TLV743P 300mA、低ドロップアウト・レギュレータ

1 特長

- 入力電圧範囲: 1.4V～5.5V
- 1µFのセラミック出力コンデンサで安定動作
- フォールドバック過電流保護
- パッケージ
  - SOT-23 (5)
  - X2SON (4)
- 非常に低いドロップアウト: 300mAで125mV ($3.3V_{OUT}$)
- 精度: 標準値1%、最大値1.4%
- 低いI_Q: 34µA
- 固定出力電圧で利用可能: 1V～3.3V
- 高いPSRR: 1kHzにおいて50dB
- アクティブ出力放電

2 アプリケーション

- タブレット
- スマートフォン
- ノートPCおよびデスクトップPC
- 携帯型産業用および民生用製品
- WLANおよび他のPCアドオン・カード
- カメラ・モジュール

3 概要

TLV743P低ドロップアウト・リニア・レギュレータ(LDO)は、非常に小型で静止電流の低いLDOであり、優れたラインおよび負荷過渡特性で300mAを供給できます。このデバイスの標準精度は1%です。

TLV743Pは、1µFの小さな出力コンデンサで安定するよう設計されています。TLV743Pデバイスは、電源投入時とイネーブル時に、フォールドバック電流制御を行います。この機能は、バッテリで動作するデバイスにおいては特に重要です。

TLV743Pにはアクティブ・プルダウン回路があり、デバイスがディセーブルになったときに出力負荷を迅速に放電できます。

TLV743Pは、標準のDBV (SOT-23)およびDQN (X2SON)パッケージで供給されます。

製品情報(1)

型番	パッケージ	本体サイズ(公称)
TLV743P	SOT-23 (5)	2.90mm×1.60mm
	X2SON (4)	1.00mm×1.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にあるパッケージ・オプションについての付録を参照してください。

Pin Functions

PIN			I/O	DESCRIPTION
NAME	SOT-23	X2SON		
EN	3	3	I	Enable pin. Drive EN greater than $V_{EN(LO)}$ to turn on the regulator. Drive EN less than $V_{EN(LO)}$ to put the LDO into shutdown mode.
GND	2	2	—	Ground pin
IN	1	4	I	Input pin. A small capacitor is recommended from this pin to ground. See *Input and Output Capacitor Selection* for more details.
NC	4		—	No internal connection
OUT	5	1	O	Regulated output voltage pin. For best transient response, use a small 1-μF ceramic capacitor from this pin to ground. See *Input and Output Capacitor Selection* for more details.
Thermal pad	—	Thermal pad	—	The thermal pad is electrically connected to the GND node. Connect to the GND plane for improved thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted); all voltages are with respect to GND(1)

		MIN	MAX	UNIT
Voltage	V_{IN}	–0.3	6	V
	V_{EN}	–0.3	V_{IN} + 0.3	
	V_{OUT}	–0.3	3.6	
Current	I_{OUT}	Internally limited		A
Output short-circuit duration		Indefinite		
Temperature	Operating junction, T_J	–40	150	°C
	Storage, T_{stg}	–65	160	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input range	1.4		5.5	V
V_{OUT}	Output range	1		3.3	V
I_{OUT}	Output current	0		300	mA
V_{EN}	Enable range	0		V_{IN}	V
T_J	Junction temperature	–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		TLV743P		UNIT
		DBV (SOT-23)	DQN (X2SON)	
		5 PINS	4 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	228.4	218.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	151.5	164.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	55.8	164.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	31.4	5.6	°C/W
ψ_{JB}	Junction-to-board characterization parameter	54.8	163.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	131.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

at operating temperature range (T_J = –40°C to +125°C), V_{IN} = V_{OUT}(nom) + 0.5 V or 2 V (whichever is greater), I_{OUT} = 1 mA, V_{EN} = V_{IN}, and C_{IN} = C_{OUT} = 1 µF (unless otherwise noted). All typical values at T_J = 25°C.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT

