

## LP3869x/-Q1 500-mA Low-Dropout CMOS Linear Regulators Stable With Ceramic Output Capacitors

### 1 Features

- Wide Input Voltage Range (2.7 V to 10 V)
- All WSON Options are Available as AEC-Q100 Grade 1
- 2% Output Accuracy (25°C)
- Low Dropout Voltage: 250 mV at 500 mA (Typical, 5 V Out)
- Precision (Trimmed) Bandgap Reference
- Ensured Specifications for –40°C to 125°C
- 1- $\mu$ A Off-State Quiescent Current
- Thermal Overload Protection
- Foldback Current Limiting
- Ground Pin Current: 55  $\mu$ A (typical) at full load
- Enable Pin (LP38693)

### 2 Applications

- Hard Disk Drives
- Notebook Computers
- Battery-Powered Devices
- Portable Instrumentation

### 4 Typical Application Circuits

\* Minimum value required for stability

\*\* WSON package devices only

### 3 Description

The LP3869x low-dropout CMOS linear regulators provide tight output tolerance (2% typical), extremely low dropout voltage (250 mV at 500-mA load current,  $V_{OUT} = 5$  V), and excellent AC performance using ultralow equivalent series resistance (ESR) ceramic output capacitors.

The low thermal resistance of the WSON, SOT-223, and TO-252 packages allow use of the full operating current even in high ambient temperature environments.

The use of a PMOS power transistor means that no DC base-drive current is required to bias it, thus allowing ground pin current to remain below 100  $\mu$ A regardless of load current, input voltage, or operating temperature.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP38691	TO-252 (3)	6.58 mm × 6.10 mm
	WSON (6)	3.00 mm × 3.00 mm
LP38693	SOT-223 (5)	6.50 mm × 3.56 mm
	WSON (6)	3.00 mm × 3.00 mm
LP38691-Q1	WSON (6)	3.00 mm × 3.00 mm
LP38693-Q1		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

\* Minimum value required for stability

\*\* WSON package devices only

## 5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision N (March 2015) to Revision O</b>	<b>Page</b>
• Added top navigator icon for TI Designs .....	<b>1</b>
• Added Caution note to <i>Foldback Current Limiting</i> subsection .....	<b>13</b>

<b>Changes from Revision M (February 2015) to Revision N</b>	<b>Page</b>
• Added "Cout = xx pF" to "Cout = $\mu$ F" for Figures 4 through 6 in <i>Typical Characteristics</i> .....	<b>1</b>

<b>Changes from Revision L (December 2014) to Revision M</b>	<b>Page</b>
• Changed wording of <i>Description</i> and added one item to <i>Features</i> ; update Vin, Vout and Ven pin names to IN, OUT, and EN in text and graphics .....	<b>1</b>
• Added top navigator icon for TI Designs .....	<b>1</b>
• Changed "PFM" to "TO-252" .....	<b>4</b>
• Changed <i>Handling Ratings</i> to <i>ESD Ratings</i> format .....	<b>4</b>

<b>Changes from Revision K (April 2013) to Revision L</b>	<b>Page</b>
• Added <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section; update thermal values .....	<b>1</b>

<b>Changes from Revision J (April 2013) to Revision K</b>	<b>Page</b>
• Changed layout of National Data Sheet to TI format .....	<b>18</b>

### Pin Functions

NAME	PIN			I/O	DESCRIPTION
	TO-252	WSON			
DAP	—	√	√	—	WSON Only - The DAP (Exposed Pad) functions as a thermal connection when soldered to a copper plane. See <a href="#">WSON Mounting</a> section for more information.
EN	—	—	3	1	The EN pin allows the part to be turned ON and OFF by pulling this pin high or low.
GND	TAB	2	2	5	Circuit ground for the regulator. For the TO-252 and SOT-223 packages this is thermally connected to the die and functions as a heat sink when the soldered down to a large copper plane.
IN	3	1, 6	1, 6	4	This is the input supply voltage to the regulator. For WSON devices, both IN pins must be tied together for full current operation (250 mA maximum per pin).
OUT	1	4	4	3	Regulated output voltage
SNS	—	5	5	—	WSON Only - Output SNS pin allows remote sensing at the load which eliminate the error in output voltage due to voltage drops caused by the resistance in the traces between the regulator and the load. This pin must be tied to OUT.

