

# LM6171 高速、低消費電力、低歪み、電圧帰還型アンプ

## 1 特長

- 特に記述のない限り標準値
- 使いやすい電圧帰還トポロジ
- 非常に高いスルーレート: 3600V/ $\mu$ s
- 幅広いユニティゲイン帯域幅積: 76MHz
- $A_V = +2$  での  $-3\text{dB}$  周波数: 75MHz
- 低い消費電流: 2.5mA
- 高い CMRR: 110dB
- 高いオープン・ループ・ゲイン: 90dB
- $\pm 15\text{V}$  および  $\pm 5\text{V}$  での動作が規定済み

## 2 アプリケーション

- マルチメディア放送システム
- ラインドライバ、スイッチ
- ビデオ・アンプ
- NTSC、PAL<sup>®</sup>、SECAM システム
- ADC/DAC バッファ
- HDTV アンプ
- パルスアンプとピーク検出器
- 計装アンプ
- アクティブ・フィルタ

## 3 概要

LM6171 はユニティゲインで安定している高速電圧帰還型アンプです。LM6171 は、わずか 2.5mA の消費電流で 3600V/ $\mu$ s の高スルーレートと 100MHz のユニティゲイン帯域幅を提供します。LM6171 は、高速の信号処理やビデオアプリケーションに威力を発揮する優れた AC/DC 性能を持っています。

$\pm 15\text{V}$  電源の採用により、大きな信号スイングが可能で、ダイナミックレンジと信号対雑音比 (SNR) が向上します。LM6171 は、高出力電流ドライブ、低スプリアスフリーダイナミックレンジ (SFDR)、全高調波歪み (THD) を特長としており、A/D コンバータ (ADC) および D/A コンバータ (DAC) システムに非常に適しています。LM6171 は、携帯機器のアプリケーション用の  $\pm 5\text{V}$  での動作が規定されています。

### パッケージ情報

部品番号	パッケージ <sup>(1)</sup>	パッケージサイズ <sup>(2)</sup>
LM6171	D (SOIC, 8)	4.9mm × 6mm
	P (PDIP, 8)	9.81mm × 9.43mm

- (1) 詳細については、[セクション 10](#) を参照してください。
- (2) パッケージサイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

## 4 Pin Configuration and Functions

図 4-1. D Package, 8-Pin SOIC  
P Package, 8-Pin PDIP  
(Top View)

表 4-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
-IN	2	I	Negative input pin
+IN	3	I	Positive input pin
N/C	1, 5, 8	—	This pin is not internally connected; leave floating or connect to any other pin on the device.
OUTPUT	6	O	Output pin.
V <sup>-</sup>	4	I/O	Negative supply voltage pin.
V <sup>+</sup>	7	I/O	Positive supply voltage pin.

(1) Signal types: I = input, O = output, I/O = input or output.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup> <sup>(2)</sup>

		MIN	MAX	UNIT
V <sub>S</sub>	Supply voltage (V <sup>+</sup> – V <sup>-</sup> )		36	V
V <sub>I</sub>	Differential input voltage		±10	V
V <sub>CM</sub>	Common-mode voltage	(V <sup>-</sup> ) – 0.3	(V <sup>+</sup> ) + 0.3	V
I <sub>IN</sub>	Input current		±10	mA
I <sub>SC</sub>	Output current short to ground <sup>(3)</sup>		Continuous	A
T <sub>stg</sub>	Storage temperature	–65	150	°C
T <sub>J</sub>	Junction temperature <sup>(4)</sup>		150	°C
T <sub>SOLDER</sub>	Infrared or convection reflow (20 seconds)		235	°C
	Wave soldering lead temp (10 seconds)		260	

- (1) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (2) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (3) Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (4) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> – T<sub>A</sub>)/R<sub>θJA</sub>. All numbers apply for packages soldered directly into a PC board.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±1500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP155 states that 2500-V HBM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	TYP	MAX	UNIT
V <sub>S</sub>	Supply voltage	5.5		34	V
T <sub>A</sub>	Ambient temperature	–40		85	°C