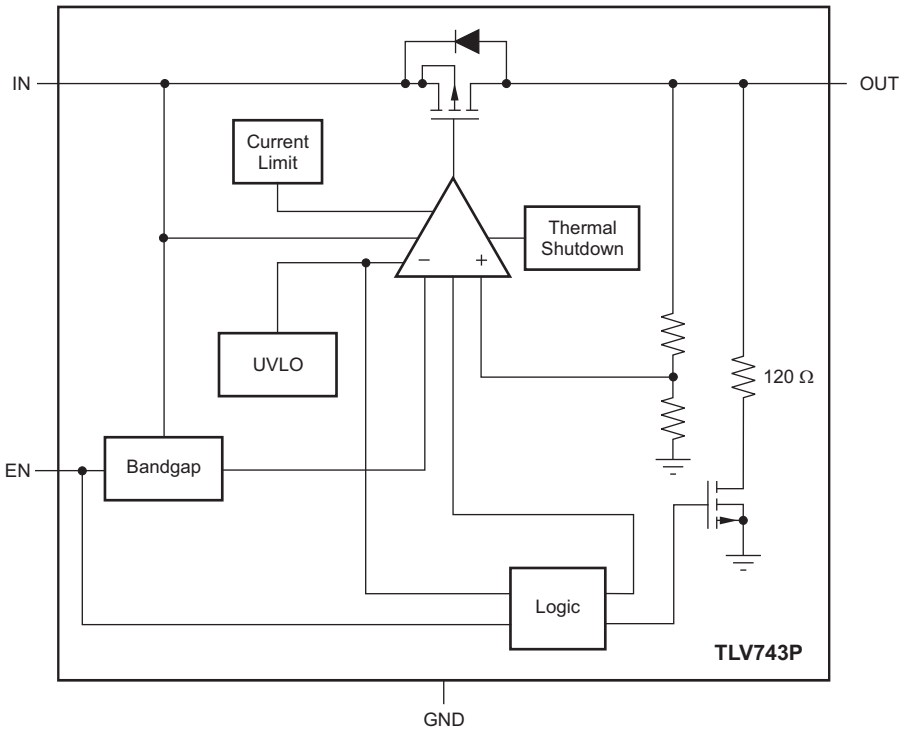
7 Detailed Description

7.1 Overview

The TLV743P device belongs to a new family of next-generation, low-dropout regulators (LDOs). This device consumes low quiescent current and delivers excellent line and load transient performance. These characteristics, combined with low noise, good PSRR with low-dropout voltage, make this device well-suited for portable consumer applications.

This regulator offers foldback current limit, shutdown, and thermal protection. The operating junction temperature for this device is –40°C to +125°C.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Undervoltage Lockout (UVLO)

The TLV743P device uses an undervoltage lockout (UVLO) circuit that disables the output until the input voltage is greater than the rising UVLO voltage, $UVLO_{RISE}$. This circuit makes certain that the device does not exhibit any unpredictable behavior when the supply voltage is lower than the operational range of the internal circuitry. During UVLO disable, the output connects to ground with a 120-Ω pulldown resistor.

7.3.2 Shutdown and Output Enable

The enable pin (EN) is active high. Enable the device by forcing the EN pin to exceed $V_{EN(HI)}$. Turn off the device by forcing the EN pin to drop below $V_{EN(LO)}$. If shutdown capability is not required, connect EN to IN. There is no internal pulldown resistor connected to the EN pin.

The TLV743P device has an internal pulldown MOSFET that connects a 120-Ω resistor to ground when the device is disabled. The discharge time after disabling depends on the output capacitance (C_{OUT}) and the load resistance (R_L) in parallel with the 120-Ω pulldown resistor. The time constant is calculated in 式 1:

$$t = \frac{120 \times R_L}{120 + R_L} \times C_{OUT} \quad (1)$$

7.3.3 Internal Foldback Current Limit

The TLV743P device has an internal foldback current limit that protects the regulator during fault conditions. The current allowed through the device is reduced as the output voltage falls. When the output is shorted, the LDO supplies a typical current of 150 mA. The output voltage is not regulated when the device is in current limit. In this condition, the output voltage is the product of the regulated current and the load resistance. When the device output is shorted, the PMOS pass transistor dissipates power [(V_{IN} – V_{OUT}) × I_{OS}] until thermal shutdown is triggered and the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the fault condition continues, the device cycles between current limit and thermal shutdown. See *Thermal Information* for more details.

