

# INA791x 75A EZShunt™ テクノロジー搭載、-4V~110V、双方向、超高精度、高帯域電流センス アンプ

## 1 特長

- シャント抵抗内蔵の高精度ソリューション
  - 25°Cで±75Aの連続電流
  - 40°C~+125°Cで±50Aの連続電流
  - シャント抵抗:400μΩ
  - シャントインダクタンス:2nH
- 広い同相電圧範囲:-4V~+110V
- 高い小信号帯域幅:1MHz
- 非常に優れたCMRR
  - 160dBのDC CMRR
  - 100kHzで104dBのAC CMRR
- 高い測定精度
  - システムゲイン誤差(最大値)
    - バージョンA:±0.35%、±35ppm/°Cのドリフト
    - バージョンB:±1%、±75ppm/°Cのドリフト
  - オフセット電流(最大値)
    - バージョンA:±30mA、±625μA/°Cのドリフト
    - バージョンB:±375mA、±1.25mA/°Cのドリフト
- 外付けの分圧抵抗回路でゲインを調整可能:
  - 20mV/A~400mV/A
- 160°CのT<sub>J</sub>のオープンドレイン温度アラート
- パッケージオプション:VQFN-15

## 2 アプリケーション

- 48V DC/DC コンバータ
- 48V バッテリー管理システム (BMS)
- 試験 / 測定
- マクロリモート無線ユニット (RRU)
- 48V ラック サーバー
- 48V 商用ネットワーク / サーバー電源 (PSU)

代表的なアプリケーション

## 3 概要

INA791x は、400μΩ のシャント抵抗を内蔵した電圧出力、電流センス アンプです。INA791x は、電源電圧にかかわらず、-4V~110V の広い同相電圧範囲で双方向の電流を監視するよう設計されています。可変ゲイン オプションは、システムのダイナミックレンジの最適化に役立ちます。ケルビン接続シャント抵抗とゼロドリフトのチョップアンプを内蔵しているため、較正と等価の測定精度、35ppm/°Cという非常に低い温度ドリフト係数、センシング抵抗に最適化されたレイアウトが実現されています。

このデバイスは 2.7V~5.5V の単一電源で動作し、消費電流は最大 3.75mA です。どのバージョンも、拡張動作温度範囲 (-40°C~+125°C) で動作が規定され、15 ピン VQFN パッケージで供給されます。

### パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ(2)
INA791A, INA791B	DEK (VQFN, 15)	6mm × 6mm

- 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。
- パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

## 4 Pin Configuration and Functions

図 4-1. INA791x DEK Package 15-Pin VQFN Top View

表 4-1. Pin Functions

PIN		Type	DESCRIPTION
NAME	NO.		
ALERT	14	Digital Out	Open-drain temperature alert
FB	12	Analog Input	Gain adjustment feedback; connect to resistor divider to adjust device gain
GND	5	Analog	Ground
IN-	9	Analog Input	Kelvin connection to internal shunt on load side and negative amplifier input
IN+	1	Analog Input	Kelvin connection to internal shunt on supply side and positive amplifier input
IS-	8	Analog Input	Connect to load
IS+	15	Analog Input	Connect to supply
NC	2	–	Connect to IN+ (Pin 1)
NC	4, 6, 7	–	Connect to ground or leave unconnected
NC	10	–	Connect to IN- (Pin 9)
OUT	11	Analog Output	Output voltage
REF	13	Analog Input	Reference voltage, 0V to VS
VS	3	Analog	Power supply, 2.7V to 5.5V

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage ( $V_s$ )			6	V
Analog Inputs, $V_{IN+}$ , $V_{IN-}$ <sup>(2)</sup>	Differential ( $V_{IN+}$ ) - ( $V_{IN-}$ )	-12	12	V
	Common-mode	GND – 20	120	V
Analog input (REF)	Analog input (REF)	GND – 0.3	$V_s + 0.3$	V
Analog input (FB)	Analog input (FB)	GND – 0.3	$V_s + 0.3$	V
Analog output (OUT)	Analog output (OUT)	GND – 0.3	$V_s + 0.3$	V
Digital output (ALERT)	Temperature Alert Output	GND – 0.3	$V_s + 0.3$	V
$T_A$	Operating Temperature	-55	150	°C
$T_J$	Junction temperature		150	°C
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2)  $V_{IN+}$  and  $V_{IN-}$  are the voltages at the IN+ and IN– pins, respectively.

