

ISO1042 70Vバス障害保護機能付き、フレキシブル・データレート対応の絶縁型CANトランシーバ

1 特長

- ISO 11898-2:2016 および ISO 11898-5:2007 物理層規格に準拠
- 最大 1Mbps の Classic CAN、最大 5Mbps の FD (フレキシブル・データレート) に対応
- 短いループ遅延時間: 152ns
- 保護機能
 - DC バス障害保護電圧: $\pm 70V$
 - バス・ピンの HBM ESD 耐性: $\pm 16kV$
 - ドライバ優先タイムアウト(TXD DTO)
 - V_{CC1} および V_{CC2} の低電圧保護機能
- 同相電圧範囲: $\pm 30V$
- 無電源時の理想的なパッシブ動作、高インピーダンスのバス端子
- 高いCMTI: 100kV/ μs
- V_{CC1} 電圧範囲: 1.71V \sim 5.5V
 - CANコントローラへの1.8V、2.5V、3.3V、5.0V ロジック・インターフェイス
- V_{CC2} 電圧範囲: 4.5V \sim 5.5V
- 堅牢な電磁環境適合性(EMC)
 - システム・レベルでの ESD、EFT、サージ耐性
 - 低い放射
- 周囲温度範囲: $-40^{\circ}C \sim +125^{\circ}C$
- 16-SOIC および 8-SOIC パッケージ・オプション
- 車載用バージョンも提供: [ISO1042-Q1](#)
- 安全関連の認定
 - DIN VDE V 0884-11:2017-01に準拠した 7071V_{PK} V_{IOTM}/1500V_{PK} V_{IORM} (強化絶縁型/基本絶縁型)
 - UL1577に準拠した絶縁耐圧: 5000V_{RMS} (1分間)
 - IEC 60950-1、IEC 60601-1、EN 61010-1認定
 - CQC、TUV、CSA 認定

2 アプリケーション

- AC およびサーボ・ドライブ
- 太陽光インバータ
- PLC および DCS 通信モジュール
- エレベータ/エスカレータ
- 産業用電源
- バッテリー充電 / 管理

3 概要

ISO1042デバイスは、ISO11898-2 (2016)規格に準拠したガルバニック絶縁のコントローラ・エリア・ネットワーク (CAN)トランシーバです。 $\pm 70V$ のDCバス障害保護機能を搭載し、 $\pm 30V$ の同相電圧範囲に対応しています。CAN FDモードで最高5Mbpsのデータレートに対応するため、Classic CANよりはるかに高速にペイロードを伝送できます。耐圧5000V_{RMS}の二酸化ケイ素(SiO₂)絶縁膜を採用しており、1060V_{RMS}の動作電圧を実現しています。電磁環境適合性が大幅に強化されているため、システム・レベルのESD、EFT、サージ、放射の規格に準拠できます。絶縁型電源と組み合わせて使用した場合、高電圧に対して保護し、バスからのノイズ電流がローカル・グラウンドに入り込むことを防止できます。ISO1042デバイスには基本絶縁型と強化絶縁型があります(強化絶縁型と基本絶縁型のオプションを参照)。ISO1042デバイスは $-40^{\circ}C \sim +125^{\circ}C$ の広い周囲温度範囲に対応し、SOIC-16 (DW)パッケージおよび小型のSOIC-8 (DWV)パッケージで供給されます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
ISO1042	SOIC (8)	5.85mmx7.50mm
	SOIC (16)	10.30mmx7.50mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

強化絶縁型と基本絶縁型のオプション

機能	ISO1042x	ISO1042Bx
保護レベル	強化	基本
サージ・テスト電圧	10000V _{PK}	6000V _{PK}
定格絶縁電圧	5000V _{RMS}	5000V _{RMS}
動作電圧	1060V _{RMS} /1500V _{PK}	1060V _{RMS} /1500V _{PK}

5 Pin Configuration and Functions

Pin Functions—16 Pins

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V _{CC1}	—	Digital-side supply voltage, Side 1
2	GND1	—	Digital-side ground connection, Side 1
3	TXD	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states)
4	NC	—	Not connected
5	RXD	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states)
6	NC	—	Not connected
7	NC	—	Not connected
8	GND1	—	Digital-side ground connection, Side 1
9	GND2	—	Transceiver-side ground connection, Side 2
10			
11	V _{CC2}	—	Transceiver-side supply voltage, Side 2. Must be externally connected to pin 16.
12	CANL	I/O	Low-level CAN bus line
13	CANH	I/O	High-level CAN bus line
14	NC	—	Not connected
15	GND2	—	Transceiver-side ground connection, Side 2
16	V _{CC2}	—	Transceiver-side supply voltage, Side 2. Must be externally connected to pin 11.

