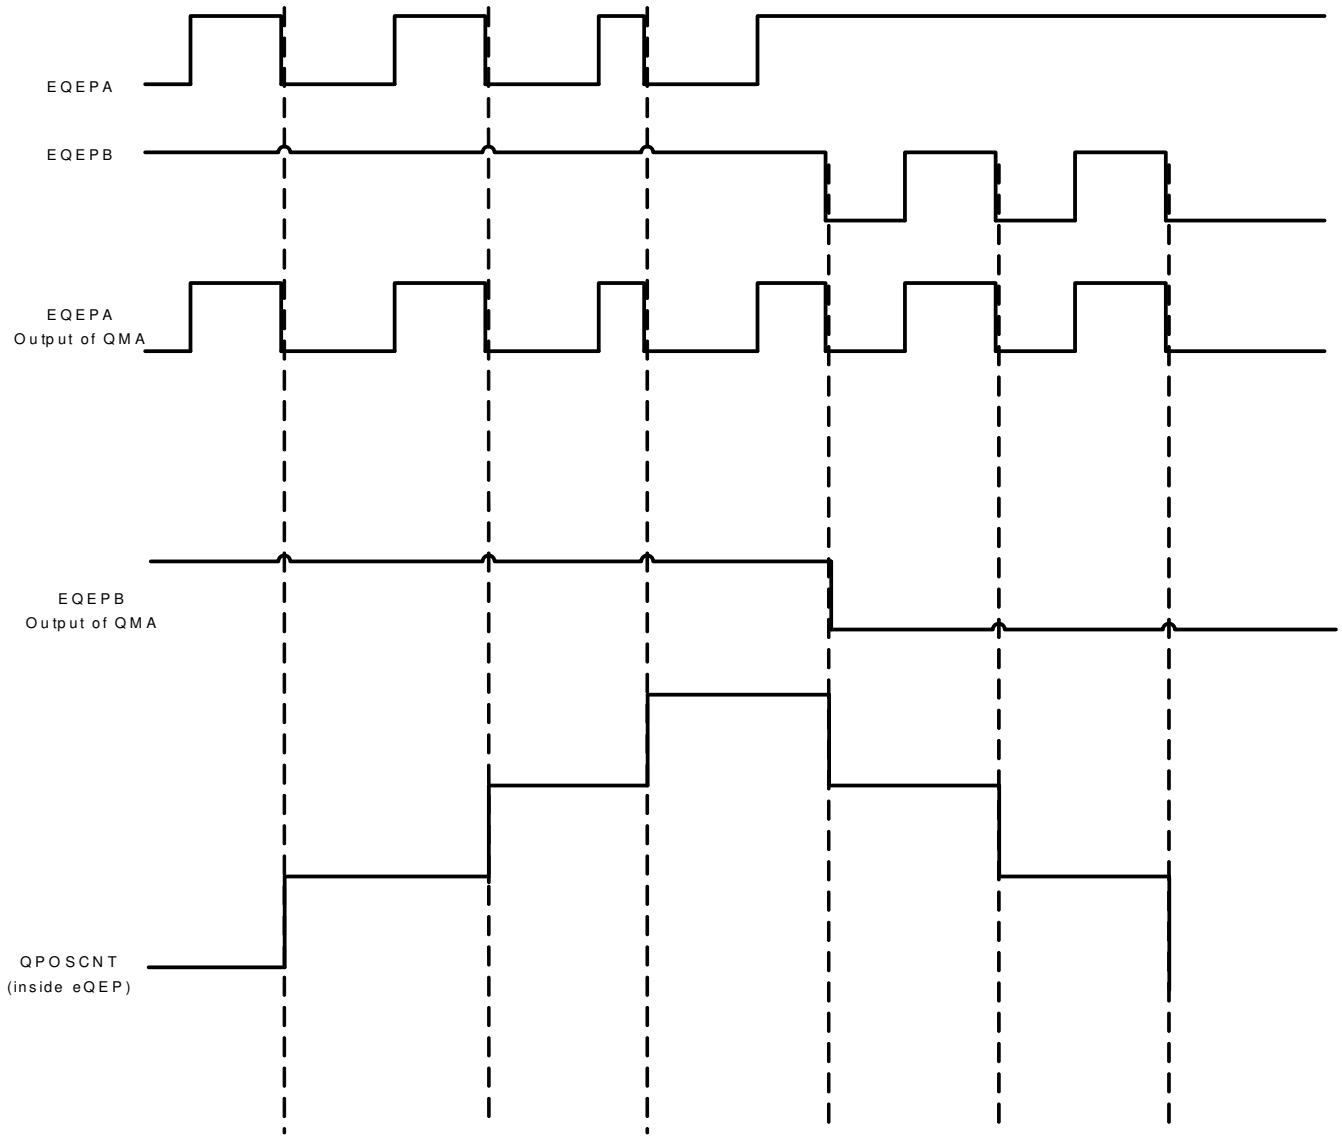

Figure 21-23. QMA Mode-1

21.9.1.2 QMA Mode-2 (QMACTRL[MODE] = 2)

This mode is used when the default state of EQEPA and EQEPB inputs is low. In this mode, outputs of QMA correspond to the following as shown in Figure 21-24:

- EQEPA Output of QMA is the OR of EQEPA and EQEPB inputs coming from the pin
- EQEPB Output of QMA is the direction signal generated by QMA based on EQEPA and EQEPB inputs