## 7 Specifications

### 7.1 Absolute Maximum Ratings<sup>(1)(2)</sup>

	MIN	MAX	UNIT
Lead temp. (Soldering, 5 seconds)		260	°C
Power dissipation <sup>(3)</sup>	Internally Limited		V
V(max) All pins (with respect to GND)	−0.3	12	V
I <sub>OUT</sub> <sup>(4)</sup>	Internally Limited		V
Junction temperature	−40	150	°C
Storage temperature, T <sub>stg</sub>	−65	150	

- (1) Absolute maximum ratings indicate limits beyond which damage to the component may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For ensured specifications, see [Electrical Characteristics](#). Specifications do not apply when operating the device outside of its rated operating conditions.
- (2) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (3) At elevated temperatures, device power dissipation must be derated based on package thermal resistance and heatsink values (if a heatsink is used). When using the WSON package, refer to [AN-1187 Leadless Leadframe Package \(LLP\)](#), [SNOA401](#), and the [WSON Mounting](#) section in this datasheet. If power dissipation causes the junction temperature to exceed specified limits, the device goes into thermal shutdown.
- (4) If used in a dual-supply system where the regulator load is returned to a negative supply, the output pin must be diode clamped to ground.

### 7.2 ESD Ratings: LP38691 and LP38693

	VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 7.3 ESD Ratings: LP38691-Q1 and LP38693-Q1

	VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.4 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
V <sub>IN</sub> supply voltage	2.7		10	V
Operating junction temperature	−40		125	°C

## 7.5 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LP38691	LP38693	LP3869x	UNIT
		TO-252	WSON	SOT-223	
		3 PINS	6 PINS	5 PINS	
$R_{\theta JA}$ <sup>(2)</sup>	Junction-to-ambient thermal resistance	50.5	50.6	68.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	52.6	44.4	52.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	29.7	24.9	13.0	°C/W
$\psi_{JT}$	Junction-to-top characterization parameter	4.8	0.4	5.5	°C/W
$\psi_{JB}$	Junction-to-board characterization parameter	29.3	25.1	12.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.5	5.4	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

(2) Junction-to-ambient thermal resistance, High-K.

## 7.6 Electrical Characteristics

Unless otherwise specified, limits apply for  $T_J = 25^\circ\text{C}$ ,  $V_{IN} = V_{OUT} + 1\text{ V}$ ,  $C_{IN} = C_{OUT} = 10\ \mu\text{F}$ ,  $I_{LOAD} = 10\ \text{mA}$ . Minimum and maximum limits are specified through testing, statistical correlation, or design.

PARAMETER		TEST CONDITIONS		MIN	TYP <sup>(1)</sup>	MAX	UNIT
$V_O$	Output voltage tolerance			-2		2	% $V_{OUT}$
		$100\ \mu\text{A} < I_L < 0.5\ \text{A}$ $V_O + 1\ \text{V} \leq V_{IN} \leq 10\ \text{V}$ Full operating temperature range		-4		4	
$\Delta V_O / \Delta V_{IN}$	Output voltage line regulation <sup>(2)</sup>	$V_O + 0.5\ \text{V} \leq V_{IN} \leq 10\ \text{V}$ $I_L = 25\ \text{mA}$			0.03		% $V$
		$V_O + 0.5\ \text{V} \leq V_{IN} \leq 10\ \text{V}$ $I_L = 25\ \text{mA}$ Full operating temperature range				0.1	
$\Delta V_O / \Delta I_L$	Output voltage load regulation <sup>(3)</sup>	$1\ \text{mA} < I_L < 0.5\ \text{A}$ $V_{IN} = V_O + 1\ \text{V}$			1.8		% $A$
		$1\ \text{mA} < I_L < 0.5\ \text{A}$ $V_{IN} = V_O + 1\ \text{V}$ Full operating temperature range				5	
$V_{IN} - V_{OUT}$	Dropout voltage <sup>(4)</sup>	$(V_O = 2.5\ \text{V})$	$I_L = 0.1\ \text{A}$		80		mV
			$I_L = 0.5\ \text{A}$		430		
		$(V_O = 2.5\ \text{V})$ Full operating temperature range	$I_L = 0.1\ \text{A}$		145		
			$I_L = 0.5\ \text{A}$		725		
		$(V_O = 3.3\ \text{V})$	$I_L = 0.1\ \text{A}$		65		
			$I_L = 0.5\ \text{A}$		330		
		$(V_O = 3.3\ \text{V})$ Full operating temperature range	$I_L = 0.1\ \text{A}$		110		
			$I_L = 0.5\ \text{A}$		550		
		$(V_O = 5\ \text{V})$	$I_L = 0.1\ \text{A}$		45		
			$I_L = 0.5\ \text{A}$		250		
		$(V_O = 5\ \text{V})$ Full operating temperature range	$I_L = 0.1\ \text{A}$		100		
			$I_L = 0.5\ \text{A}$		450		

(1) Typical numbers represent the most likely parametric norm for 25°C operation.