Pin Functions—8 Pins

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V _{CC1}	—	Digital-side supply voltage, Side 1
2	TXD	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states)
3	RXD	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states)
4	GND1	—	Digital-side ground connection, Side 1
5	GND2	—	Transceiver-side ground connection, Side 2
6	CANL	I/O	Low-level CAN bus line
7	CANH	I/O	High-level CAN bus line
8	V _{CC2}	—	Transceiver-side supply voltage, Side 2

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
V _{CC1}	Supply voltage, side 1	-0.5	6	V
V _{CC2}	Supply voltage, side 2	-0.5	6	V
V _{IO}	Logic input and output voltage range (TXD and RXD)	-0.5	V _{CC1} +0.5 ⁽³⁾	V
I _O	Output current on RXD pin	-15	15	mA
V _{BUS}	Voltage on bus pins (CANH, CANL)	-70	70	V
V _{BUS_DIFF}	Differential voltage on bus pins (CANH-CANL)	-70	70	V
T _J	Junction temperature	-40	150	°C
T _{STG}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge Human body model (HBM), per ANSI/ESDA/JEDEC JS-001	All pins ⁽¹⁾	±6000	V
		CANH and CANL to GND2 ⁽¹⁾	±16000	V
	Electrostatic discharge Charged device model (CDM), per JEDEC specification JESD22-C101	All pins ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Transient Immunity

	PARAMETER	TEST CONDITIONS	VALUE	UNIT
V _{PULSE}	ISO7637-2 Transients according to GIFT - ICT CAN EMC test specification	Pulse 1; CAN bus terminals (CANH, CANL) to GND2	-100	V
		Pulse 2; CAN bus terminals (CANH, CANL) to GND2	75	V
		Pulse 3a; CAN bus terminals (CANH, CANL) to GND2	-150	V
		Pulse 3b; CAN bus terminals (CANH, CANL) to GND2	100	V

6.4 Recommended Operating Conditions

		MIN	MAX	UNIT
V _{CC1}	Supply Voltage, Side 1, 1.8-V operation	1.71	1.89	V
	Supply Voltage, Side 1, 2.5-V, 3.3-V and 5.5-V operation	2.25	5.5	V
V _{CC2}	Supply Voltage, Side 2	4.5	5.5	V
T _A	Operating ambient temperature	-40	125	°C

6.5 Thermal Information

THERMAL METRIC ⁽¹⁾		ISO1042		UNIT
		DW (SOIC)	DWV (SOIC)	
		16 PINS	8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	69.9	100	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	31.8	40.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	29.0	51.8	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	13.2	16.8	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	28.6	49.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	-	-	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.6 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _D	Maximum power dissipation (both sides)	See Figure 17 , V _{CC1} = V _{CC2} = 5.5 V, T _J = 150°C, R _L = 50 Ω, A repetitive pattern on TXD with 1 ms time period, 990 μs LOW time, and 10 μs HIGH time.			385	mW
P _{D1}	Maximum power dissipation (side-1)	See Figure 19 , V _{CC1} = V _{CC2} = 5.5 V, T _J = 150°C, R _L = 50 Ω, Input a 2-V pk-pk 2.5-MHz 50% duty cycle differential square wave on CANH-CANL			25	mW
P _{D2}	Maximum power dissipation (side-2)	See Figure 17 , V _{CC1} = V _{CC2} = 5.5 V, T _J = 150°C, R _L = 50 Ω, A repetitive pattern on TXD with 1 ms time period, 990 μs LOW time, and 10 μs HIGH time.			360	mW

