

LMZ35003 QFNパッケージ、7V~50V入力の2.5Aパワー・モジュール

1 特長

- 小さな占有面積で低プロファイルの設計を可能にする完全な統合電源ソリューション
- 広い入力電圧範囲: 7V~50V
- 出力電圧を2.5V~15Vの範囲で設定可能
- 65Vのサージ耐圧
- 最高96%の効率
- 可変スイッチング周波数(300kHz~1MHz)
- 外部クロックに同期
- 調整可能なスロー・スタート
- 出力電圧のシーケンシングとトラッキング
- パワー・グッド出力
- 低電圧誤動作防止(UVLO)をプログラム可能
- 出力過電流保護
- 過熱保護機能
- プリバイアス出力によるスタートアップ
- 動作温度範囲: -40°C~85°C
- 強化された熱特性: 14°C/W
- EN55022 Class Bの放射要件に準拠
 - シールド付きインダクタを内蔵
- 設計の手引きについては、<http://www.ti.com/LMZ35003>を参照
- WEBENCH® Power Designerにより、LMZ35003を使用するカスタム設計を作成

2 アプリケーション

- 産業用およびモータ制御
- 自動テスト機器
- 医療用およびイメージング機器
- 高密度の電源システム

3 概要

LMZ35003パワー・モジュールは、2.5AのDC/DCコンバータとシールド付きインダクタ、受動部品を組み合わせて、低プロファイルのQFNパッケージに封入した、使いやすい統合型パワー・ソリューションです。外部部品は5個しか使用せず、ループ補償や磁気部品の選択プロセスも不要になります。

9mm×11mm×2.8mmの小型QFNパッケージはプリント基板へ簡単にハンダ付けでき、90%を超える効率と非常に優れた消費電力特性を持つ、小型のポイント・オブ・ロード設計を実現できます。LMZ35003は、ディスクリートPOL設計と同等の柔軟性および機能セットを備え、幅広い範囲のIC/システムへの電力供給に最適です。先進のパッケージング技術により、標準のQFN実装/試験手法に対応した、堅牢で信頼性の高い電源ソリューションを実現できます。

アプリケーション概略図

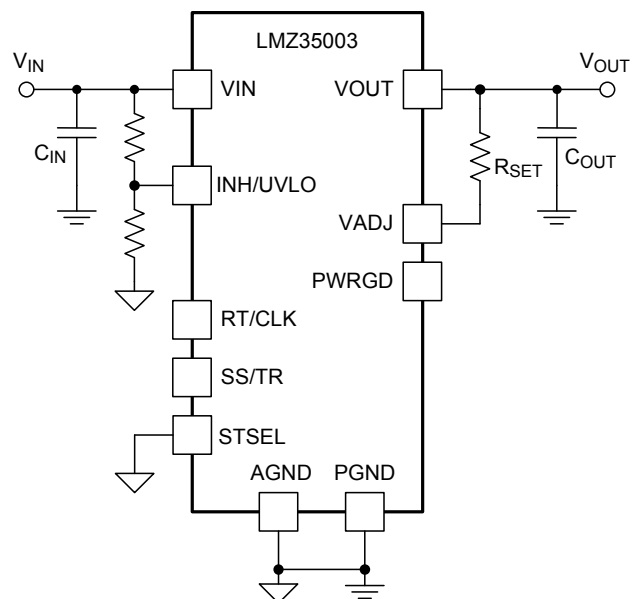

Table 1. Ordering Information

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

4 Specifications

4.1 Absolute Maximum Ratings⁽¹⁾

over operating temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Input Voltage	V _{IN}	-0.3	65	V
	INH/UVLO	-0.3	5	V
	V _{ADJ}	-0.3	3	V
	PWRGD	-0.3	6	V
	SS/TR	-0.3	3	V
	STSEL	-0.3	3	V
	RT/CLK	-0.3	3.6	V
Output Voltage	PH	-0.6	65	V
	PH 10ns Transient	-2	65	V
	V _{OUT}	-0.6	V _{IN}	V
V _{DIFF} (GND to exposed thermal pad)		±200	mV	
Source Current	RT/CLK		100	µA
	INH/UVLO		100	µA
Sink Current	SS/TRK		200	µA
	PWRGD		10	mA
Operating Junction Temperature		-40	105 ⁽²⁾	°C
Storage Temperature		-65	150	°C
Peak Reflow Case Temperature ⁽³⁾			250 ⁽⁴⁾	°C
Maximum Number of Reflows Allowed ⁽³⁾			3 ⁽⁴⁾	
Mechanical Shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		1500	G
Mechanical Vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz		20	

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) See the temperature derating curves in the Typical Characteristics section for thermal information.
- (3) For soldering specifications, refer to the [Soldering Requirements for BQFN Packages](#) application note.
- (4) Devices with a date code prior to week 14 2018 (1814) have a peak reflow case temperature of 240°C with a maximum of one reflow.

