CC3200MOD SimpleLink™ Wi-Fi® およびモノのインターネット･モジュール、ソリューション、シングル･チップのワイヤレス MCU

1 特長

- CC3200MOD は、CC3200R1M2RGC シングル･チップ･ ワイヤレス･ マイクロコントローラ (MCU) で構成される Wi-Fi® モジュール
- 完全に統合されたモジュールで、必要なクロック、SPI フラッシュ、パッシブをすべて内蔵
- モジュールの FCC、IC、TELEC、CE 認定によりユーザーの手間、時間、コストを削減
- Wi-Fi Alliance のメンバーは Wi-Fi CERTIFIED™ モジュール証明書の転送を要求可能
- 1.27mm ピッチの QFM パッケージにより組み立てが簡単で、低コストの PCB を設計可能
- アプリケーション MCU サブシステム：
  - 80MHz の Arm® Cortex®-M4 コア
  - 組み込みメモリ：
    - シリアル･ フラッシュ
    - RAM 内蔵 (最大 256KB)
    - ROM にペリフェラル･ ドライバを内蔵
  - ハードウェア暗号化エンジンによる高度なハードウェア･ セキュリティ：
    - AES、DES、3DES
    - SHA および MD5
    - CRC およびチェックサム
  - 8 ビットの並列カメラ
  - I2S フォーマットをサポートする､1 つのマルチチャネル･ オーディオ･ シリアルポート (McASP) インターフェイス
  - 1 つの SD (MMC) インターフェイス
  - 32 チャネルのマイクロ･ ダイレクト･ メモリ･ アクセス (μDMA)
  - 2 つの UART (Universal Asynchronous Receivers and Transmitter)
  - 2 つのシリアル･ ペリフェラル･ インターフェイス (SPI)
  - 1 つの I^2C (Inter-Integrated Circuit)
  - 4 つの汎用タイマ (GPT)
  - 16 ビットのパルス幅変調 (PWM) モード
  - 1 つのウォッチドッグ･ タイマ･ モジュール
  - 4 チャネル、12 ビットのアナログ / デジタル･ コンバータ (ADC)
  - 最大 25 の個別にプログラム可能な GPIO ピン
- Wi-Fi ネットワーク･ プロセッサ･ サブシステム：
  - 802.11 b/g/n 無線、ベースバンド、およびメディア･ アクセス制御
  - TCP/IP スタック
    - 8 つの TCP、UDP、または RAW ソケットを同時に使用可能
    - 2 つの TLS v1.2 または SSL 3.0 ソケットを同時に使用可能
  - ARP、ICMP、DHCP、DNS、mDNS のサポート
  - HTTP サーバーと組み込みのプログラム可能 HTML ページにより、ネットワーク経由でデバイスを構成
  - 強力な暗号化エンジンによる、高速で 256 ビット暗号化を使用するセキュアな WLAN 接続
  - ステーション、アクセス･ ポイント、Wi-Fi Direct® の各モード
  - WPA2 パーソナルおよびエンタープライズ･ セキュリティ
  - SimpleLink™ 接続マネージャによる Wi-Fi セキュリティ状態の管理
  - TX 出力：
    - 1DSSS で 17.0dBm
    - 11CCK で 17.25dBm
    - 54OFDM で 13.5dBm
  - RX 感度：
    - 1DSSS で –94.7dBm
    - 11CCK で –87.0dBm
    - 54OFDM で –73.0dBm
  - アプリケーションのスループット：
    - UDP：16Mbps
    - TCP：13Mbps
- パワー･ マネージメント･ サブシステム：
  - 電源電圧範囲の広い内蔵 DC/DC コンバータ
    - V_{BAT}：2.3 ~ 3.6V
  - 低消費電力 3.6V：
    - ハイバネーション (リアルタイム･ クロック (RTC) を使用)：7μA
    - 低消費電力ディープ･ スリープ : 275μA 未満
    - RX トラフィック：54OFDM で 59mA
    - TX トラフィック：54OFDM で 229mA
  - パッケージおよび動作条件：
    - 1.27mm ピッチ､63 ピン､20.5mm × 17.5mm の QFM パッケージにより組み立てが簡単で、低コストの PCB を設計可能

English Data Sheet: SWRS166

  - 動作温度範囲：
    –20℃～+70℃
- 追加の内蔵コンポーネント：
  – 40.0MHz 水晶振動子
  – 32.768kHz 水晶振動子 (RTC)
  – 8Mbit の SPI シリアル・フラッシュ
  – RF フィルタおよび受動部品
- QFM パッケージ
  – 1.27mm ピッチ、63 ピン、20.5mm × 17.5mm の QFM パッケージにより組み立てが簡単で、低コストの PCB を設計可能
- 動作温度：
  – 周囲温度範囲：–40℃～+85℃
- SimpleLink 開発者エコシステムによるサポート

2 アプリケーション

- モノのインターネット (IoT)
- 家電製品
- ビル・オートメーション
- セキュリティ・システム
- スマート・エネルギー
- インターネット・ゲートウェイ
- 産業用制御
- スマート・プラグおよび計量
- ワイヤレス通信
- ウェアラブル

3 概要

業界初のプログラム可能で、Wi-Fi® コネクティビティ機能が内蔵された、FCC、IC、CE、Wi-Fi CERTIFIED™ のワイヤレス MCU モジュールを使用して、設計を開始できます。IoT 用に開発された SimpleLink™ CC3200MOD は、Arm® Cortex®-M4 MCU を内蔵するワイヤレス MCU モジュールであるため、ユーザーは 1 つのデバイスによりアプリケーション全体を開発できます。オンチップの Wi-Fi、インターネット、および堅牢なセキュリティ・プロトコルがあるため、過去に Wi-Fi の経験がなくても迅速に開発を行えます。CC3200MOD には、クロック、SPI フラッシュ、RF スイッチ、パッシブを含む、必要なシステム・レベルのハードウェア・コンポーネントがすべて QFM パッケージに内蔵されているため、組み立てが簡単で、低コストの PCB を設計できます。CC3200MOD は、ソフトウェア、サンプル・アプリケーション、ツール、ユーザーおよびプログラミング・ガイド、リファレンス・デザイン、TI E2E™ サポート・コミュニティを含む、完全なプラットフォーム・ソリューションを実現します。

アプリケーション MCU サブシステムには、80 MHz で動作する業界標準の Arm® Cortex®-M4 コアが内蔵されています。

このデバイスには、高速なパラレル・カメラ・インターフェイス、I2S、SD/MMC、UART、SPI、I2C、4 チャネルの ADC など、広範なペリフェラルが含まれています。CC3200 ファミリには、コードおよびデータ用の柔軟な組み込み RAM、外部のシリアル・フラッシュ・ブートローダーおよびペリフェラル・ドライブを持つ ROM、および Wi-F i ネットワーク・プロセッサのサービス・パック、Wi-Fi 証明書、資格情報用の SPI フラッシュが含まれています。

Wi-Fi ネットワーク・プロセッサ・サブシステムは、Wi-Fi Internet-on-a chip™ を搭載しており、アプリケーション MCU を完全にオフロードする専用の Arm® MCU を追加しています。このサブシステムには、802.11b/g/n 無線、ベースバンド、MAC が含まれ、強力な暗号化エンジンが搭載されているため、256 ビットの暗号化を使用して、高速でセキュアなインターネット接続が可能です。CC3200MOD は、ステーション、アクセス・ポイント、Wi-Fi Direct モードに対応しています。また、このデバイスは WPA2 パーソナルおよび WPA2 エンタープライズ・セキュリティと、WPS 2.0 にも対応しています。Wi-Fi Internet-on-a-chip には、組み込みの TCP/IP および TLS/SSL スタック、HTTP サーバー、および複数のインターネット・プロトコルが含まれています。電源管理サブシステムには DC/DC コンバータが内蔵され、広範な電源電圧に対応します。このサブシステムにより、7μA 未満の電流しか必要としない、RTC 使用ハイバネーション・モードなどの、低消費電力モードが可能になります。

6.1 Related Products

For information about other devices in this family of products or related products see the links below.

The SimpleLink™ MCU Portfolio offers a single development environment that delivers flexible hardware, software and tool options for customers developing wired and wireless applications. With 100 percent code reuse across host MCUs, Wi-Fi®, Bluetooth® low energy, Sub-1GHz devices and more, choose the MCU or connectivity standard that fits your design. A one-time investment with the SimpleLink software development kit (SDK) allows you to reuse often, opening the door to create unlimited applications.

Companion Products Review products that are frequently purchased or used in conjunction with this product.

SimpleLink™ Wi-Fi® Family The SimpleLink Wi-Fi Family offers several Internet-on-a chip solutions, which address the need of battery operated, security enabled products. Texas instruments offers a single chip wireless microcontroller and a wireless network processor which can be paired with any MCU, to allow developers to design new wi-fi products, or upgrade existing products with wi-fi capabilities.

BoosterPack™ Plug-In Modules BoosterPack™ Plug-In Modules extend the functionality of TI LaunchPad Kit. Application specific BoosterPack Plug in modules allow you to explore a broad range of applications, including capacitive touch, wireless sensing, LED Lighting control, and more. Stack multiple BoosterPack modules onto a single LaunchPad kit to further enhance the functionality of your design.

Reference Designs for CC3200 and CC3220 Devices TI Designs Reference Design Library is a robust reference design library spanning analog, embedded processor and connectivity. Created by TI experts to help you jump start your system design, all TI Designs include schematic or block diagrams, BOMs and design files to speed your time to market. Search and download designs at ti.com/tidesigns.

SimpleLink™ Wi-Fi® CC3220 SDK The SimpleLink Wi-Fi CC3220 SDK contains drivers for the CC3220 programmable MCU, sample applications, and documentation required to start development with CC3220 solutions.

7.3 Pin Attributes and Pin Multiplexing

The module makes extensive use of pin multiplexing to accommodate the large number of peripheral functions in the smallest possible package. To achieve this configuration, pin multiplexing is controlled using a combination of hardware configuration (at module reset) and register control.

The board and software designers are responsible for the proper pin multiplexing configuration. Hardware does not ensure that the proper pin multiplexing options are selected for the peripherals or interface mode used. 表 7-1 describes the general pin attributes and presents an overview of pin multiplexing. All pin multiplexing options are configurable using the pin mux registers. The following special considerations apply:

- All I/Os support drive strengths of 2, 4, and 6 mA. Drive strength is individually configurable for each pin.
- All I/Os support 10-µA pullup and pulldown resistors.
- These pulls are not active and all of the I/Os remain floating while the device is in Hibernate state.
- The VIO and VBAT supply must be tied together at all times.
- All digital I/Os are nonfail-safe.

表 7-1. Pin Multiplexing

(1) LPDS state: The state of unused I/Os is Hi-Z. Software may program the I/Os to be input with pull or drive (regardless of active pin configuration), according to the need.
(2) Hibernate mode: The state of the I/Os is Hi-Z. Software may program the I/Os to be input with pull or drive (regardless of active pin configuration), according to the need.
(3) To minimize leakage in some serial Flash vendors during LPDS, TI recommends that the user application always enables internal weak pulldowns on FLASH_SPI_DIN, FLASH_SPI_DOUT, and FLASH_SPI_CLK pins.
(4) For details on proper use, see *Drive Strength and Reset States for Analog-Digital Multiplexed Pins*.
(5) Pin is one of three that must have a passive pullup or pulldown resistor onboard to configure the chip hardware power-up mode. For this reason, the pin must be output only when used for digital functions.
(6) Device firmware automatically enables the digital path during ROM boot.
(7) Requires user configuration to enable the analog switch of the ADC channel. (Switch is off by default.) The digital I/O is always connected and must be made Hi-Z before enabling the ADC switch.

7.4 Recommended Pin Multiplexing Configurations

表 7-2 lists the recommended pin multiplexing configurations.

(1) Pins marked *wake* can be configured to wake up the chip from HIBERNATE or LPDS state. In the current silicon revision, any wake pin can trigger wake up from HIBERNATE. The wake-up monitor in the hibernate control module logically ORs these pins applying a selection mask. However, wake up from LPDS state can be triggered only by one of the wake-up pins that can be configured before entering LPDS. The core digital wake-up monitor use a mux to select one of these pins to monitor.

7.4.1 ADC Reference Accuracy Specifications

The ADC accuracy is 1% at room temperature and 2% across temperature.

7.5 Drive Strength and Reset States for Analog-Digital Multiplexed Pins

表 7-3 describes the use, drive strength, and default state of analog- and digital-multiplexed pins at first-time power up and reset (nRESET pulled low).

