

## ISO782xLL 高性能、8000V<sub>PK</sub>強化絶縁デュアルLVDSバッファ

### 1 特長

- TIA/EIA-644-A LVDS標準に準拠
- 信号速度: 最大100Mbps
- 広い電源電圧範囲: 2.25V~5.5V
- 広い温度範囲: 周囲温度-55°C~+125°C
- 低消費電力: 100Mbpsでチャンネルごとの標準値
  - 9.3mA (ISO7820LL)
  - 9.5mA (ISO7821LL)
- 低い伝搬遅延: 17ns (標準値)
- 業界最先端のCMTI (最小値): ±100kV/μs
- 堅牢な電磁気互換性(EMC)
- システム・レベルでのESD、EFT、サージ耐性
- 低い放射
- 絶縁バリアの寿命: 40年以上
- ワイド・ボディ、および超ワイド・ボディのSOIC-16パッケージ・オプション
- 絶縁サージ耐久電圧12800V<sub>PK</sub>
- 安全関連の認定
  - 8000V<sub>PK</sub>の、DIN V VDE V 0884-10 (VDE V 0884-10):2006-12準拠の強化絶縁
  - UL 1577に準拠した絶縁耐圧: 5700V<sub>RMS</sub> (1分間)
  - CSA Component Acceptance Notice 5A、IEC-60950-1、およびIEC 60601-1最終機器標準
  - EN 61010-1およびEN 60950-1準拠のTUV認定
  - GB4943.1-2011 CQC認定
  - すべての認定は計画中

### 2 アプリケーション

- モーター制御
- 試験/測定機器
- 産業用オートメーション
- 医療用機器
- 通信システム

### 3 概要

ISO782xLLファミリのデバイスは高性能の絶縁されたデュアルLVDSバッファで、8000V<sub>PK</sub>の絶縁耐圧があります。このデバイスは、高い電磁気耐性、低い放射、低い消費電力を実現し、同時にLVDSバス信号が絶縁されています。それぞれの絶縁チャンネルにはLVDS受信および送信バッファがあり、二酸化シリコン(SiO<sub>2</sub>)絶縁バリアにより分離されています。

ISO7820LLデバイスには、2つの順方向チャンネルがあります。ISO7821LLデバイスには、1つの順方向チャンネルと1つの逆方向チャンネルがあります。

革新的なチップ設計およびレイアウト技法により、ISO782xLLファミリのデバイスは電磁環境適合性が大幅に強化されているため、システム・レベルのESD、EFT、サージ、および放射に関するコンプライアンスを簡単に実現できます。

ISO782xLLファミリのデバイスは、16ピンのSOICワイド・ボディ(DW)パッケージと、超ワイド・ボディ(DWW)パッケージで供給されます。

#### 製品情報<sup>(1)</sup>

型番	パッケージ	本体サイズ(公称)
ISO7820LL	DW (16)	10.30mm×7.50mm
ISO7821LL	DWW (16)	10.30mm×14.00mm

(1) 提供されているすべてのパッケージについては、巻末の注文情報を参照してください。

## 5 Pin Configuration and Functions

### Pin Functions

NAME	PIN NO.		I/O	DESCRIPTION
	ISO7820LL	ISO7821LL		
EN1	—	7	I	Output enable 1. Output pins on side 1 are enabled when EN1 is high or open and in high impedance state when EN1 is low.
EN2	10	10	I	Output enable 2. Output pins on side 2 are enabled when EN2 is high or open and in high impedance state when EN2 is low.
GND1	2	2	—	Ground connection for $V_{CC1}$
	8	8		
GND2	9	9	—	Ground connection for $V_{CC2}$
	15	15		
INA+	3	3	I	Positive differential input, channel A
INA-	4	4	I	Negative differential input, channel A
INB+	6	11	I	Positive differential input, channel B
INB-	5	12	I	Negative differential input, channel B
NC	7	—	—	Not connected
OUTA+	14	14	O	Positive differential output, channel A
OUTA-	13	13	O	Negative differential output, channel A
OUTB+	11	6	O	Positive differential output, channel B
OUTB-	12	5	O	Negative differential output, channel B
$V_{CC1}$	1	1	—	Power supply, side 1, $V_{CC1}$
$V_{CC2}$	16	16	—	Power supply, side 2, $V_{CC2}$