### 5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{CM}$	Common-mode input range	-4		110	V
$V_s$	Operating supply range	2.7		5.5	V
$I_{SENSE}$	Continuous Current	-50		50	A
$V_{REF}$	Reference voltage range	0		$V_s$	V
$V_{FB}$	Feed-back voltage range	0		$V_s$	V
$T_A$	Ambient temperature	-40		125	°C

### 5.4 Thermal Information

## 6 Detailed Description

### 6.1 Overview

The INA791x features a precision current sensing solution with 400 $\mu\Omega$  current-sensing EZShunt™ technology resistor and supports common-mode voltages up to 110V. The internal amplifier features a precision zero-drift topology with excellent common-mode rejection ratio (CMRR). High-precision measurements are enabled by matching the shunt resistor value and the current-sensing amplifier gain across temperature, thus providing a highly-accurate, system-calibrated method for measuring current. The high-speed current-sensing amplifier helps output settle fast after the common-mode transients. Flexibility of adjustable gain with two external resistors allows for the optimization of the desired full-scale output voltage based on the target current range expected in the application.

### 6.2 Functional Block Diagram

### 6.3 Feature Description

#### 6.3.1 Integrated Shunt Resistor

The INA791x features an integrated EZShunt™ technology current-sensing resistor that provides accurate measurements over the entire specified temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . The integrated current-sensing resistor provides measurement stability over temperature, and simplifies printed circuit board (PCB) layout and board constraint difficulties common in high-precision measurements.

The onboard current-sensing resistor is designed as a 4-wire (or Kelvin) connected resistor that enables accurate measurements through a force-sense connection. Internally connected amplifier input pins (IN– and IN+) to the sense pins of the shunt resistor eliminates many instances of parasitic impedance commonly found in typical very-low sensing-resistor level measurements. The INA791x is system-calibrated to make sure that the current-sensing resistor and current-sensing amplifier are both precisely matched to one another. The in-package integrated sensing resistor must be used with the internal current-sensing amplifier to achieve the optimized system gain specification.

The INA791x has approximately 550 $\mu\Omega$  of package resistance. Of this total package resistance, 400 $\mu\Omega$  resistance from the Kelvin-connected current-sensing resistor is used by the amplifier. The power dissipation requirements of the system and package are based on the total 550 $\mu\Omega$  package resistance between the IS+ and IS– pins.

**図 6-1. IS+ to IS- Package Resistance vs Temperature**

### 6.3.2 Safe Operating Area

The heat dissipated across the package when current flows through the device ultimately determines the maximum current that can be safely handled by the package. The current consumption of the silicon is relatively low, leaving the total package resistance to carry the high load current as the primary contributor to the total power dissipation of the package. The maximum safe-operating current level shown in [図 6-2](#) is set to make sure that the heat dissipated across the package is limited so that no damage occurs to the resistor or the package, or that the internal junction temperature of the silicon does not exceed a 165°C limit.

External factors, such as ambient temperature, external air flow, and PCB layout, contribute to how effectively the device dissipates heat. The internal heat is developed as a result of the current flowing through the total package resistance of 550μΩ.

**図 6-2. Maximum Continuous Current vs Ambient Temperature**

### 6.3.3 Short-Circuit Duration

The INA791x features a physical shunt resistance that is able to withstand current levels higher than the continuous handling limit of 50A without sustaining damage to the current-sensing resistor or the current-sensing amplifier, if the excursions are brief. [図 6-3](#) shows the short-circuit duration curve for the INA791x.

**Figure 6-3. Maximum Pulse Current vs Pulse Duration (Single Event)**

### 6.3.4 Temperature Stability

System calibration is common for many industrial applications to eliminate initial component and system-level errors that can be present. A system-level calibration reduces the initial accuracy requirement for many of the individual components because the errors associated with these components are effectively eliminated through the calibration procedure. This calibration enables precise measurements at the temperature in which the system is calibrated. As the system temperature changes because of external ambient changes or self heating, measurement errors are reintroduced. Without accurate temperature compensation used in addition to the initial adjustment, the calibration procedure is not effective. The user must account for temperature-induced changes. The built-in programmed temperature compensation in the INA791x (including both the integrated current-sensing resistor and current-sensing amplifier) keep the device measurement accurate, even when the temperature changes throughout the specified temperature range of the device.