6.7 Insulation Specifications

PARAMETER		TEST CONDITIONS	SPECIFICATIONS		UNIT
			DW-16	DWV-8	
IEC 60664-1					
CLR	External clearance ⁽¹⁾	Side 1 to side 2 distance through air	>8	>8.5	mm
CPG	External Creepage ⁽¹⁾	Side 1 to side 2 distance across package surface	>8	>8.5	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	>17	>17	µm
CTI	Comparative tracking index	IEC 60112; UL 746A	>600	>600	V
	Material Group	According to IEC 60664-1	I	I	
	Overvoltage category	Rated mains voltage ≤ 600 V _{RMS}	I-IV	I-IV	
		Rated mains voltage ≤ 1000 V _{RMS}	I-III	I-III	
DIN VDE V 0884-11:2017-01⁽²⁾					
V _{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	1500	1500	V _{PK}
V _{IOWM}	Maximum isolation working voltage	AC voltage (sine wave); time-dependent dielectric breakdown (TDDB) test;	1060	1060	V _{RMS}
		DC voltage	1500	1500	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification); V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production)	7071	7071	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ISO1042 ⁽³⁾	Test method per IEC 62368-1, 1.2/50 µs waveform, V _{TEST} = 1.6 × V _{IOSM} = 10000 V _{PK} (qualification)	6250	6250	V _{PK}
	Maximum surge isolation voltage ISO1042B ⁽³⁾	Test method per IEC 62368-1, 1.2/50 µs waveform, V _{TEST} = 1.3 × V _{IOSM} = 6000 V _{PK} (qualification)	4615	4615	V _{PK}
q _{pd}	Apparent charge ⁽⁴⁾	Method a: After I/O safety test subgroup 2/3, V _{ini} = V _{IOTM} , t _{ini} = 60 s; V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10 s	≤ 5	≤ 5	pC
		Method a: After environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s; ISO1042: V _{pd(m)} = 1.6 × V _{IORM} , t _m = 10 s; ISO1042B: V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10 s	≤ 5	≤ 5	
		Method b1: At routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s; ISO1042: V _{pd(m)} = 1.875 × V _{IORM} , t _m = 1 s; ISO1042B: V _{pd(m)} = 1.5 × V _{IORM} , t _m = 1 s	≤ 5	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁵⁾	V _{IO} = 0.4 × sin (2 πft), f = 1 MHz	1	1	pF
R _{IO}	Insulation resistance, input to output ⁽⁵⁾	V _{IO} = 500 V, T _A = 25°C	> 10 ¹²	> 10 ¹²	Ω
		V _{IO} = 500 V, 100°C ≤ T _A ≤ 150°C	> 10 ¹¹	> 10 ¹¹	
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	> 10 ⁹	
	Pollution degree		2	2	
	Climatic category		40/125/ 21	40/125/ 21	
UL 1577					
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60 s (qualification); V _{TEST} = 1.2 × V _{ISO} , t = 1 s (100% production)	5000	5000	V _{RMS}

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.
- (2) ISO1042 is suitable for *safe electrical insulation* and ISO1042B is suitable for *basic electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-pin device.

6.8 Safety-Related Certifications

6.9 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DW-16 PACKAGE						
I _S	Safety input, output, or supply current	R _{θJA} = 69.9°C/W, V _I = 5.5 V, T _J = 150°C, T _A = 25°C, see 1			325	mA
		R _{θJA} = 69.9°C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C, see 1			496	
		R _{θJA} = 69.9°C/W, V _I = 2.75 V, T _J = 150°C, T _A = 25°C, see 1			650	
		R _{θJA} = 69.9°C/W, V _I = 1.89 V, T _J = 150°C, T _A = 25°C, see 1			946	
P _S	Safety input, output, or total power	R _{θJA} = 69.9°C/W, T _J = 150°C, T _A = 25°C, see 3			1788	mW
T _S	Maximum safety temperature				150	°C
DWV-8 PACKAGE						
I _S	Safety input, output, or supply current	R _{θJA} = 100°C/W, V _I = 5.5 V, T _J = 150°C, T _A = 25°C, see 2			227	mA
		R _{θJA} = 100°C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C, see 2			347	
		R _{θJA} = 100°C/W, V _I = 2.75 V, T _J = 150°C, T _A = 25°C, see 2			454	
		R _{θJA} = 100°C/W, V _I = 1.89 V, T _J = 150°C, T _A = 25°C, see 2			661	
P _S	Safety input, output, or total power	R _{θJA} = 100°C/W, T _J = 150°C, T _A = 25°C, see 4			1250	mW
T _S	Maximum safety temperature				150	°C

(1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power respectively. The maximum limits of I_S and P_S should not be exceeded. These limits vary with the ambient temperature, T_A.

The junction-to-air thermal resistance, R_{θJA}, in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$$T_J = T_A + R_{\theta JA} \times P, \text{ where } P \text{ is the power dissipated in the device.}$$

$$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S, \text{ where } T_{J(max)} \text{ is the maximum allowed junction temperature.}$$

$$P_S = I_S \times V_I, \text{ where } V_I \text{ is the maximum input voltage.}$$

6.10 Electrical Characteristics - DC Specification

Over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY CHARACTERISTICS						
I _{CC1}	Supply current Side 1	V _{CC1} = 1.71 V to 1.89 V, TXD = 0 V, bus dominant		2.3	3.5	mA
		V _{CC1} = 2.25 V to 5.5 V, TXD = 0 V, bus dominant		2.4	3.5	mA

8 Detailed Description

8.1 Overview

The ISO1042 device is a digitally isolated CAN transceiver that offers ± 70 -V DC bus fault protection and ± 30 -V common-mode voltage range. The device supports up to 5-Mbps data rate in CAN FD mode allowing much faster transfer of payload compared to classic CAN. The ISO1042 device has an isolation withstand voltage of $5000 V_{RMS}$ and is available in basic and reinforced isolation with a surge test voltage of $6 kV_{PK}$ and $10 kV_{PK}$ respectively. The device can operate from 1.8-V, 2.5-V, 3.3-V, and 5-V supplies on side 1 and a 5-V supply on side 2. This supply range is of particular advantage for applications operating in harsh industrial environments because the low voltage on side 1 enables the connection to low-voltage microcontrollers for power conservation, whereas the 5 V on side 2 maintains a high signal-to-noise ratio of the bus signals.