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CCx}$	Supply voltage <sup>(2)</sup>	$V_{CC1}, V_{CC2}$	-0.5      6	V
V	Voltage on input, output, and enable pins	OUTx, INx, ENx	-0.5 $V_{CCx} + 0.5^{(3)}$	V
$I_O$	Maximum current through OUTx pins		-20      20	mA
$T_J$	Junction temperature		-55      150	°C
$T_{stg}$	Storage temperature		-65      150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4500
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC1}, V_{CC2}$	Supply voltage	2.25	3.3	5.5	V
$ V_{ID} $	Magnitude of RX input differential voltage	Driven with voltage sources on RX pins		100      600	mV
$V_{IC}$	RX input common-mode voltage	$V_{CC1}, V_{CC2} \geq 3\text{ V}$	$0.5  V_{ID} $	$2.4 - 0.5  V_{ID} $	V
		$V_{CC1}, V_{CC2} < 3\text{ V}$	$0.5  V_{ID} $	$V_{CCx} - 0.6 - 0.5  V_{ID} $	V
$R_L$	TX far end differential termination			100	$\Omega$
DR	Signaling rate	0		100	Mbps
$T_A$	Ambient temperature	-55	25	125	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ISO7820LL ISO7821LL		UNIT
		DW (SOIC)	DWW (SOIC)	
		16 PINS	16 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	82	84.6	°C/W
R <sub>θJC(top)</sub>	Junction-to-case(top) thermal resistance	44.6	46.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	46.6	55.3	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	17.8	18.7	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	46.1	54.5	°C/W

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-terminal device.

## 6.7 Safety-Related Certifications

VDE	CSA	UL	CQC	TUV
Plan to certify according to DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 and DIN EN 60950-1 (VDE 0805 Teil 1):2011-01	Plan to certify under CSA Component Acceptance Notice 5A, IEC 60950-1 and IEC 60601-1	Plan to certify according to UL 1577 Component Recognition Program	Plan to certify according to GB 4943.1-2011	Plan to certify according to EN 61010-1:2010 (3rd Ed) and EN 60950-1:2006/A11:2009/A1:2010/A12:2011/A2:2013

Certification planned	Certification planned	Certification planned	Certification planned	Certification planned

## 6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>DW PACKAGE</b>						
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 82°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 3</a>			277	mA
		R <sub>θJA</sub> = 82°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 3</a>			423	
		R <sub>θJA</sub> = 82°C/W, V <sub>I</sub> = 2.75 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 3</a>			554	
P <sub>S</sub>	Safety input, output, or total power	R <sub>θJA</sub> = 82°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 5</a>			1524	mW
T <sub>S</sub>	Maximum safety temperature				150	°C
<b>DWW PACKAGE</b>						
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 84.6°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 4</a>			269	mA
		R <sub>θJA</sub> = 84.6°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 4</a>			410	
		R <sub>θJA</sub> = 84.6°C/W, V <sub>I</sub> = 2.75 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 4</a>			537	
P <sub>S</sub>	Safety input, output, or total power	R <sub>θJA</sub> = 84.6°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 6</a>			1478	mW
T <sub>S</sub>	Maximum safety temperature				150	°C

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) is that of a device installed on a High-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 6.9 DC Electrical Characteristics

(over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{IN(EN)}$	Leakage Current on ENx pins	Internal pullup on ENx pins		13	40	$\mu\text{A}$

## 8 Detailed Description

### 8.1 Overview

The ISO782xLL is a family of isolated LVDS buffers. The differential signal received on the LVDS input pins is first converted to CMOS logic levels. The signal is then transmitted across a silicon-dioxide (SiO<sub>2</sub>) based capacitive-isolation barrier using an on-off keying (OOK) modulation scheme. A high frequency carrier transmitted across the barrier represents one logic state and an absence of a carrier represents the other logic state. On the other side of the barrier a demodulator converts the OOK signal back to logic levels, which is then converted to LVDS outputs by a differential driver. These devices incorporate advanced circuit techniques to maximize CMTI performance and minimize radiated emissions.