表 7-3. Drive Strength and Reset States for Analog-Digital Multiplexed Pins

PIN	BOARD LEVEL CONFIGURATION AND USE	DEFAULT STATE AT FIRST POWER UP OR FORCED RESET	STATE AFTER CONFIGURATION OF ANALOG SWITCHES (ACTIVE, LPDS, and HIB POWER MODES)	MAXIMUM EFFECTIVE DRIVE STRENGTH (mA)
25	Connected to the enable pin of the RF switch (ANT_SEL1). Other use is not recommended.	Analog is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
26	Connected to the enable pin of the RF switch (ANT_SEL2). Other use is not recommended.	Analog is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
44	Generic I/O	Analog is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
42	Generic I/O	Analog is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
47	Analog signal (1.8-V absolute, 1.46-V full scale)	ADC is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
48	Analog signal (1.8-V absolute, 1.46-V full scale)	ADC is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
49	Analog signal (1.8-V absolute, 1.46-V full scale)	ADC is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4
50	Analog signal (1.8-V absolute, 1.46-V full scale)	ADC is isolated. The digital I/O cell is also isolated.	Determined by the I/O state, as are other digital I/Os.	4

7.6 Pad State After Application of Power to Chip, but Before Reset Release

When a stable power is applied to the CC3200 device for the first time or when supply voltage is restored to the proper value following a prior period with supply voltage below 1.5 V, the level of the digital pads are undefined in the period starting from the release of nRESET and until the DIG_DCDC of the CC3220x chip powers up. This period is less than approximately 10 ms. During this period, pads can be internally pulled weakly in either direction. If a certain set of pins are required to have a definite value during this pre-reset period, an appropriate pullup or pulldown must be used at the board level. The recommended value of this external pull is 2.7 kΩ.

8 Specifications

8.1 Absolute Maximum Ratings

All measurements are referenced at the module pins unless otherwise indicated. All specifications are over process and voltage unless otherwise indicated.
Over operating free-air temperature range (unless otherwise noted)[(1)] [(2)]

	MIN	MAX	UNIT
V_{BAT} and V_{IO}	–0.5	3.8	V
Digital I/O	–0.5	V_{BAT} + 0.5	V
RF pin	–0.5	2.1	V
Analog pins	–0.5	2.1	V
Operating temperature (T_A)	–40	85	°C
Storage temperature (T_{stg})	–40	85	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to V_{SS}, unless otherwise noted.

8.2 ESD Ratings

				VALUE	UNIT
V_{ESD}	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS001[(1)]		±1000	V
		Charged device model (CDM), per JESD22-C101[(2)]	All pins	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Power-On Hours (POH)

NOTE: This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

OPERATING CONDITION	JUNCTION TEMPERATURE (T_j)	POWER-ON HOURS [POH] (hours)
20% active mode 80% sleep mode	$T_{Ambient}$ up to 85°C	87600[(1)]

(1) The CC3200MOD device can be operated reliably for 10 years.

8.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)[(1)]

	MIN	TYP	MAX	UNIT
V_{BAT} and V_{IO}	2.3	3.3	3.6	V
Operating temperature	–20	25	70	°C
Ambient thermal slew	–20		20	°C/minute

(1) To ensure WLAN performance, the ripple on the power supply must be less than ±300 mV. The ripple should not cause the supply to fall below the brownout voltage.

8.5 Power Consumption Summary

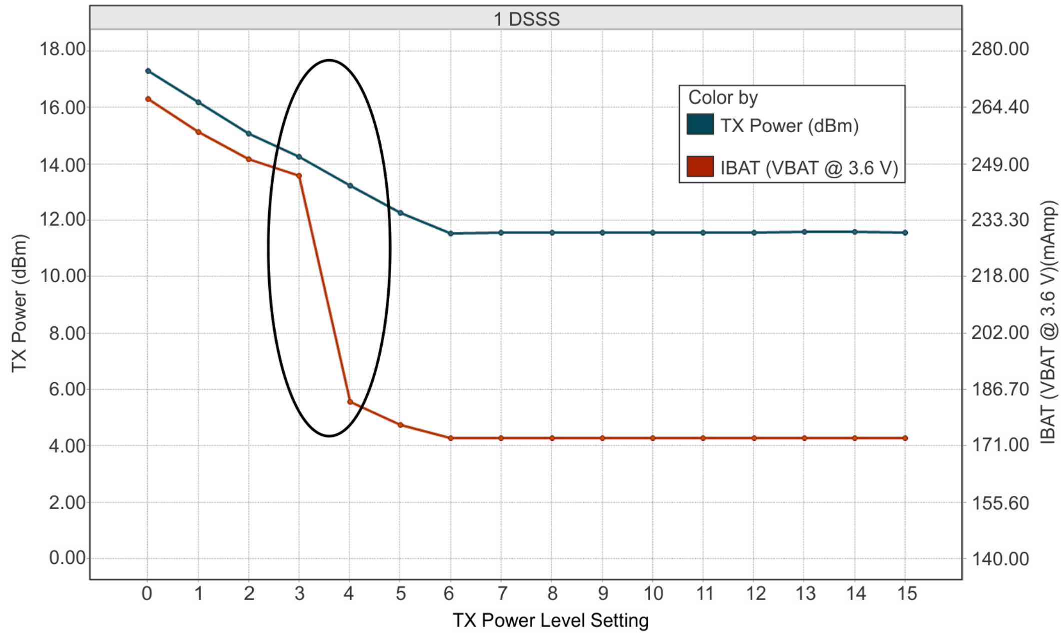
8.5.1 Current Consumption

T_A = 25 °C, V_{BAT} = 3.6 V

PARAMETER		TEST CONDITIONS[1] [5]			MIN	TYP	MAX	UNIT
MCU ACTIVE	NWP ACTIVE	TX	1 DSSS	TX power level = 0		278		mA
				TX power level = 4		194		
			6 OFDM	TX power level = 0		254		
				TX power level = 4		185		
			54 OFDM	TX power level = 0		229		
				TX power level = 4		166		
		RX	1 DSSS			59		
			54 OFDM			59		
	NWP idle connected[3]					15.3		
MCU SLEEP	NWP ACTIVE	TX	1 DSSS	TX power level = 0		275		mA
				TX power level = 4		191		
			6 OFDM	TX power level = 0		251		
				TX power level = 4		182		
			54 OFDM	TX power level = 0		226		
				TX power level = 4		163		
		RX	1 DSSS			56		
			54 OFDM			56		
	NWP idle connected[3]					12.2		
MCU LPDS	NWP active	TX	1 DSSS	TX power level = 0		272		mA
				TX power level = 4		188		
			6 OFDM	TX power level = 0		248		
				TX power level = 4		179		
			54 OFDM	TX power level = 0		223		
				TX power level = 4		160		
		RX	1 DSSS			53		
			54 OFDM			53		
	NWP LPDS[2]					0.275		
	NWP idle connected[3]					0.875		
MCU hibernate	NWP hibernate					7		µA
Peak calibration current [4]		V_{BAT} = 3.3 V				450		mA
		V_{BAT} = 2.3 V				620		

(1) TX power level = 0 implies maximum power (see 図 8-1 through 図 8-3). TX power level = 4 implies output power backed off approximately 4 dB.
(2) The LPDS number reported is with retention of 64KB MCU SRAM. The CC3200 device can be configured to retain 0KB, 64KB, 128KB, 192KB or 256KB SRAM in LPDS. Each 64KB retained increases LPDS current by 4 µA.
(3) DTIM = 1
(4) The complete calibration can take up to 17 mJ of energy from the battery over a time of 24 ms. Calibration is performed sparingly, typically when coming out of Hibernate and only if temperature has changed by more than 20°C or the time elapsed from prior calibration is greater than 24 hours.
(5) The CC3200 system is a constant power-source system. The active current numbers scale based on the V_{BAT} voltage supplied.

Copyright © 2021 Texas Instruments Incorporated



Note: The area enclosed in the circle represents a significant reduction in current when transitioning from TX power level 3 to 4. In the case of lower range requirements (13-dBm output power), TI recommends using TX power level 4 to reduce the current.

8.6 Brownout and Blackout Conditions

The module enters a brownout condition whenever the input voltage dips below $V_{BROWNOUT}$ (see 図 8-4 and 図 8-5). This condition must be considered during design of the power supply routing, especially if operating from a battery. High-current operations, such as a TX packet or any external activity (not necessarily related directly to networking) can cause a drop in the supply voltage, potentially triggering a brownout. The resistance includes the internal resistance of the battery, contact resistance of the battery holder (four contacts for a 2× AA battery), and the wiring and PCB routing resistance.

Note

When the module is in HIBERNATE state, brownout is not detected. Only blackout is in effect during HIBERNATE state.

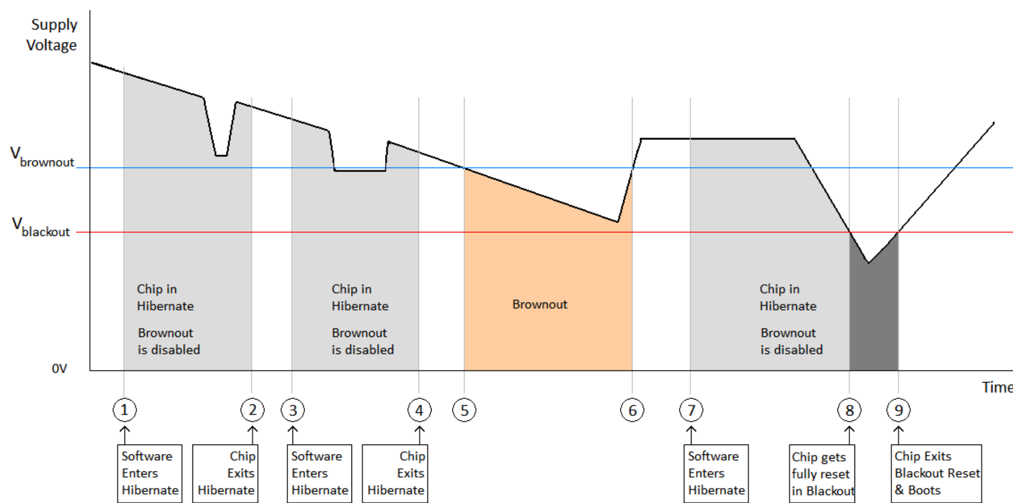

図 8-4. Brownout and Blackout Levels (1 of 2)

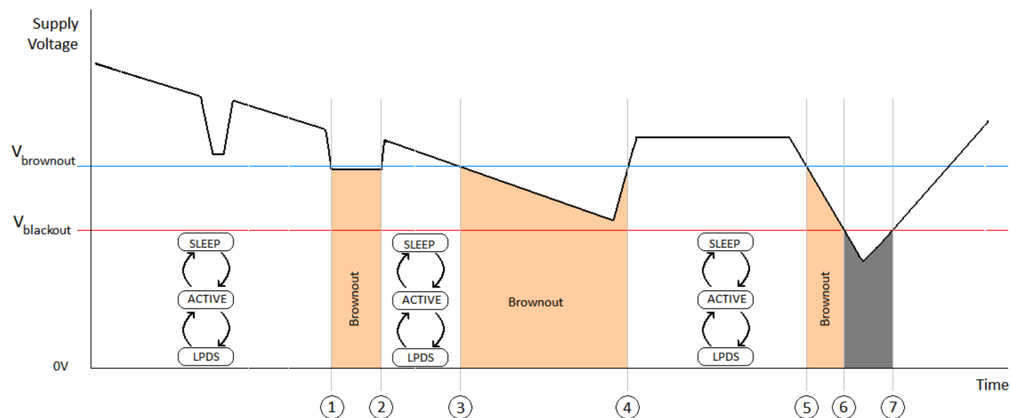

図 8-5. Brownout and Blackout Levels (2 of 2)

In the brownout condition, all sections of the CC3200MOD shut down within the module except for the Hibernate block (including the 32-kHz RTC clock), which remains on. The current in this state can reach approximately 400 µA. The blackout condition is equivalent to a hardware reset event in which all states within the module are lost. $V_{brownout}$ = 2.1 V and $V_{blackout}$ = 1.67 V

表 8-1 lists the brownout and blackout voltage levels.

表 8-1. Brownout and Blackout Voltage Levels

CONDITION	VOLTAGE LEVEL	UNIT
$V_{brownout}$	2.1	V
$V_{blackout}$	1.67	V

8.7 WLAN RF Characteristics

8.7.1 WLAN Receiver Characteristics

T_A = 25°C, V_{BAT} = 2.3 to 3.6 V. Parameters measured at module pin on channel 7 (2442 MHz).

PARAMETER	RATE	MIN	TYP	MAX	UNIT
Sensitivity (8% PER for 11b rates, 10% PER for 11g or 11n rates) (10% PER)[(1)]	1 DSSS		–94.7		dBm
	2 DSSS		–92.6		
	11 CCK		–87.0		
	6 OFDM		–89.0		
	9 OFDM		–88.0		
	18 OFDM		–85.0		
	36 OFDM		–79.5		
	54 OFDM		–73.0		
	MCS7 (Mixed Mode)		–69.0		
Maximum input level (10% PER)	802.11b		–3.0		dBm
	802.11g		–9.0		

(1) Sensitivity is 1 dB worse on channel 13 (2472 MHz).

8.7.2 WLAN Transmitter Characteristics

T_A = 25°C, V_{BAT} = 2.3 V to 3.6 V. Parameters measured at module pin on channel 7 (2442 MHz).[(1)]

PARAMETER	RATE	MIN	TYP	MAX	UNIT
Max RMS Output Power measured at 1 dB from IEEE spectral mask or EVM	1 DSSS		17.0		dBm
	2 DSSS		17.0		
	11 CCK		17.25		
	6 OFDM		16.25		
	9 OFDM		16.25		
	18 OFDM		16		
	36 OFDM		15		
	54 OFDM		13.5		
	MCS7 (mixed mode)		12		
Transmit center frequency accuracy		–20		20	ppm

(1) Channel-to-channel variation is up to 2 dB. The edge channels (2412 MHz and 2462 MHz) have reduced TX power to meet FCC emission limits.