8.2 Functional Block Diagram

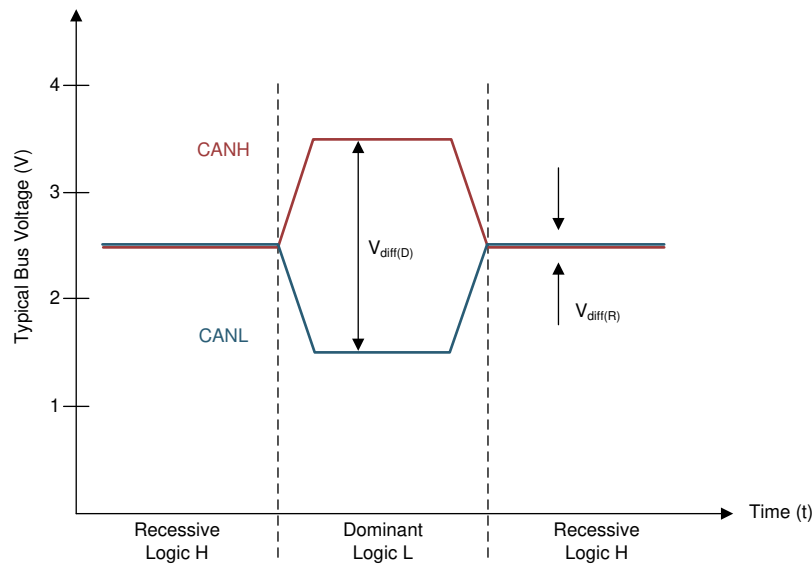

8.3 Feature Description

8.3.1 CAN Bus States

The CAN bus has two states during operation: *dominant* and *recessive*. A dominant bus state, equivalent to logic low, is when the bus is driven differentially by a driver. A recessive bus state is when the bus is biased to a common mode of $V_{CC} / 2$ through the high-resistance internal input resistors of the receiver, equivalent to a logic high. The host microprocessor of the CAN node uses the TXD pin to drive the bus and receives data from the bus on the RXD pin. See [Figure 25](#) and [Figure 26](#).

Feature Description (continued)

25. Bus States (Physical Bit Representation)

26. Simplified Recessive Common Mode Bias and Receiver

8.3.2 Digital Inputs and Outputs: TXD (Input) and RXD (Output)

The V_{CC1} supply for the isolated digital input and output side of the device can be supplied by 1.8-V, 2.5-V, 3.3-V, and 5-V supplies and therefore the digital inputs and outputs are 1.8-V, 2.5-V, 3.3-V, and 5-V compatible.

注

The TXD pin is very weakly internally pulled up to V_{CC1} . An external pullup resistor should be used to make sure that the TXD pin is biased to recessive (high) level to avoid issues on the bus if the microprocessor does not control the pin and the TXD pin floats. The TXD pullup strength and CAN bit timing require special consideration when the device is used with an open-drain TXD output on the CAN controller of the microprocessor. An adequate external pullup resistor must be used to make sure that the TXD output of the microprocessor maintains adequate bit timing input to the input on the transceiver.

Feature Description (continued)

8.3.3 Protection Features

8.3.3.1 TXD Dominant Timeout (DTO)

The TXD DTO circuit prevents the transceiver from blocking network communication in the event of a hardware or software failure where the TXD pin is held dominant longer than the timeout period, t_{TXD_DTO} . The DTO circuit timer starts on a falling edge on the TXD pin. The DTO circuit disables the CAN bus driver if no rising edge occurs before the timeout period expires, which frees the bus for communication between other nodes on the network. The CAN driver is activated again when a recessive signal occurs on the TXD pin, clearing the TXD DTO condition. The receiver and RXD pin still reflect activity on the CAN bus, and the bus terminals are biased to the recessive level during a TXD dominant timeout.