The ISO782xLL family of devices is TIA/EIA-644-A standard compliant. The LVDS transmitters drive a minimum differential-output voltage magnitude of 250 mV into a 100-Ω load, and the LVDS receivers are capable of detecting differential signals ≥50 mV in magnitude. The device consumes 10 mA per channel at 100 Mbps with 5-V supplies.

The [Functional Block Diagram](#) section shows a conceptual block diagram of one channel of the ISO782xLL family of devices.

### 8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 8.3 Feature Description

The ISO782xLL family of devices is available in two channel configurations with a default differential high-output state.

PART NUMBER	CHANNEL DIRECTION	RATED ISOLATION	MAXIMUM DATA RATE	DEFAULT DIFFERENTIAL OUTPUT
ISO7820LL	2 Forward	5700 V <sub>RMS</sub> / 8000 V <sub>PK</sub> <sup>(1)</sup>	100 Mbps	High
ISO7821LL	1 Forward, 1 Reverse			

(1) See the [Safety-Related Certifications](#) section for detailed isolation ratings.

### 8.4 Device Functional Modes

Table 1 lists the functional modes for the ISO782xLL family of devices.

Table 1. ISO782xLL Function Table<sup>(1)</sup>

V <sub>CCI</sub>	V <sub>CCO</sub>	INPUT (IN <sub>x±</sub> ) <sup>(2)</sup>	OUTPUT ENABLE (EN <sub>x</sub> )	OUTPUT (OUT <sub>x±</sub> ) <sup>(3)</sup>	COMMENTS
PU	PU	H	H or open	H	Normal Operation: A channel output assumes the logic state of the input.
		L	H or open	L	
		I	H or open	H or L	
X	PU	X	L	Z	A low-logic state at the output enable causes the outputs to be in high impedance.
PD	PU	X	H or open	H	Default mode: When V <sub>CCI</sub> is unpowered, a channel output assumes the logic high state. When V <sub>CCI</sub> transitions from unpowered to powered up, a channel output assumes the logic state of the input. When V <sub>CCI</sub> transitions from powered up to unpowered, a channel output assumes the selected default high state.
X	PD	X	X	Undetermined	When V <sub>CCO</sub> is unpowered, a channel output is undetermined. When V <sub>CCO</sub> transitions from unpowered to powered-up, a channel output assumes the logic state of the input

(1) V<sub>CCI</sub> = input-side V<sub>CC</sub>; V<sub>CCO</sub> = output-side V<sub>CC</sub>; PU = powered up (V<sub>CCx</sub> ≥ 2.25 V); PD = powered down (V<sub>CCx</sub> ≤ 1.7 V); X = irrelevant

(2) Input (IN<sub>x±</sub>): H = high level (V<sub>ID</sub> ≥ 50 mV); L = low level (V<sub>ID</sub> ≤ -50 mV); I = indeterminate (-50 mV < V<sub>ID</sub> < 50 mV)

(3) Output (OUT<sub>x±</sub>): H = high level (V<sub>OD</sub> ≥ 250 mV); L = low level (V<sub>OD</sub> ≤ -250 mV); Z = high impedance.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO782xLL is a family of high-performance, reinforced isolated dual-LVDS buffers. Isolation can be used to help achieve human and system safety, to overcome ground potential difference (GPD), or to improve noise immunity and system performance.

The LVDS signaling can be used over most interfaces to achieve higher data rates because the LVDS is only a physical layer. LVDS can also be used for a proprietary communication scheme implemented between a host controller and a slave. Example use cases include connecting a high-speed I/O module to a host controller, a subsystem connecting to a backplane, and connection between two high-speed subsystems. Many of these systems operate under harsh environments making them susceptible to electromagnetic interferences, voltage surges, electrical fast transients (EFT), and other disturbances. These systems must also meet strict limits on radiated emissions. Using isolation in combination with a robust low-noise signaling standard such as LVDS, achieves both high immunity to noise and low emissions.

