

LM36273 バイアス電源内蔵の3チャンネルLCDバックライト・ドライバ

1 特長

- 最大3つの白色LEDストリングを並列に駆動 (最大 V_{OUT} 29V)
- 11ビットの指数および線形調光制御
- PWMおよび I^2C による輝度制御
- 4.7 μ H~15 μ Hのインダクタによるバックライト動作
- バックライトおよびLCDの最大バイアス効率: 92%
- プログラム可能なLCDバイアス電圧($\pm 4V \sim \pm 6.5V$ 、分解能50mV)、出力ごとに最大80mA
- 60 μ A~30mAで0.2%一致のLED電流
- 60 μ A~30mAで1%精度のLED電流
- 入力電圧範囲: 2.7V~5V

2 アプリケーション

- 最大24個のLEDを使用するLCDパネル
- スマートフォン
- タブレットおよびゲーム用タブレット
- ホーム・オートメーション用パネル

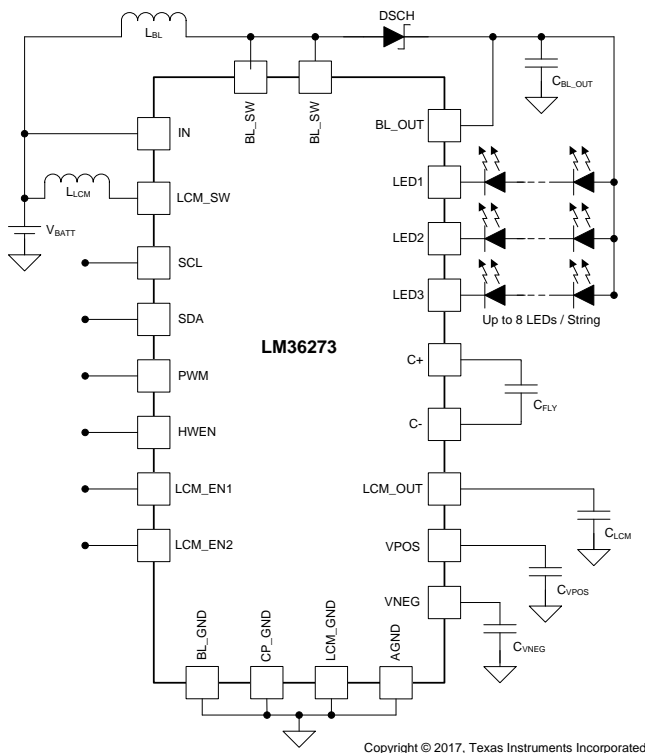

3 概要

LM36273は、統合された3チャンネルのWLEDドライバおよびLCDバイアス電源です。超小型、高効率、高レベルの統合、プログラム可能なことから、LM36273はハードウェア変更の必要なしに広範なアプリケーションに対応でき、ソリューション全体の面積も最小化できます。

バックライト昇圧により、3つのLEDストリングを並列に、合計出力電圧29Vまでバイアス駆動できます。11ビットのLED電流は、 I^2C バスによりプログラム可能で、ロジックレベルPWM入力でも制御でき、60 μ A~30mAの範囲を設定できます。それぞれのLEDストリングは別々にイネーブルおよびディセーブル可能で、ゾーン調光を行えます。バックライト昇圧は、4.7 μ H~15 μ Hの範囲のインダクタンスにより効率的に操作でき、効率化とソリューション・サイズの最適化を実現できます。

LCDバイアス昇圧により、正のLDOと反転チャージ・ポンプの両方に電力を供給できます。正と負の両方のバイアス電源で、出力電圧を $\pm 4V \sim \pm 6.5V$ に50mV単位でプログラムでき、最大 $\pm 80mA$ の電流を供給できます。自動シーケンス機能により、正から負へのバイアスのアクティブ化の遅延をプログラムでき、電圧スルー・レート制御もプログラム可能です。2つのウェークアップ・モードにより、単一の外部信号によって両方のバイアス出力を制御でき、非常に低い静止電流でアクティブ状態を維持できます。

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NUMBER	NAME		
A1	VNEG	O	Inverting charge pump output. Bypass VNEG with a 10- μ F ceramic capacitor to CP_GND.
A2	C-	O	Inverting charge-pump flying capacitor negative connection
A3	CP_GND	—	Charge pump GND. Connect the CNEG capacitor negative terminal to this pin.
A4	C+	O	Inverting charge-pump flying capacitor positive connection
B1	IN	I	Input voltage connection. Bypass IN with a 10- μ F ceramic capacitor to GND.
B2	LCM_EN2	I	Enable for LCD bias negative output; 300-k Ω internal pulldown resistor between LCM_EN2 and GND.
B3	LCM_EN1	I	Enable for LCD bias positive output; 300-k Ω internal pulldown resistor between LCM_EN1 and GND.
B4	VPOS	O	Positive LCD bias output. Bypass VPOS with a 10- μ F ceramic capacitor to GND.
C1	NC	—	No connect; leave this pin disconnected
C2	SCL	I	Serial clock connection for I ² C-compatible interface
C3	SDA	I/O	Serial clock connection for I ² C-compatible interface
C4	LCM_OUT	O	LCD bias boost output voltage. Bypass LCM_OUT with a 10- μ F ceramic capacitor to LCM_GND.
D1	LED3	I	Current sink 3 input. Connect the cathode of LED string 3 to this pin. Leave this pin disconnected if not used.
D2	PWM	I	PWM input for duty cycle current control; 300-k Ω internal pulldown resistor between PWM and GND.
D3	HWEN	I	Active high chip enable; 300-k Ω internal pulldown resistor between HWEN and GND.
D4	LCM_SW	O	LCD bias boost inductor connection
E1	LED2	I	Current sink 2 input. Connect the cathode of LED string 2 to this pin. Leave this pin disconnected if not used.

Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NUMBER	NAME		
E2	AGND	—	Analog ground connection. Connect AGND directly to GND on the PCB.
E3	LCM_GND	—	LCD bias boost GND connection. Connect LCM_GND to the negative terminal of the LCD bias output capacitor.
E4	BL_GND	—	Backlight boost output capacitor GND connection
F1	LED1	I	Current sink 1 input. Connect the cathode of LED string 1 to this pin. Leave this pin disconnected if not used.
F2	BL_OUT	O	Backlight boost output voltage sense connection. Connect to the positive terminal of backlight boost output capacitor.
F3	BL_SW	O	Backlight boost inductor connection
F4	BL_SW	O	Backlight boost inductor connection

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Voltage on IN, HWEN, LCM_EN1, LCM_EN2, SCL, SDA, PWM	−0.3	6	V
Voltage on LCM_SW, LCM_OUT, VPOS, C+	−0.3	9	V
Voltage on VNEG, C−	−7	0.3	V
Voltage on BL_SW	−0.3	35	V
Voltage on BL_OUT, LED1, LED2, LED3	−0.3	30	V
Continuous power dissipation	Internally limited		
Maximum junction temperature, $T_{J(MAX)}$		150	°C
Storage temperature, T_{stg}	−45	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltages are with respect to the potential at the AGND pin.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Input voltage, V_{IN}	2.7	5	V
Operating ambient temperature, T_A ⁽³⁾	−40	85	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltages are with respect to the potential at the AGND pin.
- In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A-MAX}) is dependent on the maximum operating junction temperature ($T_{J-MAX-OP} = 125^{\circ}\text{C}$), the maximum power dissipation of the device in the application (P_{D-MAX}), and the junction-to-ambient thermal resistance of the part/package in the application ($R_{\theta JA}$), as given by the following equation: $T_{A-MAX} = T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})$.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM36273	UNIT
		DSBGA (YFF)	
		(24 PINS)	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	63.1	°C/W
$R_{\theta JC}$	Junction-to-case (top) thermal resistance	0.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	11.6	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.6	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	11.6	°C/W