## 6.4 Device Functional Modes

### 6.4.1 Adjusting the Output With the Reference Pin

The INA791x output is configurable to allow for unidirectional or bidirectional operation. Figure 6-4 shows a circuit for setting output with an external reference.

图 6-4. Adjusting the Output

The output voltage is set by applying a voltage from an external reference at REF. The reference input is connected to internal gain network. The external resistor network of  $R_{FB1}$  and  $R_{FB2}$ , connected to OUT, FB and REF pins, set up adjustable gain as explained in [Adjustable Gain Set Using External Resistors](#). Output is set accurately at the voltage provided by external reference as shown in 式 1 when the resistor  $R_{FB2}$  is connected to the same voltage as REF pin. The voltage at REF pin can range between supply  $V_S$  and GND. For symmetric bidirectional current sensing REF is set at mid-supply which sets out at mid-supply as well.

$$V_{OUT} = G \times (I_{SHUNT}) + V_{REF} \quad (1)$$

#### 6.4.1.1 Reference Pin Connections for Unidirectional Current Measurements

Unidirectional operation allows current measurements through a resistive shunt in one direction. For unidirectional operation, connect the device reference pin to the negative rail (see the [Ground Referenced Output](#) section) or positive rail,  $V_S$ . The required differential input polarity depends on the output voltage setting. The amplifier output moves away from the referenced rail proportional to the current passing through the internal shunt resistor.

#### 6.4.1.2 Ground Referenced Output

When using the INA791x in unidirectional mode with a ground-referenced output, both REF input and resistor  $R_{FB2}$  are connected to ground. 图 6-5 shows how this configuration takes the output to ground when there is 0A flowing across the internal shunt.

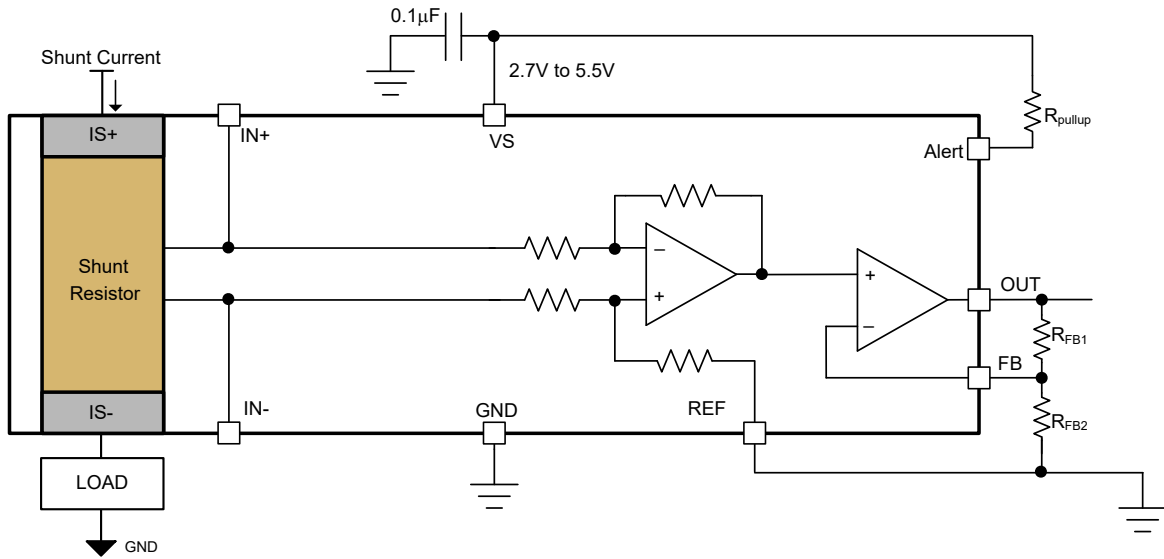

図 6-5. Ground-Referenced Output

#### 6.4.1.3 Reference Pin Connections for Bidirectional Current Measurements

Bidirectional operation allows the INA791x to measure currents through a resistive shunt in two directions. For this case, set the output voltage anywhere within the reference input limits. A common configuration is to set the reference inputs at half-scale for equal range in both directions. However, the reference input can be set to a voltage other than half-scale when the bidirectional current is nonsymmetrical.

