

# ADS7038x Small, 8-Channel, 12-Bit ADC With SPI Interface, GPIOs, and CRC

## 1 Features

- Small package size:
  - WQFN 3mm × 3mm
- 8 channels configurable as any combination of:
  - Up to 8 analog inputs, digital inputs, or digital outputs
- GPIOs for I/O expansion:
  - Open-drain, push-pull digital outputs
- Analog watchdog:
  - Programmable thresholds per channel
  - Event counter for transient rejection
- Wide operating ranges:
  - AVDD: 2.35V to 5.5V
  - DVDD: 1.65V to 5.5V
  - –40°C to +125°C temperature range
- Enhanced-SPI digital interface:
  - High-speed, 60MHz interface
  - Achieve full throughput with >13.5MHz SPI
- CRC for read/write operation:
  - CRC on data read/write
  - CRC on power-up configuration
- Programmable averaging filters:
  - Programmable sample size for averaging
  - Averaging with internal conversions
  - 16-bit resolution

## 2 Applications

- [Macro remote radio units \(RRU\)](#)
- [Battery management systems \(BMS\)](#)
- [String inverters](#)
- [Central inverters](#)

## 3 Description

The ADS7038 is an easy-to-use, 8-channel, multiplexed, 12-bit, successive approximation register analog-to-digital converter (SAR ADC). The eight channels can be independently configured as either analog inputs, digital inputs, or digital outputs. The device has an internal oscillator for the ADC conversion process.

The ADS7038 communicates through an SPI-compatible interface and operates in either autonomous or single-shot conversion mode. The ADS7038 implements the analog watchdog function by event-triggered interrupts per channel using a digital window comparator with programmable high and low thresholds, hysteresis, and an event counter. The ADS7038 has a built-in cyclic redundancy check (CRC) for data read/write operations and the power-up configuration.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
ADS7038, ADS7038H	RTE (WQFN, 16)	3mm × 3mm

(1) For more information, see the Mechanical, Packaging, and Orderable Information.

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

### Device Information

PART NUMBER	SPEED
ADS7038	1MSPS
ADS7038H	1.5MSPS

## 4 Device Comparison Table

PART NUMBER	DESCRIPTION	SPEED	CRC MODULE	ZERO-CROSSING-DETECT (ZCD) MODULE	ROOT-MEAN-SQUARE (RMS) MODULE
ADS7028	8-channel, 12-bit ADC with SPI interface and GPIOs	1 MSPS	Yes	Yes	Yes
ADS7038		1 MSPS	Yes	No	No
ADS7038-Q1		1MSPS	Yes	No	No
ADS7038H		1.5MSPS	Yes	No	No

## 5 Pin Configuration and Functions

**Figure 5-1. RTE Package, 16-Pin WQFN, Top View**

**Table 5-1. Pin Functions**

PIN		FUNCTION <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
AIN0/GPIO0	15	AI, DI, DO	Channel 0; can be configured as either an analog input (default), digital input, or digital output.
AIN1/GPIO1	16	AI, DI, DO	Channel 1; can be configured as either an analog input (default), digital input, or digital output.
AIN2/GPIO2	1	AI, DI, DO	Channel 2; can be configured as either an analog input (default), digital input, or digital output.
AIN3/GPIO3	2	AI, DI, DO	Channel 3; can be configured as either an analog input (default), digital input, or digital output.
AIN4/GPIO4	3	AI, DI, DO	Channel 4; can be configured as either an analog input (default), digital input, or digital output.
AIN5/GPIO5	4	AI, DI, DO	Channel 5; can be configured as either an analog input (default), digital input, or digital output.
AIN6/GPIO6	5	AI, DI, DO	Channel 6; can be configured as either an analog input (default), digital input, or digital output.
AIN7/GPIO7	6	AI, DI, DO	Channel 7; can be configured as either an analog input (default), digital input, or digital output.
AVDD	7	Supply	Analog supply input, also used as the reference voltage to the ADC; connect a 1- $\mu$ F decoupling capacitor to GND.
$\overline{\text{CS}}$	11	DI	Chip-select input pin; active low. The device takes control of the data bus when $\overline{\text{CS}}$ is low. The device starts converting the active input channel on the rising edge of $\overline{\text{CS}}$ . SDO goes hi-Z when $\overline{\text{CS}}$ is high.
DECAP	8	Supply	Connect a 1- $\mu$ F decoupling capacitor to GND for the internal power supply.
DVDD	10	Supply	Digital I/O supply voltage; connect a 1- $\mu$ F decoupling capacitor to GND.
GND	9	Supply	Ground for the power supply; all analog and digital signals are referred to this pin voltage.
SCLK	13	DI	Serial clock for the SPI interface.
SDI	14	DI	Serial data in for the device.
SDO	12	DO	Serial data out for the device.
Thermal pad	—	Supply	Exposed thermal pad; connect to GND.

(1) AI = analog input, DI = digital input, and DO = digital output.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
DVDD to GND	-0.3	5.5	V
AVDD to GND	-0.3	5.5	V
AIN <sub>x</sub> / GPO <sub>x</sub> <sup>(3)</sup> to GND	GND - 0.3	AVDD + 0.3	V
Digital input to GND	GND - 0.3	5.5	V
Current through any pin except supply pins <sup>(2)</sup>	-10	10	mA
Junction temperature, T <sub>J</sub>	-40	125	°C
Storage temperature, T <sub>stg</sub>	-60	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) Limit pin current to 10mA or less.

(3) AIN<sub>x</sub> / GPIO<sub>x</sub> refers to pins 1, 2, 3, 4, 5, 6, 15, and 16.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY</b>					
AVDD	Analog supply voltage	2.35	3.3	5.5	V
DVDD	Digital supply voltage	1.65	3.3	5.5	V
<b>ANALOG INPUTS</b>					
FSR	Full-scale input range	AIN <sub>x</sub> - GND		AVDD	V
V <sub>IN</sub>	Absolute input voltage	AIN <sub>x</sub> - GND		AVDD + 0.1	V
<b>TEMPERATURE RANGE</b>					
T <sub>A</sub>	Ambient temperature	-40	25	125	°C

(1) AIN<sub>x</sub> refers to AIN0, AIN1, AIN2, AIN3, AIN4, AIN5, AIN6, and AIN7.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ADS7038, ADS7038H	
		RTE (WQFN)	
		16 PINS	
			UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	49.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	24.7	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	1.3	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	24.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	9.3	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

at AVDD = 5V, DVDD = 1.65V to 5.5V, and maximum throughput (unless otherwise noted); minimum and maximum values at  $T_A = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ; typical values at  $T_A = 25^{\circ}\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>ANALOG INPUTS</b>						
$C_{SH}$	Sampling capacitance			12		pF
<b>DC PERFORMANCE</b>						
	Resolution	No missing codes		12		bits

## 7 Detailed Description

### 7.1 Overview

The ADS7038 is a small, eight-channel, multiplexed, 12-bit, 1-MSPS, analog-to-digital converter (ADC) with an enhanced-SPI serial interface. The eight channels of the ADS7038 can be individually configured as either analog inputs, digital inputs, or digital outputs. The device includes a digital window comparator that can be used to alert the host when a programmed high or low threshold is crossed on any input channel. The device uses an internal oscillator for conversion. The ADC can be used in manual mode for reading ADC data over the SPI interface or in autonomous and turbo comparator modes for monitoring the analog inputs without an active SPI interface.

The device features a programmable averaging filter that outputs a 16-bit result for enhanced resolution.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Multiplexer and ADC

The eight channels of the multiplexer can be independently configured as ADC inputs or general-purpose inputs/outputs (GPIOs). As shown in Figure 7-1, every AINx/GPIOx channel has ESD protection diodes to AVDD and GND. On power-up or after device reset, all eight multiplexer channels are configured as analog inputs.

Figure 7-1 shows an equivalent circuit for pins configured as analog inputs. The ADC sampling switch is represented by ideal switch (SW) in series with the resistor  $R_{SW}$  (typically 150  $\Omega$ ) and the sampling capacitor,  $C_{SH}$  (typically 12 pF).

**Figure 7-1. Analog Inputs, GPIOs, and ADC Connections**

During acquisition, the SW switch is closed to allow the signal on the selected analog input channel to charge the internal sampling capacitor. During conversion, the SW switch is opened to disconnect the analog input channel from the sampling capacitor.

The multiplexer channels can be configured as GPIOs in the PIN\_CFG register. The direction of a GPIO (either as an input or an output) can be set in the GPIO\_CFG register. The logic level on the channels configured as digital inputs can be read from the GPI\_VALUE register. The digital outputs can be accessed by writing to the GPO\_VALUE register. The digital outputs can be configured as either open-drain or push-pull in the GPO\_DRIVE\_CFG register.

### 7.3.2 Reference

The device uses the analog supply voltage (AVDD) as the reference for the analog-to-digital conversion process. TI recommends connecting a 1- $\mu$ F, low-equivalent series resistance (ESR) ceramic decoupling capacitor between the AVDD and GND pins.

### 7.3.3 ADC Transfer Function

The ADC output is in straight binary format. Equation 1 computes the ADC resolution:

$$1 \text{ LSB} = V_{\text{REF}} / 2^N \tag{1}$$

where:

- $V_{\text{REF}} = \text{AVDD}$
- $N = 12$

Figure 7-2 and Table 7-1 detail the transfer characteristics for the device.

