3 概要

SN74LVC1T45-Q1 デバイスは、個別に構成可能な 2 本の電源レールを採用したシングルビット非反転バス・トランシーバです。A ポートは V_{CCA} に追従する設計です。 V_{CCA} は 1.65V～5.5V の任意の電源電圧に対応できます。B ポートは V_{CCB} に追従する設計です。 V_{CCB} は 1.65V～5.5V の任意の電源電圧に対応できます。このため、1.8V、2.5V、3.3V、5V の任意の電圧ノード間で自由に低電圧双方向変換を実行できます。

SN74LVC1T45-Q1 デバイスは、シングルビットの非反転レベル・トランスレータです。完全に構成可能なデュアル・レール設計により、1.65V～5.5V の電源電圧の全範囲にわたって各ポートが動作可能です。広い双方向変換範囲を必要とするアプリケーションに最適です。

SN74LVC1T45-Q1 は、DIR 入力がある V_{CCA} によって給電されるように設計されています。

このデバイスは、 I_{off} を使用する部分的パワーダウン・アプリケーション用の動作が完全に規定されています。 I_{off} 回路が出力をディセーブルにするため、電源切断時にデバイスに電流が逆流して損傷に至ることを回避できます。

V_{CC} 絶縁機能により、どちらかの V_{CC} 入力がある GND レベルになると、両方のポートが確実に高インピーダンス状態に移行します。

7 Detailed Description

7.1 Overview

The SN74LVC1T45-Q1 is single-bit, dual-supply, non-inverting voltage level translation. Pin A and that direction control pin (DIR) are supported by V_{CCA} and pin B is supported by V_{CCB} . The A port is able to accept I/O voltages ranging from 1.65 V to 5.5 V, while the B port can accept I/O voltages from 1.65 V to 5.5 V. The high on the DIR allows data transmissions from A to B and a low on the DIR allows data transmissions from B to A.

7.2 Functional Block Diagram

7-1. Logic Diagram (Positive Logic)

7.3 Feature Description

The SN74LVC1T45-Q1 has a fully configurable dual-rail design that allows each port to operate over the full 1.65-V to 5.5-V power-supply range. Both V_{CCA} and V_{CCB} can be supplied at any voltage between 1.65 V and 5.5 V, making the device suitable for translating between any of the voltage nodes (1.8-V, 2.5-V, 3.3-V, and 5-V).

SN74LVC1T45-Q1 can support high data rate applications. The translated signal data rate can be up to 420 Mbps when the signal is translated from 3.3 V to 5 V.

I_{off} prevents backflow current by disabling I/O output circuits when device is in partial-power-down mode.

Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The SN74LVC1T45-Q1 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The max data rate can be up to 420 Mbps when device translates signals from 3.3 V to 5 V.

8.1.1 Enable Times

Calculate the enable times for the SN74LVC1T45-Q1 using the following formulas:

- $t_{PZH} \text{ (DIR to A)} = t_{PLZ} \text{ (DIR to B)} + t_{PLH} \text{ (B to A)}$
- $t_{PZL} \text{ (DIR to A)} = t_{PHZ} \text{ (DIR to B)} + t_{PHL} \text{ (B to A)}$
- $t_{PZH} \text{ (DIR to B)} = t_{PLZ} \text{ (DIR to A)} + t_{PLH} \text{ (A to B)}$
- $t_{PZL} \text{ (DIR to B)} = t_{PHZ} \text{ (DIR to A)} + t_{PHL} \text{ (A to B)}$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the SN74LVC1T45-Q1 initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.

8.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

PARAMETER	VALUE
Input voltage	1.65 V to 5.5 V
Output voltage	1.65 V to 5.5 V

8.2.1.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
 - Use the supply voltage of the device that is driving the SN74LVC1T45-Q1 device to determine the input voltage range. For a valid logic high the value must exceed the V_{IH} of the input port. For a valid logic low the value must be less than the V_{IL} of the input port.
- Output voltage range
 - Use the supply voltage of the device that the SN74LVC1T45-Q1 device is driving to determine the output voltage range.

8.2.2 Bidirectional Logic Level-Shifting Application

8-3 shows the SN74LVC1T45-Q1 being used in a bidirectional logic level-shifting application. Because the SN74LVC1T45-Q1 does not have an output-enable (OE) pin, the system designer should take precautions to avoid bus contention between SYSTEM-1 and SYSTEM-2 when changing directions.

8 Power Supply Recommendations

The SN74LVC1T45-Q1 device uses two separate configurable power-supply rails, V_{CCA} and V_{CCB} . V_{CCA} accepts any supply voltage from 1.65 V to 5.5 V, and V_{CCB} accepts any supply voltage from 1.65 V to 5.5 V. The A port and B port are designed to track V_{CCA} and V_{CCB} , respectively allowing for low-voltage bidirectional translation between any of the 1.8-V, 2.5-V, 3.3-V, and 5-V voltage nodes.

Each V_{CC} pin should have a good bypass capacitor to prevent power disturbance. For multiple V_{CC} pins then 0.01- μ F or 0.022- μ F capacitor is recommended for each power pin. It is ok to parallel multiple bypass capacitors to reject different frequencies of noise. 0.1- μ F and 1- μ F capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

A proper power-up sequence is advisable as listed in the following:

1. Connect ground before any supply voltage is applied.
2. Power up V_{CCB} .
3. V_{CCA} can be ramped up along with V_{CCB} .

TI recommends that the inputs are grounded during power up. Take care to assure that any state changes do not affect system level operation.

9 Layout

9.1 Layout Guidelines

To assure reliability of the device, the following common printed-circuit board layout guidelines are recommended:

- Bypass capacitors must be used on power supplies.
- Short trace lengths must be used to avoid excessive loading.
- Placing pads on the signal paths for loading capacitors or pullup resistors to help adjust rise and fall times of signals depends on the system requirements.