4.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{IN}	Input Voltage	7	50	V
V _{OUT}	Output Voltage	2.5	15	V
f _{SW}	Switching Frequency	400	1000	kHz
T _A	Operating Ambient Temperature	-40	85	°C

4.3 Thermal Information

THERMAL METRIC ⁽¹⁾		LMZ35003	UNIT
		RKG	
		41 PINS	
θ_{JA}	Junction-to-ambient thermal resistance ⁽²⁾	14	°C/W
Ψ_{JT}	Junction-to-top characterization parameter ⁽³⁾	3.3	
Ψ_{JB}	Junction-to-board characterization parameter ⁽⁴⁾	6.8	

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* (SPRA953) application report.
- (2) The junction-to-ambient thermal resistance, θ_{JA} , applies to devices soldered directly to a 100 mm x 100 mm double-sided, 4-layer PCB with 1 oz. copper and natural convection cooling. Additional airflow reduces θ_{JA} .
- (3) The junction-to-top characterization parameter, Ψ_{JT} , estimates the junction temperature, T_J , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \Psi_{JT} * P_{dis} + T_T$; where P_{dis} is the power dissipated in the device and T_T is the temperature of the top of the device.
- (4) The junction-to-board characterization parameter, Ψ_{JB} , estimates the junction temperature, T_J , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \Psi_{JB} * P_{dis} + T_B$; where P_{dis} is the power dissipated in the device and T_B is the temperature of the board 1mm from the device.

4.4 Package Specifications

LMZ35003		UNIT
Weight		0.9 grams
Flammability	Meets UL 94 V-O	
MTBF Calculated reliability	Per Bellcore TR-332, 50% stress, $T_A = 40^\circ\text{C}$, ground benign	31.7 Mhrs

4.5 Electrical Characteristics

$-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$, $V_{IN} = 24\text{ V}$, $V_{OUT} = 5.0\text{ V}$, $I_{OUT} = 2.5\text{ A}$, $R_T = \text{Open}$
 $C_{IN} = 2 \times 2.2\ \mu\text{F}$ ceramic, $C_{OUT} = 2 \times 47\ \mu\text{F}$ ceramic (unless otherwise noted)

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_{OUT}	Output current	Over input voltage and output voltage range	0		2.5	A
V_{IN}	Input voltage range	Over output current range	7.0 ⁽¹⁾		50 ⁽²⁾	V
UVLO	VIN Undervoltage lockout	No hysteresis, Rising and Falling		2.5		V
$V_{OUT(adj)}$	Output voltage adjust range	Over output current range	2.5 ⁽³⁾		15	V
V_{OUT}	Set-point voltage tolerance	$T_A = 25^\circ\text{C}$; $I_{OUT} = 100\text{ mA}$			$\pm 2.0\%$ ⁽⁴⁾	
	Temperature variation	$-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$		$\pm 0.5\%$	$\pm 1.0\%$	
	Line regulation	Over input voltage range		$\pm 0.1\%$		
	Load regulation	Over output current range		$\pm 0.4\%$		
	Total output voltage variation	Includes set-point, line, load, and temperature variation				$\pm 3.0\%$ ⁽⁴⁾
η	Efficiency	$V_{IN} = 24\text{ V}$ $I_{OUT} = 1.5\text{ A}$	$V_{OUT} = 12\text{ V}$, $f_{SW} = 800\text{ kHz}$		93 %	
			$V_{OUT} = 5.0\text{ V}$, $f_{SW} = 500\text{ kHz}$		84 %	
			$V_{OUT} = 3.3\text{ V}$, $f_{SW} = 400\text{ kHz}$		79 %	
		$V_{IN} = 48\text{ V}$ $I_{OUT} = 1.5\text{ A}$	$V_{OUT} = 12\text{ V}$, $f_{SW} = 800\text{ kHz}$		87 %	
			$V_{OUT} = 5.0\text{ V}$, $f_{SW} = 500\text{ kHz}$		79 %	
			$V_{OUT} = 3.3\text{ V}$, $f_{SW} = 400\text{ kHz}$		74 %	
Output voltage ripple	20 MHz bandwidth, $0.25\text{ A} \leq I_{OUT} \leq 2.5\text{ A}$, $V_{OUT} \geq 3.3\text{ V}$			1% ⁽³⁾		V_{OUT}
I_{LIM}	Current limit threshold			5.1		A
Transient response	1.0 A/ μs load step from 50 to 100% $I_{OUT(max)}$	Recovery time		400		μs
		VOUT over/undershoot		90		mV
V_{INH}	Inhibit threshold voltage	No hysteresis	1.15	1.25	1.36 ⁽⁵⁾	V

- (1) For output voltages $\leq 12\text{ V}$, the minimum input voltage is 7 V or $(V_{OUT} + 3\text{ V})$, whichever is greater. For output voltages $> 12\text{ V}$, the minimum input voltage is $(1.33 \times V_{OUT})$. See [Figure 27](#) for more details.
- (2) The maximum input voltage is 50 V or $(15 \times V_{OUT})$, whichever is less.
- (3) Output voltages $< 3.3\text{ V}$ are subject to reduced $V_{IN(max)}$ specifications and higher ripple magnitudes.
- (4) The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance is affected by the tolerance of the external R_{SET} resistor.
- (5) Value when no voltage divider is present at the INH/UVLO pin.