**Figure 7-2. Ideal Transfer Characteristics**

**Table 7-1. Transfer Characteristics**

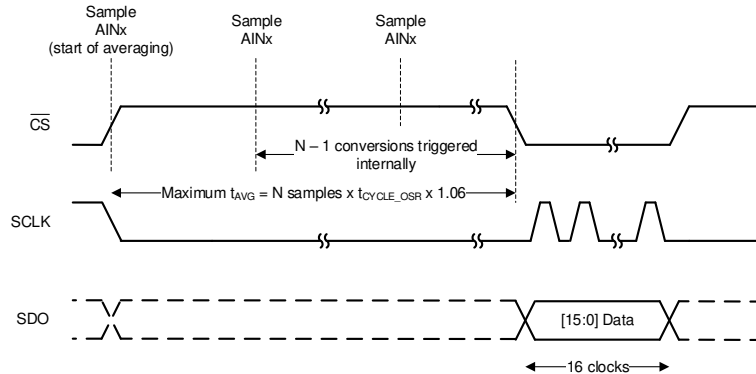

INPUT VOLTAGE	CODE	IDEAL OUTPUT CODE
$\leq 1 \text{ LSB}$	Zero	000
1 LSB to 2 LSBs	Zero + 1	001
$(\text{AVDD} / 2)$ to $(\text{AVDD} / 2) + 1 \text{ LSB}$	Mid-scale code	800
$(\text{AVDD} / 2) + 1 \text{ LSB}$ to $(\text{AVDD} / 2) + 2 \text{ LSB}$	Mid-scale code + 1	801
$\geq \text{AVDD} - 1 \text{ LSB}$	Full-scale code	FFF

### 7.3.4 ADC Offset Calibration

The variation in ADC offset error resulting from changes in temperature or AVDD can be calibrated by setting the CAL bit in the GENERAL\_CFG register. The CAL bit is reset to 0 after calibration. The host can poll the CAL bit to check the ADC offset calibration completion status.

### 7.3.5 Programmable Averaging Filter

The TLA2518 features a built-in oversampling (OSR) function that can be used to average several samples. The averaging filter can be enabled by programming the OSR[2:0] bits in the OSR\_CFG register. The averaging filter configuration is common to all analog input channels. Figure 7-3 shows that the averaging filter module output is 16 bits long. In manual conversion mode and auto-sequence mode, only the first conversion for the selected analog input channel must be initiated by the host; see the *Manual Mode* and *Auto-Sequence Mode* sections. As shown in Figure 7-3, any remaining conversions for the selected averaging factor are generated internally. The time required to complete the averaging operation is determined by the sampling speed and number of samples to be averaged. As shown in Figure 7-3, the 16-bit result can be read out after the averaging operation completes.

**Figure 7-3. Averaging Example**

In autonomous mode of operation, samples from analog input channels that are enabled in the AUTO\_SEQ\_CH\_SEL register are averaged sequentially. The digital window comparator compares the top 12 bits of the 16-bit average result with the thresholds.

Equation 2 provides the LSB value of the 16-bit average result.

$$1 \text{ LSB} = \frac{AVDD}{2^{16}} \tag{2}$$

### 7.3.6 General-Purpose I/Os

The eight channels of the TLA2518 can be independently configured as analog inputs, digital inputs, or digital outputs. Table 7-2 describes how the PIN\_CFG and GPIO\_CFG registers can be used to configure the device channels.

**Table 7-2. Configuring Channels as Analog Inputs or GPIOs**

PIN_CFG[7:0]	GPIO_CFG[7:0]	GPO_DRIVE_CFG[7:0]	CHANNEL CONFIGURATION
0	x	x	Analog input (default)
1	0	x	Digital input
1	1	0	Digital output; open-drain driver
1	1	1	Digital output; push-pull driver

Digital outputs can be configured to logic 1 or 0 by writing to the GPO\_VALUE register. Reading the GPI\_VALUE register returns the logic level for all channels configured as digital inputs or digital outputs. The GPI\_VALUE register can be read to detect a failure in external components, such as a floating pullup resistor or a low-impedance pulldown resistor, that prevents digital outputs being set to the desired logic level.

### 7.3.7 Oscillator and Timing Control

The device uses an internal oscillator for conversion. When using the averaging module, the host initiates the first conversion and subsequent conversions are generated internally by the device. Also, in autonomous mode of operation, the start of the conversion signal is generated by the device. [Table 7-3](#) describes how the sampling rate can be controlled by the OSC\_SEL and CLK\_DIV[3:0] register fields when the device generates the start of the conversion

**Table 7-3. Configuring Sampling Rate for Internal Conversion Start Control**

CLK_DIV[3:0]	OSC_SEL = 0		OSC_SEL = 1	
	SAMPLING FREQUENCY, f <sub>CYCLE_OSR</sub> (kSPS)	CYCLE TIME, t <sub>CYCLE_OSR</sub> (μs)	SAMPLING FREQUENCY, f <sub>CYCLE_OSR</sub> (kSPS)	CYCLE TIME, t <sub>CYCLE_OSR</sub> (μs)
0000b	1000	1	31.25	32
0001b	666.7	1.5	20.83	48
0010b	500	2	15.63	64
0011b	333.3	3	10.42	96
0100b	250	4	7.81	128
0101b	166.7	6	5.21	192
0110b	125	8	3.91	256
0111b	83	12	2.60	384
1000b	62.5	16	1.95	512
1001b	41.7	24	1.3	768
1010b	31.3	32	0.98	1024
1011b	20.8	48	0.65	1536
1100b	15.6	64	0.49	2048
1101b	10.4	96	0.33	3072
1110b	7.8	128	0.24	4096
1111b	5.2	192	0.16	6144

The conversion time of the device, given by tCONV in the [Section 6.7](#) table, is independent of the OSC\_SEL and CLK\_DIV[3:0] configuration.

### 7.3.8 CRC on Data Interface

The ADS7028 features a cyclic redundancy check (CRC) module for checking the integrity of the data bits exchanged over the SPI interface. The CRC module is bidirectional, which appends an 8-bit CRC to every byte read from the device and also evaluates the CRC of every incoming byte over the SPI interface. The CRC module uses the CRC-8-CCITT polynomial ( $x^8 + x^2 + x + 1$ ) for CRC computation.

To enable the CRC module, set the CRC\_EN bit in the GENERAL\_CFG register. [Table 7-4](#) shows the different ways that a CRC error that occurs when configuring the ADS7028 can be detected.

**Table 7-4. Configuring Channels as Analog Inputs or GPIOs**

CRC ERROR NOTIFICATION	CONFIGURATION	DESCRIPTION
ALERT	ALERT_CRCIN = 1b	ALERT (internal signal) is asserted if a CRC error is detected
Status flags	APPEND_STATUS = 10b	4-bit status flags are appended to the ADC data. See the <a href="#">Output Data Format</a> section for details.
Register read	—	Read the CRCERR_IN bit to check if a CRC error was detected.

When the ADS7028 detects a CRC error on the SPI interface, the erroneous data are ignored and the CRCERR\_IN bit is set. Additional notifications can be enabled as described in [Table 7-4](#). Further register writes are disabled until the CRCERR\_IN bit is cleared by writing 1b to this bit. When using autonomous conversion mode, further conversions can be disabled on a CRC error on the SPI interface by setting CONV\_ON\_ERR = 1b.

### 7.3.8.1 Input CRC (From Host To Device)

The host must compute and append the appropriate 8-bit CRC to the command string in the same SPI frame (see [Register Read With CRC](#)). The ADC also computes the expected 8-bit CRC corresponding to the 24-bit payload received from the host and compares the calculated CRC code to the CRC received from the host. If a communication error is detected, the CRCERR\_IN bit in the SYSTEM\_STATUS register is set to 1b. The CRCERR\_IN bit is set in the following scenarios:

- The SPI communication frame did not have 32 clocks exactly, corresponding to a 24-bit data payload and an 8-bit CRC.
- The CRC calculated by the ADC over the received 24-bit payload does not match with the corresponding 8-bit CRC received from the host.

If a CRC error is detected by the device, the command does not execute and the CRCERR\_IN flag is set to 1b. ADC conversion data read and register read, with a valid CRC from the host, are still supported. The error condition can be detected, as listed in [Table 7-5](#), by either status flags or by a register read. Further register writes to the device are blocked until CRCERR\_IN flag is cleared to 0b. Register write operation, with valid CRC from the host, to the SYSTEM\_STATUS and GENERAL\_CFG registers is still supported.

The device can be configured to set all channels to analog inputs on detecting a CRC error by setting CH\_RST bit to 1b. This would ensure that channels which were configured as digital outputs are not driven by the device when CRC error is detected. All channels will be reset as per the configuration in the PIN\_CFG and GPIO\_CFG registers when CRCERR\_IN flag is cleared.

The device can be configured to abort further conversions in autonomous and turbo comparator modes (see the [Autonomous Mode](#) and [Turbo Comparator Mode](#) sections), on detecting a CRC error, by setting CONV\_ON\_ERR = 1b.

**Table 7-5. Configuring Notifications when CRC Error is Detected**

CRC ERROR NOTIFICATION	CONFIGURATION	DESCRIPTION
ALERT	ALERT_CRCIN = 1b	ALERT (internal signal) is asserted if a CRC error is detected.
Status flags	APPEND_STATUS = 10b	See <a href="#">Status Flags</a> for details.
Register read	—	Read the CRCERR_IN bit to check if a CRC error was detected.

### 7.3.8.2 Output CRC (From Device to Host)

The device appends an 8-bit CRC to the output data packet when the CRC module is enabled. The output data packet length can be one of the following:

- An 8-bit for register reads (see the [Register Read With CRC](#) section for more details).
- A 16-bit or 24-bit for ADC conversion result reads (see [Section 7.3.9](#) for more details).

The SPI frame must be exactly 32 bits long when the CRC module is enabled.

### 7.3.9 Output Data Format

[Figure 7-4](#) depicts various SPI frames for reading data from the device. The data output is MSB aligned. If averaging is enabled the output data from the ADC are 16 bits long, otherwise the output data are 12 bits long. Optionally, a 4-bit channel ID or status flags can be appended at the end of the output data by configuring the APPEND\_STATUS field.