#### 6.4.1.4 Output Set to Mid-Supply Voltage

図 6-6 shows two equal resistors  $R_1$  and  $R_2$  connected between VS and the GND pins divide the supply at half, and by connecting REF pin to the divided supply, output is set to mid-supply voltage. The mid-point of these resistors is buffered using external operational amplifier to avoid loading of resistors resulting in error. The output is set to middle of the supply when there is no differential input voltage or 0A current in shunt resistor. This method creates a ratiometric offset to the supply voltage, where the output voltage remains at  $VS / 2$  when 0A of current flows through internal shunt resistor.

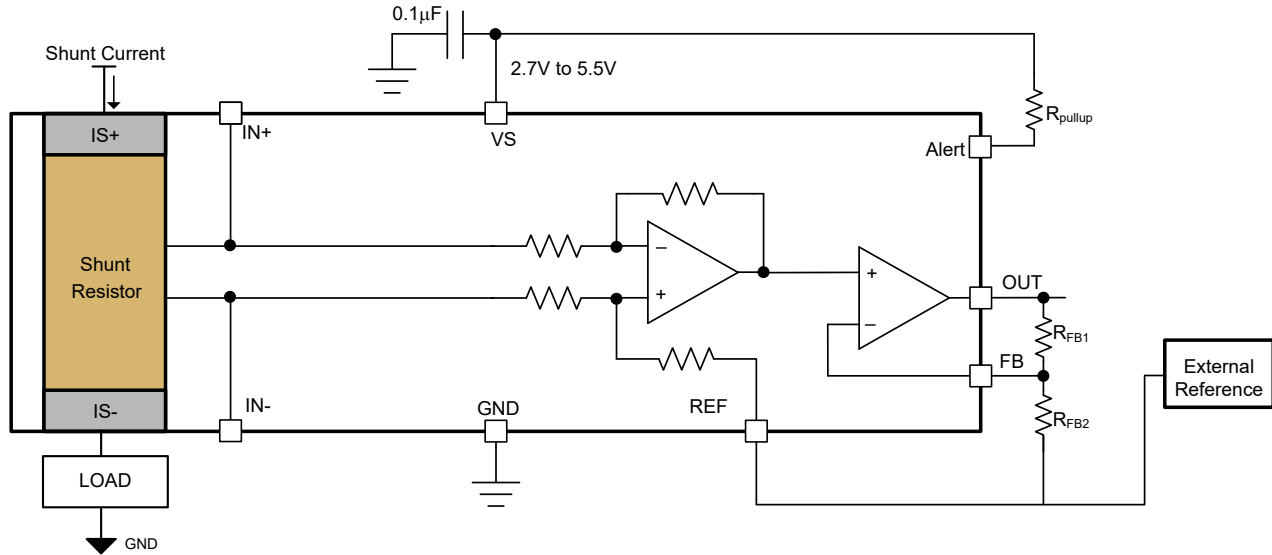

図 6-6. Mid-Supply Voltage Output

### 6.4.2 Adjustable Gain Set Using External Resistors

The INA791x features adjustable gain with two external resistor network. The default gain is 20mV/A, and with added external adjustable gain resistor network, total gain (G) can range up to 400mV/A. [図 6-7](#) shows two external resistors  $R_{FB1}$  and  $R_{FB2}$  configured for added external gain. [式 2](#) can be used for calculating external adjustable gain and [式 3](#) shows the total gain of the system with external adjustable gain. The REF pin and one end of resistor  $R_{FB2}$  is connected to external reference based on needed voltage at OUT pin as described in [Adjusting the Output With the Reference Pin](#).

**図 6-7. Adjustable Gain Setting With External Resistor Divider**

$$\text{Adjustable Gain} = \left( 1 + \frac{R_{FB1}}{R_{FB2}} \right) \quad (2)$$

$$G = 20 \frac{\text{mV}}{\text{V}} \times \left( 1 + \frac{R_{FB1}}{R_{FB2}} \right) \quad (3)$$

The FB pin in INA791x has associated bias current, which can add to error when large values of adjustable gain resistor,  $R_{FB1}$ , is used. Alternatively, very low values of adjustable gain resistors load the output of the sense amplifier limiting the capability of the sense amplifier to get close to the supply rail. Keeping the sum of external resistors  $R_{FB1}$  and  $R_{FB2}$  between 10kΩ and 40kΩ is recommended when external adjustable gain is higher than 1. [表 6-1](#) shows recommended values of external gain resistors for the most common gains.