Electrical Characteristics (continued)

$-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$, $V_{\text{IN}} = 24\text{ V}$, $V_{\text{OUT}} = 5.0\text{ V}$, $I_{\text{OUT}} = 2.5\text{ A}$, $R_T = \text{Open}$
 $C_{\text{IN}} = 2 \times 2.2\text{ }\mu\text{F}$ ceramic, $C_{\text{OUT}} = 2 \times 47\text{ }\mu\text{F}$ ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
I_{INH}	INH Input current	$V_{\text{INH}} < 1.15\text{ V}$		-0.9		μA	
		$V_{\text{INH}} > 1.36\text{ V}$		-3.8		μA	
$I_{\text{I(stby)}}$	Input standby current	INH pin to AGND		1.3	4	μA	
Power Good	PWRGD Thresholds	V_{OUT} rising	Good	94%			
			Fault	109%			
		V_{OUT} falling	Fault	91%			
			Good	106%			
	PWRGD Low Voltage	$I(\text{PWRGD}) = 3.5\text{ mA}$		0.2		V	
f_{SW}	Switching frequency	RT/CLK pin OPEN	300	400	500	kHz	
f_{CLK}	Synchronization frequency	CLK Control	300		1000	kHz	
$V_{\text{CLK-H}}$	CLK High-Level Threshold			1.9	2.2	V	
$V_{\text{CLK-L}}$	CLK Low-Level Threshold			0.5	0.7	V	
D_{CLK}	CLK Duty cycle			25%	50%	75%	
	Thermal Shutdown		Thermal shutdown		180		$^{\circ}\text{C}$
		Thermal shutdown hysteresis		15		$^{\circ}\text{C}$	
C_{IN}	External input capacitance	Ceramic	4.4 ⁽⁶⁾	10		μF	
		Non-ceramic		22			
C_{OUT}	External output capacitance		100 ⁽⁷⁾		430	μF	

- (6) A minimum of 4.4 μF of ceramic external capacitance is required across the input (V_{IN} and PGND connected) for proper operation. Locate the capacitor close to the device. See [Table 3](#) for more details.
- (7) The required capacitance must include at least 2 x 47 μF ceramic capacitors (or 4 x 22 μF). Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients. See [Table 3](#) for more details.

5 Device Information

FUNCTIONAL BLOCK DIAGRAM

Table 2. PIN DESCRIPTIONS

TERMINAL		DESCRIPTION
NAME	NO.	
AGND	1	These pins are connected to the internal analog ground (AGND) of the device. This node should be treated as the zero volt ground reference for the analog control circuitry. Pad 37 should be connected to PCB ground planes using multiple vias for good thermal performance. Not all pins are connected together internally. All pins must be connected together externally with a copper plane or pour directly under the module. Connect AGND to PGND at a single point (GND_PT; pins 8 & 9). See Layout Recommendations.
	4	
	5	
	30	
	32	
	33	
	34	
DNC	2	Do Not Connect. Do not connect these pins to AGND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
	3	
	25	
PH	6	Phase switch node. Do not place any external component on these pins or tie them to a pin of another function.
	7	
	21	
	22	
	23	
	24	
	38	
GND_PT	8	Ground Point. Connect AGND to PGND at these pins as shown in the Layout Considerations . These pins are not connected to internal circuitry, and are not connected to one other.
	9	
VOUT	10	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external bypass capacitors between these pins and PGND. Connect a resistor from these pins to VADJ to set the output voltage.
	11	
	12	
	13	
	14	
	15	
PGND	16	This is the return current path for the power stage of the device. Connect these pins to the load and to the bypass capacitors associated with VIN and VOUT. Pad 40 should be connected to PCB ground planes using multiple vias for good thermal performance.
	17	
	18	
	19	
	20	
	40	
VIN	26	Input voltage. This pin supplies all power to the converter. Connect this pin to the input supply and connect bypass capacitors between this pin and PGND.
INH/UVLO	27	Inhibit and UVLO adjust pin. Use an open drain or open collector logic device to ground this pin to control the INH function. A resistor divider between this pin, AGND, and VIN sets the UVLO voltage.
SS/TR	28	Slow-start and tracking pin. Connecting an external capacitor to this pin adjusts the output voltage rise time. A voltage applied to this pin allows for tracking and sequencing control.
STSEL	29	Slow-start or track feature select. Connect this pin to AGND to enable the internal SS capacitor. Leave this pin open to enable the TR feature.
RT/CLK	31	This pin is connected to an internal frequency setting resistor which sets the default switching frequency. An external resistor can be connected from this pin to AGND to increase the frequency. This pin can also be used to synchronize to an external clock.
PWRGD	35	Power Good flag pin. This open drain output asserts low if the output voltage is more than approximately $\pm 6\%$ out of regulation. A pull-up resistor is required.
VADJ	36	Connecting a resistor between this pin and VOUT sets the output voltage.

(TOP VIEW)**

6 Typical Characteristics (VIN = 12 V)

The electrical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the converter. Applies to [Figure 1](#), [Figure 2](#), and [Figure 3](#). The temperature derating curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures. Derating limits apply to devices soldered directly to a 100 mm × 100 mm double-sided PCB with 1 oz. copper. Applies to [Figure 4](#).