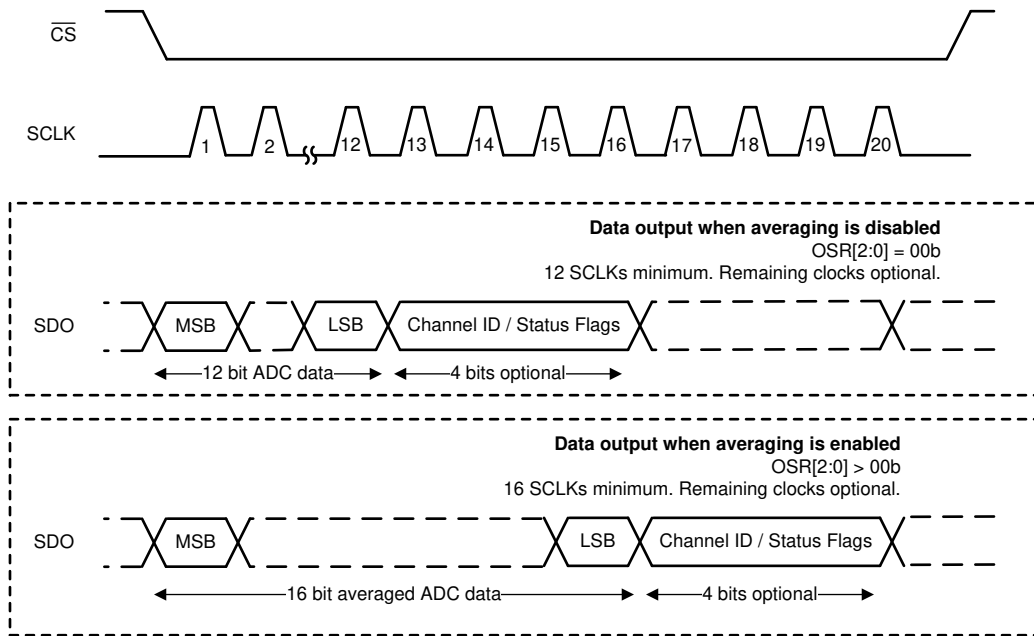

Figure 7-4. SPI Frames for Reading Data

### 7.3.9.1 Status Flags

Status flags can be appended to the ADC output by setting APPEND\_STATUS = 10b. Status flags are not appended to data corresponding to a register read operation or when FIX\_PAT = 1b. The 4-bit status flag field is constructed as follows:

Status flag[3:0] = { 1, 0, CRCERR\_IN, ALERT }

- CRCERR\_IN: This flag is the same as the CRCERR\_IN bit in the SYSTEM\_STATUS register.
- ALERT: This flag indicates if any of the event flags are set in the EVENT\_FLAG register.

### 7.3.10 Digital Window Comparator

The internal digital window comparator (DWC) is available in both conversion modes (manual and autonomous). The DWC outputs an internal ALERT signal. The internal ALERT signal can be output on any one of the digital output channels by configuring the ALERT\_PIN register. Figure 7-5 provides a block diagram for the digital window comparator.

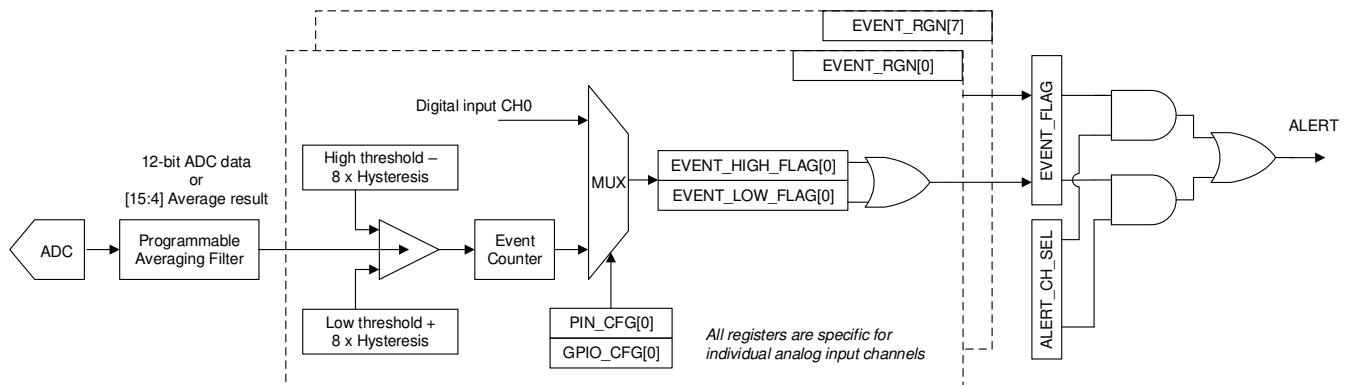

Figure 7-5. Digital Window Comparator Block Diagram

The low-side threshold, high-side threshold, event counter, and hysteresis parameters are independently programmable for each input channel. Figure 7-6 illustrates that the window comparator can monitor events for every analog input channel.

**Figure 7-6. Event Monitoring With the Window Comparator**

To enable the digital window comparator, set the `DWC_EN` bit in the `GENERAL_CFG` register. By default, hysteresis = 0, high threshold = 0xFFFF, and low threshold = 0x000. For detecting when a signal is in-band, the `EVENT_RGN` register must be configured. In each of the cases shown in Figure 7-6, either or both `ALERT_HIGH_FLAG` and `ALERT_LOW_FLAG` can be set. The programmable event counter counts consecutive threshold violations before alert flags are set. The event count can be set to a higher value to avoid transients in the input signal setting the alert flags.

In order to assert the `ALERT` signal (internal) when the alert flag is set for a particular analog input channel, set the corresponding bit in the `DWC_CH_SEL` register. Alert flags are set, irrespective of the `DWC_CH_SEL` configuration, if `DWC_EN` = 1 and high or low thresholds are exceeded.

**7.3.10.1 Interrupts From Digital Inputs**

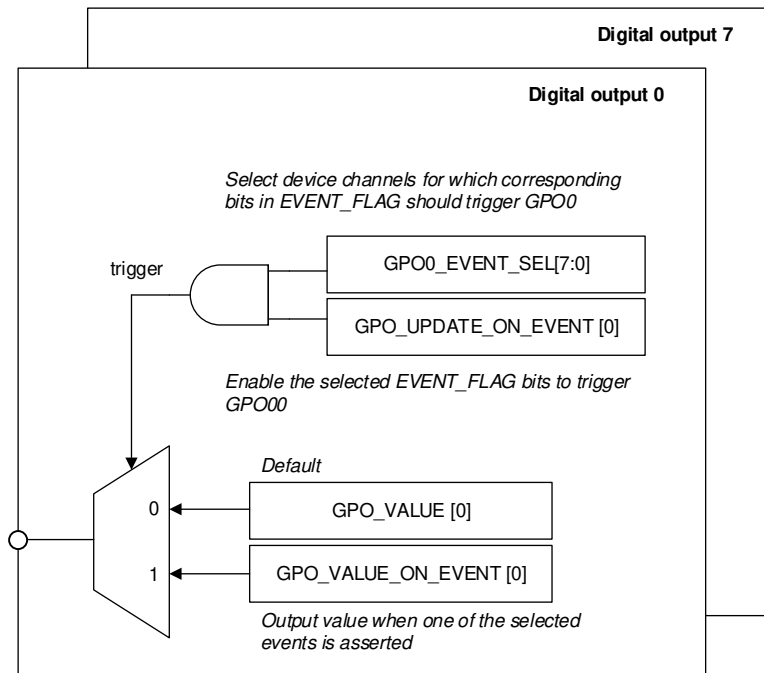

Table 7-6 shows that rising edge or falling edge events can be detected on channels configured as digital inputs.

**Table 7-6. Configuring Interrupts from Digital Inputs**

PIN_CFG[7:0]	GPIO_CFG[7:0]	EVENT_RGN[7:0]	EVENT DESCRIPTION
1	0	0	<code>ALERT_HIGH_FLAG</code> is set on the rising edge on the digital input channel
1	0	1	<code>ALERT_LOW_FLAG</code> is set on the falling edge on the digital input channel

### 7.3.10.2 Triggering Digital Outputs with Alert and ZCD

Figure 7-7 shows that digital outputs can be updated in response to alerts from individual channels or synchronous to the zero-crossing-detect signal.

**Figure 7-7. Block Diagram of the Digital Output Logic**

### 7.3.11 Minimum, Maximum, and Latest Data Registers

The ADS7028 can record the minimum, maximum, and latest code (statistics registers) for every analog input channel. To enable or re-enable recording statistics, set the STATS\_EN bit in the GENERAL\_CFG register. Writing 1 to the STATS\_EN bit reinitializes the statistics module. Afterwards, results from new conversions are recorded in the statistics registers.. Previous values can be read from the statistics registers until a new conversion result is available. Before reading the statistics registers, set STATS\_EN = 0 to prevent any updates to this block of registers.

### 7.3.12 Device Programming

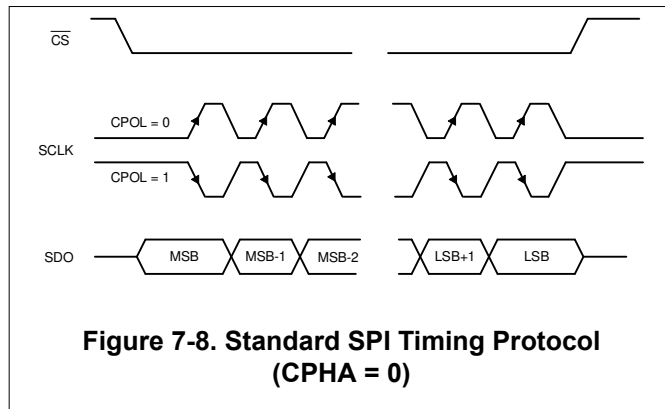

#### 7.3.12.1 Enhanced-SPI Interface

The device features an enhanced-SPI interface that allows the host controller to operate at slower SCLK speeds and still achieve full throughput. As described in [Table 7-7](#), the host controller can use any of the four SPI-compatible protocols (SPI-00, SPI-01, SPI-10, or SPI-11) to access the device.