**表 6-1. Recommended Values of External Resistors Setting Adjustable Gain**

External Adjustable Gain	$R_{FB1}$	$R_{FB2}$	Total Gain (G)
1	0Ω (short)	Open	20mV/A
2	20kΩ	20kΩ	40mV/A
4	30kΩ	10kΩ	80mV/A
5	20kΩ	5kΩ	100mV/A

#### 6.4.2.1 Adjustable Unity Gain

[図 6-8](#) shows adjustable gain set to unity gain or 1. In this configuration OUT is connected to FB without any external resistor. This unity gain sets INA791x to default minimum gain of 20mV/A. [式 3](#) can be used to calculate the total gain of the system. The REF pin is connected to external reference based on needed output voltage setting as described in [Adjusting the Output With the Reference Pin](#).

Figure 6-8. Adjustable Unity Gain Setting

### 6.4.3 Thermal Alert Function

The INA791x has thermal Alert function that provides an alert when internal shunt temperature reaches 160°C. The power dissipation as a result of internal shunt current causes the temperature to rise inside the package. Extended time at temperature higher than 150°C can cause permanent shift in device specification. Thermal alert function can be used to keep the temperature of INA791x below 150°C. Figure 6-9 shows a circuit where  $R_{pullup}$  resistor is tied between open-drain Alert pin and the supply pin. When temperature of the INA791x reaches 160°C, the open-drain FET pulls Alert pin to the ground asserting thermal alert.

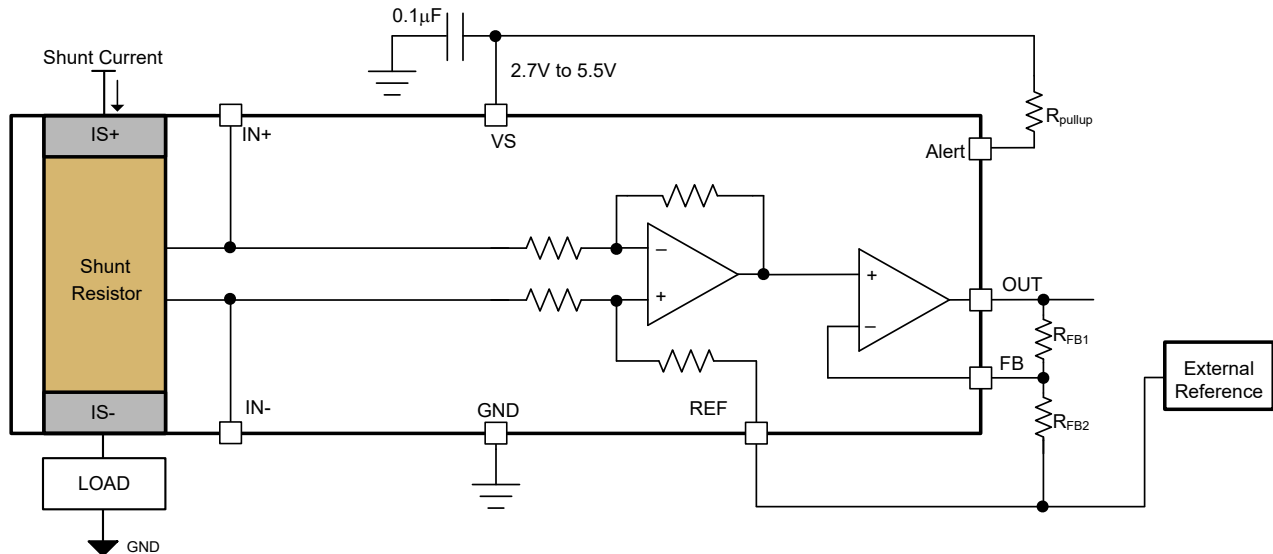

Figure 6-9. Thermal Alert Function

## 7 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 7.1 Application Information

The INA791x measures the voltage developed as current flows across the integrated current shunt. The device provides a reference pin to configure operation as either unidirectional or bidirectional output swing. When using the INA791x for inline motor current sense or measuring current in an H-bridge, the device is commonly configured for bidirectional operation.