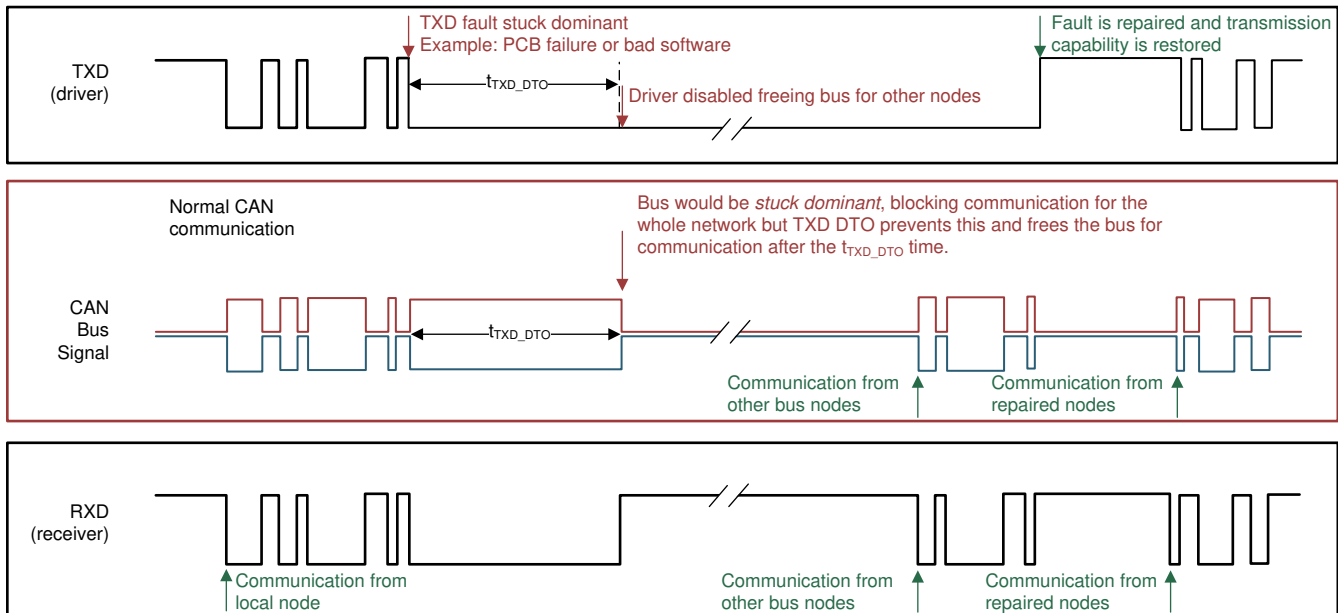

图 27. Example Timing Diagram for TXD DTO

注

The minimum dominant TXD time (t_{TXD_DTO}) allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the t_{TXD_DTO} minimum, limits the minimum data rate. Calculate the minimum transmitted data rate with 式 1.

$$\text{Minimum Data Rate} = 11 / t_{TXD_DTO}$$

(1)

8.3.3.2 Thermal Shutdown (TSD)

If the junction temperature of the device exceeds the thermal shutdown threshold (T_{TSD}), the device turns off the CAN driver circuits, blocking the TXD-to-bus transmission path. The CAN bus terminals are biased to the recessive level during a thermal shutdown, and the receiver-to-RXD path remains operational. The shutdown condition is cleared when the junction temperature drops at least the thermal shutdown hysteresis temperature (T_{TSD_HYST}) below the thermal shutdown temperature (T_{TSD}) of the device.

Feature Description (continued)

8.3.3.3 Undervoltage Lockout and Default State

The supply pins have undervoltage detection that places the device in protected or default mode which protects the bus during an undervoltage event on the V_{CC1} or V_{CC2} supply pins. If the bus-side power supply, V_{CC2} , is less than about 4 V, the power shutdown circuits in the ISO1042 device disable the transceiver to prevent false transmissions because of an unstable supply. If the V_{CC1} supply is still active when this occurs, the receiver output (RXD) goes to a default HIGH (recessive) value. 表 2 summarizes the undervoltage lockout and fail-safe behavior.

表 2. Undervoltage Lockout and Default State

V_{CC1}	V_{CC2}	DEVICE STATE	BUS OUTPUT	RXD
$> UV_{VCC1}$	$> UV_{VCC2}$	Functional	Per Device State and TXD	Mirrors Bus
$< UV_{VCC1}$	$> UV_{VCC2}$	Protected	Recessive	Undetermined
$> UV_{VCC1}$	$< UV_{VCC2}$	Protected	High Impedance	Recessive (Default High)

注

After an undervoltage condition is cleared and the supplies have returned to valid levels, the device typically resumes normal operation in 300 μ s.

8.3.3.4 Floating Pins

Pullup and pulldown resistors should be used on critical pins to place the device into known states if the pins float. The TXD pin should be pulled up through a resistor to the V_{CC1} pin to force a recessive input level if the microprocessor output to the pin floats.

8.3.3.5 Unpowered Device

The device is designed to be *ideal passive* or *no load* to the CAN bus if it is unpowered. The bus pins (CANH, CANL) have extremely low leakage currents when the device is unpowered to avoid loading down the bus which is critical if some nodes of the network are unpowered while the rest of the of network remains in operation.