8.8 Reset Requirement

	PARAMETER	MIN	TYP	MAX	UNIT
V_{IH}	Operation mode level		0.65 × V_{BAT}		V
V_{IL}	Shutdown mode level[(1)]	0	0.6		V
	Minimum time for nReset low for resetting the module	5			ms
T_r and T_f	Rise and fall times		20		μs

(1) The nRESET pin must be held below 0.6 V for the module to register a reset.

8.9 Thermal Resistance Characteristics for MOB and MON Packages

NAME	DESCRIPTION	°C/W[(1)] [(2)]	AIR FLOW (m/s)[(3)]
$R\Theta_{JC}$	Junction-to-case	9.08	0.00
$R\Theta_{JB}$	Junction-to-board	10.34	0.00
$R\Theta_{JA}$	Junction-to-free air	11.60	0.00
Psi_{JT}	Junction-to-package top	9.08	0.00
Psi_{JB}	Junction-to-board	10.19	0.00

(1) °C/W = degrees Celsius per watt.

(2) These values are based on a JEDEC-defined 2S2P system (with the exception of the Theta JC [$R\Theta_{JC}$] value, which is based on a JEDEC-defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

Power dissipation of 2 W and an ambient temperature of 70°C is assumed.

(3) m/s = meters per second.

8.10 Timing and Switching Characteristics

8.10.1 nRESET

図 8-6 shows the reset timing diagram for the 32K crystal first-time power-up and reset.

表 8-2 describes the timing requirements for the first-time power-up and reset removal.

表 8-2. First-Time Power-Up and Reset Removal Timing Requirements

ITEM	NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
T1	Supply settling time	The time for which the nRESET pin must be held low after supply stabilizes		3		ms
T2	Hardware wake-up time	Time taken by the hardware to initialize		25		ms
T3	Firmware initiation time	Time taken by the ROM firmware to initialize the hardware (Includes 32-KHz oscillator wake-up time)		1.1		s
T4	Code download time	Time taken to download the code from the serial Flash to on-chip RAM		Image size (KB) × 0.75 ms		

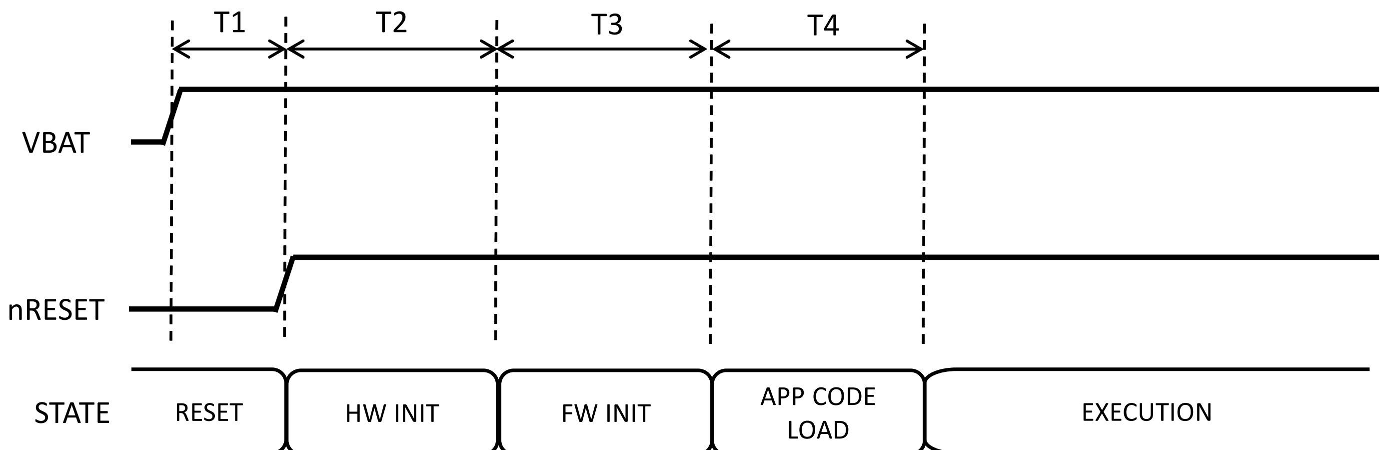

図 8-6. First-Time Power-Up and Reset Removal Timing Diagram

9 Detailed Description

9.1 Overview

The CC3200MOD is a Wi-Fi® internet-on-a chip module that consists of an Arm® Cortex®-M4 processor with a rich set of peripherals for diverse application requirements, a Wi-Fi network processor, and power-management subsystems. The device optimizes bus matrix and memory management to provide an advantage to the application developer.

9.2 Functional Block Diagram

図 9-1 shows the functional block diagram of the CC3200MOD SimpleLink™ Wi-Fi® solution.

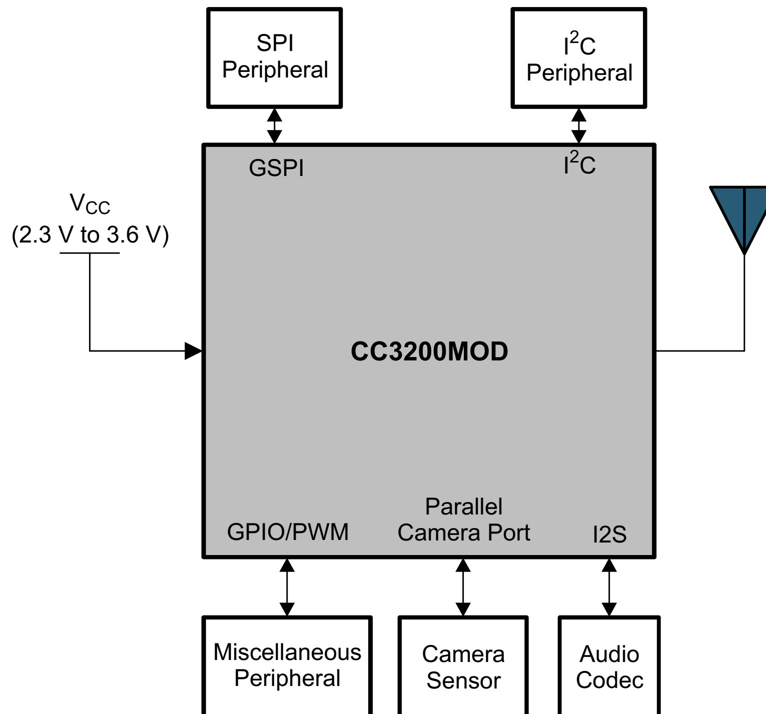

図 9-1. Functional Block Diagram

9.3 Arm® Cortex®-M4 プロセッサ・コア・サブシステム

高性能 Arm® Cortex®-M4 プロセッサは、最小限のメモリ実装、少ピン構成、低消費電力の要求を満たす低コストのプラットフォームを提供する一方、極めて優れた計算性能と、割り込みに対する並外れたシステム応答性能を備えています。

- 低レイテンシで割り込みを処理する Cortex®-M4 コアは、以下の特長を備えています。
  - 組込みアプリケーション用に最適化された 32 ビット Arm® Thumb® 命令セット
  - ハンドラ· モードとスレッド· モード
  - 開始および終了時のプロセッサ状態の自動保存および復元による低レイテンシの割り込み処理
  - ARMv6 非整列アクセスのサポート
- ネスト型ベクタ割り込みコントローラ (NVIC) は、低レイテンシの割り込み処理を実現するためプロセッサ· コアと密統合されています。NVIC の主な特長を以下に示します。
  - 3～8 に設定可能な優先度ビット
  - 割り込みの動的優先度設定
  - プリエンプティブ割り込みレベルとノンプリエンプティブ割り込みレベルを選択できるようにする優先度のグループ化

Copyright © 2021 Texas Instruments Incorporated

  - 割り込みのテール・チェーンと後着をサポートしているため、割り込み間の状態保存および復元のオーバーヘッドなしで、バックツーバック割り込み処理が可能
  - 命令のオーバーヘッドなしで、プロセッサの状態を割り込み開始時に自動的に保存し、割り込み終了時に自動的に復元
  - 超低消費電力スリープ・モードをサポートするウェイクアップ割り込みコントローラ (WIC)
- バス・インターフェイス :
  - AHB-Lite インターフェイス : システム・バス・インターフェイス (AHB : Advanced High-performance Bus)
  - メモリと、アトミックなビットバンド書き込みおよび読み出し動作を含む一部の周辺モジュールのビットバンドをサポート
- 低コストのデバッグ・ソリューション :
  - システム内のすべてのメモリとレジスタへのデバッグ・アクセス (例 : メモリ・マップド・デバイスへのアクセス、コアが停止したときの内部コア・レジスタへのアクセス、デバッグ制御レジスタへのアクセス (SYSRESETn がアサートされている間を含む))
  - シリアル・ワイヤ・デバッグ・ポート (SW-DP) またはシリアル・ワイヤ JTAG デバッグ ポート (SWJ-DP) のデバッグ・アクセス
  - ブレークポイントとコード・パッチを実装するためのフラッシュ・パッチ / ブレークポイント (FPB) ユニット

9.4 CC3200 Device Encryption

図 9-2 shows a standard MCU for the CC3200 device. Application image and user data files are not encrypted. Network certificates are encrypted using a device-specific key.

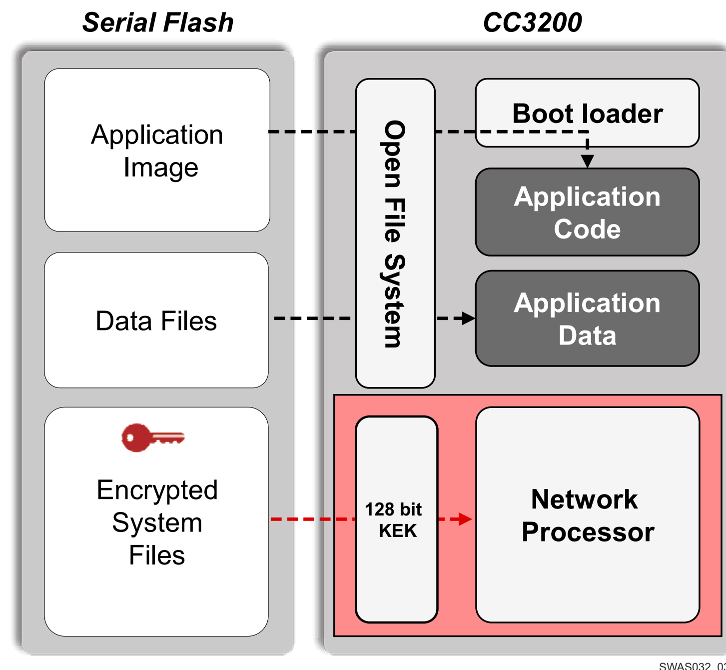

図 9-2. CC3200 Standard MCU

9.5 Wi-Fi® Network Processor Subsystem

The Wi-Fi network processor subsystem includes a dedicated Arm® MCU to completely offload the host MCU along with an 802.11 b/g/n radio, baseband, and MAC with a powerful crypto engine for a fast, secure WLAN and Internet connections with 256-bit encryption. The CC3200 device supports station, AP, and Wi-Fi Direct modes. The device also supports WPA2 personal and enterprise security in addition to WPS 2.0. The Wi-Fi network processor includes an embedded IPv4 TCP/IP stack.

表 9-1 summarizes the NWP features.