Figure 2. Voltage Ripple vs. Output Current

Figure 3. Power Dissipation vs. Output Current

Figure 4. Safe Operating Area

Figure 5. $V_{OUT} = 5\text{ V}$, $I_{OUT} = 2\text{ A}$, $C_{OUT1} = 44\text{ }\mu\text{F}$ ceramic, $C_{OUT2} = 56\text{ }\mu\text{F}$ electrolytic, $f_{SW} = 500\text{ kHz}$

Figure 6. $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 2\text{ A}$, $C_{OUT1} = 44\text{ }\mu\text{F}$ ceramic, $C_{OUT2} = 56\text{ }\mu\text{F}$ electrolytic, $f_{SW} = 400\text{ kHz}$

7 Typical Characteristics (VIN = 24 V)

The electrical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the converter. Applies to Figure 7, Figure 8, and Figure 9. At light load the output voltage ripple may increase due to pulse skipping. See [Light-Load Behavior](#) for more information. Applies to Figure 8. The temperature derating curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures. Derating limits apply to devices soldered directly to a 100 mm × 100 mm double-sided PCB with 1 oz. copper. Applies to Figure 10.

Figure 23. $V_{OUT} = 5\text{ V}$, $I_{OUT} = 2\text{ A}$, $C_{OUT1} = 44\text{ }\mu\text{F}$ ceramic, $C_{OUT2} = 56\text{ }\mu\text{F}$ electrolytic, $f_{SW} = 500\text{ kHz}$

Figure 24. $V_{OUT} = 12\text{ V}$, $I_{OUT} = 2\text{ A}$, $C_{OUT1} = 44\text{ }\mu\text{F}$ ceramic, $C_{OUT2} = 56\text{ }\mu\text{F}$ electrolytic, $f_{SW} = 800\text{ kHz}$

10 Capacitor Recommendations for the LMZ35003 Power Supply

10.1 Capacitor Technologies

10.1.1 Electrolytic, Polymer-Electrolytic Capacitors

When using electrolytic capacitors, high-quality, computer-grade electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz, and are suitable when ambient temperatures are above 0°C.

10.1.2 Ceramic Capacitors

The performance of aluminum electrolytic capacitors is less effective than ceramic capacitors above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

10.1.3 Tantalum, Polymer-Tantalum Capacitors

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

10.2 Input Capacitor

The LMZ35003 requires a minimum input capacitance of 4.4 μF of ceramic type. The voltage rating of input capacitors must be greater than the maximum input voltage. The ripple current rating of the capacitor must be at least 450 mA rms. [Table 3](#) includes a preferred list of capacitors by vendor.

10.3 Output Capacitor

The output capacitance of the LMZ35003 can be comprised of either all ceramic capacitors, or a combination of ceramic and bulk capacitors. The required output capacitance must include at least 100 μF of ceramic type (or 2 x 47 μF). When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in [Table 3](#) are required. Additional capacitance above the minimum is determined by actual transient deviation requirements. [Table 3](#) includes a preferred list of capacitors by vendor.

Table 3. Recommended Input/Output Capacitors⁽¹⁾

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS		
			WORKING VOLTAGE (V)	CAPACITANCE (μF)	ESR ⁽²⁾ ($\text{m}\Omega$)
Murata	X5R	GRM31CR61H225KA88L	50	4.7	2
TDK	X5R	C3216X5R1H475K	50	4.7	2
Murata	X5R	GRM32ER61E226K	16	22	2
TDK	X5R	C3225X5R0J476K	6.3	47	2
Murata	X5R	GRM32ER60J476M	6.3	47	2
Sanyo	POSCAP	16TQC68M	16	68	50
Sanyo	POSCAP	6TPE100MI	6.3	100	25
Kemet	T530	T530D227M006ATE006	6.3	220	6

(1) Capacitor Supplier Verification, RoHS, Lead-free and Material Details

Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.

(2) Maximum ESR @ 100 kHz, 25°C.

11 Application Information

11.1 LMZ35003 Operation

The LMZ35003 can operate over a wide input voltage range of 7 V to 50 V and produce output voltages from 2.5 V to 15 V. The performance of the device varies over this wide operating range, and there are some important considerations when operated near the boundary limits. This section offers guidance in selecting the optimum components depending on the application and operating conditions.

The user must select three primary parameters when designing with the LMZ35003.

- Output Voltage
- UVLO Threshold
- Switching Frequency

The adjustment of each of these parameters can be made using just one or two resistors. [Figure 25](#) below shows a typical LMZ35003 schematic with the key parameter-setting resistors labeled.

Figure 25. LMZ35003 Typical Schematic

11.2 Adjusting the Output Voltage

The LMZ35003 is designed to provide output voltages from 2.5V to 15V. The output voltage is determined by the value of R_{SET} , which must be connected between the VOUT node and the VADJ pin (Pin 36). For output voltages greater than 5.0V, improved operating performance can be obtained by increasing the operating frequency. This adjustment requires the addition of R_{RT} between RT/CLK (Pin 31) and AGND (Pin 30). See the [Switching Frequency](#) section for more details. [Table 4](#) gives the standard external R_{SET} resistor for a number of common bus voltages and also includes the recommended R_{RT} resistor for output voltages above 5.0V.