8.3.3.6 CAN Bus Short Circuit Current Limiting

The device has two protection features that limit the short circuit current when a CAN bus line has a short-circuit fault condition. The first protection feature is driver current limiting (both dominant and recessive states) and the second feature is TXD dominant state time out to prevent permanent higher short circuit current of the dominant state during a system fault. During CAN communication the bus switches between dominant and recessive states, therefore the short circuit current may be viewed either as the instantaneous current during each bus state or as an average current of the two states. For system current (power supply) and power considerations in the termination resistors and common-mode choke ratings, use the average short circuit current. Determine the ratio of dominant and recessive bits by the data in the CAN frame plus the following factors of the protocol and PHY that force either recessive or dominant at certain times:

- Control fields with set bits
- Bit stuffing
- Interframe space
- TXD dominant time out (fault case limiting)

These factors ensure a minimum recessive amount of time on the bus even if the data field contains a high percentage of dominant bits. The short circuit current of the bus depends on the ratio of recessive to dominant bits and their respective short circuit currents. Use 式 2 to calculate the average short circuit current.

$$I_{OS(AVG)} = \%Transmit \times [(\%REC_Bits \times I_{OS(SS_REC)}) + (\%DOM_Bits \times I_{OS(SS_DOM)})] + [\%Receive \times I_{OS(SS_REC)}]$$

where

- $I_{OS(AVG)}$ is the average short circuit current
- %Transmit is the percentage the node is transmitting CAN messages
- %Receive is the percentage the node is receiving CAN messages

- %REC_Bits is the percentage of recessive bits in the transmitted CAN messages
- %DOM_Bits is the percentage of dominant bits in the transmitted CAN messages
- $I_{OS(SS)_REC}$ is the recessive steady state short circuit current
- $I_{OS(SS)_DOM}$ is the dominant steady state short circuit current

(2)

注

Consider the short circuit current and possible fault cases of the network when sizing the power ratings of the termination resistance and other network components.

8.4 Device Functional Modes

表 3 和 表 4 list the driver and receiver functions. 表 5 lists the functional modes for the ISO1042 device.

表 3. Driver Function Table

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The ISO1042 device can be used with other components from Texas Instruments such as a microcontroller, a transformer driver, and a linear voltage regulator to form a fully isolated CAN interface.

9.2 Typical Application

图 28. Application Circuit With ISO1042 in 16-SOIC Package

Typical Application (continued)

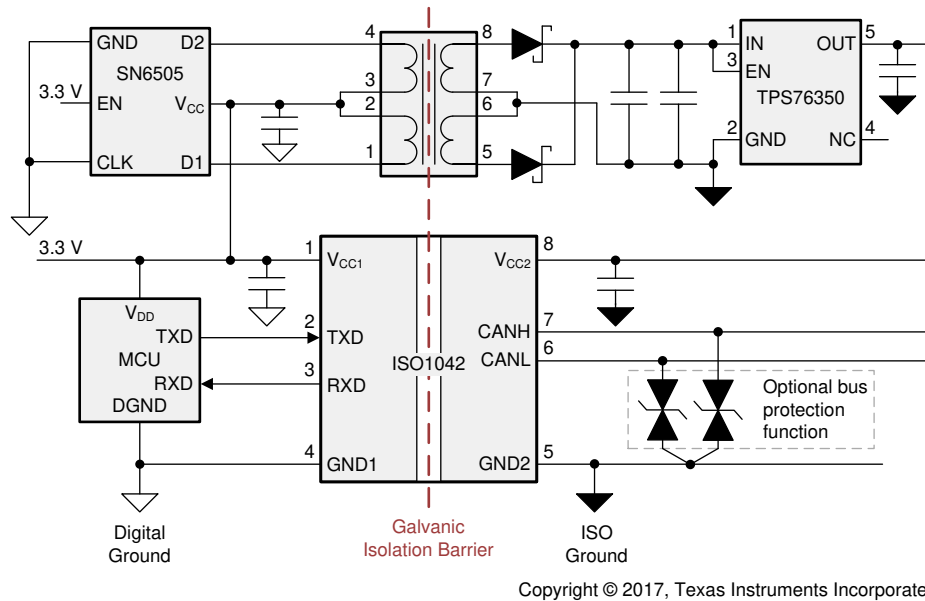

Figure 29. Application Circuit With ISO1042 in 8-SOIC Package

9.2.1 Design Requirements

Unlike an optocoupler-based solution, which requires several external components to improve performance, provide bias, or limit current, the ISO1042 device only requires external bypass capacitors to operate.

9.2.2 Detailed Design Procedure

9.2.2.1 Bus Loading, Length and Number of Nodes

The ISO 11898-2 Standard specifies a maximum bus length of 40 m and maximum stub length of 0.3 m. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A large number of nodes requires transceivers with high input impedance such as the ISO1042 transceivers.

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898-2 Standard. These organizations and standards have made system-level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, DeviceNet, and NMEA2000.