表 9-1. Summary of Features Supported by the NWP Subsystem

ITEM	DOMAIN	CATEGORY	FEATURE	DETAILS
1	TCP/IP	Network Stack	IPv4	Baseline IPv4 stack
2	TCP/IP	Network Stack	TCP/UDP	Base protocols
3	TCP/IP	Protocols	DHCP	Client and server mode
4	TCP/IP	Protocols	ARP	Support ARP protocol
5	TCP/IP	Protocols	DNS/mDNS	DNS Address resolution and local server
6	TCP/IP	Protocols	IGMP	Up to IGMPv3 for multicast management
7	TCP/IP	Applications	mDNS	Support multicast DNS for service publishing over IP
8	TCP/IP	Applications	mDNS-SD	Service discovery protocol over IP in local network
9	TCP/IP	Applications	Web Sever/HTTP Server	URL static and dynamic response with template
10	TCP/IP	Security	TLS/SSL	TLS v1.2 (client/server) / SSL v3.0
11	TCP/IP	Security	TLS/SSL	For the supported Cipher Suite, go to SimpleLink Wi-Fi CC3200 SDK.
12	TCP/IP	Sockets	RAW Sockets	User-defined encapsulation at WLAN MAC/PHY or IP layers
13	WLAN	Connection	Policies	Allows management of connection and reconnection policy
14	WLAN	MAC	Promiscuous mode	Filter-based Promiscuous mode frame receiver
15	WLAN	Performance	Initialization time	From enable to first connection to open AP less than 50 ms
16	WLAN	Performance	Throughput	UDP = 16 Mbps
17	WLAN	Performance	Throughput	TCP = 13 Mbps
18	WLAN	Provisioning	WPS2	Enrollee using push button or PIN method.
19	WLAN	Provisioning	AP Config	AP mode for initial product configuration (with configurable Web page and beacon Info element)
20	WLAN	Provisioning	SmartConfig	Alternate method for initial product configuration
21	WLAN	Role	Station	802.11 b/g/n Station with legacy 802.11 power save
22	WLAN	Role	Soft AP	802.11 b/g single station with legacy 802.11 power save
23	WLAN	Role	P2P	P2P operation as GO
24	WLAN	Role	P2P	P2P operation as CLIENT
25	WLAN	Security	STA-Personal	WPA2 personal security
26	WLAN	Security	STA-Enterprise	WPA2 enterprise security
27	WLAN	Security	STA-Enterprise	EAP-TLS
28	WLAN	Security	STA-Enterprise	EAP-PEAPv0/TLS
29	WLAN	Security	STA-Enterprise	EAP-PEAPv1/TLS
30	WLAN	Security	STA-Enterprise	EAP-PEAPv0/MSCHAPv2
31	WLAN	Security	STA-Enterprise	EAP-PEAPv1/MSCHAPv2
32	WLAN	Security	STA-Enterprise	EAP-TTLS/EAP-TLS
33	WLAN	Security	STA-Enterprise	EAP-TTLS/MSCHAPv2

ITEM	DOMAIN	CATEGORY	FEATURE	DETAILS
34	WLAN	Security	AP-Personal	WPA2 personal security

9.6 Power-Management Subsystem

The CC3220MODx and CC3220MODAx power-management subsystems contain DC/DC converters to accommodate the differing voltage or current requirements of the system.

The CC3220MODx is a fully integrated module-based WLAN radio solution used on an embedded system with a wide-voltage supply range. The internal power management, including DC/DC converters and LDOs, generates all of the voltages required for the module to operate from a wide variety of input sources. For maximum flexibility, the module can operate in the modes described in the following sections.

The CC3200 power-management subsystem contains DC/DC converters to accommodate the differing voltage or current requirements of the system. The module can operate from an input voltage ranging from 2.3 V to 3.6 V and can be directly connected to 2× AA Alkaline batteries.

The CC3200MOD is a fully integrated module-based WLAN radio solution used on an embedded system with a wide-voltage supply range. The internal power management, including DC/DC converters and LDOs, generates all of the voltages required for the module to operate from a wide variety of input sources. For maximum flexibility, the module can operate in the modes described in the following sections.

9.6.1 VBAT Wide-Voltage Connection

In the wide-voltage battery connection, the module can be directly connected to two AA alkaline batteries. All other voltages required to operate the module are generated internally by the DC/DC converters. This scheme is the most common mode for the module because it supports wide-voltage operation from 2.3 to 3.6 V.

In the wide-voltage battery connection, the module is powered directly by the battery or preregulated 3.3-V supply. All other voltages required to operate the device are generated internally by the DC/DC converters. This scheme is the most common mode for the device because it supports wide-voltage operation from 2.3 to 3.6 V.

9.7 Low-Power Operating Mode

From a power-management perspective, the CC3220MODx and CC3220MODAx module comprise the following two independent subsystems:

- Arm® Cortex®-M4 application processor subsystem
- Networking subsystem

Each subsystem operates in one of several power states.

The Arm® Cortex®-M4 application processor runs the user application loaded from an external serial Flash, or internal Flash (in CC3220MODSF). The networking subsystem runs preprogrammed TCP/IP and Wi-Fi data link layer functions.

Copyright © 2021 Texas Instruments Incorporated

The user program controls the power state of the application processor subsystem and can be in one of the five modes described in 表 9-2.

表 9-2. User Program Modes

APPLICATION PROCESSOR (MCU) MODE(1)	DESCRIPTION
MCU active mode	MCU executing code at 80-MHz state rate
MCU sleep mode	The MCU clocks are gated off in sleep mode and the entire state of the device is retained. Sleep mode offers instant wakeup. The MCU can be configured to wake up by an internal fast timer or by activity from any GPIO line or peripheral.
MCU LPDS mode	State information is lost and only certain MCU-specific register configurations are retained. The MCU can wake up from external events or by using an internal timer. (The wake-up time is less than 3 ms.) Certain parts of memory can be retained while the MCU is in LPDS mode. The amount of memory retained is configurable. Users can choose to preserve code and the MCU-specific setting. The MCU can be configured to wake up using the RTC timer or by an external event on specific GPIOs as the wake-up source.
MCU hibernate mode	The lowest power mode in which all digital logic is power-gated. Only a small section of the logic directly powered by the input supply is retained. The RTC keeps running and the MCU supports wakeup from an external event or from an RTC timer expiry. Wake-up time is longer than LPDS mode at about 15 ms plus the time to load the application from serial Flash, which varies according to code size. In this mode, the MCU can be configured to wake up using the RTC timer or external event on a GPIO (GPIO0 to GPIO6).
MCU shutdown mode	The lowest power mode system-wise. All device logics are off, including the RTC. The wake-up time in this mode is longer than hibernate at about 1.1 s. To enter or exit the shutdown mode, the state of the nRESET line is changed (low to shut down, high to turn on).

(1) Modes are listed in order of power consumption, with highest power modes listed first.

The NWP can be active or in LPDS mode and takes care of its own mode transitions. When there is no network activity, the NWP sleeps most of the time and wakes up only for beacon reception (see 表 9-3).

表 9-3. Networking Subsystem Modes

NETWORK PROCESSOR MODE	DESCRIPTION
Network active mode (processing layer 3, 2, and 1)	Transmitting or receiving IP protocol packets
Network active mode (processing layer 2 and 1)	Transmitting or receiving MAC management frames; IP processing not required.
Network active listen mode	Special power optimized active mode for receiving beacon frames (no other frames supported)
Network connected Idle	A composite mode that implements 802.11 infrastructure power save operation. The CC3220MODx and CC3220MODAx NWPs automatically goes into LPDS mode between beacons and then wakes to active listen mode to receive a beacon and determine if there is pending traffic at the AP. If not, the NWP returns to LPDS mode and the cycle repeats.
Network LPDS mode	Low-power state between beacons in which the state is retained by the NWP, allowing for a rapid wake up.
Network disabled	The network is disabled

The operation of the application and network processor ensures that the module remains in the lowest power mode most of the time to preserve battery life.

The following examples show the use of the power modes in applications:

- A product that is continuously connected to the network in the 802.11 infrastructure power-save mode but sends and receives little data spends most of the time in connected idle, which is a composite of receiving a beacon frame and waiting for the next beacon.

- A product that is not continuously connected to the network but instead wakes up periodically (for example, every 10 minutes) to send data, spends most of the time in hibernate mode, jumping briefly to active mode to transmit data.

9.8 Memory

9.8.1 External Memory Requirements

The CC3200 device maintains a proprietary file system on the SFLASH. The CC3200 file system stores the service pack file, system files, configuration files, certificate files, web page files, and user files. By using a format command through the API, users can provide the total size allocated for the file system. The starting address of the file system cannot be set and is always located at the beginning of the SFLASH. The applications microcontroller must access the SFLASH memory area allocated to the file system directly through the CC3200 file system. The applications microcontroller must not access the SFLASH memory area directly.

The file system manages the allocation of SFLASH blocks for stored files according to download order, which means that the location of a specific file is not fixed in all systems. Files are stored on SFLASH using human-readable file names rather than file IDs. The file system API works using plain text, and file encryption and decryption is invisible to the user. Encrypted files can be accessed only through the file system (see 図 9-2).

All file types can have a maximum of 128 supported files in the file system. All files are stored in blocks of 4KB and thus use a minimum of 4KB of flash space. Encrypted files with fail-safe support and optional security are twice the original size and use a minimum of 8KB. Encrypted files are counted as fail safe in terms of space. The maximum file size is 16MB.

表 9-4. CC3200 SFLASH Size Recommendations

ITEM	TYPICAL FAIL-SAFE	TYPICAL NONFAIL-SAFE
File system	20KB	20KB
Service pack	224KB	112KB
System and configuration files	216KB	108KB
MCU code	512KB	256KB
Total	4Mb	2Mb
Recommended	16Mb	8Mb

The CC3200 device supports JEDEC specification SFDP (serial flash device parameters). The following SFLASH devices are verified for functionality with the CC3200 device in addition to the ones in the reference design:

- Micron (N25Q128-A13BSE40): 128 Mb
- Spansion (S25FL208K): 8 Mb
- Winbond (W25Q16V): 16 Mb
- Adesto (AT25DF081A): 8 Mb
- Macronix (MX25L12835F-M2): 128 Mb

For compatibility with the CC3200 device, the SFLASH device must support the following commands:

- Command 0x9F (read the device ID [JEDEC]). Procedure: SEND 0x9F, READ 3 bytes.
- Command 0x05 (read the status of the SFLASH). Procedure: SEND 0x05, READ 1 byte. Assume bit 0 is busy and bit 1 is write enable.
- Command 0x06 (set write enable). Procedure: SEND 0x06, read status until write-enable bit is set.
- Command 0xC7 (chip erase). Procedure: SEND 0xC7, read status until busy bit is cleared.
- Command 0x03 (read data). Procedure: SEND 0x03, SEND 24-bit address, read *n* bytes.
- Command 0x02 (write page). Procedure: SEND 0x02, SEND 24-bit address, write *n* bytes ($0 < n < 256$).
- Command 0x20 (sector erase). Procedure: SEND 0x20, SEND 24-bit address, read status until busy bit is cleared. Sector size is always assumed to be 4K.

9.8.2 Internal Memory

The CC3200 device includes on-chip SRAM to which application programs are downloaded and executed. The application developer must share the SRAM for code and data. To select the appropriate SRAM configuration, see the device variants listed in the orderable addendum at the end of this datasheet. The micro direct memory

access (µDMA) controller can transfer data to and from SRAM and various peripherals. The CC3200 ROM holds the rich set of peripheral drivers, which saves SRAM space. For more information on drivers, see the CC3200 API list in *セクション 12.3*.

9.8.2.1 SRAM

The CC3200 family provides up to 256KB of zero-wait-state, on-chip SRAM. Internal RAM is capable of selective retention during LPDS mode. This internal SRAM is located at offset 0x2000 0000 of the device memory map.

Use the µDMA controller to transfer data to and from the SRAM.

When the device enters low-power mode, the application developer can choose to retain a section of memory based on need. Retaining the memory during low-power mode provides a faster wakeup. The application developer can choose the amount of memory to retain in multiples of 64KB. For more information, see the API guide in *セクション 12.3*.

9.8.2.2 ROM

The internal zero-wait-state ROM of the CC3200 module is at address 0x0000 0000 of the device memory and is programmed with the following components:

- Bootloader
- Peripheral driver library (DriverLib) release for product-specific peripherals and interfaces

The bootloader is used as an initial program loader (when the serial Flash memory is empty). The DriverLib software library of the CC3200 controls on-chip peripherals with a bootloader capability. The library performs peripheral initialization and control functions, with a choice of polled or interrupt-driven peripheral support. The DriverLib APIs in ROM can be called by applications to reduce Flash memory requirements and free the Flash memory to be used for other purposes.

9.8.2.3 Memory Map

表 9-5 describes the various MCU peripherals and how they are mapped to the processor memory. For more information on peripherals, see the API document in *セクション 12.3*.

表 9-5. Memory Map

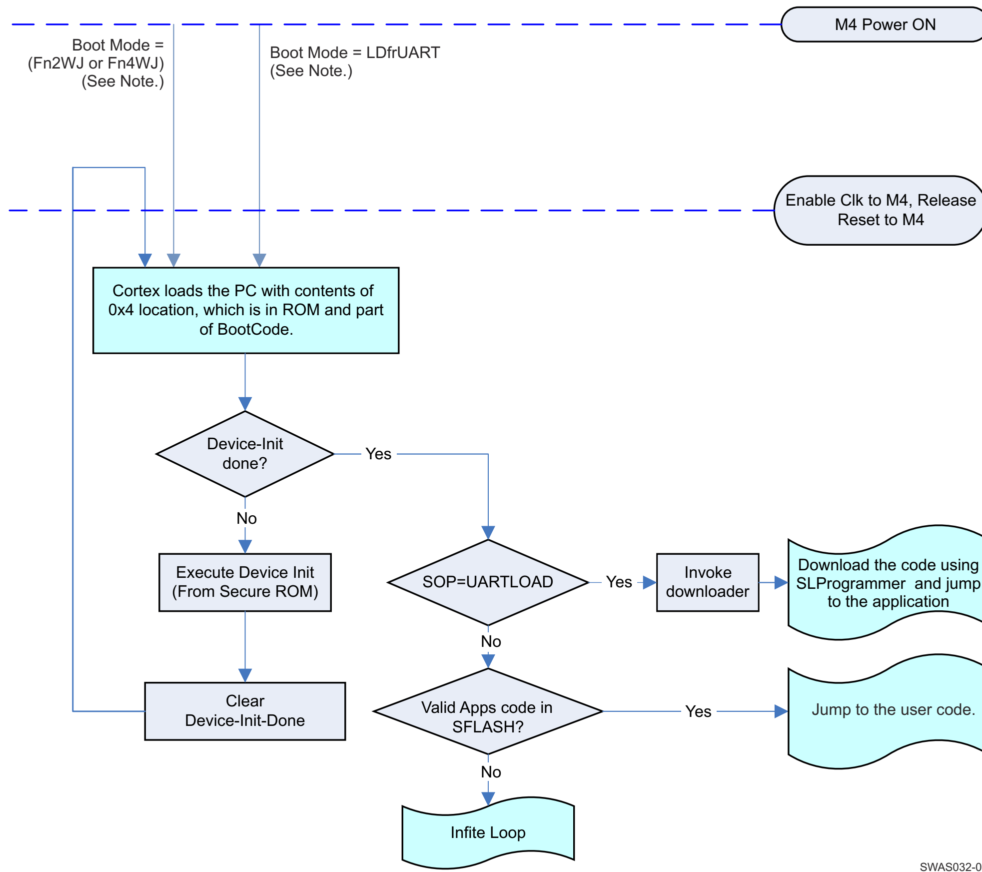
9.9 Boot Modes

9.9.1 Overview

The boot process of the application processor includes two phases. The first phase consists of unrestricted access to all register space and configuration of the specific device setting. In the second phase, the application processor executes user-specific code.