**Table 7-7. SPI Protocols for Configuring the Device**

PROTOCOL	SCLK POLARITY (At the CS Falling Edge)	SCLK PHASE (Capture Edge)	CPOL_CPHA[1:0]	DIAGRAM
SPI-00	Low	Rising	00b	<a href="#">Figure 7-8</a>
SPI-01	Low	Falling	01b	<a href="#">Figure 7-9</a>
SPI-10	High	Falling	10b	<a href="#">Figure 7-8</a>
SPI-11	High	Rising	11b	<a href="#">Figure 7-9</a>

On power-up or after coming out of any asynchronous reset, the device supports the SPI-00 protocol for data read and data write operations. To select a different SPI-compatible protocol, program the CPOL\_CPHA[1:0] field. This first write operation must adhere to the SPI-00 protocol. Any subsequent data transfer frames must adhere to the newly-selected protocol.

#### 7.3.12.2 Register Read/Write Operation

The device supports the commands listed in [Table 7-8](#) to access the internal configuration registers.

**Table 7-8. Opcodes for Commands**

OPCODE	COMMAND DESCRIPTION
0000 0000b	No operation
0001 0000b	Single register read
0000 1000b	Single register write
0001 1000b	Set bit
0010 0000b	Clear bit

### 7.3.12.2.1 Register Write

A 24-bit SPI frame is required for writing data to configuration registers. The 24-bit data on SDI, as shown in Figure 7-10, consists of an 8-bit write command (0000 1000b), an 8-bit register address, and 8-bit data. The write command is decoded on the  $\overline{CS}$  rising edge and the specified register is updated with the 8-bit data specified during the register write operation.

**Figure 7-10. Register Write Operation**

### 7.3.12.2.2 Register Read

Register read operation consists of two SPI frames: the first SPI frame initiates a register read and the second SPI frame reads data from the register address provided in the first frame. As shown in Figure 7-11, the 8-bit register address and the 8-bit dummy data are sent over the SDI pin during the first 24-bit frame with the read command (0001 0000b). On the rising edge of  $\overline{CS}$ , the read command is decoded and the requested register data are available for reading during the next frame. During the second frame, the first eight bits on SDO correspond to the requested register read. During the second frame, SDI can be used to initiate another operation or can be set to 0.

**Figure 7-11. Register Read Operation**

**7.3.12.2.2.1 Register Read With CRC**

A register read consists of two SPI frames, as described in the [Register Read](#) section. As shown in [Figure 7-12](#), the device appends an 8-bit output CRC byte along with 8-bit register data when the CRC module is enabled during a register read. The output CRC is computed by the device on 8-bit register data.

**Figure 7-12. Register Read With CRC**

## 7.4 Device Functional Modes

Table 7-9 lists the functional modes supported by the TLA2518.

**Table 7-9. Functional Modes**

FUNCTIONAL MODE	CONVERSION CONTROL	MUX CONTROL	CONV_MODE[1:0]	SEQ_MODE[1:0]
Manual	$\overline{CS}$ rising edge	Register write to MANUAL_CHID	00b	00b
On-the-fly	$\overline{CS}$ rising edge	First 5 bits after the $\overline{CS}$ falling edge	00b	10b
Auto-sequence	$\overline{CS}$ rising edge	Channel sequencer	00b	01b
Autonomous	Internal to the device	Channel sequencer	01b	01b
Turbo comparator	Internal to the device	Channel sequencer	10b	01b

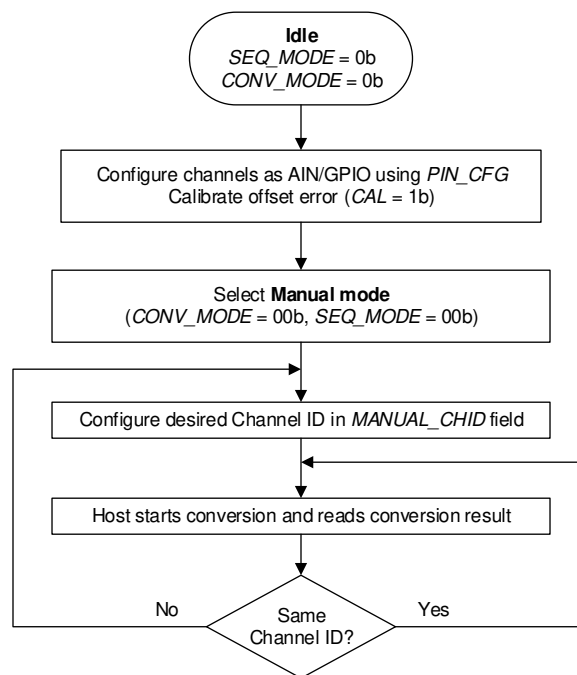

The device powers up in manual mode and can be configured into either of these modes by writing the configuration registers for the desired mode.

### 7.4.1 Device Power-Up and Reset

On power-up, the BOR bit is set indicating a power-cycle or reset event. The device can be reset by setting the RST bit or by recycling power on the AVDD pin.

### 7.4.2 Manual Mode

Manual mode allows the external host processor to directly select the analog input channel. Figure 7-13 shows the steps for operating the device in manual mode.

**Figure 7-13. Device Operation in Manual Mode**

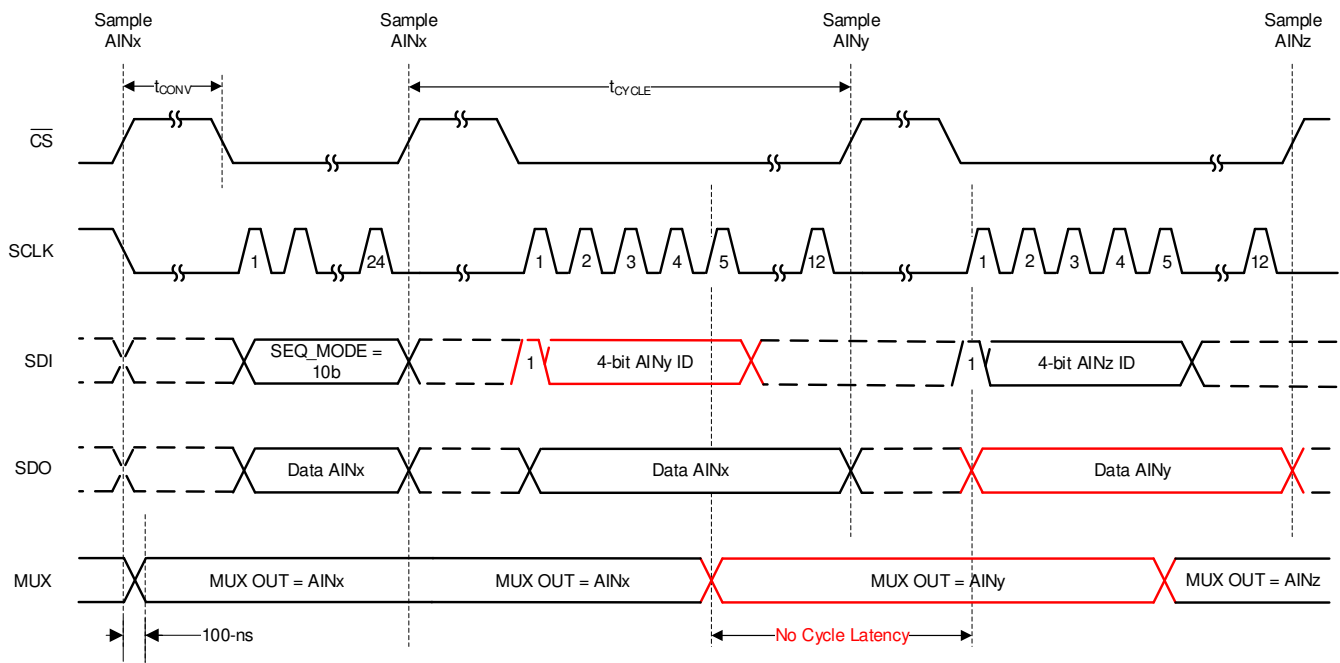

In manual mode, the command to switch to a new channel (indicated by cycle N in Figure 7-14) is decoded by the device on the  $\overline{CS}$  rising edge. The  $\overline{CS}$  rising edge is also the start of the conversion signal, and therefore the device samples the previously selected MUX channel in cycle N+1. The newly selected analog input channel data are available in cycle N+2. For switching the analog input channel, a register write to the MANUAL\_CHID field requires 24 clocks; see the [Register Write](#) section for more details. After a channel is selected, the number of clocks required for reading the output data depends on the device output data frame size; see the [Output Data Format](#) section for more details.

**Figure 7-14. Starting Conversions and Reading Data in Manual Mode**

### 7.4.3 On-the-Fly Mode

In the on-the-fly mode of operation, the analog input channel is selected, as shown in Figure 7-15, using the first five bits on SDI without waiting for the  $\overline{CS}$  rising edge. Thus, the ADC samples the newly selected channel on the  $\overline{CS}$  rising edge and there is no latency between the channel selection and the ADC output data.

**Figure 7-15. Starting Conversions and Reading Data in On-the-Fly Mode**

The number of clocks required for reading the output data depends on the device output data frame size; see the [Output Data Format](#) section for more details.

#### 7.4.4 Auto-Sequence Mode

In auto-sequence mode, the internal channel sequencer switches the multiplexer to the next analog input channel after every conversion. The desired analog input channels can be configured for sequencing in the AUTO\_SEQ\_CH\_SEL register. To enable the channel sequencer, set SEQ\_START = 1b. After every conversion, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set SEQ\_START = 0b.

In the example shown in [Figure 7-16](#), AIN2 and AIN6 are enabled for sequencing in AUTO\_SEQ\_CH\_SEL. The channel sequencer loops through AIN2 and AIN6 and repeats until SEQ\_START is set to 0b. The number of clocks required for reading the output data depends on the device output data frame size; see the [Output Data Format](#) section for more details.

**Figure 7-16. Starting Conversions and Reading Data in Auto-Sequence Mode**

#### 7.4.5 Autonomous Mode

In autonomous mode, the device can be programmed to monitor the voltage applied on the analog input pins of the device and generate an ALERT signal internal to the device when the programmable high or low threshold values are crossed. The internal ALERT signal can be mapped to any one digital output channel by configuring the channel ID in the ALERT\_PIN[3:0] register field. In autonomous mode, the device generates the start of conversion using the internal oscillator. The first start of conversion must be provided by the host and the device generates the subsequent start of conversions.