- For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

Unless otherwise specified, typical limits apply at 25°C, minimum and maximum limits apply over the full operating ambient temperature range ($-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$), and $V_{IN} = 3.6\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
CURRENT CONSUMPTION							
I_{SD}	Shutdown current	HWEN = 0		0.2	2.8	μA	
I_Q	Quiescent current, device not switching	HWEN = V_{IN} , LCM boost disabled		1	7	μA	
I_{LCM_EN}	Bias power no load supply current	VPOS, VNEG enabled with no load, backlight boost disabled, typical application circuit (not ATE tested)		0.5	10	μA	
BACKLIGHT LED CURRENT SINKS (LED1, LED2, LED3, LED4)							
I_{LED_MAX}	Maximum output current (per string)	$2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$, linear or exponential mode		30		mA	
I_{LED}	LED current accuracy ⁽¹⁾	$2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$, $60\ \mu\text{A} < I_{LED} < 30\text{ mA}$, linear or exponential mode	-3%		3%		
I_{MATCH}	I_{LED} current matching ⁽²⁾	$2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$, $60\ \mu\text{A} \leq I_{LED} \leq 30\text{ mA}$, linear or exponential mode	-2%	0.2%	2%		
I_{LED_MIN}	Minimum LED current (per string)	Linear or exponential mode		60		μA	
I_{STEP}	LED current step size (code to code)	Exponential mode ⁽³⁾		0.3%			
		Linear mode		14.63		μA	
BACKLIGHT BOOST							
OVP threshold		ON threshold, $2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$	011 to 111	28.5	29	29.5	V
			010	24.5	25	25.5	
			001	20.5	21	21.5	
			000	16.3	17	17.7	
OVP hysteresis		OFF threshold		0.5		V	
Efficiency	Boost efficiency	$V_{IN} = 3.6\text{ V}$, $I_{BLEDD} = 5\text{ mA/string}$, (P_{OUT}/P_{IN}), Typical Application Circuit (not ATE tested)		90%			
V_{HR}	Regulated current-sink headroom voltage (boost feedback voltage)	$I_{LED} = 30\text{ mA}$ $I_{LED} = 5\text{ mA}$		310		mV	
				120		mV	
V_{HR_MIN}	Current-sink minimum headroom voltage	$I_{LED} = 95\%$ of nominal, $I_{LED} = 5\text{ mA}$		30	50	mV	
R_{DSON}	NMOS switch on resistance	$I_{SW} = 250\text{ mA}$		0.2		Ω	
I_{CL}	NMOS switch current limit	$2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$	00	792	900	1008	mA
			01	1056	1200	1344	mA
			10	1320	1500	1680	mA
			11	1584	1800	2016	mA
f_{BL_SW}	Switching frequency	$2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$	500-kHz mode	450	500	550	kHz
			1-MHz mode	900	1000	1100	
D_{MAX}	Maximum duty cycle	$V_{IN} = 2.7\text{ V}$, $f_{LED_SW} = 1\text{ MHz}$		93%	94%		
DEVICE PROTECTION							
TSD	Thermal shutdown	Not ATE tested		140		$^{\circ}\text{C}$	

(1) Output current accuracy is the difference between the actual value of the output current and programmed value of this current.

(2) LED current matching is the maximum difference between any string current and the average string current, divided by the average string current. This is calculated as $(I_{LEDX} - I_{LED_AVE}) / I_{LED_AVE} \times 100$.

(3) LED current step size from code to code in exponential mode is typically 0.304%, given as $(1 - (I_{LED(CODE+1)} / I_{LED(CODE)}))$.

Electrical Characteristics (continued)

Unless otherwise specified, typical limits apply at 25°C, minimum and maximum limits apply over the full operating ambient temperature range ($-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$), and $V_{IN} = 3.6\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DISPLAY BIAS (LCM BOOST)						
V_{OVP_LCM}	LCM bias boost overvoltage protection	On threshold, $2.7\text{ V} \leq V_{IN} \leq 5\text{ V}$		7.8		V

7 Detailed Description

7.1 Overview

The LM36273 is a single-chip, complete backlight and LCM power solution. The device operates over the 2.7-V to 5-V input voltage range.

The backlight block consists of an inductive boost plus three current sink white-LED drivers designed to power from one to three LED strings with up to eight LEDs each (up to 28 V typical), with a maximum of 30 mA per string. A higher number of LEDs per string can be supported if the total output power requirement for the boost does not exceed 2.5 Watts. The power for the LED strings comes from an integrated asynchronous backlight boost converter with three selectable switching frequencies to optimize performance or solution area. LED current is regulated by the low-headroom current sinks. The inductive backlight boost automatically adjusts its output voltage to keep the active current sinks in regulation, while minimizing current sink headroom voltage. The 11-bit LED current is set via an I²C interface, via a logic level PWM input, or a combination of both.

The LCM bias power portion of the LM36273 consists of a synchronous LCM bias boost converter, inverting charge pump, and an integrated LDO. The LCM positive bias voltage VPOS (up to 6.5 V) is post-regulated from the LCM bias boost converter output voltage. The LCM negative bias voltage VNEG (down to –6.5 V) is generated from the LCM bias boost converter output using a regulated inverting charge pump.

The LM36273 flexible control interface consists of an HWEN active low reset input, LCM_EN1 and LCM_EN2 inputs for VPOS and VNEG enable control, PWM input for content adaptive backlight control (CABC), and an I²C-compatible interface.

Additionally, there is a flag register with flag and status bits. The user can read back this register and determine if a fault or warning message has been generated.

7.2 Functional Block Diagram

7.3 Features Description

7.3.1 Enabling the LM36273

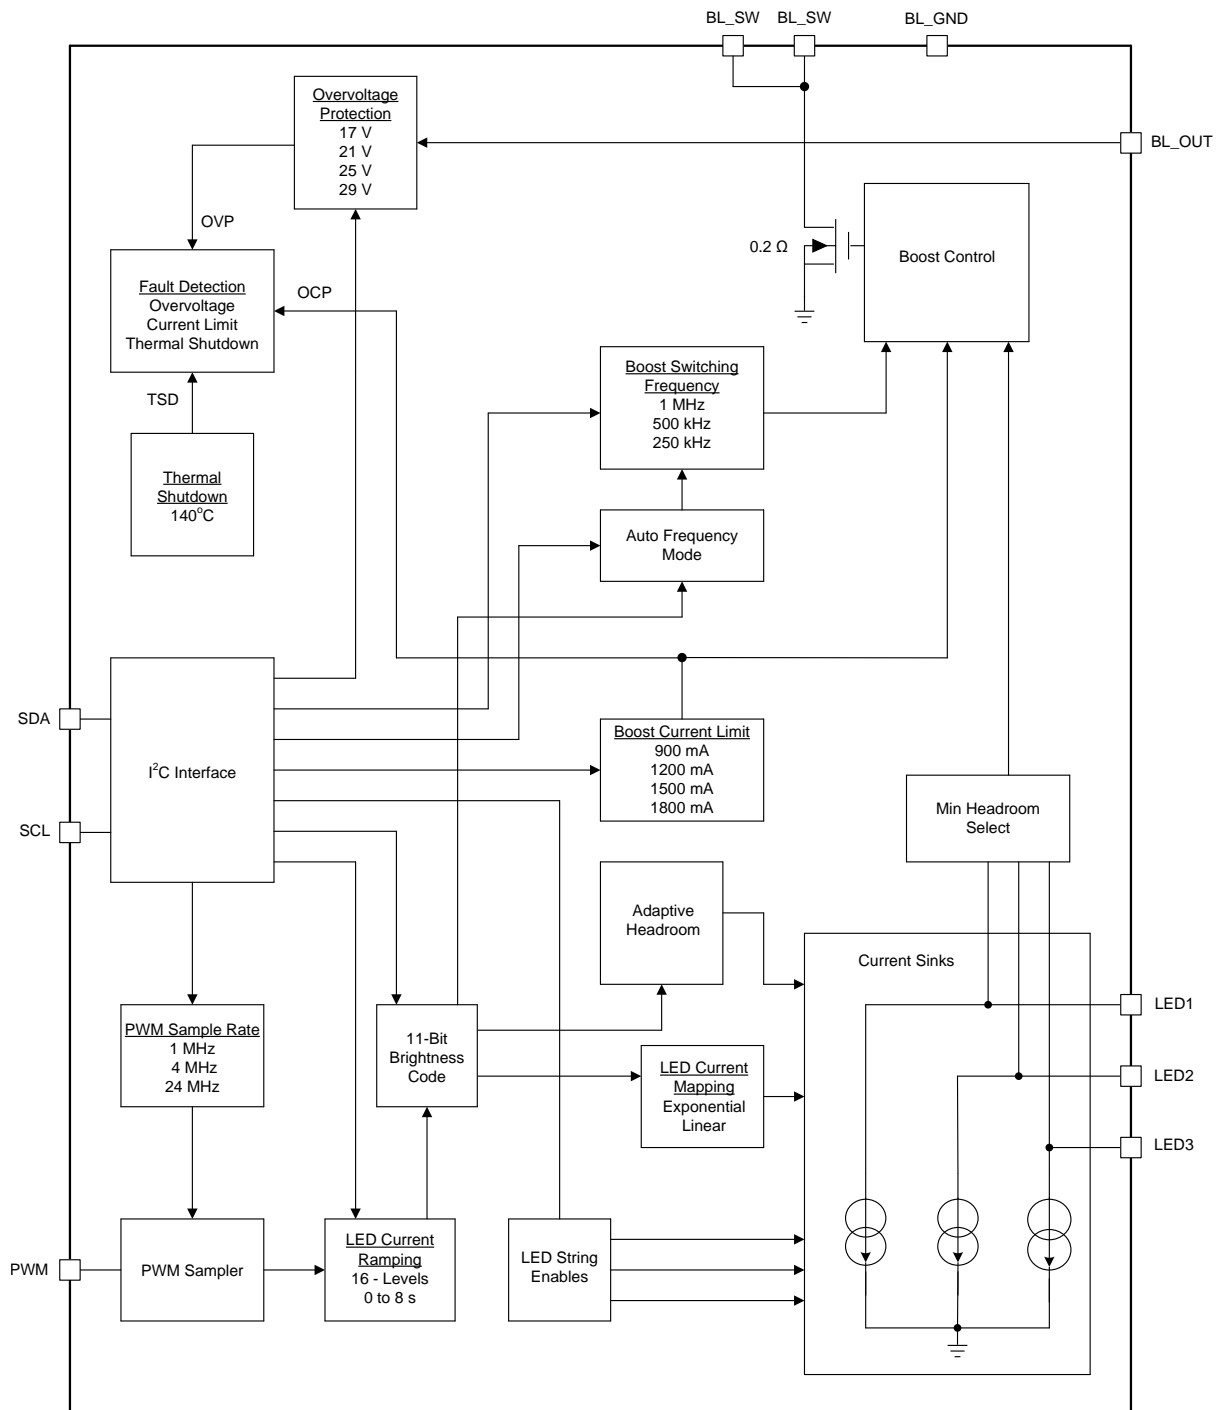

The LM36273 has a logic level input HWEN which serves as the master enable/disable for the device. When HWEN is low the device is disabled, the registers are reset to their default state, the I²C bus is inactive, and the device is placed in a low-power shutdown mode. When HWEN is forced high the device is enabled, and I²C writes are allowed to the device.