Table 4. Standard R_{SET} Resistor Values for Common Output Voltages

RESISTORS	OUTPUT VOLTAGE V_{OUT} (V)					
	2.5	3.3	5.0	8.0	12.0	15.0
R_{SET} (k Ω)	21.5	31.6	52.3	90.9	140	178
R_{RT} (k Ω)	open	open	1100	549	267	178

For other output voltages the value of R_{SET} can be calculated using the following formula, or simply selected from the range of values given in [Table 5](#).

$$R_{SET} = 10 \times \left(\frac{V_{OUT}}{0.798} - 1 \right) \text{ (k}\Omega\text{)} \quad (1)$$

Table 5. Standard R_{SET} and R_{RT} Resistor Values

V_{OUT} (V)	R_{SET} (k Ω)	R_{RT} (k Ω)	f_{sw} (kHz)	V_{OUT} (V)	R_{SET} (k Ω)	R_{RT} (k Ω)	f_{sw} (kHz)
2.5	21.5	open	400	9.0	102	365	700
3.0	27.4	open	400	9.5	110	365	700
3.3	31.6	open	400	10.0	115	365	700
3.5	34.0	open	400	10.5	121	267	800
4.0	40.2	open	400	11.0	127	267	800

11.3 Input Voltage

The LMZ35003 operates over the input voltage range of 7 V to 50 V. For reliable start-up and operation at light loads, the minimum input voltage depends on the output voltage. For output voltages $\leq 12V$, the minimum input voltage is 7V or $(V_{OUT} + 3V)$, whichever is greater. For output voltages $> 12V$, the minimum input voltage is $(1.33 \times V_{OUT})$.

The maximum input voltage is $(15 \times V_{OUT})$ or 50 V, whichever is less.

While the device can safely handle input surge voltages up to 65 V, sustained operation at input voltages above 50 V is not recommended.

See the [Undervoltage Lockout \(UVLO\) Threshold](#) section of this datasheet for more information.

11.4 Undervoltage Lockout (UVLO) Threshold

At turn-on, the V_{ON} UVLO threshold determines the input voltage level where the device begins power conversion. During the power-down sequence, the V_{OFF} UVLO threshold determines the input voltage where power conversion ceases. The turn-on and turn-off thresholds are set by two resistors, R_{UVLO1} and R_{UVLO2} as shown in Figure 26.

The V_{ON} UVLO threshold must be set to at least ($V_{OUT} + 3\text{ V}$) or 7 V whichever is greater to insure proper start-up and reduce current surges on the host input supply as the voltage rises. If possible, it is recommended to set the UVLO threshold to approximately 80 to 85% of the minimum expected input voltage.

Use Equation 2 and Equation 3 to calculate the values of R_{UVLO1} and R_{UVLO2} . V_{ON} is the voltage threshold during power-up when the input voltage is rising. V_{OFF} is the voltage threshold during power-down when the input voltage is decreasing. V_{OFF} should be selected to be at least 500mV less than V_{ON} . Table 6 lists standard resistor values for R_{UVLO1} and R_{UVLO2} for adjusting the V_{ON} UVLO threshold for several input voltages.

$$R_{UVLO1} = \frac{(V_{ON} - V_{OFF})}{2.9 \times 10^{-3}} \text{ (k}\Omega\text{)} \tag{2}$$

$$R_{UVLO2} = \frac{1.25}{\left(\frac{V_{ON} - 1.25}{R_{UVLO1}}\right) + 0.9 \times 10^{-3}} \text{ (k}\Omega\text{)} \tag{3}$$

Figure 26. Adjustable VIN UVLO

Table 6. Standard Resistor Values to set V_{ON} UVLO Threshold

V_{ON} THRESHOLD (V)	6.5	10.0	15.0	20.0	25.0	30.0	35.0	40.0	45.0
R_{UVLO1} (k Ω)	174	174	174	174	174	174	174	174	174
R_{UVLO2} (k Ω)	40.2	24.3	15.8	11.5	9.09	7.50	6.34	5.62	4.99

11.5 Power Good (PWRGD)

The PWRGD pin is an open drain output. Once the output voltage is between 94% and 106% of the set voltage, the PWRGD pin pull-down is released and the pin floats. The recommended pull-up resistor value is between 10 k Ω and 100 k Ω to a voltage source that is 5.5 V or less. The PWRGD pin is in a defined state once VIN is greater than 1.0 V, but with reduced current sinking capability. The PWRGD pin achieves full current sinking capability once the VIN pin is above 4.5V. The PWRGD pin is pulled low when the output voltage is lower than 91% or greater than 109% of the nominal set voltage. Also, the PWRGD pin is pulled low if the input UVLO or thermal shutdown is asserted, the INH pin is pulled low, or the SS/TR pin is below 1.4 V.