(2) Output voltage line regulation is defined as the change in output voltage from nominal value resulting from a change in input voltage.

(3) Output voltage load regulation is defined as the change in output voltage from nominal value as the load current increases from 1 mA to full load.

(4) Dropout voltage is defined as the minimum input to output differential required to maintain the output within 100 mV of nominal value.

**Electrical Characteristics (continued)**

Unless otherwise specified, limits apply for  $T_J = 25^\circ\text{C}$ ,  $V_{IN} = V_{OUT} + 1\text{ V}$ ,  $C_{IN} = C_{OUT} = 10\ \mu\text{F}$ ,  $I_{LOAD} = 10\text{ mA}$ . Minimum and maximum limits are specified through testing, statistical correlation, or design.

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$I_Q$	Quiescent current	$V_{IN} \leq 10\text{ V}$ , $I_L = 100\ \mu\text{A} - 0.5\text{ A}$		55		$\mu\text{A}$
		$V_{IN} \leq 10\text{ V}$ , $I_L = 100\ \mu\text{A} - 0.5\text{ A}$ Full operating temperature range			100	
		$V_{EN} \leq 0.4\text{ V}$ , (LP38693 Only)		0.001	1	
$I_L(\text{MIN})$	Minimum load current	$V_{IN} - V_O \leq 4\text{ V}$ Full operating temperature range			100	
$I_{FB}$	Foldback current limit	$V_{IN} - V_O > 5\text{ V}$		350		mA
		$V_{IN} - V_O < 4\text{ V}$		850		
PSRR	Ripple rejection	$V_{IN} = V_O + 2\text{ V(DC)}$ , with 1 V(p-p) / 120-Hz Ripple		55		dB
$T_{SD}$	Thermal shutdown activation (junction temp)			160		$^\circ\text{C}$
$T_{SD}(\text{HYST})$	Thermal shutdown hysteresis (junction temp)			10		
$e_n$	Output noise	BW = 10 Hz to 10 kHz $V_O = 3.3\text{ V}$		0.7		$\mu\text{V}/\sqrt{\text{Hz}}$
$V_O(\text{LEAK})$	Output leakage current	$V_O = V_O(\text{NOM}) + 1\text{ V}$ at $10\text{ V}_{IN}$		0.5	12	$\mu\text{A}$
$V_{EN}$	Enable voltage (LP38693 Only)	Output = OFF Full operating temperature range			0.4	V
		Output = ON, $V_{IN} = 4\text{ V}$ Full operating temperature range	1.8			
		Output = ON, $V_{IN} = 6\text{ V}$ Full operating temperature range	3			
		Output = ON, $V_{IN} = 10\text{ V}$ Full operating temperature range	4			
$I_{EN}$	Enable pin leakage (ILP38693 only)	$V_{EN} = 0\text{ V}$ or $10\text{ V}$ , $V_{IN} = 10\text{ V}$	-1	0.001	1	$\mu\text{A}$

## 7.7 Typical Characteristics

## 8 Detailed Description

### 8.1 Overview

The LP38691 and LP38693 are designed to meet the requirements of portable, battery-powered digital systems providing an accurate output voltage with fast start-up. When disabled via a low logic signal at the enable pin (EN), the power consumption is reduced to virtually zero (LP38693 only).

The LP38691 and LP38693 perform well with a single 1- $\mu$ F input capacitor and a single 1- $\mu$ F ceramic output capacitor.