Features Description (continued)

7.3.2 Backlight

The high voltage required by the LED strings is generated with an asynchronous backlight boost converter. An adaptive voltage control loop automatically adjusts the output voltage based on the voltage over the LED drivers LED1, LED2 and LED3. The LM36273 has three switching frequency modes, 1 MHz, 500 kHz, and 250 kHz. These are set via the BL_FREQ Select bit, register 0x03 bit[7] and by utilizing the auto-frequency feature (refer to [Auto Switching Frequency](#)). Operation in low-frequency mode results in better efficiency at lighter load currents due to the decreased switching losses. Operation in high-frequency mode gives better efficiency at higher load currents due to the reduced inductor current ripple and the resulting lower conduction losses in the MOSFET and inductor.

30. Backlight Block Diagram

7.3.2.1 Current Sink Enable

Each current sink in the device has a separate enable input. This allows for a one-string, two-string or three-string application. Once the correct LED string configuration is programmed and a non-zero code is written to the brightness registers, the device can be enabled by writing the backlight enable bit high (register 0x08 bit[4]).

Features Description (continued)

The default settings for the device are backlight enable bit set to 0, all backlight strings disabled, PWM input disabled, linear mapped mode, and the brightness level set to 30 mA per string.

When PWM is enabled, the LM36273 actively monitors the PWM input. After a non-zero PWM duty cycle is detected, the LM36273 multiplies the duty cycle with the programmed I²C brightness code to give an 11-bit brightness value between 60 μ A and 30 mA. [Figure 31](#) and [Figure 32](#) describe the start-up timing for operation with I²C controlled current and with PWM controlled current.

Figure 31. Enabling the LM36273 via I²C

Figure 32. Enabling the LM36273 via PWM

The LM36273 backlight can be enabled or disabled in various ways. When disabled, the device is considered shut down, and the quiescent current drops to I_{SHDN} . When the device is in standby, it returns to the $I_{STANDBY}$ current level retaining all programmed register values. [Table 1](#) describes the different backlight operating states for the LM36273.

Features Description (continued)

(1) Standby implies the backlight boost and current sinks are shut down. Register writes are still possible. Shutdown implies that the device is in reset and no I²C communication is possible.

7.3.2.2 Brightness Mapping

There are two different ways to map the brightness code (or PWM duty cycle) to the LED current: linear and exponential mapping.

7.3.2.2.1 Linear Mapping

For linear mapped mode the LED current increases proportionally to the 11-bit brightness code and follows the relationship:

$$I_{LED} = 45.37 \mu A + 14.63 \mu A \times \text{Code} \quad (1)$$

This is valid from codes 1 to 2047. Code 0 programs 0 current. Code is an 11-bit code that can be the I²C brightness code or the product of the I²C brightness code and the PWM duty cycle.

7.3.2.2.2 Exponential Mapping

In exponential mapped mode the LED current follows the relationship:

$$I_{LED} = 60 \mu A \times 1.003040572^{\text{Code}} \quad (2)$$

This results in an LED current step size of approximately 0.304% per code. This is valid for codes from 1 to 2047. Code 0 programs 0 current. Code is an 11-bit code that can be the I²C brightness code or the product of the I²C brightness code and the PWM duty cycle. [Figure 33](#) details the LED current exponential response.

The 11-bit (0.304%) per code step is small enough such that the transition from one code to the next in terms of LED brightness is not distinguishable to the eye. This, therefore, gives a perfectly smooth brightness increase between adjacent codes.

Figure 33. LED Current vs Brightness Code (Exponential Mapping)

7.3.2.3 Backlight Brightness Control Modes

The LM36273 has 2 brightness control modes:

1. I²C only brightness control
2. I²C × PWM brightness control

7.3.2.3.1 I²C Brightness Control (PWM Pin Disabled)

If the PWM pin is disabled the I²C brightness registers are in control of the LED current, and the PWM input is disabled. The brightness data (BRT) is the concatenation of the two brightness registers (3 LSBs) and (8 MSBs) (registers 0x04 and 0x05, respectively). The LED current only changes when the MSBs are written, meaning that to do a full 11-bit current change via I²C, first the 3 LSBs are written and then the 8 MSBs are written. In this mode the ramper only controls the time from one I²C brightness set-point to the next Figure 34.

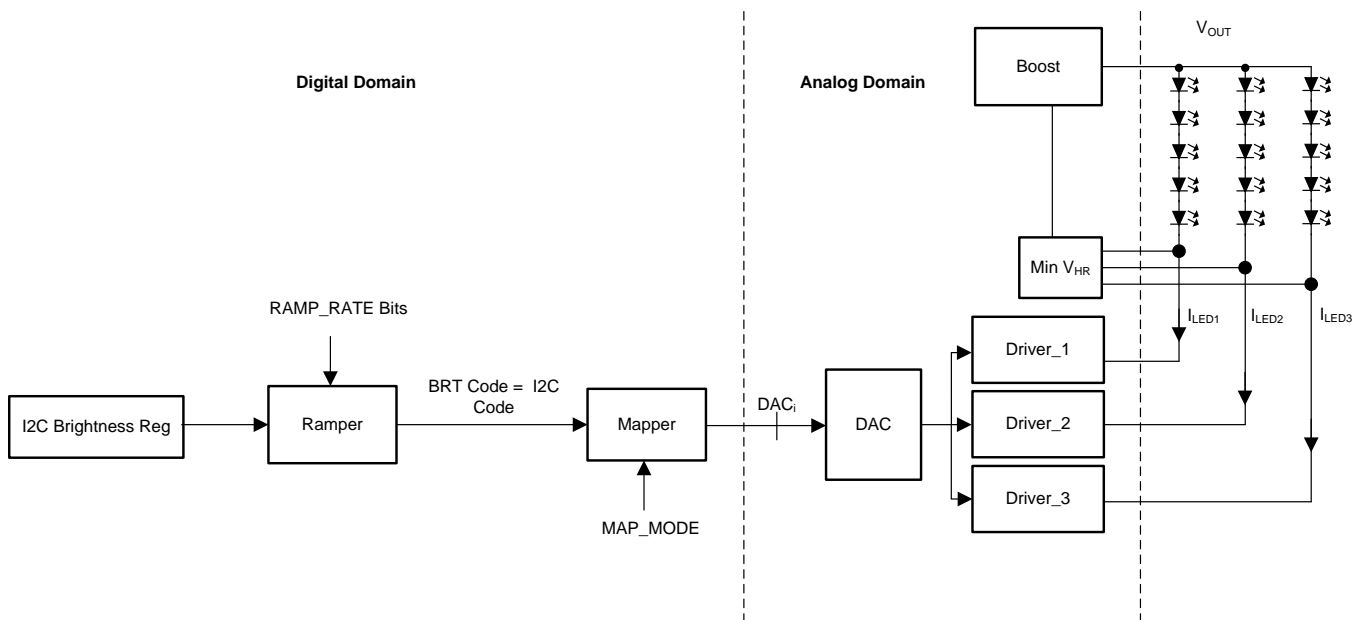

Figure 34. I²C Only Brightness Control

7.3.2.3.2 I²C × PWM Brightness Control (PWM Pin Enabled)

If the PWM pin is enabled both the I²C brightness code and the PWM duty-cycle control the LED current.

With linear mapping the PWM duty cycle-to-current response is approximated by 式 3:

$$I_{LED} = 45.37 \mu A + 14.63 \mu A \times I^2C \text{ BRGT CODE} \times \text{PWM D/C} \tag{3}$$

With exponential mapping the PWM duty cycle-to-current response is approximated by 式 4:

$$I_{LED} = 60 \mu A \times 1.003040572^{I^2C \text{ BRGT CODE} \times \text{PWM D/C}} \tag{4}$$

7.3.2.3.2.1 PWM Ramper

The PWM ramp option (register 0x02 bit[1]) determines whether the ramper is active or inactive during a change in PWM duty cycle.

The ramper smooths the transition from one brightness value to another. Ramp time can be adjusted from 0 ms to 8000 ms with LED Current Ramp [3:0] bits (register 0x03 bits [6:3]). Ramp time is used for sloping both up and down. Ramp time always remains the same regardless of the amount of change in brightness.