The foldback current limit circuit limits the current allowed through the device to current levels lower than the minimum current limit at nominal V_{OUT} current limit (I_{LIM}) during startup. See 図 18 to 図 20 for typical foldback current limit values. If the output is loaded by a constant-current load during startup, or if the output voltage is negative when the device is enabled, then the required load current by the load may exceed the foldback current limit and the device may not rise to the full output voltage. For constant current loads, disable the output load until the TLV743P has risen to the nominal output voltage.

The TLV743P PMOS pass element has an intrinsic body diode that conducts current when the voltage at the OUT pin exceeds the voltage at the IN pin. Do not force the output voltage to exceed the input voltage because excessively high current may flow through the body diode.

7.3.4 Thermal Shutdown

Thermal shutdown protection disables the output when the junction temperature rises to approximately 160°C. Disabling the device eliminates power dissipated by the device, which allows the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled again. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits regulator dissipation, which protects the device from damage as a result of overheating.

Activating the thermal shutdown feature usually indicates excessive power dissipation as a result of the product of the (V_{IN} – V_{OUT}) voltage and the load current. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design, increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The TLV743P internal protection circuitry protects against overload conditions, but is not intended to be active in normal operation. Continuously running the TLV743P device into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage has previously exceeded the UVLO rising voltage and has not decreased below the UVLO falling threshold.
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the thermal shutdown temperature.

7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout may result in large output voltage deviations.

7.4.3 Disabled

The device is disabled under the following conditions:

- The input voltage is less than the UVLO falling voltage, or has not yet exceeded the UVLO rising threshold.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

When the device is disabled, the active pulldown resistor discharges the output.

表 1 lists the conditions that result in different operating modes.

表 1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT}(nom) + V_{DO}$ and $V_{IN} > UVLO_{RISE}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160°C$
Dropout mode	$UVLO_{RISE} < V_{IN} < V_{OUT}(nom) + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160°C$
Disabled mode (any true condition disables the device)	$V_{IN} < UVLO_{FALL}$	$V_{EN} < V_{EN(LO)}$	—	$T_J > 160°C$

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Input and Output Capacitor Selection

The TLV743P device uses an advanced internal control loop to obtain stable operation with the use of input or output capacitors. An output capacitance of 1 μF or larger generally provides good dynamic response. Use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature.

Although an input capacitor is not required for stability, increased output impedance from the input supply may compromise the performance of the TLV743P. Good analog design practice is to connect a 0.1-μF to 1-μF capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is greater than 0.5 Ω. Use a higher-value capacitor if large, fast, rise-time load transients are expected, or if the device is located several inches from the input power source.

8.1.2 Dropout Voltage

The TLV743P device uses a PMOS pass transistor to achieve low dropout. When (V_{IN} – V_{OUT}) is less than the dropout voltage (V_{DO}), the PMOS pass device is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass element. V_{DO} scales approximately with output current because the PMOS device behaves like a resistor in dropout mode. As with any linear regulator, PSRR and transient response degrade as (V_{IN} – V_{OUT}) approaches dropout operation. See 図 7 to 図 12 for typical dropout values.

Application Information (continued)

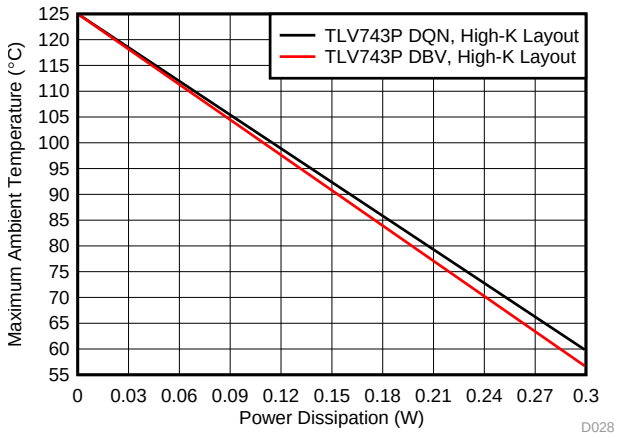
8.1.3 Power Dissipation

The ability to remove heat from the die is different for each package type and presents different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to ambient air. Performance data for JEDEC high-K boards are shown in *Thermal Information*. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heat sink effectiveness.