### 8.2 Functional Block Diagrams

Figure 23. LP38691 Functional Diagram (WSON)

Figure 24. LP38691 Functional Diagram (TO-252)

**Functional Block Diagrams (continued)**

**Figure 25. LP38693 Functional Diagram (WSON)**

**Figure 26. LP38693 Functional Diagram (SOT-223)**

## 8.3 Feature Description

### 8.3.1 Enable (EN)

The LP38693 has an Enable pin (EN) which allows an external control signal to turn the regulator output On and Off. The Enable On/Off threshold has no hysteresis. The voltage signal must rise and fall cleanly, and promptly, through the ON and OFF voltage thresholds. The EN pin voltage must be higher than the  $V_{EN(MIN)}$  threshold to ensure that the device is fully enabled under all operating conditions. The EN pin voltage must be lower than the  $V_{EN(MAX)}$  threshold to ensure that the device is fully disabled. The EN pin has no internal pullup or pulldown to establish a default condition and, as a result, this pin must be terminated either actively or passively. If the EN pin is driven from a source that actively pulls high and low, the drive voltage must not be allowed to go below ground potential or higher than  $V_{IN}$ . If the application does not require the Enable function, the pin must be connected directly to the IN pin.

### 8.3.2 Thermal Overload Protection ( $T_{SD}$ )

Thermal Shutdown disables the output when the junction temperature rises to approximately 160°C which allows the device to cool. When the junction temperature cools to approximately 150°C, the output circuitry enables.

Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This thermal cycling limits the dissipation of the regulator and protects it from damage as a result of overheating. The Thermal Shutdown circuitry of the LP38693 has been designed to protect against temporary thermal overload conditions.

The Thermal Shutdown circuitry was not intended to replace proper heat-sinking. Continuously running the LP38693 device into thermal shutdown degrades device reliability.

### 8.3.3 Foldback Current Limiting

Foldback current limiting is built into the LP38691 and LP38693 devices which reduces the amount of output current the part can deliver as the output voltage is reduced. The amount of load current is dependent on the differential voltage between the IN and OUT pins. Typically, when this differential voltage exceeds 5 V, the load current limits at about 350 mA. When the  $V_{IN} - V_{OUT}$  differential is reduced below 4 V, load current is limited to about 850 mA.

#### CAUTION

When toggling the LP38693 Enable (EN) after the input voltage ( $V_{IN}$ ) is applied, the foldback current limit circuitry is functional the first time that the EN pin is taken high. The foldback current limit circuitry is non-functional the second, and subsequent, times that the EN pin is taken high. Depending on the input and output capacitance values the input inrush current may be higher than expected which can cause the input voltage to droop.

If the EN pin is connected to the IN pin, the foldback current limit circuitry is functional when  $V_{IN}$  is applied if  $V_{IN}$  starts from less than 0.4 V.

## 8.4 Device Functional Modes

### 8.4.1 Enable (EN)

The EN pin voltage must be higher than the  $V_{EN(MIN)}$  threshold to ensure that the device is fully enabled under all operating conditions.

### 8.4.2 Minimum Operating Input Voltage ( $V_{IN}$ )

The LP38691 and LP38693 do not include any dedicated UVLO circuitry. Neither device internal circuitry is fully functional until  $V_{IN}$  is at least 2.7 V. The output voltage is not regulated until  $V_{IN} \geq (V_{OUT} + V_{DO})$ , or 2.7 V, whichever is higher.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

#### 9.1.1 Reverse Voltage

A reverse voltage condition exists when the voltage at the output pin is higher than the voltage at the input pin. Typically this happens when  $V_{IN}$  is abruptly taken low and  $C_{OUT}$  continues to hold a sufficient charge such that the input to output voltage becomes reversed. A less common condition is when an alternate voltage source is connected to the output.

There are two possible paths for current to flow from the OUT pin back to IN during a reverse voltage condition.

1. While  $V_{IN}$  is high enough to keep the control circuitry alive, and the EN pin (LP38693 only) is above the  $V_{EN(ON)}$  threshold, the control circuitry attempts to regulate the output voltage. If the input voltage is less than the programmed output voltage, the control circuit drives the gate of the pass element to the full ON condition. In this condition, reverse current flows from the OUT to the IN pin, limited only by the  $R_{DS(ON)}$  of the pass element and the output to input voltage differential. Discharging an output capacitor up to 1000  $\mu\text{F}$  in this manner does not damage the device as the current rapidly decays. However, continuous reverse current must be avoided. When the EN pin is low, this condition is prevented.
2. The internal PFET pass element has an inherent parasitic diode. During normal operation, the input voltage is higher than the output voltage and the parasitic diode is reverse biased. However, when  $V_{IN}$  is below the value where the control circuitry is alive, or the EN pin is low (LP38693 only), and the output voltage is more than 500 mV (typical) above the input voltage the parasitic diode becomes forward biased and current flows from the output pin to the input pin through the diode. The current in the parasitic diode must be limited to less than 1-A continuous and 5-A peak.