Example end applications that could benefit from the ISO782xLL family of devices include high-voltage motor control, test and measurement, industrial automation, and medical equipment.

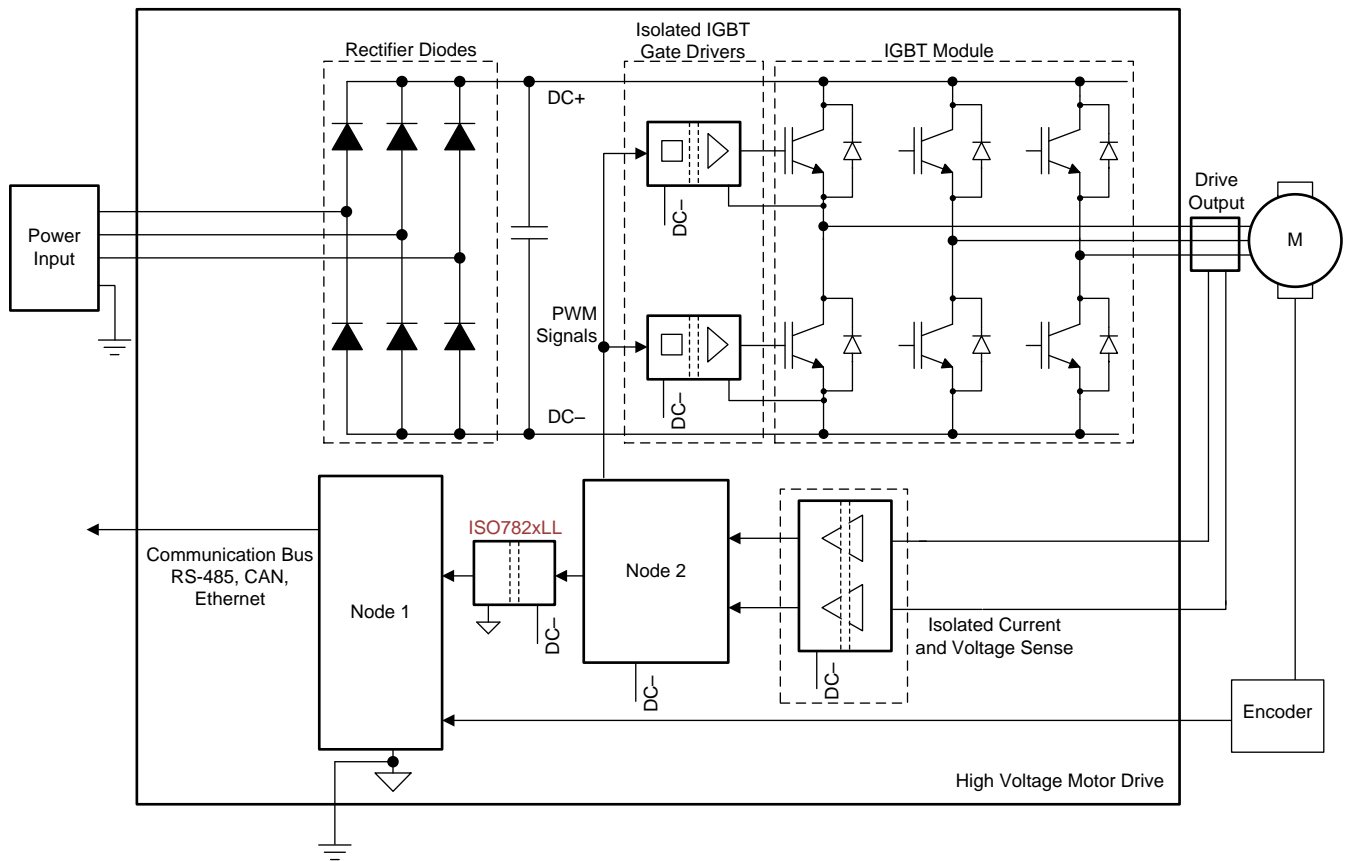

### 9.2 Typical Application

One application for isolated LVDS buffers is for point-to-point communication between two high-speed capable, application-specific integrated circuits (ASICs) or FPGAs. In a high-voltage motor control application, for example, Node 1 could be a controller on a low-voltage or earth referenced board, and Node 2, could be controller placed on the power board, biased to high voltage. [Figure 29](#) and [Figure 30](#) show the application schematics.