図 9-3 shows the bootloader flow chart.



Note: For definitions of the SoP mode functional configurations, see 表 9-6.

図 9-3. Bootloader Flow Chart

Copyright © 2021 Texas Instruments Incorporated

9.9.2 Invocation Sequence and Boot Mode Selection

The following sequence of events occurs during the Cortex® processor boot:

1. After power-on-reset (POR), the processor starts execution.
2. The processor jumps to the first few lines (FFL) of code in the ROM to determine if the current boot is the first device-init boot or the second MCU boot. The determination is based on the Device-Init flag in a secure register. The Device-Init flag is set while out of POR. The registers in the secure region are accessible only in the device-init mode.
3. If the current boot is the first boot, the processor executes the device-init code from ROM.
4. At the end of the boot, the processor clears the Device-Init flag and changes the master ID of the processor and the DMA. These registers are part of the secure region.
5. The processor resets itself, initiating a second boot.
6. During the second boot, the processor rereads the Device-Init flag, the bit is cleared, and the processor obtains a different master ID.
7. After executing FFL and the unsecure boot code, the processor jumps to the developer code (application).
8. For the rest of the operation (until the next power cycle), the Cortex® mode is designated the MCU. During this phase, access to the secure region is restricted.

9.9.3 Boot Mode List

The CC3200 device implements a sense-on-power (SoP) scheme to determine the device operation mode. The device can be configured to power up in one of the three following modes:

- Fn4WJ: Functional mode with a 4-wire JTAG mapped to fixed pins
- Fn2WJ: Functional mode with a 2-wire SWD mapped to fixed pins
- LDfrUART: UART load mode to Flash the system during development and in OEM assembly line (for example, serial Flash connected to the CC3200R device)

SoP values are sensed from the device pin during power up. This encoding determines the boot flow. Before the device is taken out of reset, the SoP values are copied to a register and then determine the device operation mode while powering up. These values determine the boot flow as well as the default mapping for some of the pins (JTAG, SWD, UART0) 表 9-6 provides the pull configurations.

表 9-6. CC32x0 Functional Configurations

NAME	SOP2	SOP1	SOP0	SOP MODE	COMMENT
UARTLOAD	Pullup	Pulldown	Pulldown	LDfrUART	Factory/Lab Flash/SRAM load through UART. Device waits indefinitely for UART to load code. The SOP bits then must be toggled to configure the device in functional mode. Also puts JTAG in 4-wire mode.
FUNCTIONAL_2WJ	Pulldown	Pulldown	Pullup	Fn2WJ	Functional development mode. In this mode, 2-pin SWD is available to the developer. TMS and TCK are available for debugger connection.
FUNCTIONAL_4WJ	Pulldown	Pulldown	Pulldown	Fn4WJ	Functional development mode. In this mode, 4-pin JTAG is available to the developer. TDI, TMS, TCK, and TDO are available for debugger connection.

There is an internal pull resistor for SOP0 and SOP1 with value of 100 kΩ. There is no need for any external pulls. TI recommends a 2.7-kΩ pull resistor for SOP2. SOP2 can be used by the application for other functions after chip power-up is complete. However, to avoid spurious SOP values from being sensed at power-up, TI strongly recommends that the SOP2 pin be used only for output signals. On the other hand, the SOP0 and SOP1 pins are multiplexed with WLAN analog test pins and are not available for other functions.

10 Applications, Implementation, and Layout

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Device Connection and Layout Fundamentals

10.1.1 Power Supply Decoupling and Bulk Capacitors

Depending upon routing resistors and battery type, TI recommends adding two 100-μF ceramic capacitors to help provide the peak current drawn by the CC3200 module.

10.1.2 Reset

The module features an internal RC circuit to reset the module during power ON. An external circuit is not required unless an external MCU controls the CC3200 module. The nRESET pin must be held below 0.6 V for at least 5 ms for the module to successfully reset.

10.1.3 Unused Pins

All unused pins can be left unconnected without any concern to leakage current.

10.1.4 General Layout Recommendations

1. Have a solid ground plane and ground vias under the module for stable system and thermal dissipation.
2. Do **not** run signal traces underneath the module on a layer where the module is mounted.
3. RF traces must have 50-Ω impedance.
4. RF trace bends must be made with gradual curves, and 90 degree bends must be avoided.
5. RF traces must **not** have sharp corners.
6. There must be no traces or ground under the antenna section.
7. RF traces must have via stitching on the ground plane beside the RF trace on both sides.
8. RF traces must be as short as possible. The antenna, RF traces, and the module must be on the edge of the PCB product in consideration of the product enclosure material and proximity.

10.1.5 Do's and Don'ts

Note

If an external device drives a positive voltage to the signal pads and the CC3200MOD is not powered, DC current is drawn from the other device. If the drive strength of the external device is adequate, an unintentional wakeup and boot of the CC3200MOD can occur. To prevent current draw, TI recommends any one of the following:

- All devices interfaced to the CC3200MOD must be powered from the same power rail as the chip.
- Use level-shifters between the module and any external devices fed from other independent rails.
- The nRESET pin of the CC3200MOD must be held low until the VBAT supply to the module is driven and stable. This is automatically done within the module if this pin is left unconnected.

Copyright © 2021 Texas Instruments Incorporated

10.2 Reference Schematics

図 10-1 shows the reference schematic for the CC3200MOD module.

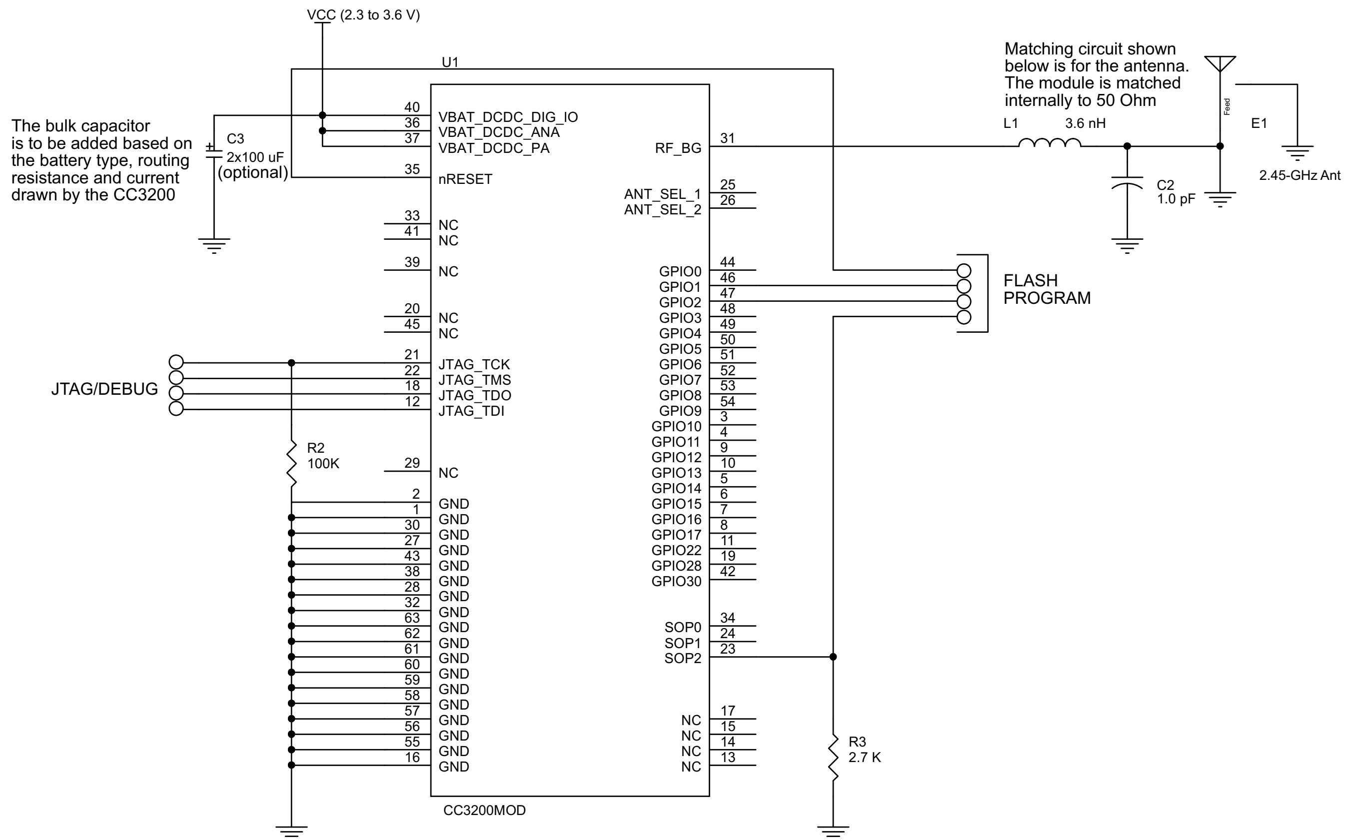

図 10-1. CC3200MOD Module Reference Schematic

10.3 Design Requirements

表 10-1 provides the bill of materials.

表 10-1. Bill of Materials (1)

QTY	PART REFERENCE	VALUE	MANUFACTURER	PART NUMBER	DESCRIPTION
1	U1	CC3200MOD	Texas Instruments	CC3200MODR1M2AMOB	SimpleLink™ Wi-Fi® and Internet-of-Things Module Solution, a Single-Chip Wireless MCU, MOB0063A (SIP MODULE-63)
1	E1	2.45-GHz Ant	Taiyo Yuden	AH316M245001-T	Antenna Bluetooth WLAN ZigBee® WIMAX
1	C2	1.0 pF	Murata Electronics North America	GJM1555C1H1R0BB01D	CAP CER 1 pF 50 V NP0 0402
1	L1	3.6 nH	Murata Electronics North America	LQP15MN3N6B02D	INDUCTOR 3.6 NH 0.1 NH 0402

(1) Resistors are not shown here. Any resistor of 5% tolerance can be used.

10.4 Detailed Design Procedure

The design procedure considerations follow:

- The bulk capacitor is to be added based on the battery type, routing resistance and current drawn by the CC3200
- For more details on brownout consideration, see セクション 8.6. The module enters a brownout condition whenever the input voltage dips below $V_{BROWNOUT}$ (see 図 8-4 and 図 8-5). This condition must be considered during design of the power supply routing, specifically if operating from a battery.

10.5 Layout Recommendations

10.5.1 RF Section (Placement and Routing)

図 10-2 shows the RF sectional layout.