If used in a dual-supply system where the regulator output load is returned to a negative supply, the output pin must be diode-clamped to ground to limit the negative voltage transition. A Schottky diode is recommended for this protective clamp.

### 9.2 Typical Application

\* Minimum value required for stability.

\*\*WSON package devices only.

## 9.2.1 Design Requirements

**Table 1. Design Parameters**

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range	2.7 V to 10 V
Output range	1.8 V
Output current	1 A
Output capacitor range	1 $\mu$ F
Input and output capacitor ESR range	5 m $\Omega$ to 500 m $\Omega$

## 9.2.2 Detailed Design Procedure

### 9.2.2.1 Power Dissipation and Device Operation

The permissible power dissipation for any package is a measure of the capability of the device to pass heat from the power source, the junctions of the IC, to the ultimate heat sink, the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum allowable power dissipation for the device in a given package can be calculated using [Equation 1](#):

$$P_{D-MAX} = ((T_{J-MAX} - T_A) / R_{\theta JA}) \quad (1)$$

The actual power being dissipated in the device can be represented by [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

These two equations establish the relationship between the maximum power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These two equations must be used to determine the optimum operating conditions for the device in the application.

In applications where lower power dissipation ( $P_D$ ) and/or excellent package thermal resistance ( $R_{\theta JA}$ ) is present, the maximum ambient temperature ( $T_{A-MAX}$ ) may be increased.

In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature ( $T_{A-MAX}$ ) may have to be derated.  $T_{A-MAX}$  is dependent on the maximum operating junction temperature ( $T_{J-MAX-OP} = 125^\circ\text{C}$ ), the maximum allowable power dissipation in the device package in the application ( $P_{D-MAX}$ ), and the junction-to ambient thermal resistance of the part/package in the application ( $R_{\theta JA}$ ), as given by [Equation 3](#):

$$T_{A-MAX} = (T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})) \quad (3)$$

Alternately, if  $T_{A-MAX}$  can not be derated, the  $P_D$  value must be reduced. This can be accomplished by reducing  $V_{IN}$  in the  $V_{IN} - V_{OUT}$  term as long as the minimum  $V_{IN}$  is met, or by reducing the  $I_{OUT}$  term, or by some combination of the two.

### 9.2.2.2 External Capacitors

In common with most regulators, the LP38691 and LP38693 require an external capacitors for regulator stability. The devices are specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

### 9.2.2.3 Input Capacitor

An input capacitor is required for stability. TI recommends that a 1- $\mu$ F capacitor be connected between the devices' IN pin and GND pin (this capacitance value may be increased without limit).

This capacitor must be located a distance of not more than 1 cm from the IN pin and returned to a clean analogue ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

**Important:** To ensure stable operation it is essential that good PCB design practices are employed to minimize ground impedance and keep input inductance low. If these conditions cannot be met, or if long leads are used to connect the battery or other power source to the LP38691 or LP38693, then TI recommends that the input capacitor is increased. Also, tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be ensured by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the equivalent series resistance (ESR) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance remains approximately 1  $\mu\text{F}$  over the entire operating temperature range.

#### 9.2.2.4 Output Capacitor

The LP3869x is designed specifically to work with very small ceramic output capacitors. A 1- $\mu\text{F}$  ceramic capacitor (temperature types Z5U, Y5V or X7R/X5R) with ESR between 5 m $\Omega$  to 500 m $\Omega$ , is suitable in the LP3869x application circuit.

For this device the output capacitor must be connected between the OUT pin and GND pin.

It is also possible to use tantalum or film capacitors at the device output, but these are not as attractive for reasons of size and cost.

The output capacitor must meet the requirement for the minimum value of capacitance and also have an ESR value that is within the range 5 m $\Omega$  to 500 m $\Omega$  for stability.

#### 9.2.2.5 No-Load Stability

The LP3869x remains stable and in regulation with no external load. This is an important consideration in some circuits, for example CMOS RAM keep-alive applications.