[Figure 30](#) provides further details of using the ISO782xLL family of devices to isolate the LVDS interface. The LVDS connection to the ISO782xLL family of devices can be traces on a board (shown as straight lines between Node 1 and the ISO782xLL device), a twisted pair cable (as shown between Node 2 and the ISO782xLL device), or any other controlled impedance channel. Differential 100-Ω terminations are placed near each LVDS receiver. The characteristic impedance of the channel should also be 100-Ω differential.

In the example shown in [Figure 29](#) and [Figure 30](#), the ISO782xLL family of devices provides reinforced or safety isolation between the high-voltage elements of the motor drive and the low-voltage control circuitry. This configuration also ensures reliable communication, regardless of the high conducted and radiated noise present in the system.

Typical Application (continued)

## Typical Application (continued)

### 9.2.1 Design Requirements

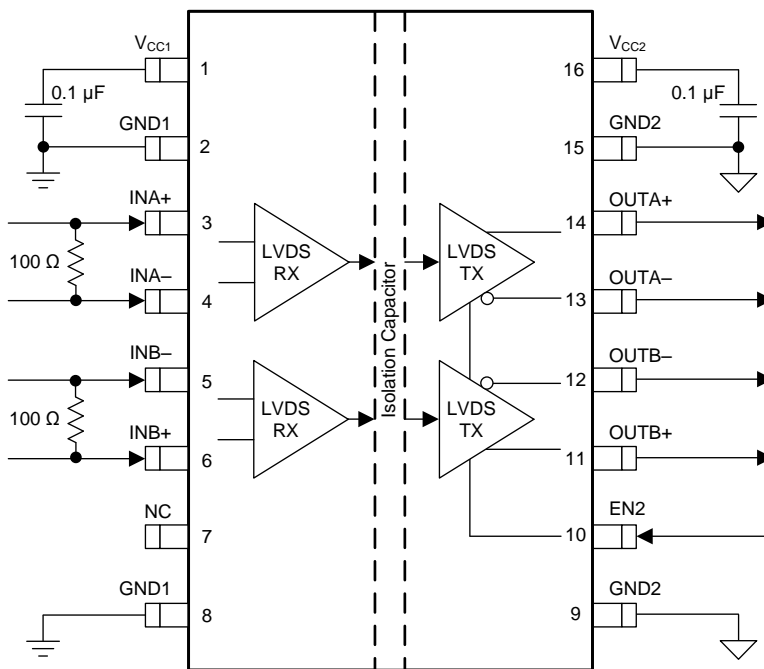

For the ISO782xLL family of devices, use the parameters listed in [Table 2](#).