Figure 7-17 shows the steps for configuring the functional mode to autonomous mode. Abort the ongoing sequence by setting SEQ\_START to 0b before changing the functional mode or device configuration.

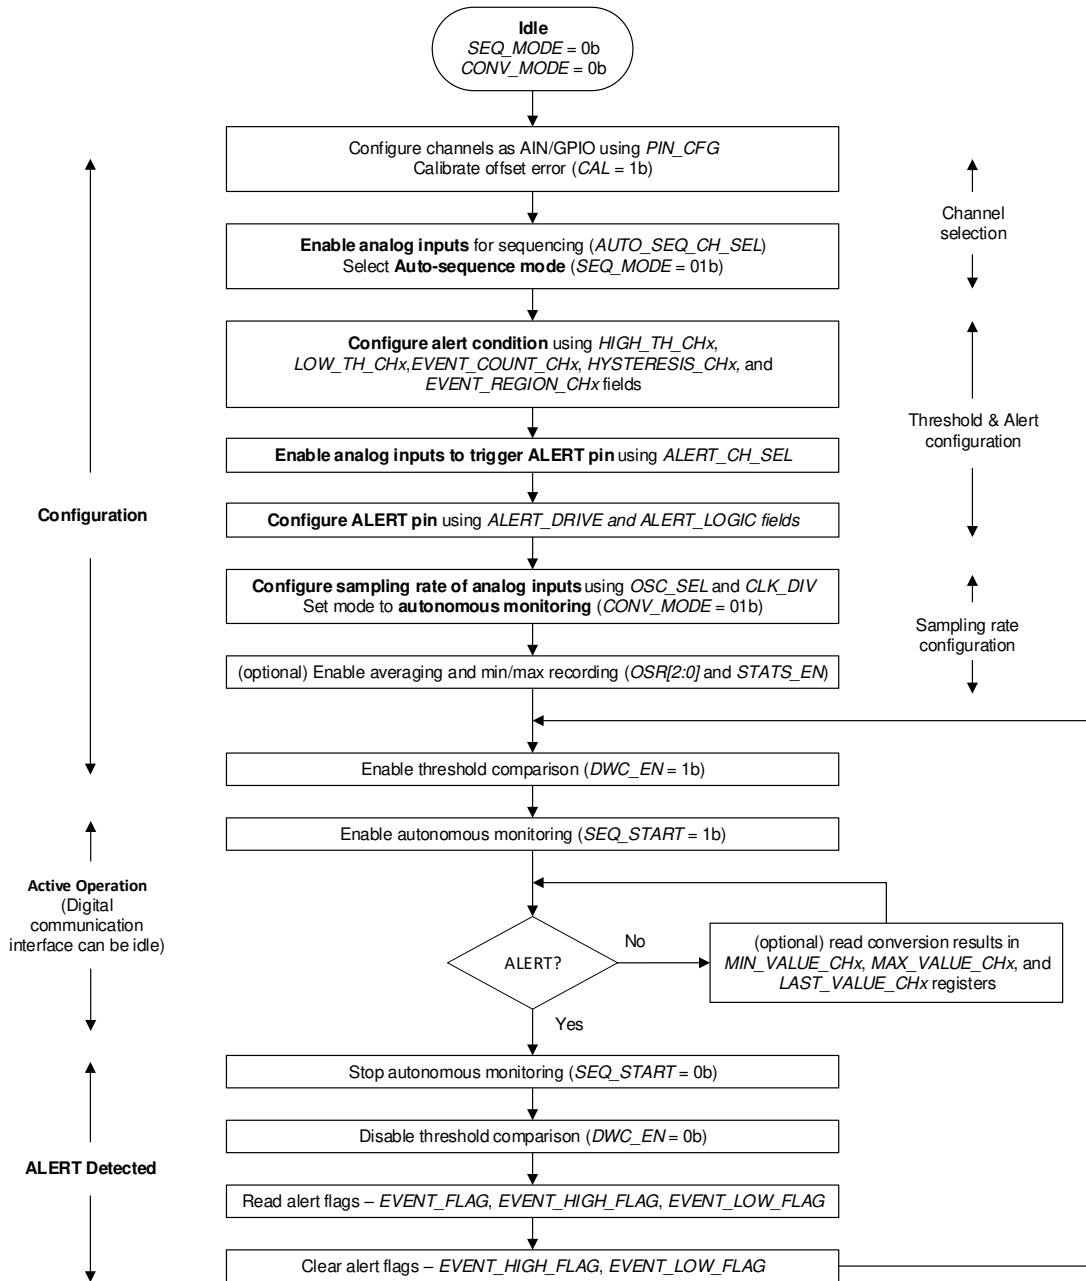

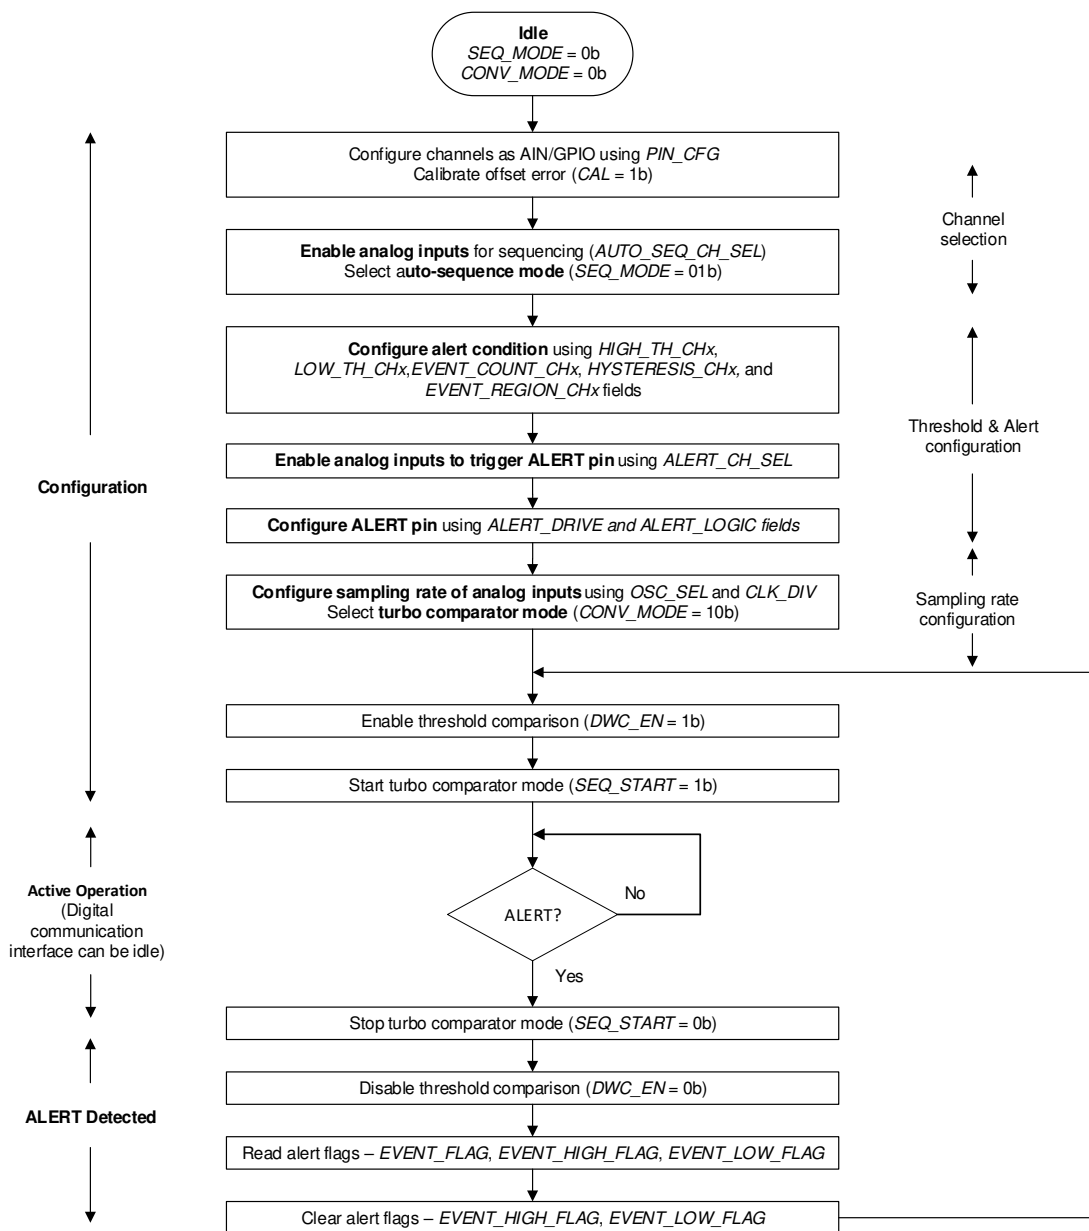

Figure 7-17. Configuring the Device in Autonomous Mode

### 7.4.6 Turbo Comparator Mode

Turbo comparator mode allows fast comparison with high/low thresholds using the digital window comparator. ADC output data is not available in this mode.

Figure 7-18 lists the comparison start and read frames for turbo comparator mode. The desired analog input channels can be configured for sequencing in the `AUTO_SEQ_CH_SEL` register. To enable the channel sequencer, set `SEQ_START` to 1b. After every comparison, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set `SEQ_START` to 0b. See section on *Oscillator and Timing Control* for more details on configuring speed in turbo comparator mode.

Abort the ongoing sequence by setting `SEQ_START` to 0b before changing the functional mode or device configuration.

**Figure 7-18. Device Operation in Turbo Comparator Mode**

## 8 Register Map

### 8.1 ADS7038 Registers

Table 8-1 lists the ADS7038 registers. All register offset addresses not listed in Table 8-1 should be considered as reserved locations and the register contents should not be modified.