#### 9.2.2.6 Capacitor Characteristics

The LP3869x is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer. For capacitance values in the range of 0.47  $\mu\text{F}$  to 4.7  $\mu\text{F}$ , ceramic capacitors are the smallest, least expensive and have the lowest ESR values, thus making them best for eliminating high frequency noise. The ESR of a typical 1- $\mu\text{F}$  ceramic capacitor is in the range of 20 m $\Omega$  to 40 m $\Omega$ , which easily meets the ESR requirement for stability for the LP3869x.

For both input and output capacitors, careful interpretation of the capacitor specification is required to ensure correct device operation. The capacitor value can change greatly, depending on the operating conditions and capacitor type.

In particular, the output capacitor selection must take account of all the capacitor parameters, to ensure that the specification is met within the application. The capacitance can vary with DC bias conditions as well as temperature and frequency of operation. Capacitor values also show some decrease over time due to aging. The capacitor parameters are also dependent on the particular case size, with smaller sizes giving poorer performance figures in general. As an example, [Figure 27](#) shows a typical graph comparing different capacitor case sizes in a Capacitance vs. DC Bias plot. As shown in the graph, increasing the DC Bias condition can result in the capacitance value falling below the minimum value given in the recommended capacitor specifications table (0.7  $\mu\text{F}$  in this case). Note that the graph shows the capacitance out of specification for the 0402 case size capacitor at higher bias voltages. It is therefore recommended that the capacitor manufacturers' specifications for the nominal value capacitor are consulted for all conditions, as some capacitor sizes (for example, 0402) may not be suitable in the actual application.

**Figure 27. Typical Variation In Capacitance vs DC Bias**

The value of the ceramic capacitor can vary with temperature. The capacitor type X7R, which operates over a temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ , only varies the capacitance to within  $\pm 15\%$ . The capacitor type X5R has a similar tolerance over a reduced temperature range of  $-55^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . Many large value ceramic capacitors, larger than  $1\ \mu\text{F}$ , are manufactured with Z5U or Y5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature varies from  $25^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . Therefore, X7R and X5R types are recommended over Z5U and Y5V in applications where the ambient temperature changes significantly above or below  $25^{\circ}\text{C}$ .

Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more costly when comparing equivalent capacitance and voltage ratings in the  $0.47\text{-}\mu\text{F}$  to  $4.7\text{-}\mu\text{F}$  range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value. It must also be noted that the ESR of a typical tantalum increases about 2:1 as the temperature goes from  $25^{\circ}\text{C}$  down to  $-40^{\circ}\text{C}$ , so some guard band must be allowed.

### 9.2.2.7 RFI/EMI Susceptibility

Radio frequency interference (RFI) and electromagnetic interference (EMI) can degrade any integrated circuit's performance because of the small dimensions of the geometries inside the device. In applications where circuit sources are present which generate signals with significant high frequency energy content ( $> 1\ \text{MHz}$ ), care must be taken to ensure that this does not affect the device regulator.

If RFI/EMI noise is present on the input side of the regulator (such as applications where the input source comes from the output of a switching regulator), good ceramic bypass capacitors must be used at the input pin of the device.

If a load is connected to the device output which switches at high speed (such as a clock), the high-frequency current pulses required by the load must be supplied by the capacitors on the IC output. Because the bandwidth of the regulator loop is less than  $100\ \text{kHz}$ , the control circuitry cannot respond to load changes above that frequency. This means the effective output impedance of the device at frequencies above  $100\ \text{kHz}$  is determined only by the output capacitors.

In applications where the load is switching at high speed, the output of the IC may need RF isolation from the load. TI recommends that some inductance be placed between the output capacitor and the load, and good RF bypass capacitors be placed directly across the load.

PCB layout is also critical in high noise environments, because RFI/EMI is easily radiated directly into PC traces. Noisy circuitry must be isolated from *clean* circuits where possible, and grounded through a separate path. At MHz frequencies, ground planes begin to look inductive and RFI/EMI can cause ground bounce across the ground plane. In multi-layer PCB applications, care must be taken in layout so that noisy power and ground planes do not radiate directly into adjacent layers which carry analog power and ground.

### 9.2.2.8 Output Noise

Noise is specified in two ways: Spot Noise or Output Noise Density is the RMS sum of all noise sources, measured at the regulator output, at a specific frequency (measured with a 1-Hz bandwidth). This type of noise is usually plotted on a curve as a function of frequency. Total Output Noise or Broad-Band Noise is the RMS sum of spot noise over a specified bandwidth, usually several decades of frequencies.