### 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LM6171			UNIT

					85		

## 5.5 Electrical Characteristics: $\pm 15$ V (続き)

at  $T_J = 25^\circ\text{C}$ ,  $V^+ = 15$  V,  $V^- = -15$  V,  $V_{CM} = 0$  V, and  $R_L = 1$  k $\Omega$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN <sup>(2)</sup>	TYP <sup>(1)</sup>	MAX <sup>(2)</sup>	UNIT
	Continuous output current (in linear region)	Sourcing, $R_L = 100$ $\Omega$				100	mA
		Sinking, $R_L = 100$ $\Omega$				80	
$I_{SC}$	Output short circuit current	Sourcing				135	mA
		Sinking				135	
$I_S$	Supply current					2.5	mA
		$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$				4	
SR	Slew rate <sup>(5)</sup>	$A_V = +2$ , $V_{IN} = 13$ V <sub>PP</sub>				3600	V/ $\mu$ s
		$A_V = +2$ , $V_{IN} = 10$ V <sub>PP</sub>				3000	
	Unity-gain bandwidth	LM6171A				76	MHz
		LM6171B				100	MHz
	-3-dB frequency	LM6171A	$A_V = +1$			200	MHz
			$A_V = +2$			75	
		LM6171B	$A_V = +1$			160	
			$A_V = +2$			62	
$\phi_m$	Phase margin	LM6171A				58	Deg
		LM6171B				40	
$t_s$	Settling time (0.1%)	$A_V = -1$ , $V_{OUT} = \pm 5$ V, $R_L = 500$ $\Omega$	LM6171A			21	ns
			LM6171B			48	
$t_p$	Propagation delay	$A_V = -2$ , $V_{IN} = \pm 5$ V, $R_L = 500$ $\Omega$	LM6171A			4.1	ns
			LM6171B			6	
$A_D$	Differential gain <sup>(6)</sup>					0.03	%
$\phi_D$	Differential phase <sup>(6)</sup>					0.5	$^\circ$
$e_n$	Input-referred voltage noise	$f = 10$ kHz				12	nV/ $\sqrt{\text{Hz}}$
$i_n$	Input-referred current noise	$f = 10$ kHz				1	pA/ $\sqrt{\text{Hz}}$

- (1) Typical values represent the most likely parametric norm
- (2) All limits are specified by testing or statistical analysis.
- (3) Large-signal voltage gain is the total output swing divided by the input signal required to produce that swing. For  $V_S = \pm 15$  V,  $V_{OUT} = \pm 5$  V. For  $V_S = +5$  V,  $V_{OUT} = \pm 1$  V.
- (4) The open-loop output current is the output swing with the 100- $\Omega$  load resistor divided by that resistor.
- (5) Slew rate is the average of the rising and falling slew rates.
- (6) Differential gain and phase are measured with  $A_V = +2$ ,  $V_{IN} = 1$  V<sub>PP</sub> at 3.58 MHz and both input and output 75  $\Omega$  terminated.

## 5.6 Electrical Characteristics: $\pm 5$ V

at  $T_J = 25^\circ\text{C}$ ,  $V^+ = 5$  V,  $V^- = -5$  V,  $V_{CM} = 0$  V, and  $R_L = 1$  k $\Omega$  (unless otherwise noted)

## 6 Detailed Description

### 6.1 Overview

The LM6171 is a high-speed, unity-gain-stable voltage-feedback amplifier. The device consumes only 2.5 mA of supply current while providing a gain-bandwidth product of 100 MHz and a slew rate of 3600 V/ $\mu$ s. The LM6171 has additional features, such as low differential gain and phase, and high output current. The LM6171 is a great choice in high-speed circuits.

The LM6171 is a true voltage-feedback amplifier. Unlike current-feedback amplifiers (CFAs) with a low inverting input impedance and a high noninverting input impedance, both inputs of voltage-feedback amplifiers (VFAs) have high-impedance nodes. The low-impedance inverting input in CFAs couples with a feedback capacitor and causes oscillation. As a result, CFAs cannot be used in traditional op-amp circuits, such as photodiode amplifiers, I-to-V converters, and integrators.