#### 7.1.1 Calculating Total Error

The INA791x electrical specifications [Electrical Characteristics](#) include typical individual errors terms (such as gain error, offset error, and nonlinearity error). Total error, including all of these individual error components, is not specified in the table. To accurately calculate the expected error of the device, the user must first know the device operating conditions. This section discusses the individual error sources and how the device total error value can be calculated from the combination of these errors for specific conditions.

Three examples are provided in [表 7-1](#), [表 7-2](#), and [表 7-3](#) that detail how different operating conditions can affect the total error calculations. Typical and maximum calculations are shown as well to provide the user more information on how much error variance is present from device to device.

##### 7.1.1.1 Error Sources

The typical error sources that have the largest effect on the total error of the device are gain error, nonlinearity, common-mode rejection ratio, and input offset error. For the INA791x, an additional error source (referred to as the *reference voltage rejection ratio*) is also included in the total error value.

##### 7.1.1.2 Reference Voltage Rejection Ratio Error

Reference voltage rejection ratio refers to the amount of error induced by applying a reference voltage to the INA791x that deviates from the mid-point of the device supply voltage.

##### 7.1.1.3 External Adjustable Gain Error

The INA791x features external adjustable gain with two external resistors as described in [Adjustable Gain Set Using External Resistors](#). The tolerance of these external resistors contribute to the total gain error of the system. These resistors are recommended to be of same kind so that temperature drift of these resistor track closely. [式 4](#) can be used for calculating total error contributed by two external gain resistors.

$$\text{Error}_{G\_R} = \sqrt{2} \times \text{Resistor}_{\text{Tolerance}} + \text{Resistor}_{\text{drift}} \times \Delta T \quad (4)$$

##### 7.1.1.4 Total Error Example 1

表 7-1. Total Error Calculation: Example 1<sup>(1)</sup>

TERM	SYMBOL	EQUATION	TYPICAL VALUE
Initial input offset with Temp drift	$I_{OS\_T}$	$I_{OS} + \frac{dI_{OS}}{dT} \times \Delta T$	30mA
Added input offset because of common-mode voltage	$I_{OS\_CM}$	$CMRR \times  (V_{CM} - 48V) $	0μA
Added input offset because of reference voltage	$I_{OS\_REF}$	$RVRR \times \left  \left( \frac{V_S}{2} - V_{REF} \right) \right $	0μA

表 7-1. Total Error Calculation: Example 1<sup>(1)</sup> (続き)

TERM	SYMBOL	EQUATION	TYPICAL VALUE
Total input offset Current	$I_{OS\_Total}$	$\sqrt{(I_{OS\_T})^2 + (I_{OS\_CM})^2 + (I_{OS\_REF})^2}$	30mA
Error from input offset	$Error_{I_{OS}}$	$\frac{I_{OS\_Total}}{I_{Sense}} \times 100$	0.12%
Gain error with Gain drift	$Error_G$	$G_{Error} + G_{Error\_drift} \times \Delta T$	0.35%
Nonlinearity error	$Error_{Lin}$	—	0.01%
<b>Total error</b>	—	$\sqrt{(Error_{I_{OS}})^2 + (Error_G)^2 + (Error_{Lin})^2}$	0.38%

(1) The data for **Total Error Example 1** was taken with the INA791x,  $V_S = 5V$ ,  $V_{CM} = 48V$ ,  $V_{REF} = V_S / 2$ ,  $T = 25^\circ C$ , External Unity Gain ( $G = 20mV/A$ ) and  $I_{SENSE} = 25A$ .