**Table 8-1. ADS7038 Registers**

Address	Acronym	Register Name	Section
0x0	SYSTEM_STATUS	SYSTEM_STATUS Register (Address = 0x0) [reset = 0x81]	
0x1	GENERAL_CFG	GENERAL_CFG Register (Address = 0x1) [reset = 0x0]	
0x2	DATA_CFG	DATA_CFG Register (Address = 0x2) [reset = 0x0]	
0x3	OSR_CFG	OSR_CFG Register (Address = 0x3) [reset = 0x0]	
0x4	OPMODE_CFG	OPMODE_CFG Register (Address = 0x4) [reset = 0x0]	
0x5	PIN_CFG	PIN_CFG Register (Address = 0x5) [reset = 0x0]

0xA7	RECENT_CH3_MSB	RECENT_CH3_MSB Register (Address = 0xA7) [reset = 0x0]	
0xA8	RECENT_CH4_LSB	RECENT_CH4_LSB Register (Address = 0xA8) [reset = 0x0]	

**Table 8-1. ADS7038 Registers (continued)**

Address	Acronym	Register Name	Section
0xA9	RECENT_CH4_MSB		RECENT_CH4_MSB Register (Address = 0xA9) [reset = 0x0]
0xAA	RECENT_CH5_LSB		RECENT_CH5_LSB Register (Address = 0xAA) [reset = 0x0]
0xAB	RECENT_CH5_MSB		RECENT_CH5_MSB Register (Address = 0xAB) [reset = 0x0]
0xAC	RECENT_CH6_LSB		RECENT_CH6_LSB Register (Address = 0xAC) [reset = 0x0]
0xAD	RECENT_CH6_MSB		RECENT_CH6_MSB Register (Address = 0xAD) [reset = 0x0]
0xAE	RECENT_CH7_LSB		RECENT_CH7_LSB Register (Address = 0xAE) [reset = 0x0]
0xAF	RECENT_CH7_MSB		RECENT_CH7_MSB Register (Address = 0xAF) [reset = 0x0]
0xC3	GPO0_TRIG_EVENT_SEL		GPO0_TRIG_EVENT_SEL Register (Address = 0xC3) [reset = 0x0]
0xC5	GPO1_TRIG_EVENT_SEL		GPO1_TRIG_EVENT_SEL Register (Address = 0xC5) [reset = 0x0]
0xC7	GPO2_TRIG_EVENT_SEL		GPO2_TRIG_EVENT_SEL Register (Address = 0xC7) [reset = 0x0]
0xC9	GPO3_TRIG_EVENT_SEL		GPO3_TRIG_EVENT_SEL Register (Address = 0xC9) [reset = 0x0]
0xCB	GPO4_TRIG_EVENT_SEL		GPO4_TRIG_EVENT_SEL Register (Address = 0xCB) [reset = 0x0]
0xCD	GPO5_TRIG_EVENT_SEL		GPO5_TRIG_EVENT_SEL Register (Address = 0xCD) [reset = 0x0]
0xCF	GPO6_TRIG_EVENT_SEL		GPO6_TRIG_EVENT_SEL Register (Address = 0xCF) [reset = 0x0]
0xD1	GPO7_TRIG_EVENT_SEL		GPO7_TRIG_EVENT_SEL Register (Address = 0xD1) [reset = 0x0]
0xE9	GPO_TRIGGER_CFG		GPO_TRIGGER_CFG Register (Address = 0xE9) [reset = 0x0]
0xEB	GPO_VALUE_TRIG		GPO_VALUE_TRIG Register (Address = 0xEB) [reset = 0x0]

Complex bit access types are encoded to fit into small table cells. [Table 8-2](#) shows the codes that are used for access types in this section.

**Table 8-2. ADS7038 Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 8.1.1 SYSTEM\_STATUS Register (Address = 0x0) [reset = 0x81]

SYSTEM\_STATUS is shown in [Figure 8-1](#) and described in [Figure 8-1](#).

Return to the [Summary Table](#).

**Figure 8-1. SYSTEM\_STATUS Register**

7	6	5	4	3	2	1	0
RSVD	SEQ_STATUS	RESERVED			CRCERR_FUSE	CRCERR_IN	BOR
R-1b	R-0b	R-0b			R-0b	R/W-0b	R/W-1b

**Table 8-3. SYSTEM\_STATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	RSVD	R	1b	Reads return 1b.
6	SEQ_STATUS	R	0b	Status of the channel sequencer. 0b = Sequence stopped 1b = Sequence in progress
5-3	RESERVED	R	0b	Reserved. Reads return 010b.
2	CRCERR_FUSE	R	0b	Device power-up configuration CRC check status. To re-evaluate this bit, software reset the device or power cycle AVDD. 0b = No problems detected in power-up configuration. 1b = Device configuration not loaded correctly.
1	CRCERR_IN	R/W	0b	Status of CRC check on incoming data. Write 1b to clear this error flag. 0b = No CRC error. 1b = CRC error detected. All register writes, except to addresses 0x00 and 0x01, are blocked.
0	BOR	R/W	1b	Brown out reset indicator. This bit is set if brown out condition occurs or device is power cycled. Write 1b to this bit to clear the flag. 0b = No brown out from the last time this bit was cleared. 1b = Brown out condition detected or device power cycled.

### 8.1.2 GENERAL\_CFG Register (Address = 0x1) [reset = 0x0]

GENERAL\_CFG is shown in [Figure 8-2](#) and described in [Table 8-4](#).

Return to the [Summary Table](#).

**Figure 8-2. GENERAL\_CFG Register**

7	6	5	4	3	2	1	0
RESERVED	CRC_EN	STATS_EN	DWC_EN	RESERVED	CH_RST	CAL	RST
R-0b	R/W-0b	R/W-0b	R/W-0b	R-0b	R/W-0b	R/W-0b	W-0b

**Table 8-4. GENERAL\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	RESERVED	R	0b	Reserved. Reads return 1b.
6	CRC_EN	R/W	0b	Enable or disable the CRC on device interface. 0b = CRC module disabled. 1b = CRC appended to data output. CRC check is enabled on incoming data.
5	STATS_EN	R/W	0b	Enable or disable the statistics module. 0b = Minimum, maximum, and recent value registers are not updated. 1b = Clear minimum, maximum, and recent value registers and continue updating with new conversion results.

**Table 8-4. GENERAL\_CFG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
4	DWC_EN	R/W	0b	Enable or disable the digital window comparator. 0b = Reset or disable the digital window comparator. 1b = Enable digital window comparator.
3	RESERVED	R	0b	Reserved. Reads return 0b.
2	CH_RST	R/W	0b	Force all channels to be analog inputs. 0b = Normal operation. 1b = All channels will be set as analog inputs irrespective of configuration in other registers.
1	CAL	R/W	0b	Calibrate ADC offset. 0b = Normal operation. 1b = ADC offset is calibrated. After calibration is complete, this bit is set to 0b.
0	RST	W	0b	Software reset all registers to default values. 0b = Normal operation. 1b = Device is reset. After reset is complete, this bit is set to 0b and BOR bit is set to 1b.

**8.1.3 DATA\_CFG Register (Address = 0x2) [reset = 0x0]**

DATA\_CFG is shown in [Figure 8-3](#) and described in [Table 8-5](#).

Return to the [Summary Table](#).

**Figure 8-3. DATA\_CFG Register**

7	6	5	4	3	2	1	0
FIX_PAT	RESERVED	APPEND_STATUS[1:0]		RESERVED		CPOL_CPHA[1:0]	
R/W-0b	R-0b	R/W-0b		R-0b		R/W-0b	

**Table 8-5. DATA\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	FIX_PAT	R/W	0b	Device outputs fixed data bits which can be helpful for debugging communication with the device. 0b = Normal operation. 1b = Device outputs fixed code 0xA5A repeatedly when reading ADC data.
6	RESERVED	R	0b	Reserved. Reads return 0b.
5-4	APPEND_STATUS[1:0]	R/W	0b	Append 4-bit channel ID or status flags to output data. 00b: 01b: 10b: 11b: 0b = Channel ID and status flags are not appended to ADC data. 1b = 4-bit channel ID is appended to ADC data. 10b = 4-bit status flags are appended to ADC data. 11b = Reserved.
3-2	RESERVED	R	0b	Reserved. Reads return 0b.
1-0	CPOL_CPHA[1:0]	R/W	0b	This field sets the polarity and phase of SPI communication. 0b = CPOL = 0, CPHA = 0. 1b = CPOL = 0, CPHA = 1. 10b = CPOL = 1, CPHA = 0. 11b = CPOL = 1, CPHA = 1.

### 8.1.4 OSR\_CFG Register (Address = 0x3) [reset = 0x0]

OSR\_CFG is shown in [Figure 8-4](#) and described in [Table 8-6](#).

Return to the [Summary Table](#).

**Figure 8-4. OSR\_CFG Register**

7	6	5	4	3	2	1	0
RESERVED					OSR[2:0]		
R-0b					R/W-0b		

**Table 8-6. OSR\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-3	RESERVED	R	0b	Reserved. Reads return 0b.
2-0	OSR[2:0]	R/W	0b	Selects the oversampling ratio for ADC conversion result. 0b = No averaging 1b = 2 samples 10b = 4 samples 11b = 8 samples 100b = 16 samples 101b = 32 samples 110b = 64 samples 111b = 128 samples

### 8.1.5 OPMODE\_CFG Register (Address = 0x4) [reset = 0x0]

OPMODE\_CFG is shown in [Figure 8-5](#) and described in [Table 8-7](#).

Return to the [Summary Table](#).