### 6.2 Functional Block Diagram

### 6.3 Feature Description

#### 6.3.1 Circuit Operation

The class AB input stage in the LM6171 is fully symmetrical and has a similar slewing characteristic to the current feedback amplifiers. In the [セクション 6.2](#), Q1 through Q4 form the equivalent of the current feedback input buffer,  $R_E$  forms the equivalent of the feedback resistor, and stage A buffers the inverting input. The triple-buffered output stage isolates the gain stage from the load to provide low output impedance.

#### 6.3.2 Slew Rate

The slew rate of the LM6171 is determined by the current available to charge and discharge an internal high impedance node capacitor. The current is the differential input voltage divided by the total degeneration resistor  $R_E$ . Therefore, the slew rate is proportional to the input voltage level, and higher slew rates are achievable in lower-gain configurations.

When a very fast, large signal pulse is applied to the input of an amplifier, some overshoot or undershoot occurs. By placing an external series resistor, such as 1 k $\Omega$ , to the input of the LM6171, the bandwidth is reduced to help reduce overshoot.

## 6.4 Device Functional Modes

The LM6171 has a single functional mode and can be used with both single-supply or split power-supply configurations. The power-supply voltage must be greater than 9 V ( $\pm 4.5$  V) and less than 33 V ( $\pm 16.5$  V).

## 7 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 7.1 Application Information

#### 7.1.1 Compensation for Input Capacitance

The combination of an amplifier input capacitance and gain setting resistors adds a pole that can cause peaking or oscillation. To solve this problem, use a feedback capacitor with the following value to cancel that pole:

$$C_F > \frac{R_G \times C_{IN}}{R_F} \quad (1)$$

For the LM6171, a feedback capacitor of 2 pF is recommended. [図 7-1](#) illustrates the compensation circuit.

**図 7-1. Compensating for Input Capacitance**

### 7.1.2 Power Supply Bypassing

Bypassing the power supply is necessary to maintain low power-supply impedance across frequency. Individually bypass both positive and negative power supplies by placing 0.01- $\mu\text{F}$  ceramic capacitors directly to power-supply pins and 2.2- $\mu\text{F}$  tantalum capacitors close to the power-supply pins.

图 7-2. Power Supply Bypassing

### 7.1.3 Termination

In high-frequency applications, reflections occur if signals are not properly terminated. 图 7-3 shows a properly terminated signal and 图 7-4 shows an improperly terminated signal.

To minimize reflection, use coaxial cable with matching characteristic impedance to the signal source. Terminate the other end of the cable with the same value terminator or resistor. For commonly used cables, RG59 has a 75- $\Omega$  characteristic impedance, and RG58 has a 50- $\Omega$  characteristic impedance.

### 7.1.4 Driving Capacitive Loads

Amplifiers driving capacitive loads can oscillate or have ringing at the output. To eliminate oscillation or reduce ringing, place an isolation resistor as shown in [Figure 7-5](#). The combination of the isolation resistor and the load capacitor forms a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of the isolation resistor; the bigger the isolation resistor, the more damped the pulse response becomes. For the LM6171, a 50-Ω isolation resistor is recommended for initial evaluation. [Figure 7-6](#) shows the LM6171 driving a 200-pF load with the 50-Ω isolation resistor.

**Figure 7-5. Isolation Resistor Used to Drive Capacitive Load**

**Figure 7-6. The LM6171 Driving a 200-pF Load With a 50-Ω Isolation Resistor**

### 7.1.5 Using Probes

Active (FET) probes are an excellent choice for taking high-frequency measurements because of a wide bandwidth, high input impedance, and low input capacitance. However, the probe ground leads provide a long ground loop that produces errors in measurement. Instead, ground the probes directly by removing the ground leads and probe jackets and using scope probe jacks.