### 7.1.1.5 Total Error Example 2

表 7-2. Total Error Calculation: Example 2<sup>(1)</sup>

TERM	SYMBOL	EQUATION	TYPICAL VALUE
Initial input offset with Temp drift	$I_{OS\_T}$	$I_{OS} + \frac{dI_{OS}}{dT} \times \Delta T$	92.5mA
Added input offset because of common-mode voltage	$I_{OS\_CM}$	$CMRR \times  (V_{CM} - 48V) $	2.8mA
Added input offset because of reference voltage	$I_{OS\_REF}$	$RVRR \times \left  \left( \frac{V_S}{2} - V_{REF} \right) \right $	31.25mA
Total input offset Current	$I_{OS\_Total}$	$\sqrt{(I_{OS\_T})^2 + (I_{OS\_CM})^2 + (I_{OS\_REF})^2}$	97.67mA
Error from input offset	$Error_{I_{OS}}$	$\frac{I_{OS\_Total}}{I_{Sense}} \times 100$	0.39%
Gain error with Gain drift	$Error_G$	$G_{Error} + G_{Error\_drift} \times \Delta T$	0.7%
Nonlinearity error	$Error_{Lin}$	—	0.01%
<b>Total error</b>	—	$\sqrt{(Error_{I_{OS}})^2 + (Error_G)^2 + (Error_{Lin})^2}$	0.8%

(1) The data for **Total Error Example 2** was taken with the INA791x,  $V_S = 5V$ ,  $V_{CM} = 12V$ ,  $V_{REF} = 0V$ ,  $T = 125^\circ C$ , External Unity Gain ( $G = 20mV/A$ ) and  $I_{SENSE} = 25A$ .

### 7.1.1.6 Total Error Example 3

表 7-3. Total Error Calculation: Example 3<sup>(1)</sup>

TERM	SYMBOL	EQUATION	TYPICAL VALUE
Initial input offset with Temp drift	$I_{OS\_T}$	$I_{OS} + \frac{dI_{OS}}{dT} \times \Delta T$	92.5mA
Added input offset because of common-mode voltage	$I_{OS\_CM}$	$CMRR \times  (V_{CM} - 48V) $	2.8mA
Added input offset because of reference voltage	$I_{OS\_REF}$	$RVRR \times \left  \left( \frac{V_S}{2} - V_{REF} \right) \right $	31.25mA
Total input offset Current	$I_{OS\_Total}$	$\sqrt{(I_{OS\_T})^2 + (I_{OS\_CM})^2 + (I_{OS\_REF})^2}$	97.67mA
Error from input offset	$Error_{I_{OS}}$	$\frac{I_{OS\_Total}}{I_{Sense}} \times 100$	0.39%
Gain error with Gain drift	$Error_G$	$G_{Error} + G_{Error\_drift} \times \Delta T$	0.7%
Nonlinearity error	$Error_{Lin}$	—	0.01%

表 7-3. Total Error Calculation: Example 3<sup>(1)</sup> (続き)

TERM	SYMBOL	EQUATION	TYPICAL VALUE
External Gain Resistor Error + Drift	Error <sub>G_R</sub>	式 4	0.6%
Total error	—	$\sqrt{(\text{Error}_{\text{IOS}})^2 + (\text{Error}_{\text{G\_R}})^2 + (\text{Error}_{\text{G}})^2 + (\text{Error}_{\text{Lin}})^2}$	1.01%

(1) The data for *Total Error Example 3* was taken with the INA791x, V<sub>S</sub> = 5V, V<sub>CM</sub> = 12V, V<sub>REF</sub> = 0V, T = 125°C, External Gain = 4 (Total Gain = 80mV/A), External Resistor Tolerance = 0.25%, External Resistor Drift = 25ppm/°C and I<sub>SENSE</sub> = 25A.

## 7.2 Typical Applications

The INA791x offers advantages for multiple applications including the following:

- High common-mode range and excellent CMRR enables direct inline sensing
- Precision low-inductive, low-drift shunt eliminates the need for overtemperature system calibration
- Ultra-low offset and drift eliminates the necessity of calibration
- Wide supply range enables a direct interface with most microprocessors

### 7.2.1 High-Side, High-Drive, Solenoid Current-Sense Application

Challenges exist in solenoid drive current sensing that are similar to those in motor inline current sensing. In certain topologies, the current-sensing amplifier is exposed to the full-scale PWM voltage between ground and supply. The INA791x is an excellent choice for this type of application. The 400μΩ integrated shunt with a total system accuracy of 0.35% with a total system drift of 35ppm/°C provides system accuracy across temperature eliminating the need for system calibration at multiple temperatures.

図 7-1. Solenoid Drive Application Circuit

#### 7.2.1.1 Design Requirements

For this application, the INA791x measures current in the driver circuit of a 12V, 500mA hydraulic valve.