**Table 2. Design Parameters**

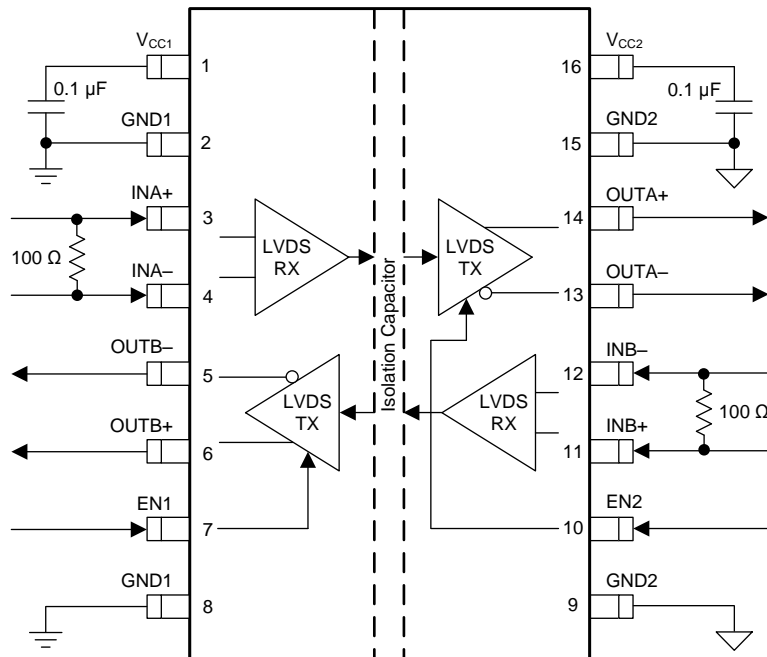

PARAMETER	VALUE
Supply voltage range, $V_{CC1}$ and $V_{CC2}$	2.25 V to 5.5 V
Receiver common-mode voltage range	For $V_{CCx} \geq 3$ V: $0.5  V_{ID} $ to $2.4 - 0.5  V_{ID} $
	For $V_{CCx} < 3$ V: $0.5  V_{ID} $ to $V_{CCx} - 0.6 - 0.5  V_{ID} $
External termination resistance	100 $\Omega$
Interconnect differential characteristic impedance	100 $\Omega$
Signaling rate	0 to 100 Mbps
Decoupling capacitor from $V_{CC1}$ and GND1	0.1 $\mu$ F
Decoupling capacitor from $V_{CC2}$ and GND2	0.1 $\mu$ F

### 9.2.2 Detailed Design Procedure

The ISO782xLL family of devices has minimum requirements on external components for correct operation. External bypass capacitors (0.1  $\mu$ F) are required for both supplies ( $V_{CC1}$  and  $V_{CC2}$ ). A termination resistor with a value of 100  $\Omega$  is required between each differential input pair (INx+ and INx-), with the resistors placed as close to the device pins as possible. A differential termination resistor with a value of 100  $\Omega$  is required on the far end for the LVDS transmitters. [Figure 31](#) and [Figure 32](#) show these connections.

**Figure 31. Typical ISO7820LL Circuit Hook-Up**

**Figure 32. Typical ISO7821LL Circuit Hook-Up**

### 9.2.2.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO782xLL family of devices incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

### 9.2.3 Application Curve

Figure 33 shows a typical eye diagram of the ISO782xLL family of devices which indicates low jitter and a wide-open eye at the maximum data rate of 100 Mbps.

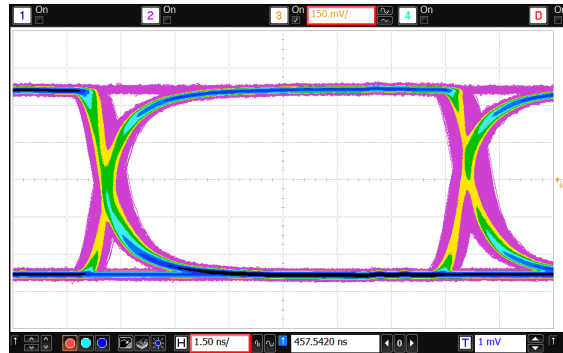

Figure 33. Eye Diagram at 100 Mbps PRBS, 3.3 V and 25°C

## 10 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at the input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#) or [SN6505](#). For such applications, detailed power supply design and transformer selection recommendations are available in the following data sheets: [SN6501 Transformer Driver for Isolated Power Supplies](#) (SLLSEA0) and [SN6505 Low-Noise 1-A Transformer Drivers for Isolated Power Supplies](#) (SLLSEP9).

## 11 Layout

### 11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 34](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- While routing differential traces on a board, TI recommends that the distance between two differential pairs be much higher (at least 2x) than the distance between the traces in a differential pair. This distance minimizes crosstalk between the two differential pairs.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

The ISO782xLL family of devices requires no special layout considerations to mitigate electromagnetic emissions.

For detailed layout recommendations, see the [Digital Isolator Design Guide](#) (SLLA284).

#### 11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps (or rise and fall times higher than 1 ns) and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 epoxy-glass as PCB material. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