### 7.1.6 Components Selection and Feedback Resistor

In high-speed applications, keep all component leads short because wires are inductive at high frequency. For discrete components, choose carbon composition-type resistors and mica-type capacitors. Surface-mount components are preferred over discrete components for minimum inductive effect.

Large values of feedback resistors can couple with parasitic capacitance and cause undesirable effects such as ringing or oscillation in high-speed amplifiers. For the LM6171, a feedback resistor of 510 Ω gives optimized performance.

LM6171

JAJS829D – MAY 1998 – REVISED NOVEMBER 2023

7.2 Typical Applications

7.2.1 Fast Instrumentation Amplifier

図 7-7. Fast Instrumentation Amplifier

$$V_{IN} = V2 - V1$$

if  $R6 = R2$ ,  $R7 = R5$  and  $R1 = R4$

$$\frac{V_{OUT}}{V_{IN}} = \frac{R6}{R2} \left( 1 + 2 \frac{R1}{R3} \right) = 3$$

7.2.2 Multivibrator

図 7-8. Multivibrator

$$f = \frac{1}{2(R1C \ln[1 + 2 \frac{R2}{R3}])}$$

$f = 4 \text{ MHz}$

7.2.3 Pulse Width Modulator

図 7-9. Pulse Width Modulator

## 7.3 Power Supply Recommendations

### 7.3.1 Power Dissipation

The maximum power allowed to dissipate in a device is defined as:

$$P_D = \frac{T_{J(max)} - T_A}{\theta_{JA}} \quad (2)$$

where

- $P_D$  is the power dissipation in a device
- $T_{J(max)}$  is the maximum junction temperature
- $T_A$  is the ambient temperature
- $\theta_{JA}$  is the thermal resistance of a particular package

For example, for the LM6171 in a SOIC-8 package, the maximum power dissipation at 25°C ambient temperature is 730 mW.

Thermal resistance,  $\theta_{JA}$ , depends on parameters such as die size, package size, and package material. The smaller the die size and package, the higher  $\theta_{JA}$  becomes. The 8-pin PDIP package has a lower thermal resistance (108°C/W) than the 8-pin SOIC-8 (172°C/W). Therefore, for higher dissipation capability, use an 8-pin PDIP package.

The total power dissipated in a device can be calculated as:

$$P_D = P_Q + P_L \quad (3)$$

where

- $P_Q$  = the quiescent power dissipated in a device with no load connected at the output.
  - $P_Q$  = supply current × total supply voltage with no load
- $P_L$  = the power dissipated in the device with a load connected at the output;  $P_L$  is not the power dissipated by the load.
  - $P_L$  = output current × (voltage difference between supply voltage and output voltage of the same supply)

For example, the total power dissipated by the LM6171 with  $V_S = \pm 15\text{ V}$ , and the output voltage of 10 V into a 1-kΩ load resistor (one end tied to ground) is:

$$\begin{aligned} P_D &= P_Q + P_L \\ &= (2.5\text{ mA}) \times (30\text{ V}) + (10\text{ mA}) \times (15\text{ V} - 10\text{ V}) \\ &= 75\text{ mW} + 50\text{ mW} \\ &= 125\text{ mW} \end{aligned}$$

## 7.4 Layout

### 7.4.1 Layout Guidelines

#### 7.4.1.1 Printed Circuit Boards and High-Speed Op Amps

There are many things to consider when designing a printed circuit board (PCB) for high-speed op amps. Without proper caution, excessive ringing, oscillation, and other degraded ac performance in high-speed circuits can be frustrating. As a rule, keep the signal traces short and wide to provide low inductance and low-impedance paths. Ground any unused board space to reduce stray signal pickup. Also ground any critical components at a common point to eliminate voltage drop. Sockets add capacitance to the board and can affect frequency performance. If possible, solder the amplifier directly into the PCB without using any socket.

## 8 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 8.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、[www.tij.co.jp](http://www.tij.co.jp) のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

### 8.2 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

### 8.3 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

PAL® is a registered trademark of and used under license from Advanced Micro Devices, Inc..

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