Attention paid to the units of measurement. Spot noise is measured in units  $\mu V\sqrt{\text{Hz}}$  or  $nV\sqrt{\text{Hz}}$ , and total output noise is measured in  $\mu V_{\text{RMS}}$ .

The primary source of noise in low-dropout regulators is the internal reference. Noise can be reduced in two ways: by increasing the transistor area or by increasing the current drawn by the internal reference. Increasing the area decreases the chance of fitting the die into a smaller package. Increasing the current drawn by the internal reference increases the total supply current (GND pin current).

### 9.2.3 Application Curves

## 10 Power Supply Recommendations

The LP38691 and LP38693 are designed to operate from an input supply voltage range of 2.7 V to 10 V. The input supply must be well regulated and free of spurious noise. To ensure that the device output voltage is well regulated, input supply must be at least  $V_{OUT} + 0.5$  V, or 2.7 V, whichever is higher. A minimum capacitor value of 1- $\mu$ F is required to be within 1 cm of the IN pin.

## 11 Layout

### 11.1 Layout Guidelines

The dynamic performance of the LP38691 or LP38693 is dependent on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the load regulation, PSRR, noise, or transient performance of the LP38691 or LP38693.

Best performance is achieved by placing  $C_{IN}$  and  $C_{OUT}$  on the same side of the PCB as the LP38691 or LP38693, and as close to the package as is practical. The ground connections for  $C_{IN}$  and  $C_{OUT}$  must be back to the LP38691 or LP38693 GND pin using as wide, and as short, a copper trace as is practical.

Connections using long trace lengths, narrow trace widths, or connections through vias must be avoided. These add parasitic inductances and resistance that result in inferior performance especially during transient conditions.

A Ground Plane, either on the opposite side of a two-layer PCB, or embedded in a multi-layer PCB, is strongly recommended. This Ground Plane serves two purposes:

- Provides a circuit reference plane to assure accuracy.
- Provides a thermal plane to remove heat from the LP38691 or LP38693 WSON package through thermal vias under the package DAP.

### 11.2 Layout Example

**Figure 30. TO-252 Package**

**Figure 31. WSON LP38691 Layout**

## Layout Example (continued)

**Figure 32. SOT-223 Layout**

**Figure 33. WSON LP38693 Layout**

### 11.3 WSON Mounting

The NGG0006A (No Pullback) 6-Lead WSON package requires specific mounting techniques which are detailed in the TI *AN-1187 Application Report* [SNOA401](#). Referring to the section *PCB Design Recommendations*, note that the pad style which must be used with the WSON package is the NSMD (non-solder mask defined) type. Additionally, TI recommends the PCB terminal pads to be 0.2 mm longer than the package pads to create a solder fillet to improve reliability and inspection.

The input current is split between two IN pins, 1 and 6. The two IN pins must be connected together to ensure that the device can meet all specifications at the rated current.

The thermal dissipation of the WSON package is directly related to the printed circuit board construction and the amount of additional copper area connected to the DAP.

The DAP (exposed pad) on the bottom of the WSON package is connected to the die substrate with a conductive die attach adhesive. The DAP has no direct electrical (wire) connection to any of the pins. There is a parasitic PN junction between the die substrate and the device ground. As such, it is strongly recommended that the DAP be connected directly to the ground at device lead 2 (that is, GND). Alternately, but not recommended, the DAP may be left floating (that is, no electrical connection). The DAP must not be connected to any potential other than ground.

## 12 Device and Documentation Support

### 12.1 Documentation Support

#### 12.1.1 Related Documentation

For related documentation see the following:

Texas Instruments AN-1187 *Leadless Leadframe Package (LLP)* ([SNOA401](#)).

### 12.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF LP38691, LP38691-Q1, LP38693, LP38693-Q1 :**

- Catalog : [LP38691](#), [LP38693](#)
- Automotive : [LP38691-Q1](#), [LP38693-Q1](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

SCALE: 8X

SOLDER MASK DETAIL

4219870/A 03/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002([www.ti.com/lit/slm002](http://www.ti.com/lit/slm002)) and SLMA004 ([www.ti.com/lit/slma004](http://www.ti.com/lit/slma004)).
5. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