In PWM mode the behavior of the ramper depends on the state of the PWM Ramp bit (register 0x02, bit [1]). If the PWM Ramp bit is set to 0, there is no LED current ramping between PWM duty cycle changes. The PWM duty cycle is multiplied with the I²C brightness code at the output of the ramper (see 图 35). If this bit is set to 1, ramping is achieved between I²C × PWM currents (see 图 36).

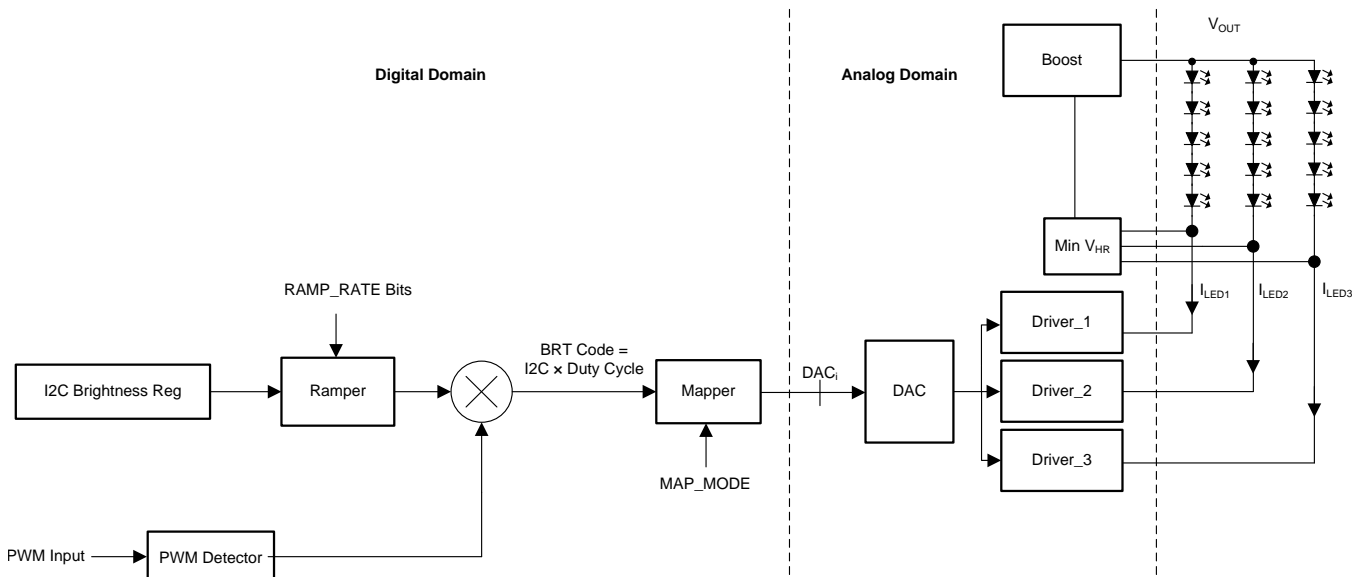

图 35. (I²C + PWM) Brightness Control, PWM Ramper Disabled

图 36. (I²C + PWM) Brightness Control, PWM Ramper Enabled

7.3.2.4 Boost Switching Frequency

The LM36273 has two programmable switching frequencies: 500 kHz and 1 MHz. These are set via the Backlight Configuration 2 register (register 0x03 bit [7]). Operation at 1 MHz is primarily beneficial when efficiency at high load current is more important. For maximum efficiency across the entire load current range the device incorporates an automatic frequency shift mode (see [Auto Switching Frequency](#)).

7.3.2.4.1 Minimum Inductor Select

The LM36273 can use inductors in the range of 4.7 μH to 15 μH . In order to optimize the converter response to changes in V_{IN} and load, the Backlight Boost L Select bits (register 0x11 bits [7:6]) must be selected depending on the nominal value of inductance chosen.

7.3.2.5 Boost Feedback Gain Select

The Boost Integral and Proportional Feedback Gain Select bits in Option 2 register (bits [3:2] and bits[5:4] in register 0x11) contain adjustment parameters for the LM36273 internal loop gain. The optimized settings using a 1- μF capacitor at BL_OUT are the default settings of 01 and 11 for Integral and Proportional, respectively.

7.3.2.6 Auto Switching Frequency

To take advantage of frequency vs load dependent losses, the LM36273 can automatically change the boost switching frequency based on the programmed brightness code. In addition to the register programmable switching frequencies of 500 kHz and 1 MHz, the auto-frequency mode also incorporates a low-frequency selection of 250 kHz. It is important to note that the 250-kHz frequency is only accessible in auto-frequency mode and has a maximum boost duty cycle (D_{MAX}) of 50%.

Auto-frequency mode operates by using two programmable registers (Backlight Auto Frequency Low Threshold (register 0x06) and Backlight Auto Frequency High Threshold (register 0x07)). The high threshold determines the switchover from 1 MHz to 500 kHz. The low threshold determines the switchover from 500 kHz to 250 kHz. Both the High and Low Threshold registers take an 8-bit code which is compared against the 8 MSB of the brightness register (register 0x05). 表 2 details the boundaries for this mode.

表 2. Auto Switching Frequency Operation

BRIGHTNESS CODE MSBs (Register 0x05 bits[7:0])	BOOST SWITCHING FREQUENCY
< Auto Frequency Low Threshold (register 06 Bits[7:0])	250 kHz ($D_{\text{MAX}} = 50\%$)
> Auto Frequency Low Threshold (Register 06 Bits[7:0]) and < Auto Frequency High Threshold (Register 07 Bits[7:0])	500 kHz

表 2. Auto Switching Frequency Operation (continued)

BRIGHTNESS CODE MSBs (Register 0x05 bits[7:0])	BOOST SWITCHING FREQUENCY
≥ Auto Frequency High Threshold (register 07 Bits[7:0])	1 MHz

Automatic-frequency mode is enabled whenever there is a non-zero code in either the Auto-Frequency High or Auto-Frequency Low registers. To disable the auto-frequency shift mode, set both registers to 0x00. When automatic-frequency select mode is disabled, the switching frequency operates at the programmed frequency (Register 0x03 bit[7]) across the entire LED current range. 表 3 provides a guideline for selecting the auto frequency threshold settings at $V_{IN} = 3.7$ V. The actual setting must be verified in the application and optimized for the desired input voltage range.

表 3. Auto Frequency Threshold Settings Examples, $V_{IN} = 3.7$ V

CONDITION ($V_f = 3.35$ V at $I_{LED} = 30$ mA)	INDUCTOR (μ H)	RECOMMENDED AUTO FREQUENCY HIGH THRESHOLD	RECOMMENDED AUTO FREQUENCY LOW THRESHOLD
2 x 4 LEDs	10	0x65 (12 mA)	0x43 (8 mA)
2 x 5 LEDs	10	0x5C (11 mA)	0x42 (7.9 mA)
2 x 6 LEDs	10	0x54 (10 mA)	0x3F (7.5 mA)
2 x 7 LEDs	10	0x4F (9.4 mA)	0x36 (6.5 mA)
2 x 8 LEDs	10	0x65 (12 mA)	0x3F (7.5 mA)
3 x 4 LEDs	10	0x4C (9 mA)	0x2A (5.1 mA)
3 x 5 LEDs	10	0x43 (8mA)	0x28 (4.8 mA)
3 x 6 LEDs	10	0x3B (7 mA)	0x27 (4.7 mA)
3 x 7 LEDs	10	0x35 (6.4 mA)	0x26 (4.6 mA)
3 x 8 LEDs	10	0x43 (8 mA)	0x25 (4.5 mA)

7.3.2.7 PWM Input

The PWM input is a sampled input which converts the input duty cycle information into an 11-bit brightness code. The use of a sampled input eliminates any noise and current ripple that traditional PWM controlled LED drivers are susceptible to. It also allows the PWM duty cycle to LED current response to have the same high accuracy and matching that is offered in the I²C brightness control.

The PWM input uses logic level thresholds with $V_{IH_MIN} = 1.25$ V and $V_{IL_MAX} = 0.4$ V. Because this is a sampled input, there are limits on the maximum PWM input frequency as well as the resolution that can be achieved.

7.3.2.7.1 PWM Sample Frequency

There are three selectable sample rates for the PWM input. The choice of sample rate depends on three factors:

1. Required PWM resolution (input duty cycle to brightness code, with 11 bits maximum)
2. PWM input frequency
3. Efficiency

7.3.2.7.1.1 PWM Resolution and Input Frequency Range

The PWM input frequency range is 50 Hz to 50 kHz. To achieve the full 11-bit maximum resolution of PWM duty cycle to the LED brightness code (BRT), the input PWM duty cycle must be ≥ 11 bits, and the PWM sample period ($1/f_{SAMPLE}$) must be smaller than the minimum PWM input pulse width. 图 37 shows the possible brightness code resolutions based on the input PWM frequency. The minimum PWM frequency for each PWM sample rate is described in [PWM Timeout](#).

图 37. PWM Sample Rate, Resolution, and PWM Input Frequency

7.3.2.7.1.2 PWM Sample Rate and Efficiency

Efficiency is maximized when the lowest f_{SAMPLE} is chosen because this lowers the quiescent operating current of the device. 表 4 describes the typical efficiency tradeoffs for the different sample clock settings.