11.6 Switching Frequency

Nominal switching frequency of the LMZ35003 is set from the factory at 400 kHz. This switching frequency is optimum for output voltages below 5.0 V. For output voltages 5.0V and above, better operating performance can be obtained raising the operating frequency. This is easily done by adding a resistor, R_{RT} in , from the RT/CLK pin (Pin 31) to the AGND pin (Pin 30). Raising the operating frequency reduces output voltage ripple, lowers the load current threshold where pulse skipping begins, and improves transient response.

The recommended switching frequency for all output voltages is listed in [Table 5](#).

For the maximum recommended output voltage value of 15 V, the switching frequency computes to 1000 kHz or 1 MHz. Operation above 1 MHz is not recommended. Use [Table 7](#) below to select the value of the timing resistor for the given values of switching frequencies.

Table 7. Standard Resistor Values to set the Switching Frequency

f_{sw} (kHz)	400	500	600	700	800	900	1000
$R_{RT}(k\Omega)$	OPEN	1100	549	365	267	215	178

It is also possible to synchronize the switching frequency to an external clock signal. See the [Synchronization \(CLK\)](#) section for further details.

While it is possible to set the operating frequency higher than 400 kHz when using the device at output voltages of 5 V or less, minimum duty cycle and pulse skipping issues restrict the maximum recommended input voltage under these conditions. The recommended operating conditions for the LMZ35003 can be summarized by [Figure 27](#). The graph shows the maximum input voltage vs. output voltage restriction for several operating frequencies. The lower boundary of the graph shows the minimum input voltage as a function of the output voltage.

11.8 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the LMZ35003 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

11.9 Power-Up Characteristics

When configured as shown in the front page schematic, the LMZ35003 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay from the point that a valid input voltage is recognized. [Figure 31](#) shows the start-up waveforms for a LMZ35003, operating from a 24-V input and the output voltage adjusted to 5 V. The waveform were measured with a 2-A constant current load.

Figure 31. Start-Up Sequence

11.10 Output On/Off Inhibit (INH)

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device. If an application requires controlling the INH pin, use an open drain/collector device, or a suitable logic gate to interface with the pin.

Figure 32 shows the typical application of the inhibit function. The Inhibit control has its own internal pull-up to VIN potential. An open-collector or open-drain device is recommended to control this input.

Turning Q1 on applies a low voltage to the inhibit control (INH) pin and disables the output of the supply, shown in Figure 33. If Q1 is turned off, the supply executes a soft-start power-up sequence, as shown in Figure 34. A regulated output voltage is produced within 5 ms. The waveforms were measured with a 2-A constant current load.

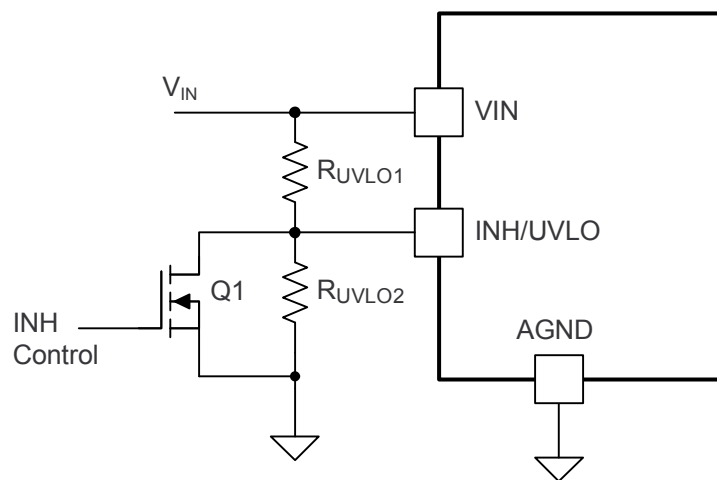

Figure 32. Typical Inhibit Control

11.11 Slow Start (SS/TR)

For outputs voltages of 5V or less, the slow start capacitance built into the LMZ35003 is sufficient to provide for a turn-on ramp rate that does not induce large surge currents while charging the output capacitors. Connecting the STSEL pin (Pin 29) to AGND while leaving SS pin (Pin 28) open enables the internal SS capacitor with a slow start interval of approximately 5 ms. For output voltages greater than 5V, additional slow start capacitance is recommended. For 12V to 15V output voltages, a 22nF capacitor should be connected between the SS/TR pin (Pin 28) and AGND, while connecting the STSEL pin (Pin 29) to AGND as well. [Figure 35](#) shows an additional SS capacitor connected to the SS pin and the STSEL pin connected to AGND. See [Table 8](#) below for SS capacitor values and timing interval.