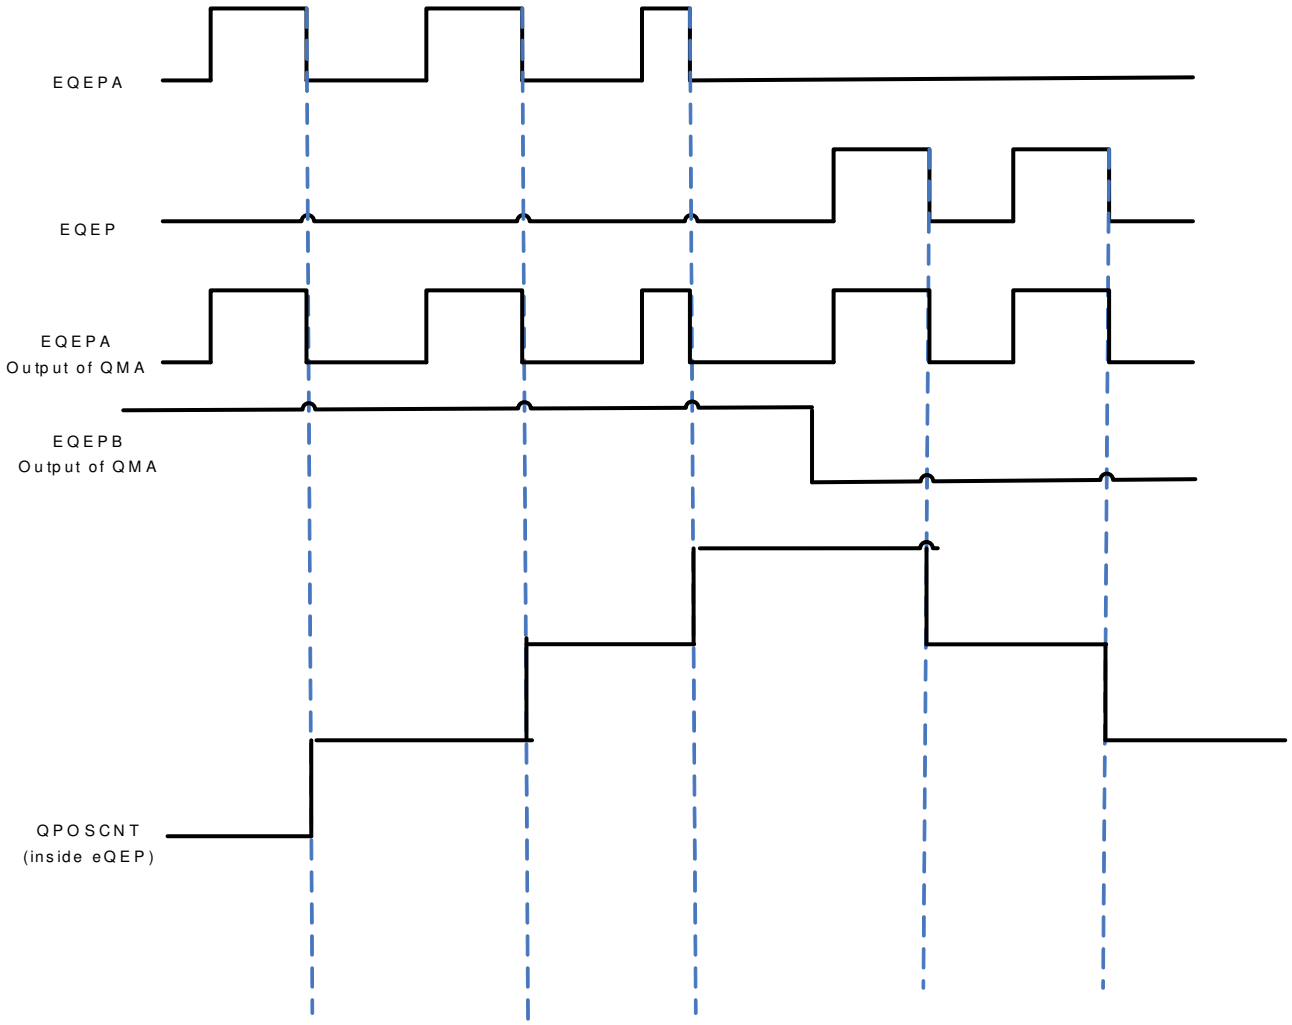

Figure 21-24. QMA Mode-2

21.9.2 Interrupt and Error Generation

The error detection logic detects illegal transitions on EQEPA and EQEPB signals and generates an error signal. This error signal can be used to generate eQEP interrupt and error output. Refer to Section 21.10 for details.

21.10 eQEP Interrupt Structure

Figure 21-25 shows how the interrupt mechanism works in the eQEP module.

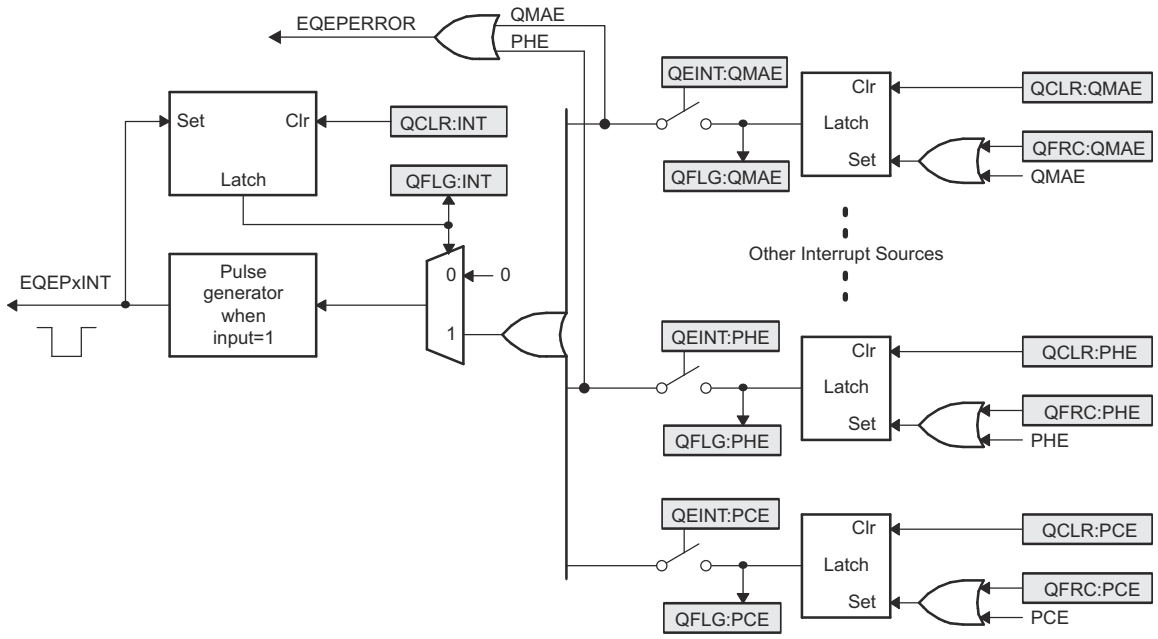

Figure 21-25. eQEP Interrupt Generation

Eleven interrupt events (PCE, PHE, QDC, WTO, PCU, PCO, PCR, PCM, SEL, IEL and UTO) can be generated. The interrupt control register (QEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (QFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT).

An interrupt pulse is generated to PIE when:

1. Interrupt is enabled for eQEP event inside QEINT register
2. Interrupt flag for eQEP event inside QFLG register is set, and
3. Global interrupt status flag bit QFLG[INT] had been cleared for previously generated interrupt event. The interrupt service routine needs to clear the global interrupt flag bit and the serviced event, by way of the interrupt clear register (QCLR), before any other interrupt pulses are generated. If either flags inside the QFLG register are not cleared, further interrupt events do not generate an interrupt to PIE. You can force an interrupt event by way of the interrupt force register (QFRC), which is useful for test purposes.

