CDx4HC243、CDx4HCT243 3 ステート出力の高速 CMOS ロジック・クワッド・バス・トランシーバ

1 特長

- 7ns の伝搬遅延 (A から B / B から A、標準値、V_{CC} = 5V、C_L = 15pF、T_A = 25℃)
- 3 ステート出力
- バッファ付き入力
- ファンアウト (全温度範囲にわたって)
  - 標準出力:10 の LSTTL 負荷
  - バス・ドライバ出力:15 の LSTTL 負荷
- 広い動作温度範囲:-55℃～125℃
- 平衡な伝搬遅延と遷移時間
- LSTTL ロジック IC に比べて消費電力を大幅削減
- HC タイプ
  - 2V～6V で動作
  - 優れたノイズ耐性:N_{IL} = V_{CC} の 30%、N_{IH} = V_{CC} の 30% (VCC = 5V の場合)
- HCT タイプ
  - 4.5V～5.5V で動作
  - LSTTL 入力ロジックと直接互換、V_{IL} = 0.8V (最大値)、V_{IH} = 2V (最小値)
  - CMOS 入力互換、V_{OL}、V_{OH} で $I_I \leq 1\mu A$

2 概要

CDx4HC243 および CDx4HCT243 は 3 ステート出力のクワッド・バス・トランシーバです。OEA と $\overline{OEB}$ 入力により、高インピーダンス状態と、デバイスを介した通信方向の両方を制御します。

7 Detailed Description

7.1 Overview

The CDx4HC243 and CDx4HCT243 silicon-gate CMOS three-state bidirectional noninverting buffers are intended for two-way asynchronous communication between data buses. They have high-drive-current outputs that enable high-speed operation when driving large bus capacitances. These circuits possess the low power dissipation of CMOS circuits and have speeds comparable to low-power Schottky TTL circuits. They can drive 15 LSTTL loads.

The states of the output-enable ($\overline{OEB}$, OEA) inputs determine both the direction of flow (A to B, B to A), and the three-state mode.

7.2 Functional Block Diagram

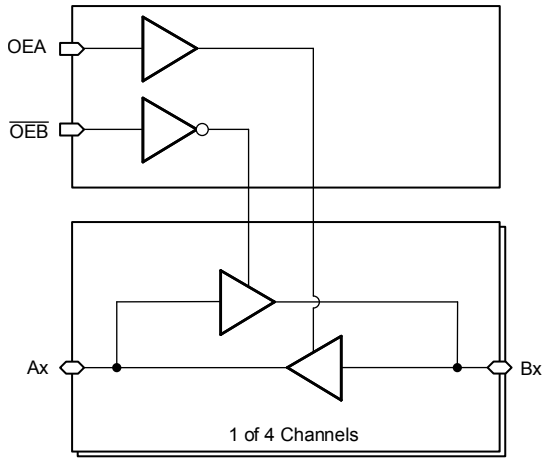

図 7-1. Functional Diagram

7.3 Device Functional Modes

表 7-1. Truth Table[(1)(2)]

Control Inputs		HC, HCT243 Series	
		Data port status	
$\overline{OEB}$	OEA	An	Bn
H	H	O	I
L	H	Z	Z
H	L	Z	Z
L	L	I	O

(1) H = High voltage level. L = Low voltage level. I = Input. O = Output (Same level as input). Z = High Impedance

(2) To prevent excess currents in the High Z modes all I/O terminals hsould be terminated with 10kΩ to 1MΩ resistors.

8 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Recommended Operating Conditions*. Each V_{CC} terminal should have a good bypass capacitor to prevent power disturbance. A 0.1-µF capacitor is recommended for this device. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The 0.1-µF and 1-µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results.

9 Layout

9.1 Layout Guidelines

When using multiple-input and multiple-channel logic devices inputs must not ever be left floating. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such unused input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a logic high or logic low voltage, as defined by the input voltage specifications, to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, the inputs are tied to GND or V_{CC}, whichever makes more sense for the logic function or is more convenient.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