The ISO1042 device is specified to meet the 1.5-V requirement with a 50-Ω load, incorporating the worst case including parallel transceivers. The differential input resistance of the ISO1042 device is a minimum of 30 kΩ. If 100 ISO1042 transceivers are in parallel on a bus, this requirement is equivalent to a 300-Ω differential load worst case. That transceiver load of 300 Ω in parallel with the 60 Ω gives an equivalent loading of 50 Ω. Therefore, the ISO1042 device theoretically supports up to 100 transceivers on a single bus segment. However, for CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity, therefore a practical maximum number of nodes is typically much lower. Bus length may also be extended beyond the original ISO 11898 standard of 40 m by careful system design and data-rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes, and a significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898-2 CAN standard. Using this flexibility requires the responsibility of good network design and balancing these tradeoffs.

Typical Application (continued)

9.2.2.2 CAN Termination

The ISO11898 standard specifies the interconnect to be a single twisted pair cable (shielded or unshielded) with 120-Ω characteristic impedance (Z_0). Resistors equal to the characteristic impedance of the line should be used to terminate both ends of the cable to prevent signal reflections. Unterminated drop-lines (stubs) connecting nodes to the bus should be kept as short as possible to minimize signal reflections. The termination may be in a node, but if nodes are removed from the bus, the termination must be carefully placed so that it is not removed from the bus.

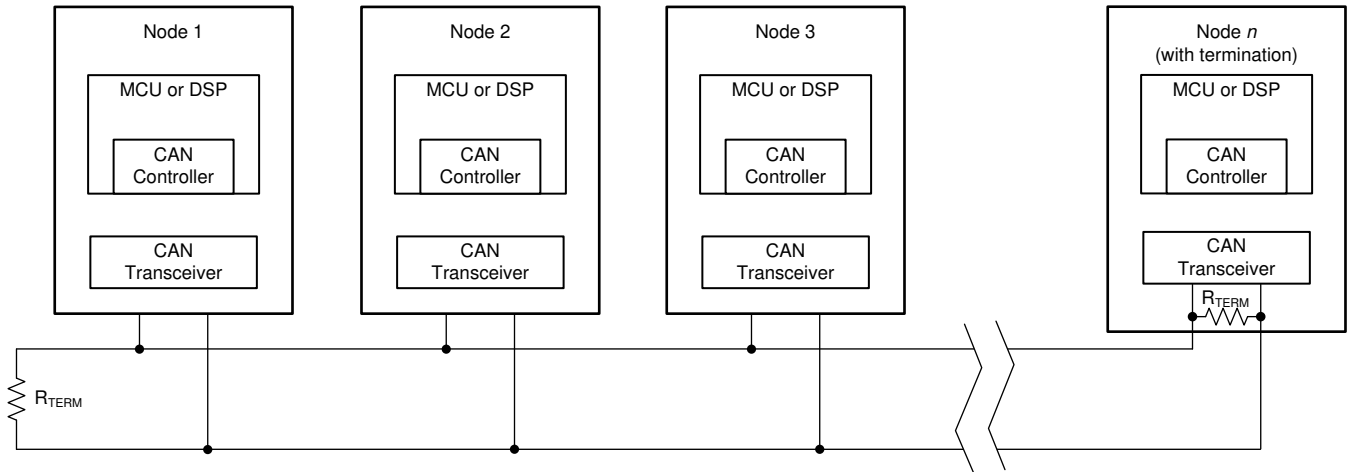

FIG 30. Typical CAN Bus

Termination may be a single 120-Ω resistor at the end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common-mode voltage of the bus is desired, then split termination can be used. (See FIG 31). Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common-mode voltages at the start and end of message transmissions.

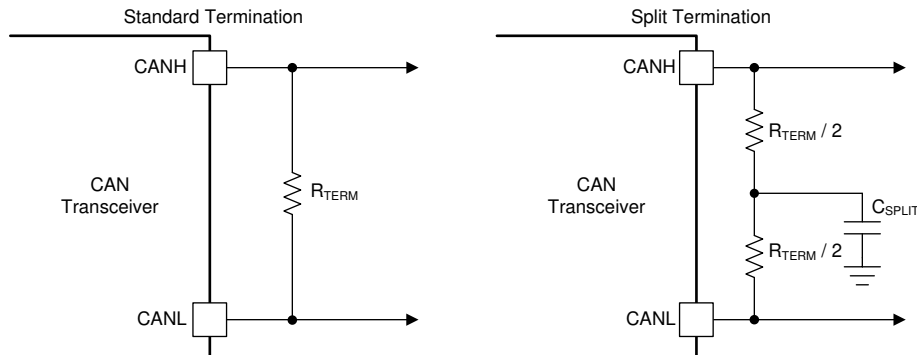

FIG 31. CAN Bus Termination Concepts

Typical Application (continued)