21.11.2 EQEP Examples

NOTE: These examples are located in the C2000Ware installation at the following location:

C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/eqep

Cloud access to these examples is available at the following link: dev.ti.com C2000Ware Examples.

21.11.2.1 Frequency Measurement Using eQEP

FILE: eqep_ex1_freq_cal.c

This example will calculate the frequency of an input signal using the eQEP module. ePWM1A is configured to generate this input signal with a frequency of 5 kHz. It will interrupt once every period and call the frequency calculation function. This example uses the IQMath library to simplify high-precision calculations.

In addition to the main example file, the following files must be included in this project:

- *eqep_ex1_calculation.c* - contains frequency calculation function
- *eqep_ex1_calculation.h* - includes initialization values for frequency structure

The configuration for this example is as follows

- Maximum frequency is configured to 10KHz (baseFreq)
- Minimum frequency is assumed at 50Hz for capture pre-scalar selection

SPEED_FR: High Frequency Measurement is obtained by counting the external input pulses for 10ms (unit timer set to 100Hz). \[SPEED_FR = \frac{Count\ Delta}{10ms} \]

SPEED_PR: Low Frequency Measurement is obtained by measuring time period of input edges. Time measurement is averaged over 64 edges for better results and the capture unit performs the time measurement using pre-scaled SYSCLK.

Note that the pre-scaler for capture unit clock is selected such that the capture timer does not overflow at the required minimum frequency. This example runs indefinitely until the user stops it.

For more information about the frequency calculation see the comments at the beginning of eqep_ex1_calculation.c and the XLS file provided with the project, eqep_ex1_calculation.xls.

21.11.2.2 Position and Speed Measurement Using eQEP

FILE: eqep_ex2_pos_speed.c

This example provides position and speed measurement using the capture unit and speed measurement using unit time out of the eQEP module. ePWM1 and a GPIO are configured to generate simulated eQEP signals. The ePWM module will interrupt once every period and call the position/speed calculation function. This example uses the IQMath library to simplify high-precision calculations.

In addition to the main example file, the following files must be included in this project:

- *eqep_ex2_calculation.c* - contains position/speed calculation function
- *eqep_ex2_calculation.h* - includes initialization values for position/speed structure

The configuration for this example is as follows

- Maximum speed is configured to 6000rpm (baseRPM)
- Minimum speed is assumed at 10rpm for capture pre-scalar selection
- Pole pair is configured to 2 (polePairs)
- Encoder resolution is configured to 4000 counts/revolution (mechScaler)
- Which means: 4000 / 4 = 1000 line/revolution quadrature encoder (simulated by ePWM1)
- ePWM1 (simulating QEP encoder signals) is configured for a 5kHz frequency or 300 rpm (= 4 * 5000 cnts/sec * 60 sec/min) / 4000 cnts/rev)

SPEEDRPM_FR: High Speed Measurement is obtained by counting the QEP input pulses for 10ms (unit timer set to 100Hz).

SPEEDRPM_FR = (Position Delta / 10ms) * 60 rpm

SPEEDRPM_PR: Low Speed Measurement is obtained by measuring time period of QEP edges. Time measurement is averaged over 64 edges for better results and the capture unit performs the time measurement using pre-scaled SYSCLK.

Note that the pre-scaler for capture unit clock is selected such that the capture timer does not overflow at the required minimum frequency. This example runs indefinitely until the user stops it.

For more information about the position/speed calculation see the comments at the beginning of eqep_ex2_calculation.c and the XLS file provided with the project, eqep_ex2_calculation.xls.