Power dissipation (P_D) depends on input voltage and load conditions. P_D is equal to the product of the output current and voltage drop across the output pass element, as shown in 式 2.

$$P_D = \left(V_{IN} - V_{OUT}\right) \times I_{OUT} \tag{2}$$

図 31 shows the maximum ambient temperature versus the power dissipation of the TLV743P device in the DQN and DBV packages. This figure assumes the device is soldered on JEDEC standard high-K layout with no airflow over the board. Actual board thermal impedances vary widely. If the application requires high power dissipation, it is helpful to have a thorough understanding of the board temperature and thermal impedances to make certain that the TLV743P device does not operate continuously above a junction temperature of 125°C.



TLV743P, high-K layout

図 31. Maximum Ambient Temperature vs Device Power Dissipation

8.2 Typical Application

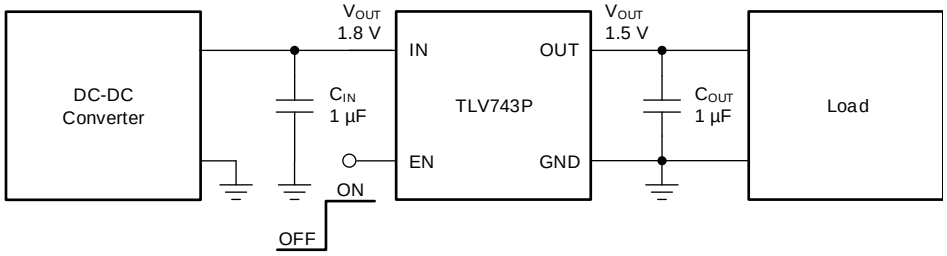


図 32. DC/DC Converter Post Regulation

8.2.1 Design Requirements

表 2. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	1.8 V, ±5%
Output voltage	1.5 V, ±1%
Output current	200-mA DC, 300-mA peak
Output voltage transient deviation	< 10%, 1-A/µs load step from 50 mA to 200 mA
Maximum ambient temperature	85°C

8.2.2 Detailed Design Procedure

Input and output capacitors are required to achieve the output voltage transient requirements. Capacitance values of 1 µF are selected to give the maximum output capacitance in a small, low-cost package.

図 7 shows the 1.2-V option dropout voltage. Given that dropout voltages are higher for lower output-voltage options, and given that the 1.2-V option dropout voltage is typically less than 300 mV at 125°C, then the 1.5-V option dropout voltage is typically less than 300 mV at 125°C.

See 図 31 to verify that the maximum junction temperature is not exceeded.

8.2.3 Application Curve

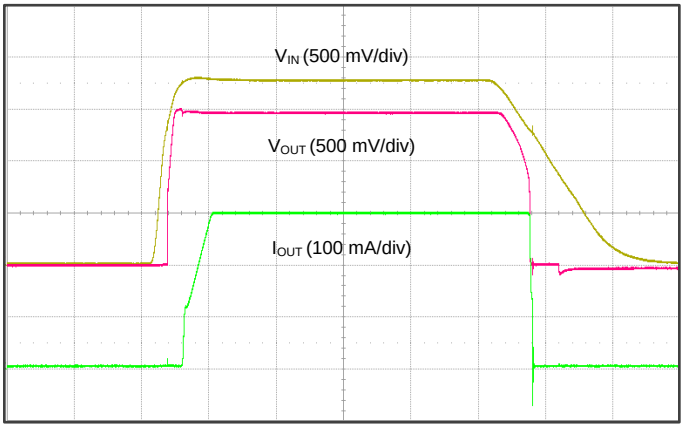

図 33. 1.8-V to 1.5-V Regulation at 300 mA

9 Power Supply Recommendations

Connect a low-output impedance power supply directly to the IN pin of the TLV743P device. Inductive impedances between the input supply and the IN pin can create significant voltage excursions at the IN pin during startup or load transient events. If inductive impedances are unavoidable, use an input capacitor.

10 Layout

10.1 Layout Guidelines

- Place input and output capacitors as close as possible to the device.
- Use copper planes for device connections to optimize thermal performance.
- Place thermal vias around the device to distribute heat.