表 4. PWM Sample Rate Trade-Offs

PWM SAMPLE RATE (f_{SAMPLE})		TYPICAL INPUT CURRENT, DEVICE ENABLED $I_{LED} = 10 \text{ mA/string, } 3 \times 6 \text{ LEDs}$	TYPICAL EFFICIENCY
0x03 Bit[2]	0x12 Bit[0]	$f_{SW} = 1 \text{ MHz}$	$V_{IN} = 3.7 \text{ V}$
0	0	1.685 mA	87.7%
1	0	1.756 mA	87.66%
X	1	2.479 mA	87.2%

7.3.2.7.1.2.1 PWM Sample Rate Example

The number of bits of resolution on the PWM input varies according to the PWM sample rate and PWM input frequency (see 表 5).

表 5. PWM Resolution vs PWM Sample Rate

PWM FREQUENCY (kHz)	RESOLUTION (PWM SAMPLE RATE = 1 MHz)	RESOLUTION (PWM SAMPLE RATE = 4 MHz)	RESOLUTION (PWM SAMPLE RATE = 24 MHz)
0.4	11	11	11
2	9	11	11
12	6.4	8.4	11

7.3.2.7.2 PWM Hysteresis

To prevent jitter at the input PWM signal from feeding through the PWM path and causing oscillations in the LED current, the LM36273 offers 4 selectable hysteresis settings. The hysteresis options for the 1-MHz and 4-MHz PWM sample rate settings are 1, 2, 4, and 6 bits and for the 24-MHz PWM sample rate setting 0, 1, 2, and 3 bits. The hysteresis works by forcing a specific number of 11-bit LSB code transitions to occur in the input duty cycle before the LED current changes. 表 6 describes the hysteresis. The hysteresis only applies during the change in direction of brightness currents. Once a change in the direction of the LED current has taken place, the PWM input must overcome the required LSB(s) of the hysteresis setting before the brightness change takes effect. Once the initial hysteresis has been overcome and the direction in brightness change remains the same, the PWM to current response changes with no hysteresis.

表 6. PWM Input Hysteresis

HYSTERESIS SETTING (0x03 Bits[1:0])	MIN CHANGE IN PWM PULSE WIDTH (Δt) REQUIRED TO CHANGE LED CURRENT, AFTER DIRECTION CHANGE (for $f_{PWM} < 11.7$ kHz)	MIN CHANGE IN PWM DUTY CYCLE (ΔD) REQUIRED TO CHANGE LED CURRENT AFTER DIRECTION CHANGE	MIN (ΔI_{LED}), INCREASE FOR INITIAL CODE CHANGE	
			EXPONENTIAL MODE	LINEAR MODE
0 LSB (24 MHz sample rate only)	$1/(f_{PWM} \times 2047)$	0.05%	0.30%	0.05%
1 LSB	$1/(f_{PWM} \times 1023)$	0.10%	0.61%	0.10%
2 LSBs	$1/(f_{PWM} \times 511)$	0.20%	1.21%	0.20%
3 LSBs (24-MHz sample rate only)	$1/(f_{PWM} \times 255)$	0.39%	2.40%	0.39%
4 LSBs (1-MHz and 4-MHz sample rate only)	$1/(f_{PWM} \times 127)$	0.78%	4.74%	0.78%
6 LSBs (1-MHz and 4-MHz sample rate only)	$1/(f_{PWM} \times 31)$	3.12%	17.66%	3.12%

- D is $t_{JITTER} \times f_{PWM}$ or equal to #LSB's = $\Delta D \times 2048$ codes.
- For 11-bit resolution, #LSBs is equal to a hysteresis setting of $\text{LN}(\#LSB's)/\text{LN}(2)$.
- For example, with a t_{JITTER} of 1 μs and a f_{PWM} of 5 kHz, the hysteresis setting should be:
 $\text{LN}(1 \mu s \times 5 \text{ kHz} \times 2048)/\text{LN}(2) = 3.35$ (4 LSBs).

☒ 38. PWM Hysteresis Example

7.3.2.7.3 PWM Step Response

The LED current response due to a step change in the PWM input is approximately 2 ms to go from minimum LED current to maximum LED current.

7.3.2.7.4 PWM Timeout

The LM36273 PWM timeout feature turns off the boost output when the PWM is enabled and there is no PWM pulse detected. The timeout duration changes based on the PWM sample rate selected which results in a minimum supported PWM input frequency. The sample rate, timeout, and minimum supported PWM frequency are summarized in 表 7.

表 7. PWM Timeout and Minimum Supported PWM Frequency vs PWM Sample Rate

SAMPLE RATE	TIMEOUT	MINIMUM SUPPORTED PWM FREQUENCY
1 MHz	25 msec	48 Hz
4 MHz	3 msec	400 Hz
24 MHz	0.6 msec	2000 Hz

7.3.2.7.5 PWM-to-Digital Code Readback

In PWM mode, registers 0x12 and 0x13 contain the PWM duty cycle to the 11-bit code conversion information. Register 0x12 contains the 8 LSBs of the brightness code and register 0x13 the 3 MSBs. To translate this reading to the actual LED current setting of the LM36273, convert it to the corresponding duty cycle and multiply it by the brightness level setting in the brightness registers (0x04 and 0x05). For example, if the 11-bit brightness code is set to 0x554 (decimal 1364) and the PWM-to-digital code readback is 0x3FF (decimal 1023) in linear mode, the expected LED current is approximately: $I_{LED} = 45.37 \mu A + ((1023 / 2047) \times 14.63 \times 1364) \mu A = 10.018 \text{ mA}$ (approximately 50% duty cycle).

7.3.2.8 Regulated Headroom Voltage

In order to optimize efficiency, current accuracy, and string-to-string matching the LED current sink regulated headroom voltage (V_{HR}) varies with the target LED current. Figure 39 details the typical variation of V_{HR} with LED current. This allows for increased solution efficiency as the dropout voltage of the LED driver changes. Furthermore, in order to ensure that all current sinks remain in regulation whenever there is a mismatch in string voltages, the minimum headroom voltage between VLED1, VLED2, VLED3 becomes the regulation point for the boost converter. For example, if the LEDs connected to LED1 require 12 V, the LEDs connected to LED2 require 12.5 V and the LEDs connected to LED3 require 13 V at the programmed current, then the voltage at LED1 is $V_{HR} + 1 \text{ V}$, the voltage at LED2 is $V_{HR} + 0.5 \text{ V}$ and the voltage at LED3 is regulated at V_{HR} . In other words, the boost makes the cathode of the highest voltage LED string the regulation point.

Figure 39. LM36273 Typical Exponential Regulated Headroom Voltage vs Programmed LED Current

7.3.2.9 Backlight Fault Protection and Faults

7.3.2.9.1 Backlight Overvoltage Protection (OVP)

The LM36273 provides an OVP that monitors the LED boost output voltage (V_{BL_OUT}) and protects BL_OUT and BL_SW from exceeding safe operating voltages. The OVP threshold can be set to 17 V, 21 V, 25 V, or 29 V with register 0x02 bits[7:5]. Once an OVP event has been detected, the BL_OVP flag is set in the Flags Register, and the subsequent behavior depends on the state of bit OVP_Mode in the Backlight Configuration 1 Register: If OVP_Mode is set to 0, as soon as V_{BL_OUT} falls below the backlight OVP threshold, the LM36273 begins switching again. If OVP_Mode is set to 1 and the device detects three occurrences of $V_{BL_OUT} > V_{OVP_BL}$ while any of the enabled current sink headroom voltages drops below 40 mV, the Backlight Boost OVP flag is set, the Backlight Enable bit is cleared, and the LM36273 enters standby mode. When the device is shut down due to a Backlight Boost OVP fault, the Flags register must be read back before the device can be reenabled.

7.3.2.9.2 Backlight Overcurrent Protection (OCP)

The LM36273 has 4 selectable OCP thresholds (900 mA, 1200 mA, 1500 mA, and 1800 mA). These are programmable in register 0x11 bits[1:0]. The OCP threshold is a cycle-by-cycle current limit and is detected in the internal low-side NFET. Once the threshold is hit the NFET turns off for the remainder of the switching period.

If enough overcurrent threshold events occur, the BL_OCP Flag (register 0x0F, bit[0]) is set. To avoid transient conditions from inadvertently setting the BL_OCP Flag, a pulse density counter monitors OCP threshold events over a 128- μ s period. If 8 consecutive 128- μ s periods occur where the pulse density count has found 2 or more OCP events, then the BL_OCP Flag is set.

During device start-up and during brightness code changes, there is a 4-ms blank time where BL OCP events are ignored. As a result, if the device starts up in an overcurrent condition there is an approximate 5-ms delay before the BL_OCP Flag is set.

7.3.3 LCM Bias

7.3.3.1 Display Bias Boost Converter (V_{VPOS} , V_{VNEG})

A single high-efficiency boost converter provides a positive voltage rail, V_{LCM_OUT} , which serves as the power rail for the LCM VPOS and VNEG outputs.

- The V_{VPOS} output LDO has a programmable range from 4 V up to 6.5 V with 50-mV steps and can supply up to 80 mA.
- The V_{VNEG} output is generated from a regulated, inverting charge pump and has an adjustable range of –6.5 V up to –4 V with 50-mV steps and a maximum load of 80 mA.