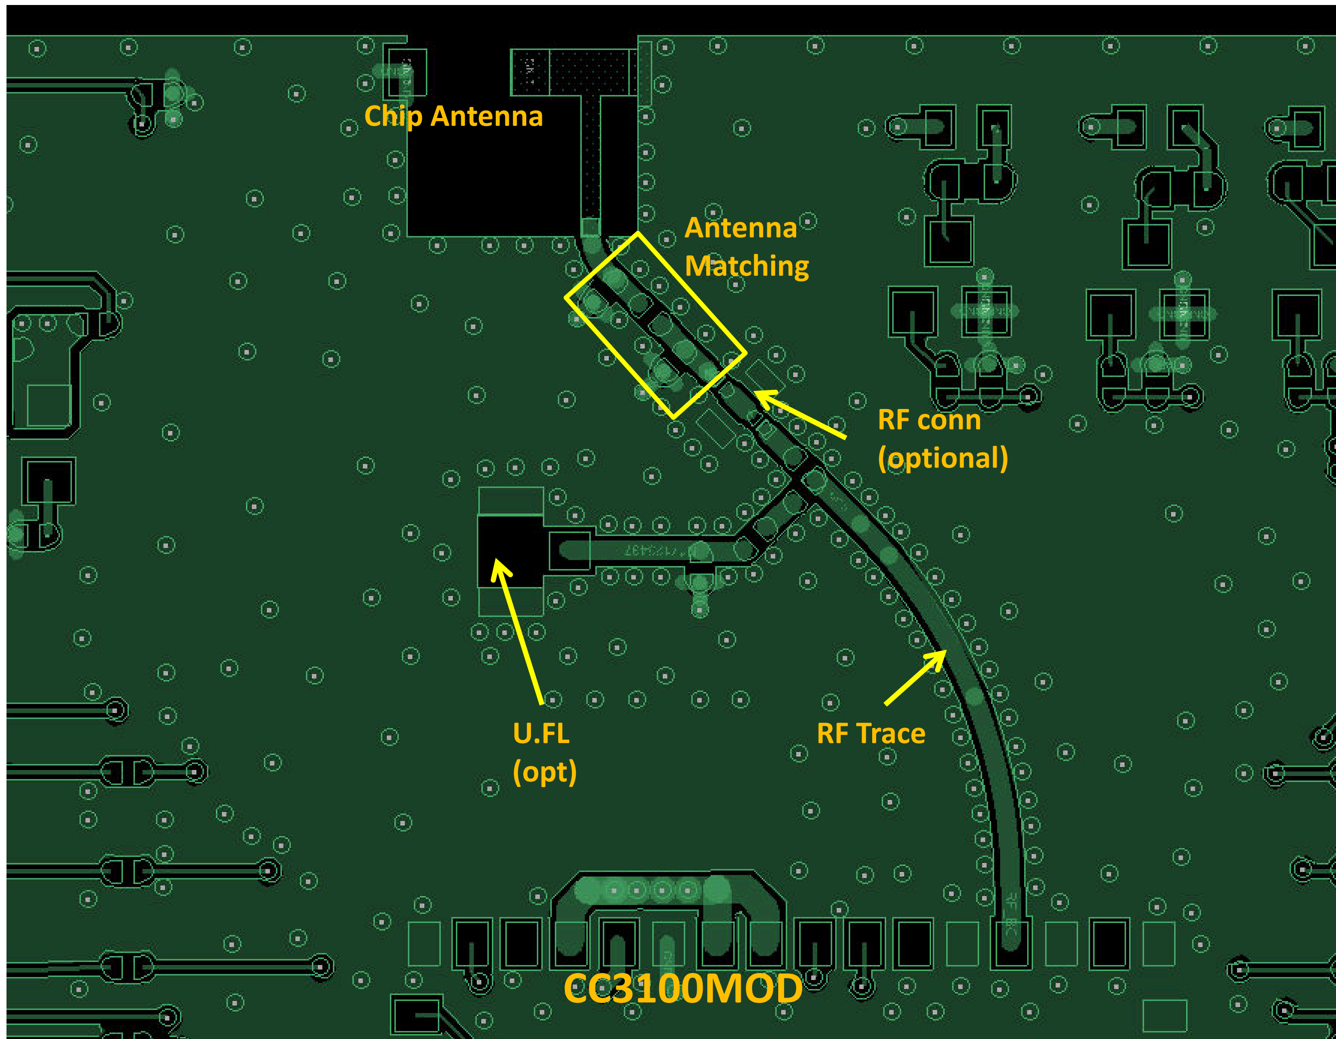

図 10-2. RF Section Layout

The RF section of this wireless device gets top priority in terms of layout. The RF section must be laid out correctly to ensure optimum performance from the device. A poor layout can cause low-output power, EVM degradation, sensitivity degradation, and mask violations.

Copyright © 2021 Texas Instruments Incorporated

10.5.2 Antenna Placement and Routing

The antenna is the element used to convert the guided waves on the PCB traces to the free space electromagnetic radiation. The placement and layout of the antenna are the keys to increased range and data rates.

The points listed in 表 10-2 must be observed for the antenna.

表 10-2. Antenna Guidelines

SR NO.	GUIDELINES
1	Place the antenna on an edge or corner of the PCB.
2	Ensure that no signals are routed across the antenna elements on all the layers of the PCB.
3	Most antennas, including the chip antenna used on the booster pack, require ground clearance on all the layers of the PCB. Ensure that the ground is cleared on inner layers as well.
4	Ensure that there is provision to place matching components for the antenna. These must be tuned for best return loss when the complete board is assembled. Any plastics or casing must also be mounted while tuning the antenna because this can impact the impedance.
5	Ensure that the antenna impedance is 50 Ω because the device is rated to work only with a 50-Ω system.
6	In case of printed antenna, ensure that the simulation is performed with the solder mask in consideration.
7	Ensure that the antenna has a near omnidirectional pattern.
8	The feed point of the antenna is required to be grounded. This is only for the antenna type used on the CC3200MOD Launchpad. See the specific antenna data sheets for the recommendations.
9	To use the FCC certification of the module, refer to CC31xx & CC32xx Radio Certifications wiki page on CC3200 Radio certification

表 10-3. Recommended Components

CHOICE	PART NUMBER	MANUFACTURER	NOTES
1	AH316M245001-T	Taiyo Yuden	Can be placed on edge of the PCB and uses much less PCB space

10.5.3 Transmission Line

The RF signal from the device is routed to the antenna using a Coplanar Waveguide with ground (CPW-G) structure. The CPW-G structure offers the maximum isolation across filter gap and the best possible shielding to the RF lines. In addition to the ground on the L1 layer, placing GND vias along the line also provides additional shielding.

図 10-3 shows the coplanar waveguide.

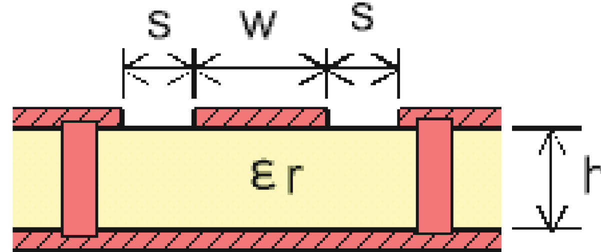

図 10-3. Coplanar Waveguide (Cross Section) With GND and Via Stitching

図 10-4 shows the top view of the CPW with GND.

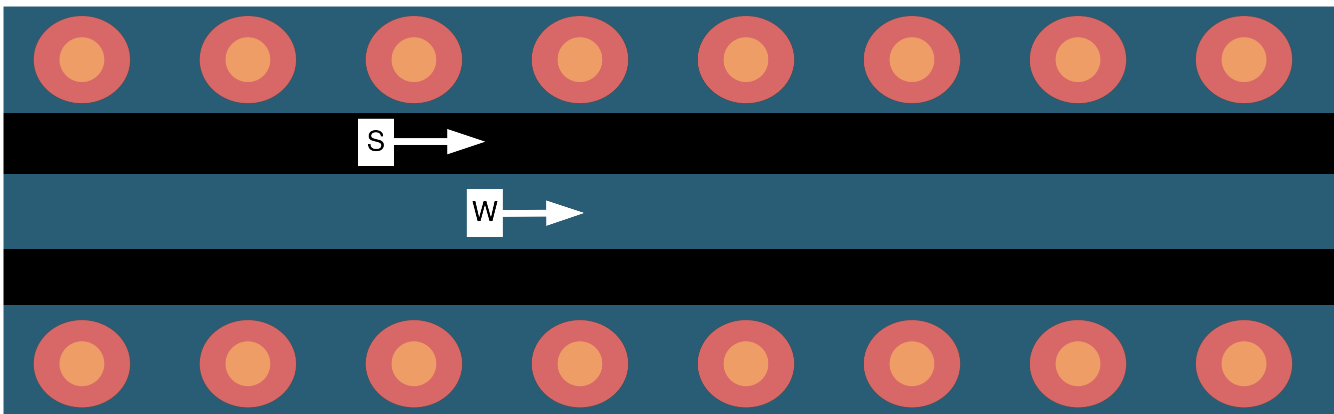

図 10-4. CPW With GND (Top View)

Copyright © 2021 Texas Instruments Incorporated

表 10-4 and 表 10-5 provide the recommended values for 2-layer boards and 4-layer boards, respectively.

表 10-4. Recommended PCB Values for 2-Layer Boards (L1 to L2 = 40 mils) [(1)]

PARAMETER	VALUE	UNIT
W	35	mils
S	6	mils
H	40	mils
Er (FR-4 substrate)	3.9	

(1) The CC3200MOD Launchpad uses a 4 layer stack-up to route other components on the board. Customer can choose a two-layer stack-up based on the values shown here.

表 10-5. Recommended PCB Values for 4-Layer Boards (L1 to L2 = 10 mils)

PARAMETER	VALUE	UNITS
W	20	mils
S	18	mils
H	10	mils
Er (FR-4 substrate)	4	

11 Environmental Requirements and Specifications

11.1 PCB Bending

The PCB bending specification will maintain planeness at a thickness of less than 0.1 mm.

11.2 Handling Environment

11.2.1 Terminals

The product is mounted with motherboard through land-grid array (LGA). To prevent poor soldering, do not make skin contact with the LGA portion.

11.2.2 Falling

The mounted components will be damaged if the product falls or is dropped. Such damage may cause the product to malfunction.

11.3 Storage Condition

11.3.1 Moisture Barrier Bag Before Opened

A moisture barrier bag must be stored in a temperature of less than 30°C with humidity under 85% RH. The calculated shelf life for the dry-packed product will be 12 months from the date the bag is sealed.

11.3.2 Moisture Barrier Bag Open

Humidity indicator cards must be blue, < 30%.

11.4 Baking Conditions

Products require baking before mounting if:

- Humidity indicator cards read > 30%
- Temp < 30°C, humidity < 70% RH, over 96 hours

Baking condition: 90°C, 12 to 24 hours

Baking times: 1 time

Copyright © 2021 Texas Instruments Incorporated

11.5 Soldering and Reflow Condition

- Heating method: Conventional convection or IR convection
- Temperature measurement: Thermocouple d = 0.1 mm to 0.2 mm CA (K) or CC (T) at soldering portion or equivalent method
- Solder paste composition: Sn/3.0 Ag/0.5 Cu
- Allowable reflow soldering times: 2 times based on the reflow soldering profile (see 図 11-1)
- Temperature profile: Reflow soldering will be done according to the temperature profile (see 図 11-1)
- Peak temperature: 245°C

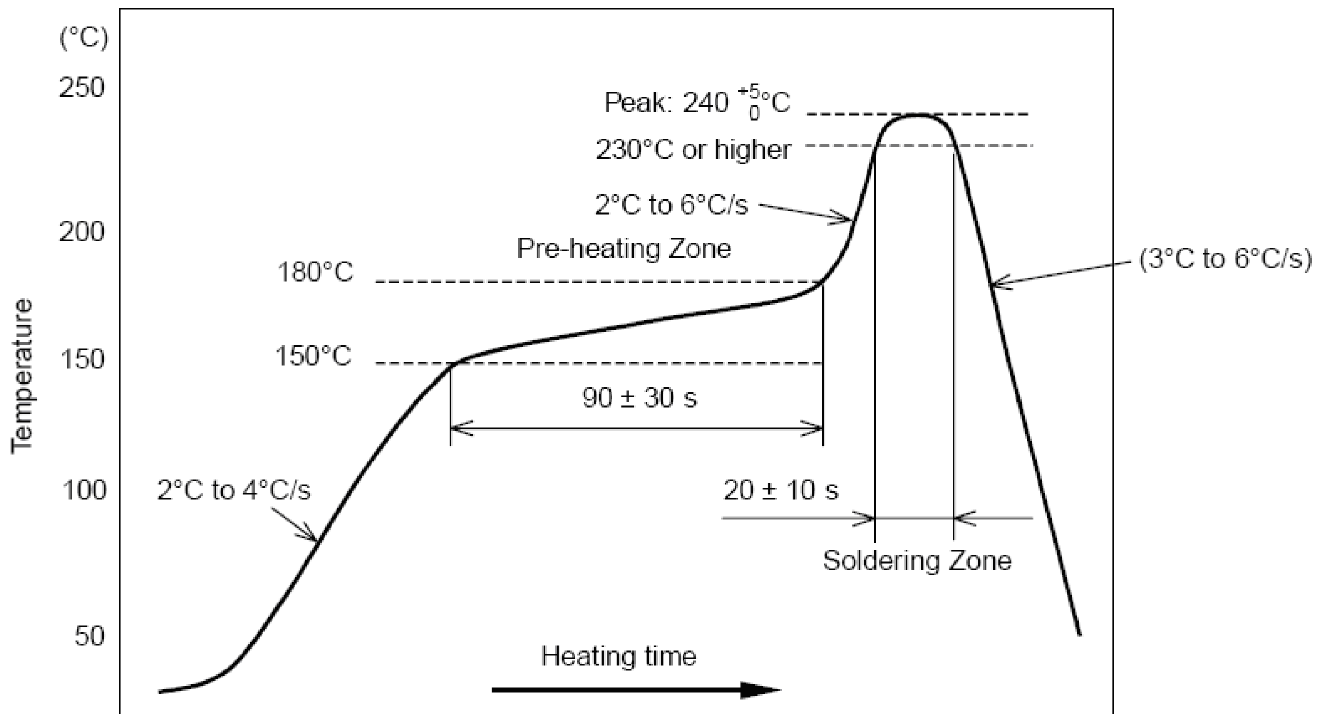

図 11-1. Temperature Profile for Evaluation of Solder Heat Resistance of a Component (at Solder Joint)

Note

TI does not recommend the use of conformal coating or similar material on the SimpleLink™ module. This coating can lead to localized stress on the solder connections inside the module and impact the module reliability. Use caution during the module assembly process to the final PCB to avoid the presence of foreign material inside the module.