9.2.3 Application Curve

Figure 32. Typical TXD, RXD, CANH and CANL Waveforms at 1 Mbps

9.3 DeviceNet Application

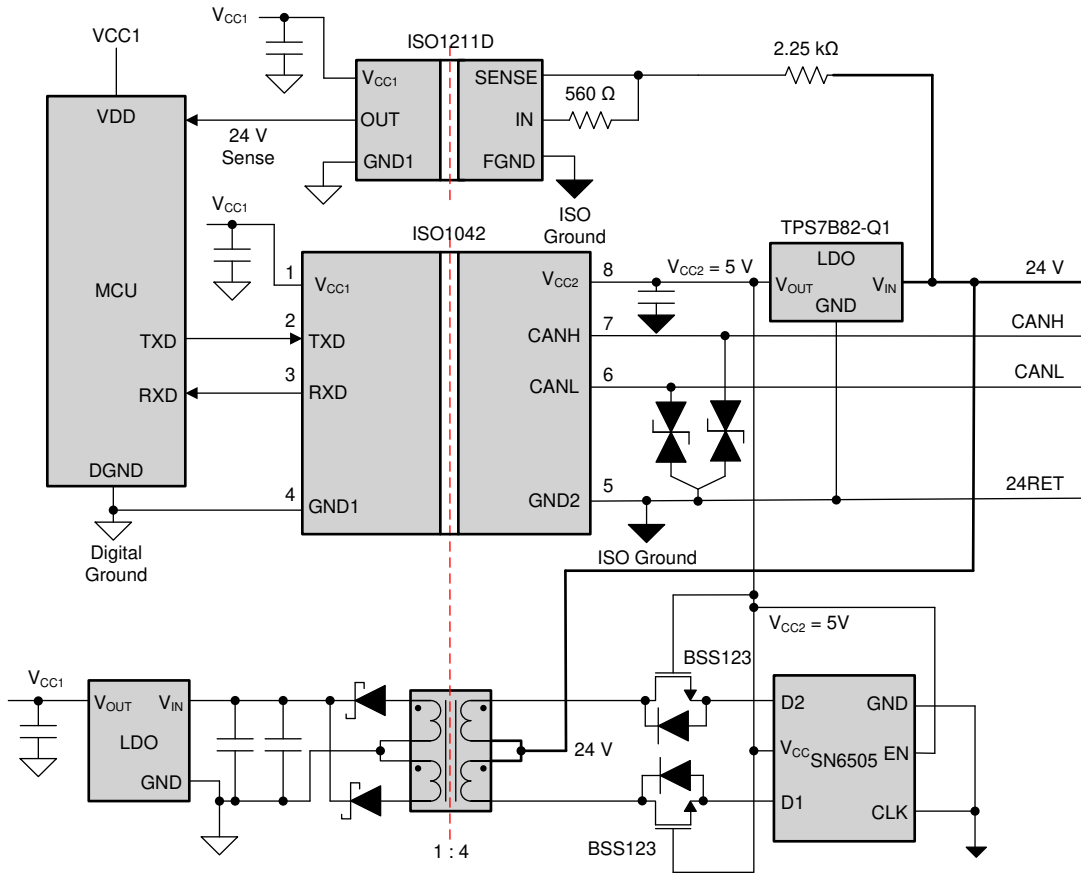

Figure 33. ISO1042, ISO1211 and SN6505 Used in a DeviceNet Application

DeviceNet Application (continued)

Figure 33 shows an application circuit for using ISO1042, ISO1211 and SN6505 in a DeviceNet application. ISO1042 is used to isolate the CAN interface. The ISO1211 24-V digital input receiver is used to detect the absence or presence of the 24-V field supply. The SN6505 push-pull transformer driver, is used to create an auxiliary isolated power supply for the micro-controller side using the 24-V field supply.

10 Power Supply Recommendations

To make sure operation is reliable at all data rates and supply voltages, a 0.1- μ F bypass capacitor is recommended at the input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. In addition, a bulk capacitance, typically 4.7 μ F, should be placed near the V_{CC2} supply pin. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as TI's [SN6505B](#). For such applications, detailed power supply design, and transformer selection recommendations are available in the [SN6505 Low-Noise 1-A Transformer Drivers for Isolated Power Supplies data sheet](#).

11 Layout

11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 34](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

Suggested placement and routing of ISO1042 bypass capacitors and optional TVS diodes is shown in [Figure 35](#) and [Figure 36](#). In particular, place the V_{CC2} bypass capacitors on the top layer, as close to the device pins as possible, and complete the connection to the V_{CC2} and G_{ND2} pins without using vias. Note that the SOIC-16 variant needs two V_{CC2} bypass capacitor, one on each V_{CC2} pin.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over lower-cost alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