Boost voltage also has a programmable range from 4 V up to 7.15 V with 50-mV steps. Refer to [表 22](#), [表 23](#) and [表 24](#) for V_{LCM_OUT} , V_{VPOS} and V_{VNEG} voltage settings. When selecting a suitable boost-output voltage, the following estimation can be used: $V_{LCM_OUT} = \max(V_{VPOS}, |V_{VNEG}|) + V_{HR}$, where $V_{HR} \geq 200$ mV for lower currents and $V_{HR} \geq 300$ mV for higher currents. When the device input voltage (V_{IN}) is greater than the programmed LCM boost output voltage, the boost voltage is regulated to $V_{IN} + 100$ mV. V_{VPOS} and V_{VNEG} voltage settings cannot be changed while they are enabled. V_{VPOS} and V_{VNEG} register setting targets take effect only after the outputs are disabled and re-enabled. However, the V_{LCM_OUT} target changes immediately upon a register write.

图 40. LCM Boost Block Diagram

The LCM Bias outputs can be controlled either by pins LCM_EN1 and LCM_EN2 or register bits VPOS_EN and VNEG_EN, register 0x09 bits[2:1]. Setting bit EXT_EN, register 0x09 bit[0], to 1 allows pins LCM_EN1 and LCM_EN2 to control VPOS and VNEG, respectively, while setting this bit to 0 yields control to bits VPOS_EN and VNEG_EN. Refer to 表 8 for LCM bias control information.

表 8. LCM Operating Modes

HWEN	LCM_EN2 INPUT	LCM_EN1 INPUT	LCM_EN MODE 0x09[7:5]	VPOS_EN 0x09[2]	VNEG_EN 0x09[1]	EXT_EN 0x09[0]	ACTION

1	1	X	111	1	0	X	WAKE2 V _{VPOS} = programmed target V _{VNEG} = disabled
1	1	X	111	0	1	X	WAKE2 V _{VPOS} = disabled V _{VNEG} = programmed target
1	1	X	111	1	1	X	WAKE2 V _{VPOS} = programmed target V _{VNEG} = programmed target
1	1	X	111	0	0	X	WAKE2 Standby ⁽¹⁾
1	0	X	111	1	1	X	WAKE2 Standby ⁽¹⁾

(1) Standby implies that VPOS and VNEG are either high impedance or being internally pulled low via the active pulldown, and that the LCM boost is off. Shutdown implies that the device is in reset and no I²C communication is possible.

7.3.3.2 Auto Sequence Mode

If this mode is selected the LM36273 controls the turnon and turnoff of VPOS and VNEG as shown in [Figure 41](#).

图 41. Auto Sequence Timing

7.3.3.3 Wake-up Mode

If wake-up mode is selected the LM36273 allows on/off control of both VPOS and VNEG with only one external pin (LCM_EN2). Any combination of VPOS or VNEG can be turned on based on the state of bits VPOS_EN and VNEG_EN in register 0x09. In these modes the internal shutdown timing of the VPOS and VNEG blocks is modified to allow for lower quiescent current in standby mode, therefore reducing the average current consumption during a sequence of on/off events.

There are two wake-up modes available on the LM36273: wake1 and wake2.

7.3.3.3.1 Wake1 Mode

In wake1 mode the LM36273 passes V_{IN} through to the LCM boost output and the enabled VPOS, VNEG outputs. Due to the impedance of the LCM boost, the VPOS LDO and the VNEG charge pump, the respective outputs are regulated close to V_{IN} only at very light load current and droop below V_{IN} as the load increases.

7.3.3.3.2 Wake2 Mode

In wake2 mode the LM36273 regulates the LCM boost output as well as the enabled VPOS and VNEG outputs to their programmed voltage.

7.3.3.4 Active Discharge

An optional active discharge is available for the VPOS and VNEG output rails. An internal switch resistance for this discharge function is implemented on each output rail. The VPOS active discharge function is enabled with register 0x09 bit[4] and the VNEG active discharge with register 0x09 bit[3].

7.3.3.5 LCM Bias Protection and Faults

The LCM bias block of the LM36273 provides three protection mechanisms in order to prevent damage to the device. Note that none of these have any effect on backlight operation.

7.3.3.5.1 LCM Overvoltage (OVP) Protection

The LM36273 provides OVP that monitors the LCM bias boost output voltage (V_{LCM_OUT}) and protects LCM_OUT and LCM_SW from exceeding safe operating voltages. The OVP threshold is set to 7.8 V (typical). If an LCM bias overvoltage condition is detected, the LCM_OVP flag, register 0x0F bit[5], is set. Once the OVP condition is removed, the flag can be cleared with an I²C read back of the register. An LCM OVP condition does not cause the LCM bias to shut down; it is a report-only flag.

7.3.3.5.2 VPOS Short-Circuit Protection

If the current at VPOS exceeds 180 mA (typical), the LM36273 sets the VPOS_SHORT flag, register 0x0F bit[3]. A readback of register 0x0F is required to clear the flag. The outcome of a VPOS_SHORT detection depends on the configuration of the bias short-circuit mode option, register 0x0A bits[7:6]. The options are report-only flag, shutdown VPOS/VNEG, and shutdown VPOS/VNEG and backlight. To prevent narrow spikes from falsely triggering a VPOS short-circuit condition, the LM36273 provides four programmable VPOS short-circuit filter options: 100 μ s, 500 μ s, 1 ms, and 2 ms. These are selected in register 0x0B bits[3:2].

7.3.3.5.3 VNEG Short-Circuit Protection

If the voltage at VNEG rises (towards GND) to above 84% of its programmed value (typical), the LM36273 sets the VNEG_SHORT flag, register 0x0F bit[2]. A readback of register 0x0F is required to clear the flag. The outcome of a VNEG_SHORT detection depends on the configuration of the bias short-circuit mode option, register 0x0A bits[7:6]. The options are report-only flag, shut down VPOS/VNEG, and shut down VPOS/VNEG and backlight. To prevent narrow spikes from falsely triggering a VNEG short circuit condition, the LM36273 provides four programmable VNEG short circuit filter options: 100 μ s, 500 μ s, 1 ms, and 2 ms. These are selected in register 0x0B bits[1:0].

7.3.4 Software Reset

Bit[7] (SWR_RESET) of the Enable Register (0x08) is a software reset bit. Writing a 1 to this bit resets all I²C register values to their default values. Once the LM36273 has finished resetting all registers, it auto-clears the SWR_RESET bit.

7.3.5 HWEN Input

The HWEN pin is a global hardware enable for the LM36273. This pin must be pulled to logic HIGH to enable the device and the I²C-compatible interface. There is a 300-k Ω internal resistor between HWEN and GND. When this pin is at logic LOW, the LM36273 is placed in shutdown, the I²C-compatible interface is disabled, and the internal registers are reset to their default state. TI recommends that V_{IN} has risen above 2.7 V before setting HWEN HIGH.

7.3.6 Thermal Shutdown (TSD)

The LM36273 has TSD protection which shuts down the backlight boost, all backlight current sinks, LCM bias boost, inverting charge pump, and the LDO when the die temperature reaches or exceeds 140°C (typical). The I²C interface remains active during a TSD event. If a TSD fault occurs the TSD fault is set (register 0x0F bit[6]). The fault is cleared by an I²C read of register 0x0F or by toggling the HWEN pin.

7.4 Device Functional Modes

7.4.1 Modes of Operation

Shutdown: The LM36273 is in shutdown when the HWEN pin is low.

Standby: After the HWEN pin is set high the LM36273 goes into standby mode. In standby mode, I²C writes are allowed but references, bias currents, the oscillator, LCM powers, and backlight are all disabled to keep the quiescent supply current low (2 μ A typical).

Normal mode: Both main blocks of the LM36273 are independently controlled. For enabling each of the blocks in all available modes, see [表 1](#) and [表 8](#).

7.5 Programming

7.5.1 I²C-Compatible Serial Bus Interface

7.5.1.1 Interface Bus Overview

The I²C-compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the devices connected to the bus. The two interface lines are the Serial Data Line (SDA) and the Serial Clock Line (SCL). These lines must be connected to a positive supply via a pullup resistor and remain HIGH even when the bus is idle.

Every device on the bus is assigned a unique address and acts as either a Master or a Slave, depending whether it generates or receives the serial clock (SCL).

7.5.1.2 Data Transactions

One data bit is transferred during each clock pulse. Data is sampled during the high state of the SCL. Consequently, throughout the clock's high period, the data remains stable. Any changes on the SDA line during the high state of the SCL and in the middle of a transaction, aborts the current transaction. New data is sent during the low SCL state. This protocol permits a single data line to transfer both command/control information and data using the synchronous serial clock.

42. Data Validity

Each data transaction is composed of a start condition, a number of byte transfers (set by the software), and a stop condition to terminate the transaction. Every byte written to the SDA bus must be 8 bits long and is transferred with the most significant bit first. After each byte, an acknowledge signal must follow. The following sections provide further details of this process.