---

12 Device and Documentation Support

12.1 Device Support

12.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of the CC3200MOD applications:

Software Development Tools: Code Composer Studio Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any CC3200MOD application.

Hardware Development Tools: Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the CC3200MOD platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

TI Designs and Reference Designs

The TI Designs Reference Design Library is a robust reference design library spanning analog, embedded processor, and connectivity. Created by TI experts to help you jumpstart your system design, all TI Designs include schematic or block diagrams, BOMs, and design files to speed your time to market.

12.1.2 Firmware Updates

TI updates features in the service pack for this module with no published schedule. Due to the ongoing changes, TI recommends that the user has the latest service pack in his or her module for production. To stay informed, sign up for the SDK Alert Me button on the tools page or www.ti.com/tool/cc3200sdk .

Copyright © 2021 Texas Instruments Incorporated

12.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of the CC3200MOD and support tools (see 図 12-1).

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *CC3200MOD*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

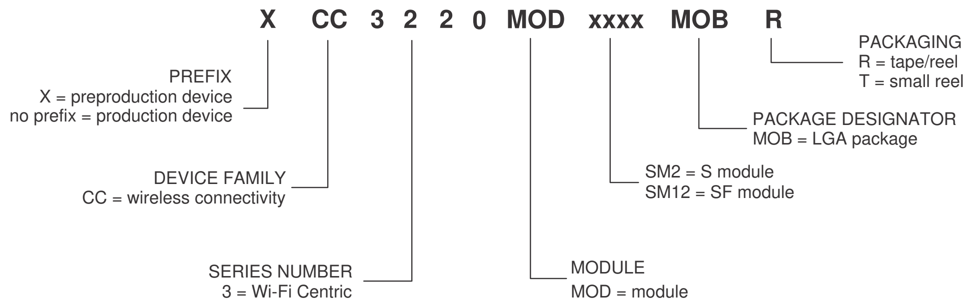

図 12-1. CC3200MOD Module Nomenclature

For orderable part numbers of CC3200MOD devices in the QFM package type, see セクション 13.2, see ti.com, or contact your TI sales representative.

12.3 Documentation Support

The following documents describe the CC3200MOD processor and MPU. These documents are available online at www.ti.com.

SimpleLink™ Wi-Fi® CC3200 and Internet-of-Things Solution, a Single Chip Wireless MCU Technical Reference Manual

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document.

13.1 Mechanical Drawing

Note

Maximum height of the module is 2.45 mm, because it includes a paper label on the top side. [1.5 + 0.88 + 0.07].

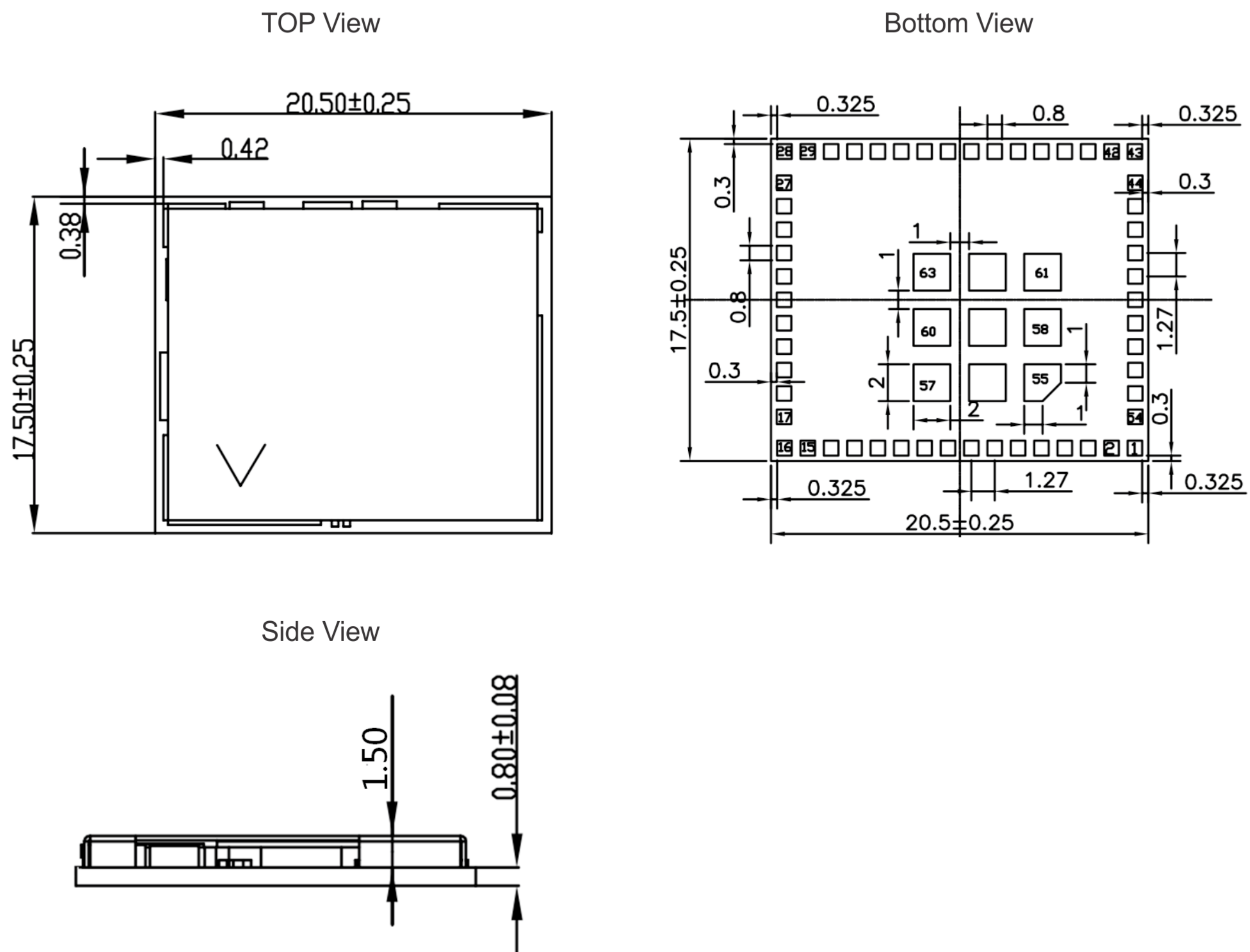

図 13-1. Mechanical Drawing

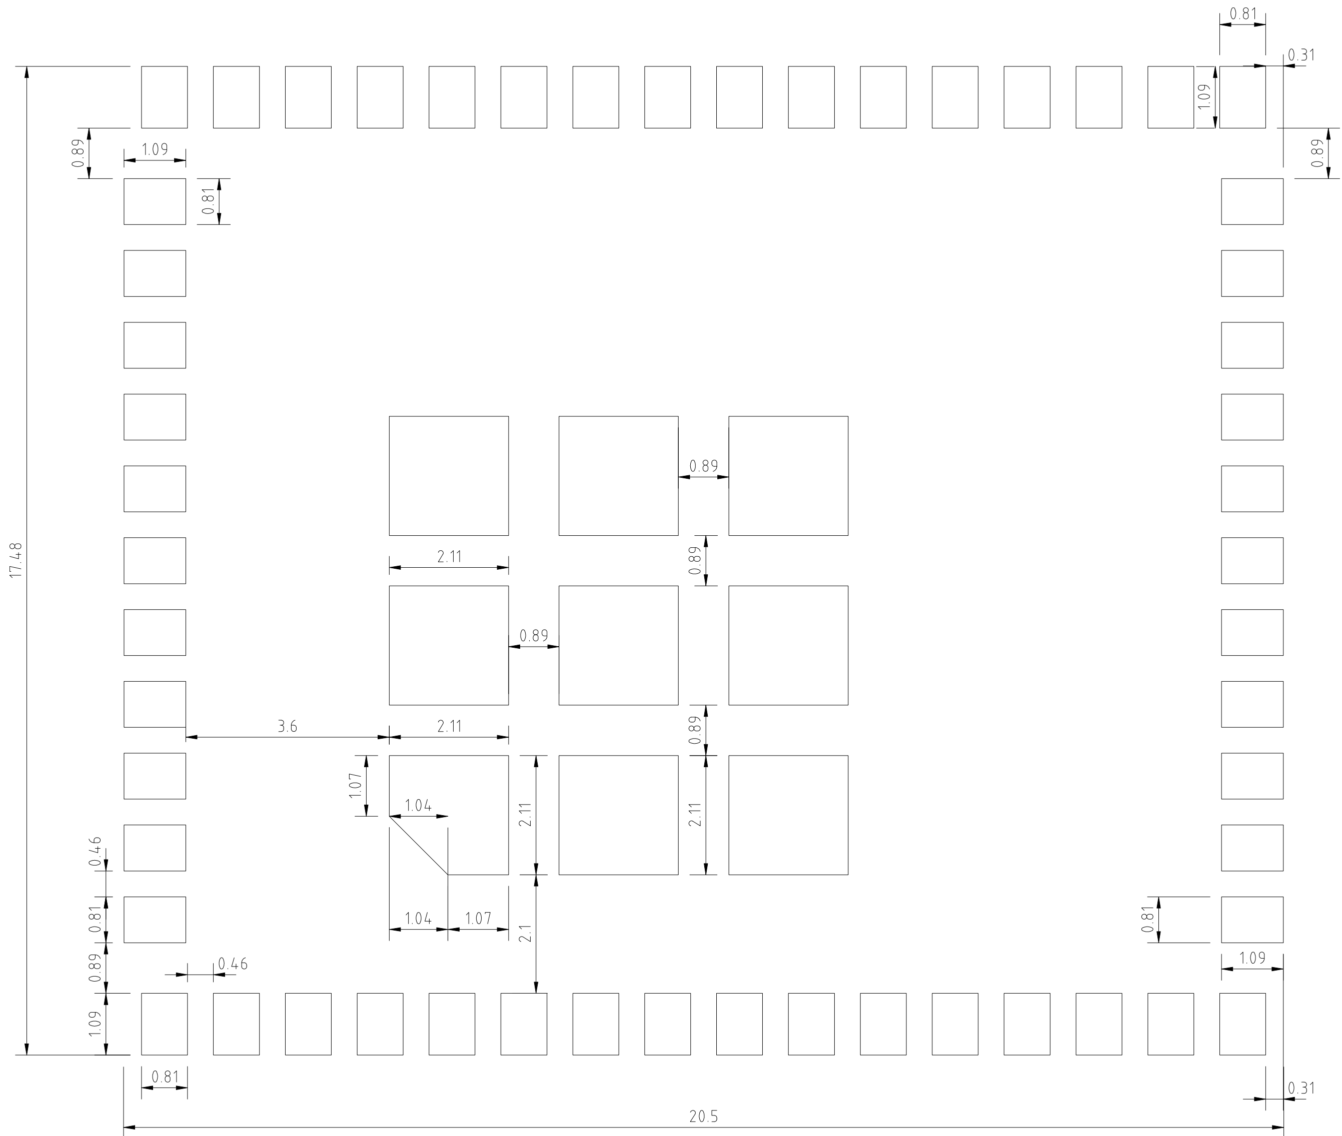

図 13-2. Land Pattern Drawing

Note

1. All dimensions are in mm.
2. Solder mask should be the same or 5% larger than the dimension of the pad
3. Solder paste must be the same as the pin for all peripheral pads. For ground pins, make the solder paste 20% smaller than the pad.

Copyright © 2021 Texas Instruments Incorporated

13.2 Package Option

We offer two reel size options for flexibility: a 750-unit reel and a 250-unit reel.