Figure 35. Slow Start Capacitor (C_{SS}) and STSEL Connection

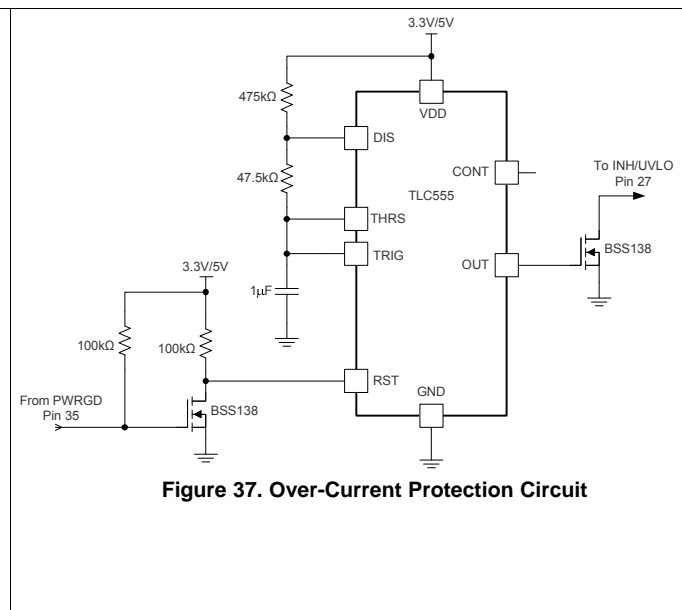

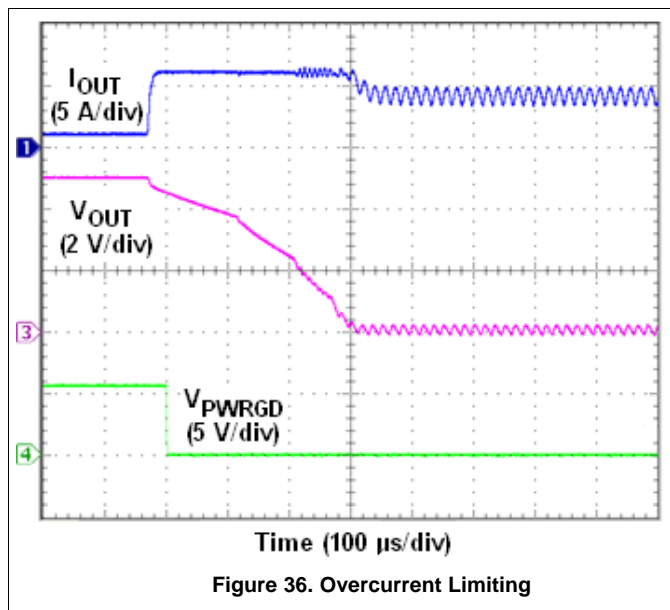

Table 8. Slow Start Capacitor Values and Slow Start Time

C _{SS} (nF)	open	4.7	10	15	22
SS Time (msec)	5	7	10	13	17

11.12 Overcurrent Protection

For protection against load faults, the LMZ35003 incorporates cycle-by-cycle current limiting. During an overcurrent condition the output current is limited and the output voltage is reduced, as shown in Figure 36. As the output voltage drops more than 8% below the set point, the PWRGD signal is pulled low. If the output voltage drops more than 25%, the switching frequency is reduced to reduce power dissipation within the device. When the overcurrent condition is removed, the output voltage returns to the established voltage.

The LMZ35003 is not designed to endure a sustained short circuit condition. The use of an output fuse, voltage supervisor circuit, or other overcurrent protection circuit is recommended. A recommended overcurrent protection circuit is shown in Figure 37. This circuit uses the PWRGD signal as an indication of an overcurrent condition. As PWRGD remains low, the 555 timer operates as a low frequency oscillator, driving the INH/UVLO pin low for approximately 400ms, halting the power conversion of the device. After the inhibit interval, the INH/UVLO pin is released and the LMZ35003 restarts. If the overcurrent condition is removed, the PWRGD signal goes high, resetting the oscillator and power conversion resumes, otherwise the inhibit cycle repeats.

11.13 Light-Load Behavior

The LMZ35003 is a non-synchronous converter. One of the characteristics of a non-synchronous converter is that as the load current on the output is decreased, a point is reached where the energy delivered by a single switching pulse is more than the load can absorb. This causes the output voltage to rise slightly. This rise in output voltage is sensed by the feedback loop and the device responds by skipping one or more switching cycles until the output voltage falls back to the set point. At very light loads or no load, many switching cycles are skipped. The observed effect during this pulse skipping mode of operation is an increase in the peak to peak ripple voltage, and a decrease in the ripple frequency. The load current where pulse skipping begins is a function of the input voltage, the output voltage, and the switching frequency. A plot of the pulse skipping threshold current as a function of input voltage is given in Figure 38 for a number of popular output voltage and switching frequency combinations.

Figure 38. Pulse Skipping Threshold

11.14 Synchronization (CLK)

An internal phase locked loop (PLL) allows synchronization between 400 kHz and 1 MHz, and to easily switch from RT mode to CLK mode. To implement the synchronization feature, connect a square wave clock signal to the RT/CLK pin with a duty cycle between 20% to 80%. The clock signal amplitude must transition lower than 0.8 V and higher than 2.0 V. The start of the switching cycle is synchronized to the falling edge of RT/CLK pin. In applications where both RT mode and CLK mode are needed, the device can be configured as shown in Figure 39.