43. Acknowledge Signal

Programming (continued)

The Master device on the bus always generates the start and stop conditions (control codes). After a Start Condition is generated, the bus is considered busy, and it retains this status until a certain time after a stop condition is generated. A high-to-low transition of the data line (SDA) while the clock (SCL) is high indicates a start condition. A low-to-high transition of the SDA line while the SCL is high indicates a stop condition.

44. Start and Stop Conditions

In addition to the first start condition, a repeated start condition can be generated in the middle of a transaction. This allows another device to be accessed, or a register read cycle.

7.5.1.3 Acknowledge Cycle

The acknowledge cycle consists of two signals: the acknowledge clock pulse the master sends with each byte transferred, and the acknowledge signal sent by the receiving device.

The master generates the acknowledge clock pulse on the ninth clock pulse of the byte transfer. The transmitter releases the SDA line (permits it to go high) to allow the receiver to send the acknowledge signal. The receiver must pull down the SDA line during the acknowledge clock pulse and ensure that SDA remains low during the high period of the clock pulse, thus signaling the correct reception of the last data byte and its readiness to receive the next byte.

7.5.1.4 Acknowledge After Every Byte Rule

The master generates an acknowledge clock pulse after each byte transfer. The receiver sends an acknowledge signal after every byte received.

There is one exception to the *acknowledge after every byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

7.5.1.5 Addressing Transfer Formats

Each device on the bus has a unique slave address. The LM36273 operates as a slave device with the 7-bit address. If an 8-bit address is used for programming, the 8th bit is 1 for read and 0 for write. The 7-bit address for the device is 0x11.

Before any data is transmitted, the master transmits the address of the slave being addressed. The slave device sends an acknowledge signal on the SDA line, once it recognizes its address. The slave address is the first seven bits after a Start Condition. The direction of the data transfer (R/W) depends on the bit sent after the slave address — the eighth bit.

When the slave address is sent, each device in the system compares this slave address with its own. If there is a match, the device considers itself addressed and sends an acknowledge signal. Depending upon the state of the R/W bit (1: read, 0: write), the device acts as a transmitter or a receiver.

45. I²C Device Address

Programming (continued)

Control Register Write Cycle

- Master device generates start condition.
- Master device sends slave address (7 bits) and the data direction bit ($r/w = 0$).
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal.
- Master sends data byte to be written to the addressed register.
- Slave sends acknowledge signal.
- If master sends further data bytes the control register address is incremented by one after acknowledge signal.
- Write cycle ends when the master creates stop condition.

Control Register Read Cycle

- Master device generates a start condition.
- Master device sends slave address (7 bits) and the data direction bit ($r/w = 0$).
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal
- Master device generates repeated start condition.
- Master sends the slave address (7 bits) and the data direction bit ($r/w = 1$).
- Slave sends acknowledge signal if the slave address is correct.
- Slave sends data byte from addressed register.
- If the master device sends acknowledge signal, the control register address is incremented by one. Slave device sends data byte from addressed register.
- Read cycle ends when the master does not generate acknowledge signal after data byte and generates stop condition.

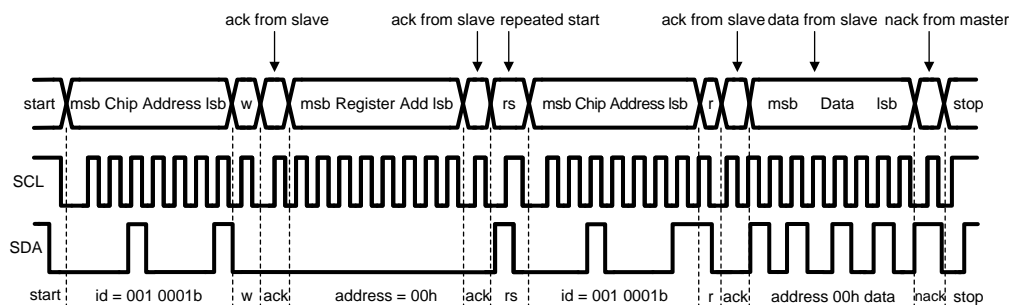

表 9. I²C Data Read/Write⁽¹⁾

	ADDRESS MODE
Data Read	<Start Condition> <Slave Address><r/w = 0>[Ack] <Register Addr>[Ack] <Repeated Start Condition> <Slave Address><r/w = 1>[Ack] [Register Data]<Ack or NAck> ...additional reads from subsequent register address possible <Stop Condition>
Data Write	<Start Condition> <Slave Address><r/w = 0>[Ack] <Register Addr>[Ack] <Register Data>[Ack] ...additional writes to subsequent register address possible <Stop Condition>

(1) < > = Data from master, [] = Data from slave

图 46. Register Write Format

When a READ function is to be accomplished, a WRITE function must precede the READ function, as show in the Read Cycle waveform.

图 47. Register Read Format

注

w = write (SDA = 0), r = read (SDA = 1), ack = acknowledge (SDA pulled down by either master or slave), rs = repeated start id = 7-bit chip address

7.5.1.6 Register Programming

For glitch-free operation, the following bits and/or registers must only be programmed while the LED Enable bits are 0 (Register 0x08, Bit [2:0] = 0) and/or Backlight Enable bit is 0 (Register 0x08, Bit[4] = 0):

1. Register 0x02 Bit[0] (PWM Enable)
2. Register 0x02 Bits[1] (PWM Ramp)
3. Register 0x02 Bit[2] (PWM Config)
4. Register 0x02 Bits[3] (LED Current Mapping)
5. Register 0x03 Bit[1:0] (PWM Hysteresis)
6. Register 0x03 Bit[2] (PWM Sample)
7. Register 0x03 Bit[6:3] (LED Current Ramp)
8. Register 0x10 Bit[0] (PWM HF Sample)
9. Register 0x10 Bit[1] (PWM Glitch Filter)
10. Register 0x10 Bit [5:3] (LED Feedback Enable)
11. Register 0x06 (auto frequency high threshold)
12. Register 0x07 (auto frequency low threshold)

8 Application and Implementation

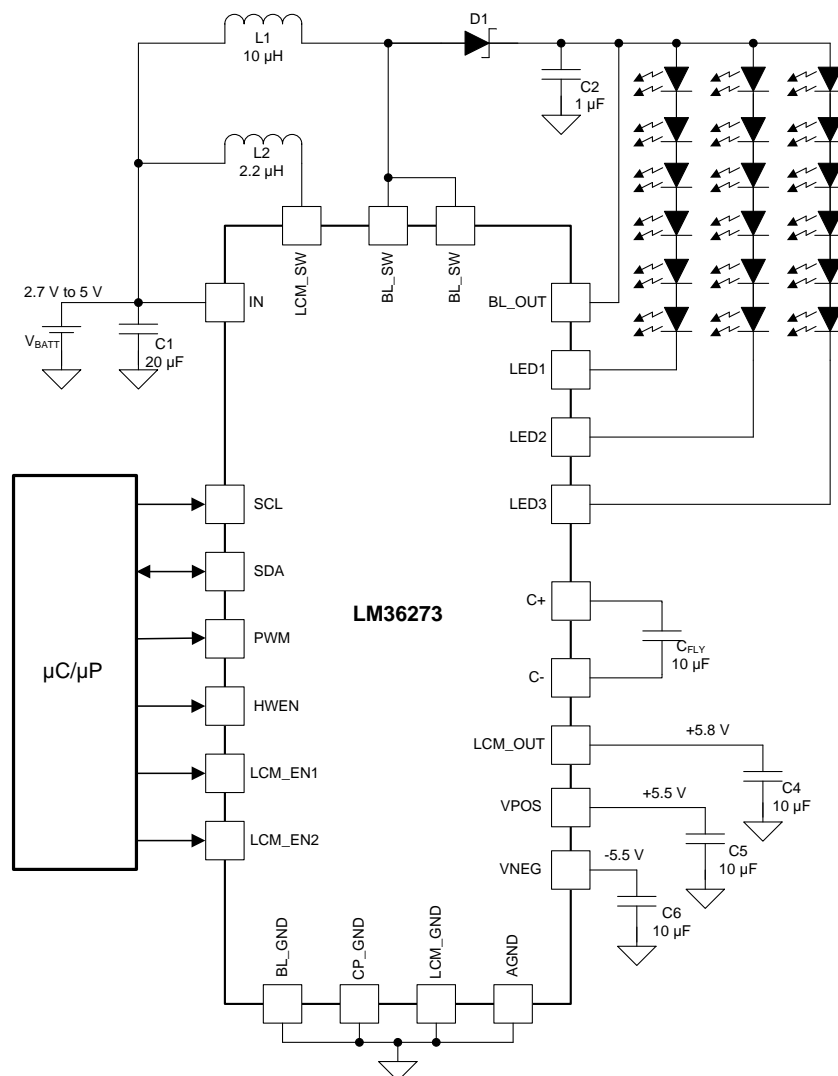

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM36273 integrates an LCD backlight driver and LCM positive and negative bias voltages into a single device. The backlight boost converter generates the high voltage required for the LEDs. The device can drive one, two, or three LED strings with up to eight white LEDs per string. Positive and negative bias voltages are post-regulated from the LCM bias boost output voltage. The LM36273 offers high performance, is highly configurable, and can support multiple LED configurations as well as independent control of the bias outputs.