10.2 Layout Examples

11 デバイスおよびドキュメントのサポート

11.1 デバイス・サポート

11.1.1 開発サポート

11.1.1.1 評価基板

TLV743Pデバイスを使用する回路の初期性能評価に役立てるため、評価基板(EVM)を利用可能です。TLV73312PEVM-643評価基板(および関連するユーザー・ガイド)は、テキサス・インスツルメンツのWebサイトの製品フォルダからご請求されるか、TI eStoreから直接お求めになれます。

11.1.2 デバイスの項目表記

表 3. デバイスの項目表記(1)(2)

製品名	V_{OUT}
TLV743P**xx(x)Pyyyz(3)**	**xx(x)**は公称出力電圧です。出力電圧の分解能が100mVの場合、注文番号に2桁が使用されます。それ以外の場合は3桁が使用されます(例: 28 = 2.8V、125 = 1.25V)。 **P**はアクティブ出力放電機能を表します。TLV743ファミリのすべての製品は、デバイスがディセーブルになると出力をアクティブに放電します。 **yyy**はパッケージ指定子です。 **z**はパッケージ数量です。Rはリール(3000ピース)、Tはテープ(250ピース)を表します。 **(3)** は指定可能なテープ・リールの方向を表します。3 は 1 ピンが第 3 象限にあることを表します。詳細については、付録「パッケージ・マテリアル情報」を参照してください。

(1) 最新のパッケージと発注情報については、このデータシートの末尾にある「パッケージ・オプション」の付録を参照するか、www.ti.comにあるデバイスの製品フォルダをご覧ください。
(2) 出力電圧は、1Vから3.3Vまで、50mV刻みで利用できます。詳細と在庫については、工場にお問い合わせください。

11.6 静電気放電に関する注意事項

すべての集積回路は、適切なESD保護方法を用いて、取扱いと保存を行うようにして下さい。

静電気放電はわずかな性能の低下から完全なデバイスの故障に至るまで、様々な損傷を与えます。高精度の集積回路は、損傷に対して敏感であり、極めてわずかなパラメータの変化により、デバイスに規定された仕様に適合しなくなる場合があります。