Before the external clock is present, the device works in RT mode where the switching frequency is set by the R_{RT} resistor. When the external clock is present, the CLK mode overrides the RT mode. The first time the CLK pin is pulled above the RT/CLK high threshold (2.0 V), the device switches from RT mode to CLK mode and the RT/CLK pin becomes high impedance as the PLL starts to lock onto the frequency of the external clock. It is not recommended to switch from CLK mode back to RT mode because the internal switching frequency drops to 100 kHz first before returning to the switching frequency set by the R_{RT} resistor .

Figure 39. CLK/RT Configuration

11.15 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 180°C typically. The device reinitiates the power up sequence when the junction temperature drops below 165°C typically.

11.16 Layout Considerations

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 40 and Figure 41 show two layers of a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the module pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Place a dedicated AGND copper area beneath the LMZ35003.
- Isolate the PH copper area from the VOUT copper area using the PGND copper area.
- Connect the AGND and PGND copper area at one point; at pins 8 & 9.
- Place R_{SET} , R_{RT} , and C_{SS} as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.
- Use a dedicated sense line to connect R_{SET} to VOUT near the load for best regulation.

Figure 40. Typical Top-Layer Recommended Layout

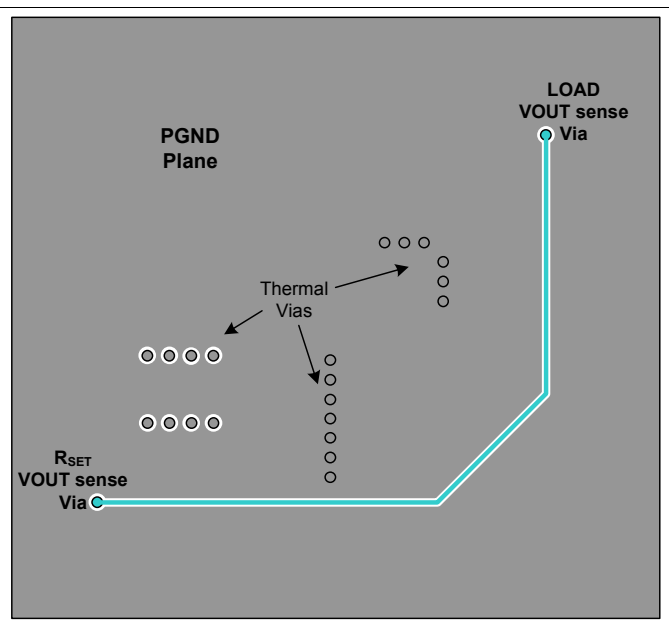

Figure 41. Typical PGND-Layer Recommended Layout

11.17 EMI

The LMZ35003 is compliant with EN55022 Class B radiated emissions. [Figure 42](#) and [Figure 43](#) show typical examples of radiated emissions plots for the LMZ35003 operating from 24 V and 12 V respectively. Both graphs include the plots of the antenna in the horizontal and vertical positions.

12 Revision History

Changes from Revision A (June 2017) to Revision B Page

- LMZ35003用のWEBENCH®設計リンクを追加..... 1
 - Increased the peak reflow temperature and maximum number of reflows to JEDEC specifications for improved manufacturability 2
 - 「デバイスおよびドキュメントのサポート」セクションを追加 27
 - 「メカニカル、パッケージ、および注文情報」セクションを追加..... 28
-

Changes from Original (July 2013) to Revision A Page

- タイトルの上の図 削除..... 1
 - Added peak reflow and maximum number of reflows information 2
-

13 デバイスおよびドキュメントのサポート

13.1 デバイス・サポート

13.1.1 開発サポート

13.1.1.1 WEBENCH®ツールによるカスタム設計

[ここをクリック](#)すると、WEBENCH® Power Designerにより、LMZ35003デバイスを使用するカスタム設計を作成できます。

1. 最初に、入力電圧(V_{IN})、出力電圧(V_{OUT})、出力電流(I_{OUT})の要件を入力します。
2. オプティマイザのダイヤルを使用して、効率、占有面積、コストなどの主要なパラメータについて設計を最適化します。
3. 生成された設計を、テキサス・インスツルメンツが提供する他のソリューションと比較します。

WEBENCH Power Designerでは、カスタマイズされた回路図と部品リストを、リアルタイムの価格と部品の在庫情報と併せて参照できます。

ほとんどの場合、次の操作を実行可能です。

- 電氣的なシミュレーションを実行し、重要な波形と回路の性能を確認する。
- 熱シミュレーションを実行し、基板の熱特性を把握する。
- カスタマイズされた回路図やレイアウトを、一般的なCADフォーマットでエクスポートする。
- 設計のレポートをPDFで印刷し、同僚と設計を共有する。

WEBENCHツールの詳細は、www.ti.com/WEBENCHでご覧になれます。

14 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMZ35003RKGR	ACTIVE	B1QFN	RKG	41	500	RoHS Exempt & Green	NIPDAU	Level-3-250C-168 HR	-40 to 85	(54260, LMZ35003)	Samples
LMZ35003RKGT	ACTIVE	B1QFN	RKG	41	250	RoHS Exempt & Green	NIPDAU	Level-3-250C-168 HR	-40 to 85	(54260, LMZ35003)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