8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

图 67. LM36273 Typical Application

Typical Application (continued)

8.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range (V_{IN})	2.7 V to 4.5 V (single Li-Ion cell battery)
LED parallel/series configuration	3 parallel, 6 series
LED maximum forward voltage (V_f)	3.35 V
Backlight LED current	maximum 30 mA / string
Backlight boost maximum voltage	29 V
Backlight boost SW frequency	1 MHz, 500 kHz, 250 kHz (auto-frequency option)
Backlight boost inductor	10- μ H, 1.5-A saturation current
Backlight boost Schottky diode	NSR05F30NXT5G
LCM boost output voltage	5.8 V
VPOS output voltage	5.5 V
VNEG output voltage	-5.5 V
LCM boost inductor	2.2- μ H, 1.5-A saturation current

The number of LED strings, number of series LEDs, and minimum input voltage are needed in order to calculate the peak input current. This information guides the designer to make the appropriate backlight boost inductor selection for the application. The LM36273 backlight boost converter output voltage (V_{OUT}) is calculated as follows: number of series LEDs $\times V_f + 0.31$ V. The LM36273 boost converter output current (I_{OUT}) is calculated as follows: number of parallel LED strings $\times 30$ mA. The LM36273 peak input current is calculated using 式 5.

8.2.2 Detailed Design Procedure

8.2.2.1 Component Selection

表 30 shows examples of external components for the LM36273. Boost converter output capacitors can be replaced with dual output capacitors of lower capacitance as long as the minimum effective capacitance requirement is met. DC bias effect of the ceramic capacitors must be taken into consideration when choosing the output capacitors. This is especially true for the high output-voltage backlight-boost converter.

表 30. Recommended External Components

DESIGNATOR	DESCRIPTION	VALUE	EXAMPLE
C1, C4, C5, C6, C _{FLY}	Ceramic capacitor	10 μ F, 10 V	C1608X5R0J106M
C2	Ceramic capacitor	1 μ F, 35 V	C2012X7R1H105K125AB
L1	Inductor	4.7 μ H, 1.94 A	VLF504012MT-4R7M
L1	Inductor	10 μ H, 1.44 A	VLF504015MT-100M
L1	Inductor	15 μ H, 1.25 A	VLF504015MT-150M
L2	Inductor	2.2 μ H, 1.5 A	DFE201612P-2R2M
D1	Schottky diode	30 V, 500 mA	NSR053F30NXT5G

8.2.2.1.1 Inductor Selection

The LM36273 backlight boost requires a typical inductance in the range of 4.7 μ H to 15 μ H. To ensure boost stability the Backlight Boost L Select bit (register 0x11 bits [7:6]) must be selected depending on the value of inductance chosen. Use the 4.7- μ H setting with a 6.8- μ H inductor.

The LCM boost is internally compensated for a typical inductance in the range of 1 μ H to 2.2 μ H. If the LCM boost output setting is greater than 6.3 V a 2.2- μ H inductor must be used.

There are two main considerations when choosing an inductor: the inductor RMS current rating must be greater than the RMS inductor current for the application, and the inductor saturation current must be greater than the peak inductor current for the application. Different saturation current rating specifications are followed by different manufacturers so attention must be given to details. Saturation current ratings are typically specified at 25°C. However, ratings at the maximum ambient temperature of the application should be requested from the

manufacturer. The saturation current must be greater than the sum of the maximum load current and the worst-case average-to-peak inductor current. When the boost device is boosting ($V_{OUT} > V_{IN}$) the inductor is one of the largest area of efficiency loss in the circuit. Therefore, choosing an inductor with the lowest possible series resistance is important, especially for an LCM bias converter. For proper inductor operation and circuit performance, ensure that the inductor saturation and the peak current limit setting of the LM36273 are greater than I_{PEAK} in 式 5:

$$I_{PEAK} = \frac{I_{LOAD}}{\eta} \times \frac{V_{OUT}}{V_{IN}} + \Delta I_{LOAD} \text{ where } \Delta I_{LOAD} = \frac{V_{IN} \times (V_{OUT} - V_{IN} \times \eta)}{2 \times f_{SW} \times L \times V_{OUT}} \quad (5)$$

See detailed information in *Understanding Boost Power Stages in Switch Mode Power Supplies* <http://focus.ti.com/lit/an/slva061/slva061.pdf>. *Power Stage Designer™ Tools* can be used for the boost calculation: <http://www.ti.com/tool/powerstage-designer>.

Also, the peak current calculated in 式 5 is different from the peak inductor current setting (I_{SAT}). The NMOS switch current limit setting (I_{CL_MIN}) must be greater than I_{PEAK} from 式 5.

8.2.2.1.2 Boost Output Capacitor Selection

At least an 1- μ F capacitor is recommended for the backlight boost converter output capacitor. A high-quality ceramic type X5R or X7R is recommended. Voltage rating must be greater than the maximum output voltage that is used. The effective output capacitance must always remain higher than 0.4 μ F for stable operation.

表 31 lists possible backlight output capacitors that can be used with the LM36273. 图 68 shows the DC bias of the four TDK capacitors. The useful voltage range is determined from the effective output voltage range for a given capacitor as determined by 式 6:

$$\text{DC Voltage Derating} \geq \frac{0.4 \mu\text{F}}{(1 - \text{Tol}) \times (1 - \text{Temp_co})} \quad (6)$$

表 31. Recommended Backlight Output Capacitors

PART NUMBER	MANUFACTURER	CASE SIZE	VOLTAGE RATING (V)	NOMINAL CAPACITANCE (μ F)	TOLERANCE (%)	TEMPERATURE COEFFICIENT (%)	RECOMMENDED MAX OUTPUT VOLTAGE (FOR SINGLE CAPACITOR)
C2012X5R1H105K085AB	TDK	0805	50	1	± 10	± 15	22
C2012X5R1H225K085AB	TDK	0805	50	2.2	± 10	± 15	24
C1608X5R1V225K080AC	TDK	0603	35	2.2	± 10	± 15	12
C1608X5R1H105K080AB	TDK	0603	50	1	± 10	± 15	15

For example, with a 10% tolerance, and a 15% temperature coefficient, the DC voltage derating must be $\geq 0.4 / (0.9 \times 0.85) = 0.523 \mu\text{F}$. For the C1608X5R1H225K080AB (0603, 50-V) device, the useful voltage range occurs up to the point where the DC bias derating falls below 0.523 μF , or around 12 V. For configurations where V_{OUT} is > 15 V, two of these capacitors can be paralleled, or a larger capacitor such as the C2012X5R1H105K085AB must be used.

FIG 68. DC Bias Derating for 0805 Case Size and 0603 Case Size 35-V and 50-V Ceramic Capacitors

For the LCM bias boost output a high-quality 10-µF ceramic type X5R or X7R capacitor is recommended. Voltage rating must be greater than the maximum output voltage that is used.

8.2.2.1.3 Input Capacitor Selection

Choosing the correct size and type of input capacitor helps minimize the voltage ripple caused by the switching of the LM36273 boost converters and reduce noise on the input pin that can feed through and disrupt internal analog signals. For the LM36273 a 10-µF ceramic input capacitor works well. It is important to place the input capacitor as close to the input (IN) pin as possible. This reduces the series resistance and inductance that can inject noise into the device due to the input switching currents.

8.2.3 Application Curves

8.2.3.1 Backlight Curves

Ambient temperature is 25°C and V_{IN} is 3.7 V unless otherwise noted. Backlight system efficiency is defined as PLED / PIN, where PLED is actual power consumed in backlight LEDs. External components are from 表 30.

9 Power Supply Recommendations

The LM36273 is designed to operate from an input voltage supply range from 2.7 V to 5 V. This input supply must be well regulated and capable to supply the required input current. If the input supply is located far from the LM36273 additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

10 Layout

10.1 Layout Guidelines

- Place the boost converter output capacitors as close to the output voltage and GND pins as possible.
- Minimize the boost converter switching loops by placing the input capacitors and inductors close to GND and switch pins.
- If possible, route the switching loops on top layer only. For best efficiency, try to minimize copper on the switch node to minimize switch pin parasitic capacitance while preserving adequate routing width.
- VIN input voltage pin must be bypassed to ground with a low-ESR bypass capacitor. Place the capacitor as close as possible to VIN pin.
- Place the output capacitor of the LDO as close to the output pins as possible. Also place the charge pump flying capacitor and output capacitor close to their respective pins.
- Route the internal pins on the second layer. Use offset micro vias to go from top layer to mid-layer1. Avoid routing the signal traces directly under the switching loops of the boost converters.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM36273YFFR	ACTIVE	DSBGA	YFF	24	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	LM36273	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LM36273YFFR	DSBGA	YFF	24	3000	180.0	8.4	1.82	2.74	0.75	4.0	8.0	Q1
LM36273YFFR	DSBGA	YFF	24	3000	180.0	8.4	1.72	2.51	0.69	4.0	8.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LM36273YFFR	DSBGA	YFF	24	3000	182.0	182.0	20.0
LM36273YFFR	DSBGA	YFF	24	3000	182.0	182.0	20.0

YFF (R-XBGA-N24)

DIE-SIZE BALL GRID ARRAY

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 B. This drawing is subject to change without notice.