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 メカニカル、パッケージ、および注文情報

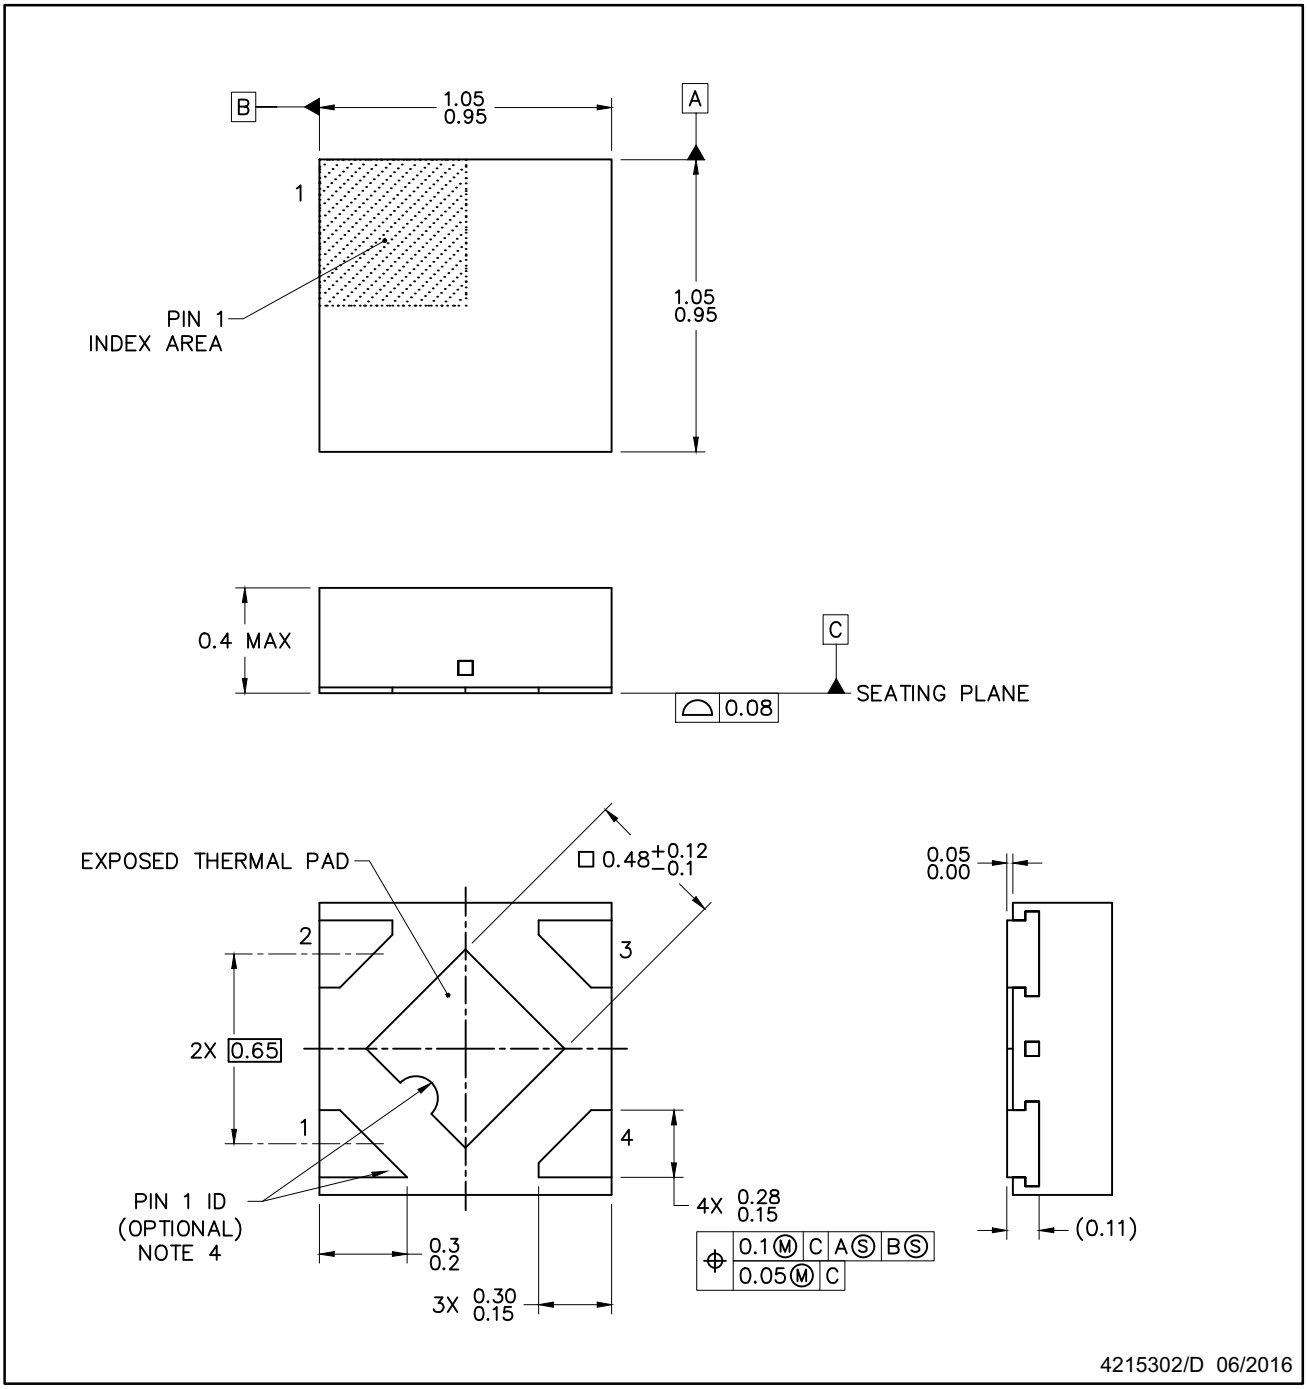
以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGE OUTLINE

DQN0004A

X2SON - 0.4 mm max height

PLASTIC SMALL OUTLINE - NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
4. Features may not exist. Recommend use of pin 1 marking on top of package for orientation purposes.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals.
TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、TI の販売条件、または ti.com やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