External Connections

- Connect GPIO20/eQEP1A to GPIO0/ePWM1A (simulates eQEP Phase A signal)
- Connect GPIO21/eQEP1B to GPIO1/ePWM1B (simulates eQEP Phase B signal)
- Connect GPIO23/eQEP1I to GPIO2 (simulates eQEP Index Signal)

Watch Variables

- *posSpeed.speedRPMFR* - Speed meas. in rpm using QEP position counter
- *posSpeed.speedRPMPR* - Speed meas. in rpm using capture unit
- *posSpeed.thetaMech* - Motor mechanical angle (Q15)
- *posSpeed.thetaElec* - Motor electrical angle (Q15)

21.11.2.3 Frequency Measurement Using eQEP via unit timeout interrupt

FILE: eqep_ex4_freq_cal_interrupt.c

This example will calculate the frequency of an input signal using the eQEP module. ePWM1A is configured to generate this input signal with a frequency of 5 kHz. EQEP unit timeout is set which will generate an interrupt every *UNIT_PERIOD* microseconds and frequency calculation occurs continuously

The configuration for this example is as follows

- PWM frequency is specified as 5000Hz
- UNIT_PERIOD is specified as 10000 us
- Min frequency is (1/(2*10ms)) i.e 50Hz
- Highest frequency can be (2^32)/ ((2*10ms))
- Resolution of frequency measurement is 50hz

freq : Frequency Measurement is obtained by counting the external input pulses for UNIT_PERIOD (unit timer set to 10 ms).

External Connections

- Connect GPIO20/eQEP1A to GPIO0/ePWM1A

Watch Variables

- *freq* - Frequency measurement using position counter/unit time out
- *pass* - If measured frequency matches with PWM frequency then pass = 1 else 0

21.11.2.4 Motor speed and direction measurement using eQEP via unit timeout interrupt

FILE: eqep_ex5_speed_dir_motor.c

This example can be used to sense the speed and direction of motor using eQEP in quadrature encoder mode. ePWM1A is configured to simulate motor encoder signals with frequency of 5 kHz on both A and B pins with 90 degree phase shift (so as to run this example without motor). EQEP unit timeout is set which will generate an interrupt every *UNIT_PERIOD* microseconds and speed calculation occurs continuously based on the direction of motor

The configuration for this example is as follows

- PWM frequency is specified as 5000Hz
- UNIT_PERIOD is specified as 10000 us

- Simulated quadrature signal frequency is 20000Hz (4 * 5000)
- Encoder holes assumed as 1000
- Thus Simulated motor speed is 300rpm (5000 * (60 / 1000))

freq : Simulated quadrature signal frequency measured by counting the external input pulses for UNIT_PERIOD (unit timer set to 10 ms). *speed* : Measure motor speed in rpm *dir* : Indicates clockwise (1) or anticlockwise (-1)

External Connections (if motor encoder signals are simulated by ePWM)

- Connect GPIO20/eQEP1A to GPIO0/ePWM1A
- Connect GPIO21/eQEP1B to GPIO1/ePWM1B With motor
- Connect GPIO20/eQEP1A to encoder A output
- Connect GPIO21/eQEP1B to encoder B output

Watch Variables

- *freq* : Simulated motor frequency measurement is obtained by counting the external input pulses for UNIT_PERIOD (unit timer set to 10 ms).
- *speed* : Measure motor speed in rpm
- *dir* : Indicates clockwise (1) or anticlockwise (-1)
- *pass* - If measured qudrature frequency matches with i.e. input quadrature frequency (4 * PWM frequency) then pass = 1 else fail = 1 (** only when "MOTOR" is commented out)

21.12 EQEP Registers

This Section describes the EQEP Registers.

21.12.1 EQEP Base Address Table

Table 21-5. EQEP Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU1.DMA	CPU1.CLA1	Pipeline Protected
Instance	Structure						
EQep1Regs	EQEP_REGS	EQEP1_BASE	0x0000_5100	YES	YES	YES	YES
EQep2Regs	EQEP_REGS	EQEP2_BASE	0x0000_5140	YES	YES	YES	YES

Complex bit access types are encoded to fit into small table cells. Table 21-7 shows the codes that are used for access types in this section.

Table 21-7. EQEP_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear

Table 21-7. EQEP_REGS Access Type Codes (continued)

Access Type	Code	Description
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

21.12.2.1 QPOSCNT Register (Offset = 0h) [Reset = 00000000h]

QPOSCNT is shown in Figure 21-26 and described in Table 21-8.

Return to the Summary Table.

Position Counter

Table 21-8. QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register (QPOSCNT) during initialization, i.e. when the eQEP position counter is disabled (QPEN bit of QEPCTL is zero). Once the position counter is enabled (QPEN bit is one), writing to the eQEP position counter register (QPOSCNT) may cause unexpected results. Reset type: SYSRSn

21.12.2.2 QPOSINIT Register (Offset = 2h) [Reset = 00000000h]

QPOSINIT is shown in Figure 21-27 and described in Table 21-9.

Return to the Summary Table.