**表 7-4. Design Parameters**

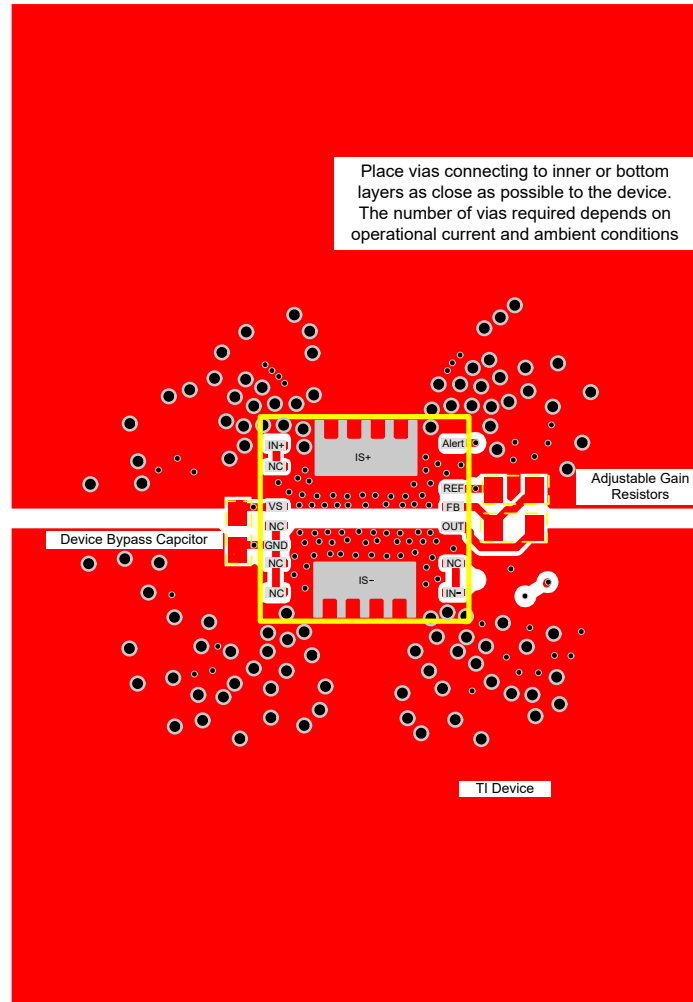

DESIGN PARAMETER	EXAMPLE VALUE
Common-mode voltage	12V
Maximum sense current	500mA
Power-supply voltage	3.3V

## 8 Power Supply Recommendations

The INA791x makes accurate measurements beyond the connected power-supply voltage ( $V_S$ ) because the inputs (IN+ and IN–) operate anywhere between  $-4V$  and  $+110V$ , independent of  $V_S$ . For example, the  $V_S$  power supply equals 5V and the common-mode voltage of the measured shunt can be as high as 110V. Although the common-mode voltage of the input can be beyond the supply voltage, the output voltage range of the INA791x is constrained to the supply voltage.

Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1  $\mu F$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies. If the INA791x output is set to mid-supply, then take extreme care to minimize noise on the power supply.

## 9 Layout Example

9-1. INA791x Layout Example

## 10 Layout Guidelines

- This device is specified for current handling of up to 50A over the entire  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  temperature range using a 2oz copper pour for the input power plane, as well as no external airflow passing over the device.
- The primary current-handling limitation for this device is how much heat is dissipated inside the package. Efforts to improve heat transfer out of the package and into the surrounding environment improve the ability of the device to handle currents of up to 50A over a wider temperature range.
- Heat transfer improvements primarily involve larger copper power traces and planes with increased copper thickness (2oz.), as well as providing airflow to pass over the device. Thermal vias help spread the current and power dissipated over multiple board layers. The INA791x evaluation module (EVM) features a 2oz copper pour for the planes, and is capable of supporting 50A at temperatures up to  $125^{\circ}\text{C}$ .
- The bypass capacitor must be placed close to device ground and supply pins, but can be moved farther out if needed to avoid cutting thermal planes. The recommended value of this bypass capacitor is  $0.1\mu\text{F}$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PINA791BIDEKR	ACTIVE	VQFN	DEK	15	4000	TBD	Call TI	Call TI	-40 to 125		Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