**Figure 8-5. OPMODE\_CFG Register**

7	6	5	4	3	2	1	0
CONV_ON_ERR	CONV_MODE[1:0]		OSC_SEL	CLK_DIV[3:0]			
R/W-0b	R/W-0b		R/W-0b	R/W-0b			

**Table 8-7. OPMODE\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	CONV_ON_ERR	R/W	0b	Control continuation of autonomous modes if CRC error is detected on communication interface. 0b = If CRC error is detected, device continues channel sequencing and pin configuration is retained. See the CRCERR_IN bit for more details. 1b = If CRC error is detected, device changes all channels to analog inpts and channel sequencing is paused until CRCERR_IN = 1b. After clearing CRCERR_IN flag, device resumes channel sequencing and pin configuration is restored.
6-5	CONV_MODE[1:0]	R/W	0b	These bits set the mode of conversion of the ADC. 0b = Manual mode; conversions are initiated by host. 1b = Autonomous mode; conversions are initiated by the internal state machine.
4	OSC_SEL	R/W	0b	Selects the oscillator for internal timing generation. 0b = High-speed oscillator. 1b = Low-power oscillator.
3-0	CLK_DIV[3:0]	R/W	0b	Sampling speed control in autonomous monitoring mode (CONV_MODE = 01b). See the section on oscillator and timing control for details.

### 8.1.6 PIN\_CFG Register (Address = 0x5) [reset = 0x0]

PIN\_CFG is shown in [Figure 8-6](#) and described in [Table 8-8](#).

Return to the [Summary Table](#).

**Figure 8-6. PIN\_CFG Register**

7	6	5	4	3	2	1	0
PIN_CFG[7:0]							
R/W-0b							

**Table 8-8. PIN\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	PIN_CFG[7:0]	R/W	0b	Configure device channels AIN / GPIO [7:0] as analog inputs or GPIOs. 0b = Channel is configured as analog input. 1b = Channel is configured as GPIO.

### 8.1.7 GPIO\_CFG Register (Address = 0x7) [reset = 0x0]

GPIO\_CFG is shown in [Figure 8-7](#) and described in [Table 8-9](#).

Return to the [Summary Table](#).

**Figure 8-7. GPIO\_CFG Register**

7	6	5	4	3	2	1	0
GPIO_CFG[7:0]							
R/W-0b							

**Table 8-9. GPIO\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	GPIO_CFG[7:0]	R/W	0b	Configure GPIO[7:0] as either digital inputs or digital outputs. 0b = GPIO is configured as digital input. 1b = GPIO is configured as digital output.

### 8.1.8 GPO\_DRIVE\_CFG Register (Address = 0x9) [reset = 0x0]

GPO\_DRIVE\_CFG is shown in [Figure 8-8](#) and described in [Table 8-10](#).

Return to the [Summary Table](#).

**Figure 8-8. GPO\_DRIVE\_CFG Register**

7	6	5	4	3	2	1	0
GPO_DRIVE_CFG[7:0]							
R/W-0b							

**Table 8-10. GPO\_DRIVE\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	GPO_DRIVE_CFG[7:0]	R/W	0b	Configure digital outputs GPO[7:0] as open-drain or push-pull outputs. 0b = Digital output is open-drain; connect external pullup resistor. 1b = Push-pull driver is used for digital output.

### 8.1.9 GPO\_VALUE Register (Address = 0xB) [reset = 0x0]

GPO\_VALUE is shown in [Figure 8-9](#) and described in [Table 8-11](#).

Return to the [Summary Table](#).

**Figure 8-9. GPO\_VALUE Register**

7	6	5	4	3	2	1	0
GPO_VALUE[7:0]							
R/W-0b							

**Table 8-11. GPO\_VALUE Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	GPO_VALUE[7:0]	R/W	0b	Logic level to be set on digital outputs GPO[7:0]. 0b = Digital output set to logic 0. 1b = Digital output set to logic 1.

### 8.1.10 GPI\_VALUE Register (Address = 0xD) [reset = 0x0]

GPI\_VALUE is shown in [Figure 8-10](#) and described in [Table 8-12](#).

Return to the [Summary Table](#).

**Figure 8-10. GPI\_VALUE Register**

7	6	5	4	3	2	1	0
GPI_VALUE[7:0]							
R-0b							

**Table 8-12. GPI\_VALUE Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	GPI_VALUE[7:0]	R	0b	Readback the logic level on GPIO[7:0]. 0b = GPIO is at logic 0. 1b = GPIO is at logic 1.

### 8.1.11 SEQUENCE\_CFG Register (Address = 0x10) [reset = 0x0]

SEQUENCE\_CFG is shown in [Figure 8-11](#) and described in [Table 8-13](#).

Return to the [Summary Table](#).

**Figure 8-11. SEQUENCE\_CFG Register**

7	6	5	4	3	2	1	0
RESERVED			SEQ_START	RESERVED		SEQ_MODE[1:0]	
R-0b			R/W-0b	R-0b		R/W-0b	

**Table 8-13. SEQUENCE\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	0b	Reserved. Reads return 0b.
4	SEQ_START	R/W	0b	Control for start of channel sequence when using auto sequence mode (SEQ_MODE = 01b). 0b = Stop channel sequencing. 1b = Start channel sequencing in ascending order for channels enabled in AUTO_SEQ_CHSEL register.
3-2	RESERVED	R	0b	Reserved. Reads return 0b.

**Table 8-13. SEQUENCE\_CFG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	SEQ_MODE[1:0]	R/W	0b	Selects the mode of scanning of analog input channels. 0b = Manual sequence mode; channel selected by MANUAL_CHID field. 1b = Auto sequence mode; channel selected by AUTO_SEQ_CHSEL. 10b = On-the-fly sequence mode. 11b = Reserved.

**8.1.12 CHANNEL\_SEL Register (Address = 0x11) [reset = 0x0]**

CHANNEL\_SEL is shown in [Figure 8-12](#) and described in [Table 8-14](#).

Return to the [Summary Table](#).

**Figure 8-12. CHANNEL\_SEL Register**

7	6	5	4	3	2	1	0
RESERVED				MANUAL_CHID[3:0]			
R-0b				R/W-0b			

**Table 8-14. CHANNEL\_SEL Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	RESERVED	R	0b	Reserved. Reads return 0b.
3-0	MANUAL_CHID[3:0]	R/W	0b	In manual mode (SEQ_MODE = 00b), this field contains the 4-bit channel ID of the analog input channel for next ADC conversion. For valid ADC data, the selected channel must not be configured as GPIO in PIN_CFG register. 1xxx = Reserved. 0b = AIN0 1b = AIN1 10b = AIN2 11b = AIN3 100b = AIN4 101b = AIN5 110b = AIN6 111b = AIN7

**8.1.13 AUTO\_SEQ\_CH\_SEL Register (Address = 0x12) [reset = 0x0]**

AUTO\_SEQ\_CH\_SEL is shown in [Figure 8-13](#) and described in [Table 8-15](#).

Return to the [Summary Table](#).

**Figure 8-13. AUTO\_SEQ\_CH\_SEL Register**

7	6	5	4	3	2	1	0
AUTO_SEQ_CH_SEL[7:0]							
R/W-0b							

**Table 8-15. AUTO\_SEQ\_CH\_SEL Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	AUTO_SEQ_CH_SEL[7:0]	R/W	0b	Select analog input channels AIN[7:0] in for auto sequencing mode. 0b = Analog input channel is not enabled in scanning sequence. 1b = Analog input channel is enabled in scanning sequence.

**8.1.14 ALERT\_CH\_SEL Register (Address = 0x14) [reset = 0x0]**

ALERT\_CH\_SEL is shown in [Figure 8-14](#) and described in [Table 8-16](#).

Return to the [Summary Table](#).

**Figure 8-14. ALERT\_CH\_SEL Register**

7	6	5	4	3	2	1	0
ALERT_CH_SEL[7:0]							
R/W-0b							

**Table 8-16. ALERT\_CH\_SEL Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	ALERT_CH_SEL[7:0]	R/W	0b	Select channels for which the alert flags can assert the internal ALERT signal. The ALERT signal can be mapped to the digital output channel configured in the ALERT_PIN[3:0] field. 0b = Alert flags for this channel do not assert the ALERT pin. 1b = Alert flags for this channel assert the ALERT pin.

**8.1.15 ALERT\_MAP Register (Address = 0x16) [reset = 0x0]**

ALERT\_MAP is shown in [Figure 8-15](#) and described in [Table 8-17](#).

Return to the [Summary Table](#).

**Figure 8-15. ALERT\_MAP Register**

7	6	5	4	3	2	1	0
RESERVED							ALERT_CRCIN
R-0b							R/W-0b

**Table 8-17. ALERT\_MAP Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	RESERVED	R	0b	Reserved. Reads return 0b.
0	ALERT_CRCIN	R/W	0b	Enable or disable the alert notification for CRC error on input data (CRCERR_IN = 1b). 0b = ALERT signal is not asserted when CRCERR_IN = 1b. 1b = ALERT signal is asserted when CRCERR_IN = 1b. Clear CRCERR_IN for deasserting the ALERT pin.

**8.1.16 ALERT\_PIN\_CFG Register (Address = 0x17) [reset = 0x0]**

ALERT\_PIN\_CFG is shown in [Figure 8-16](#) and described in [Table 8-18](#).

Return to the [Summary Table](#).

**Figure 8-16. ALERT\_PIN\_CFG Register**

7	6	5	4	3	2	1	0
ALERT_PIN[3:0]				RESERVED		ALERT_LOGIC[1:0]	
R/W-0b				R-0b		R/W-0b	

**Table 8-18. ALERT\_PIN\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	ALERT_PIN[3:0]	R/W	0b	Internal ALERT output of the digital window comparator will be output on this channel. This channel must be configured as digital output.
3-2	RESERVED	R	0b	Reserved. Reads return 0b.

**Table 8-18. ALERT\_PIN\_CFG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	ALERT_LOGIC[1:0]	R/W	0b	Configure how the ALERT signal is asserted. 0b = Active low. 1b = Active high. 10b = Pulsed low (one logic low pulse once per alert flag). 11b = Pulsed high (one logic high pulse once per alert flag).

**8.1.17 EVENT\_FLAG Register (Address = 0x18) [reset = 0x0]**

EVENT\_FLAG is shown in [Figure 8-17](#) and described in [Table 8-19](#).

Return to the [Summary Table](#).