13.2.1 Packaging Information

Orderable Device	Status [(1)]	Package Drawing	Pins	Package Qty	Eco Plan [(2)]	Lead/Ball Finish	MSL, Peak Temp [(3)]	Op Temp (°C)	Device Marking[(4)] [(5)]
CC3200MODR1M2AMOBR	ACTIVE	MOB	63	750	RoHS Exempt	Ni Au	3, 250°C	–20 to 70	CC3200MODR1M2AMOB
CC3200MODR1M2AMOBT	ACTIVE	MOB	63	250	RoHS Exempt	Ni Au	3, 250°C	–20 to 70	CC3200MODR1M2AMOB

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PRE_PROD Unannounced device, not in production, not available for mass market, nor on the web, samples not available.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device

(5) Multiple Device markings will be inside parentheses. Only on Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. NOTES:

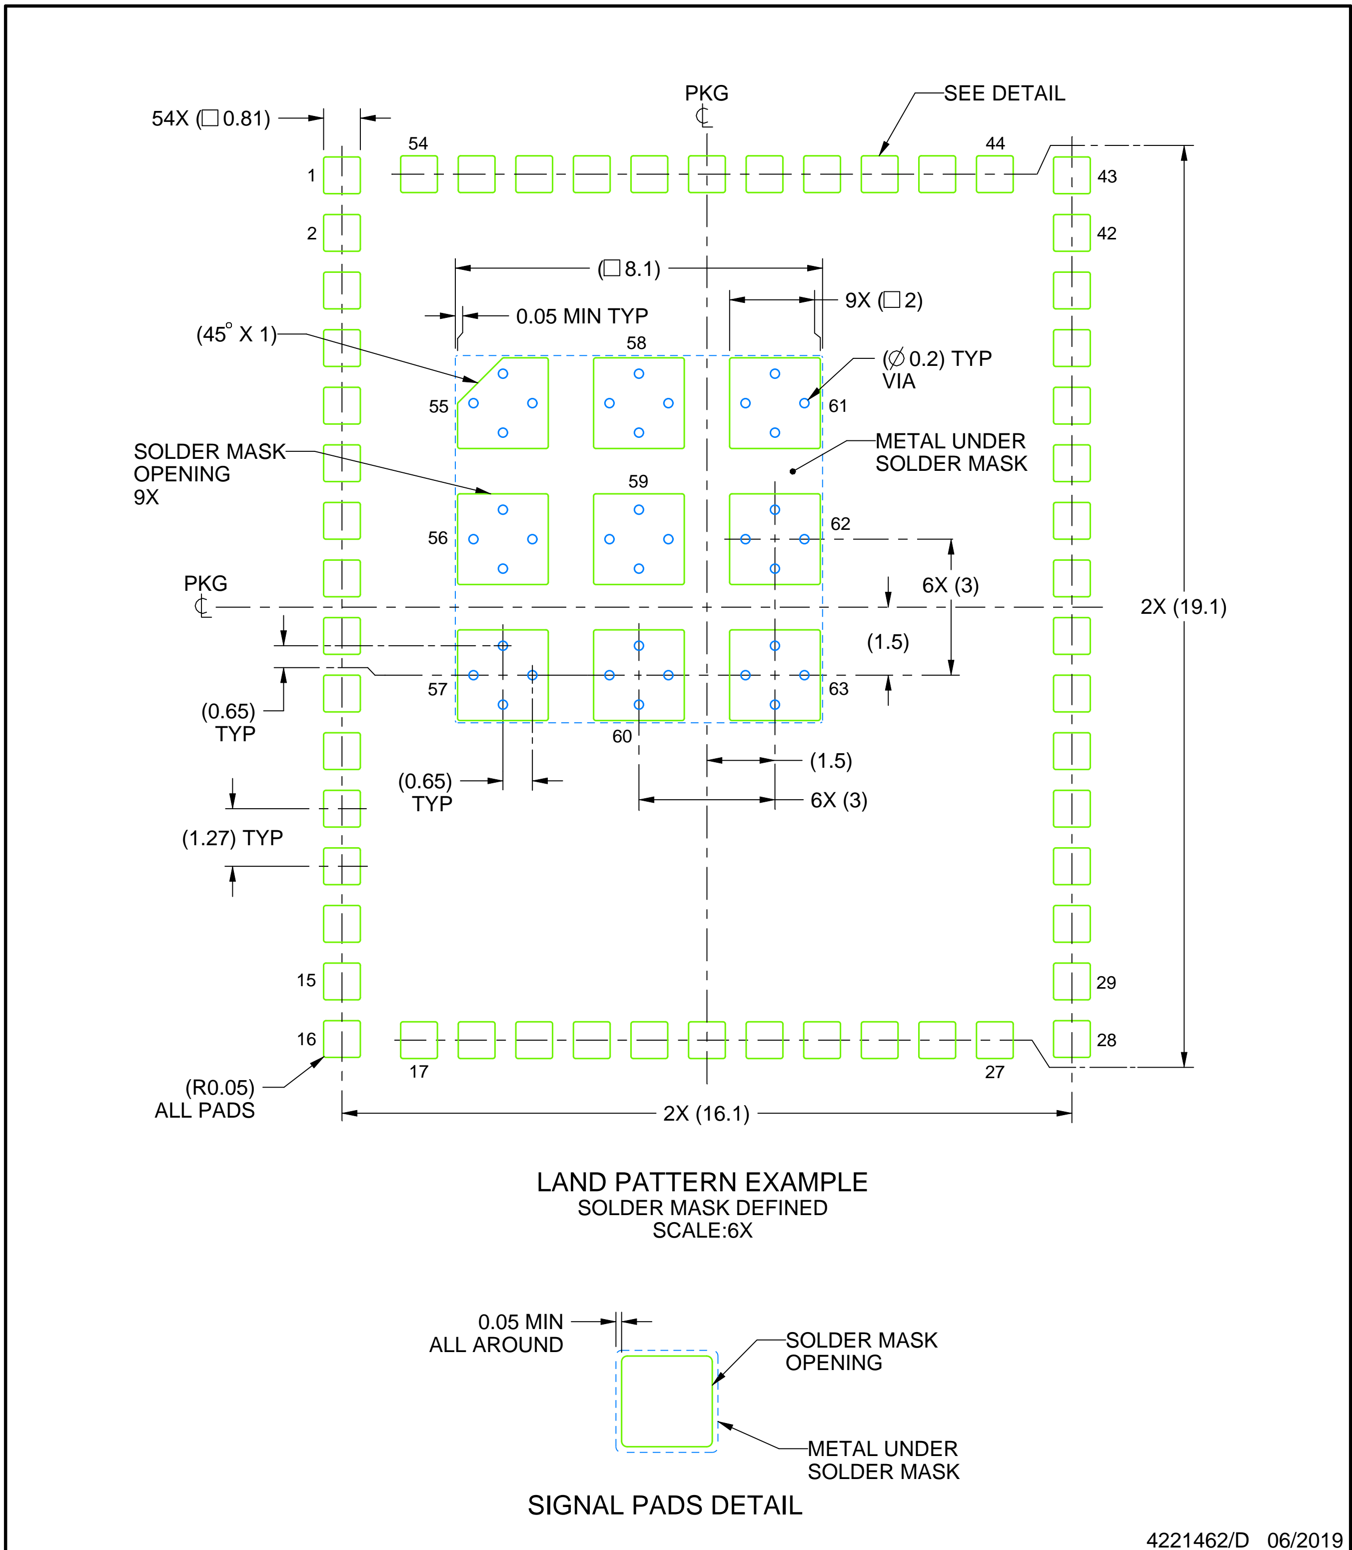
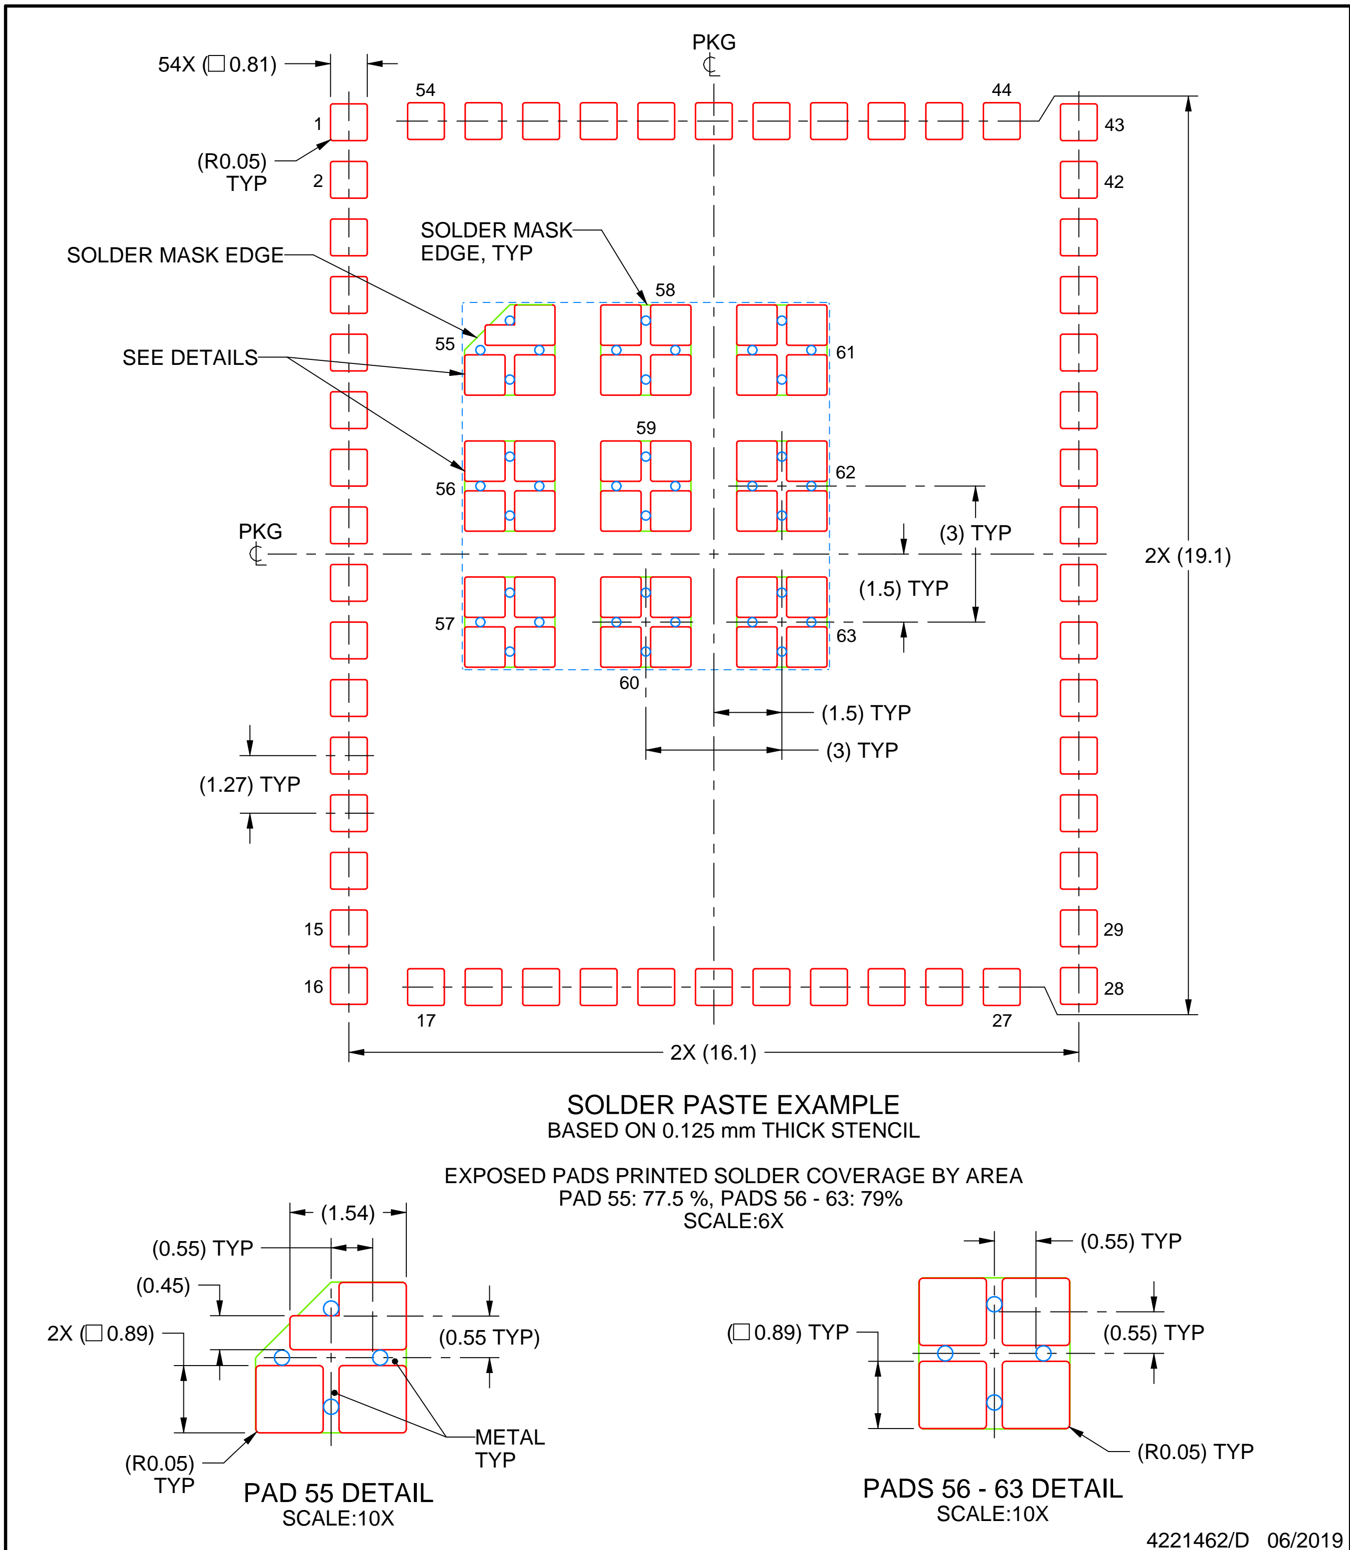
1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.



NOTES: (continued)

3. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).



NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要なお知らせと免責事項

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションが適用される各種規格や、その他のあらゆる安全性、セキュリティ、またはその他の要件を満たしていることを確実にする責任を、お客様のみが単独で負うものとします。上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、TI の販売約款 (https://www.tij.co.jp/ja-jp/legal/terms-of-sale.html)、または ti.com やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。