**Figure 8-17. EVENT\_FLAG Register**

7	6	5	4	3	2	1	0
EVENT_FLAG[7:0]							
R-0b							

**Table 8-19. EVENT\_FLAG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	EVENT_FLAG[7:0]	R	0b	Alert flags indicating digital window comparator status for CH[7:0]. Clear individual bits of EVENT_HIGH_FLAG or EVENT_LOW_FLAG registers to clear the corresponding alert flag. 0b = Event condition not detected. 1b = Event condition detected.

**8.1.18 EVENT\_HIGH\_FLAG Register (Address = 0x1A) [reset = 0x0]**

EVENT\_HIGH\_FLAG is shown in [Figure 8-18](#) and described in [Table 8-20](#).

Return to the [Summary Table](#).

**Figure 8-18. EVENT\_HIGH\_FLAG Register**

7	6	5	4	3	2	1	0
EVENT_HIGH_FLAG[7:0]							
R/W-0b							

**Table 8-20. EVENT\_HIGH\_FLAG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	EVENT_HIGH_FLAG[7:0]	R/W	0b	Alert flag corresponding to high threshold of analog input or rising edge of digital input on CH[7:0]. Write 1b to clear this flag. 0b = No alert condition detected. 1b = Either high threshold was exceeded (analog input) or rising edge was detected (digital input).

**8.1.19 EVENT\_LOW\_FLAG Register (Address = 0x1C) [reset = 0x0]**

EVENT\_LOW\_FLAG is shown in [Figure 8-19](#) and described in [Table 8-21](#).

Return to the [Summary Table](#).

**Figure 8-19. EVENT\_LOW\_FLAG Register**

7	6	5	4	3	2	1	0
EVENT_LOW_FLAG[7:0]							
R/W-0b							

**Table 8-21. EVENT\_LOW\_FLAG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	EVENT_LOW_FLAG[7:0]	R/W	0b	Alert flag corresponding to low threshold of analog input or falling edge of digital input on CH[7:0]. Write 1b to clear this flag. 0b = No Event condition detected. 1b = Either low threshold was exceeded (analog input) or falling edge was detected (digital input).

**8.1.20 EVENT\_RGN Register (Address = 0x1E) [reset = 0x0]**

EVENT\_RGN is shown in [Figure 8-20](#) and described in [Table 8-22](#).

Return to the [Summary Table](#).

**Figure 8-20. EVENT\_RGN Register**

7	6	5	4	3	2	1	0
EVENT_RGN[7:0]							
R/W-0b							

**Table 8-22. EVENT\_RGN Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	EVENT_RGN[7:0]	R/W	0b	Choice of region used in monitoring analog/digital inputs CH[7:0]. 0b = Alert flag is set if: (conversion result < low threshold) or (conversion result > high threshold). For digital inputs, logic 1 sets the alert flag. 1b = Alert flag is set if: (low threshold > conversion result < high threshold). For digital inputs, logic 0 sets the alert flag.

**8.1.21 HYSTERESIS\_CH0 Register (Address = 0x20) [reset = 0xF0]**

HYSTERESIS\_CH0 is shown in [Figure 8-21](#) and described in [Table 8-23](#).

Return to the [Summary Table](#).

**Figure 8-21. HYSTERESIS\_CH0 Register**

Configure GPOx_TRIG_EVENT_SEL register to select which alert flags can trigger an update on the desired GPO.

**8.1.111 GPO\_VALUE\_TRIG Register (Address = 0xEB) [reset = 0x0]**

GPO\_VALUE\_TRIG is shown in [Figure 8-111](#) and described in [Table 8-113](#).

Return to the [Summary Table](#).

**Figure 8-111. GPO\_VALUE\_TRIG Register**

**Table 8-113. GPO\_VALUE\_TRIG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	GPO_VALUE_ON_TRIGGER[7:0]	R/W	0b	Value to be set on digital outputs GPO[7:0] when the corresponding trigger occurs. GPO update on alert flags must be enabled in the corresponding bit in the GPO_TRIGGER_CFG register. 0b = Digital output is set to logic 0. 1b = Digital output is set to logic 1.

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The two primary circuits required to maximize the performance of a high-precision, successive approximation register analog-to-digital converter (SAR ADC) are the input driver and the reference driver circuits. This section details some general principles for designing the input driver circuit, reference driver circuit, and provides some application circuits designed for the ADS7038.

### 9.2 Typical Applications

#### 9.2.1 Mixed-Channel Configuration

**Figure 9-1. DAQ Circuit: Single-Supply DAQ**

##### 9.2.1.1 Design Requirements

The goal of this application is to configure some channels of the ADS7038 as digital inputs, open-drain digital outputs, and push-pull digital outputs.

##### 9.2.1.2 Detailed Design Procedure

The ADS7038 can support GPIO functionality at each input pin. Any analog input pin can be independently configured as a digital input, a digital open-drain output, or a digital push-pull output through the PIN\_CFG and GPIO\_CFG registers; see [Table 7-2](#).

##### 9.2.1.2.1 Digital Input

The digital input functionality can be used to monitor a signal within the system. [Figure 9-2](#) illustrates that the state of the digital input can be read from the GPI\_VALUE register.

Figure 9-2. Digital Input

**9.2.1.2.2 Digital Open-Drain Output**

The channels of the ADS7038 can be configured as digital open-drain outputs supporting an output voltage up to 5.5 V. An open-drain output, as shown in Figure 9-3, consists of an internal FET (Q) connected to ground. The output is idle when not driven by the device, which means Q is off and the pullup resistor, R<sub>PULL\_UP</sub>, connects the GPOx node to the desired output voltage. The output voltage can range anywhere up to 5.5 V, depending on the external voltage that the GPIOx is pulled up to. When the device is driving the output, Q turns on, thus connecting the pullup resistor to ground and bringing the node voltage at GPOx low.

Figure 9-3. Digital Open-Drain Output

The minimum value of the pullup resistor, as calculated in Equation 3, is given by the ratio of V<sub>PULL\_UP</sub> and the maximum current supported by the device digital output (5 mA).

$$R_{MIN} = (V_{PULL\_UP} / 5 \text{ mA}) \tag{3}$$

The maximum value of the pullup resistor, as calculated in Equation 4, depends on the minimum input current requirement, I<sub>LOAD</sub>, of the receiving device driven by this GPIO.

$$R_{MAX} = (V_{PULL\_UP} / I_{LOAD}) \tag{4}$$

Select R<sub>PULL\_UP</sub> such that R<sub>MIN</sub> < R<sub>PULL\_UP</sub> < R<sub>MAX</sub>.

### 9.2.1.3 Application Curve

**Figure 9-4. DC Input Histogram**

### 9.2.2 Digital Push-Pull Output Configuration

The channels of the ADS7038 can be configured as digital push-pull outputs supporting an output voltage up to AVDD. As shown in Figure 9-5, a push-pull output consists of two mirrored opposite bipolar transistors, Q1 and Q2. The device can both source and sink current because only one transistor is on at a time (either Q2 is on and pulls the output low, or Q1 is on and sets the output high). A push-pull configuration always drives the line opposed to an open-drain output where the line is left floating.

**Figure 9-5. Digital Push-Pull Output**

## 9.3 Power Supply Recommendations

### 9.3.1 AVDD and DVDD Supply Recommendations

The ADS7038 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. For supplies greater than 2.35V, AVDD and DVDD can be shorted externally if single-supply operation is desired. The AVDD supply also defines the full-scale input range of the device. Decouple the AVDD and DVDD pins individually, as shown in Figure 9-6, with 1µF ceramic decoupling capacitors. The minimum capacitor value required for AVDD and DVDD is 200nF and 20nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220nF is required for decoupling.

Connect 1µF ceramic decoupling capacitors between the DECAP and GND pins.

**Figure 9-6. Power-Supply Decoupling**

## 9.4 Layout

### 9.4.1 Layout Guidelines

Figure 9-7 shows a board layout example for the ADS7038. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the AVDD supply away from noise sources.

Use 1µF ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect the GND pin to the ground plane using short, low-impedance paths. The AVDD supply voltage also functions as the reference voltage for the ADS7038. Place the decoupling capacitor for AVDD close to the device AVDD and GND pins and connect the decoupling capacitor to the device pins with thick copper tracks.

### 9.4.2 Layout Example

**Figure 9-7. Example Layout**

## 10 Device and Documentation Support

### 10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision B (June 2020) to Revision C (September 2024)</b>	<b>Page</b>
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Added ADS7038H device to document.....	1
• Added full throughput sub-bullet to <i>Enhanced-SPI digital interface</i> bullet in <i>Features</i> section.....	1
• Changed <i>Description</i> section: Deleted <i>1 MSPS</i> from first paragraph, added ADS7038H to <i>Package Information</i> table, and added <i>Device Information</i> table.....	1
• Added <i>Speed</i> column and ADS7038H row to <i>Device Comparison Table</i> .....	2
• Changed <i>SPI-Compatible Serial Interface Timing</i> figure to include $t_{HT\_CKDO}$ timing.....	8
• Changed last paragraph of <i>Input CRC (From Host To Device)</i> section.....	18

<b>Changes from Revision A (December 2019) to Revision B (June 2020)</b>	<b>Page</b>
• Changed description of DECAP pin in <i>Pin Functions</i> table.....	3
• Added last sentence to <i>AVDD and DVDD Supply Recommendations</i> section.....	75
• Changed last sentence of <i>Layout Guidelines</i> section.....	76

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS7038IRTER	ACTIVE	WQFN	RTE	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	7038	Samples
ADS7038IRTET	ACTIVE	WQFN	RTE	16	250	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	7038	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

Refer to the product data sheet for package details.

4225944/A

SIDE WALL METAL THICKNESS DIM A	
OPTION 1	OPTION 2
0.1	0.2

4219117/B 04/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:20X

SOLDER MASK DETAILS

4219117/B 04/2022

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

**SOLDER PASTE EXAMPLE**  
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 17:  
85% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE  
SCALE:25X

4219117/B 04/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
