

THVD1400、THVD1420 小型パッケージ、±12kV IEC ESD 保護機能搭載、3.3V～5V、RS-485 トランシーバ

1 特長

- TIA/EIA-485A 規格の要件に適合またはそれを上回る性能
- 3V～5.5V の電源電圧
- 半二重 RS-422/RS-485
- データ・レート
 - THVD1400: 500kbps
 - THVD1420: 12Mbps
- バス I/O 保護
 - ±16kV HBM ESD
 - ±12kV IEC 61000-4-2 接触放電
 - ±15kV IEC 61000-4-2 エアギャップ放電
 - ±4kV IEC 61000-4-4 高速過渡バースト
 - ±16V のバス・フォルト保護 (バス・ピンの絶対最大電圧)
- 小型で省スペースの 8 ピン SOT パッケージ (2.1mm × 1.2mm) も提供
 - 標準 SOIC-8 パッケージとの共存レイアウトについては、[レイアウト例](#)を参照
- 工業用拡張温度範囲に対応: -40°C～125°C
- 大きなヒステリシスによるレシーバのノイズ除去
- 低い消費電力
 - 低いスタンバイ時電源電流: 1µA 未満
 - 動作中の静止電流: 1.5mA (標準値)
- グリッチなしの電源オン / オフによる活線挿抜機能
- 開放、短絡、アイドル・バスのフェイルセーフ
- 1/8 単位負荷 (最大 256 のバス・ノード)

2 アプリケーション

- ファクトリ・オートメーション / 制御
- ビル・オートメーション
- グリッド・インフラストラクチャ
- モーター・ドライブ
- PD (パワー・デリバリー)
- 産業用輸送
- HVAC システム
- ビデオ監視
- スマート・メーター

概要

THVD1400 と THVD1420 は、産業用アプリケーション向けの堅牢な半二重 RS-485 トランシーバです。バスのピンは高レベルの IEC 接触放電 ESD への耐性があるため、システム・レベルでの追加保護部品が不要です。

本デバイスは 3～5.5V の単電源で動作します。同相電圧範囲が広く、バスのピンでの入力リークが小さいため、長いケーブルを使用するマルチポイントのアプリケーションに適しています。

THVD1400 と THVD1420 は、ドロップイン互換性がある業界標準の 8 ピン SOIC パッケージと、業界をリードする小型 SOT パッケージで供給されます。これらのデバイスは、周囲温度 -40°C～125°C での動作が規定されています。

製品情報

部品番号	パッケージ ⁽¹⁾	本体サイズ (公称)
THVD1400	SOT (8)	2.1mm × 1.2mm
THVD1420	SOIC (8)	4.90mm × 3.91mm

- (1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

3 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision A (April 2021) to Revision B (October 2021)	Page
• 「特長」セクションで IEC ESD の接触放電定格を 8kV から 12kV に更新.....	1
• Changed HBM rating for non-bus pins from 1kV to 4kV in the <i>ESD Ratings table</i>	4
• Changed the IEC ESD contact rating for bus pins from 8kV to 12kV in the <i>ESD Ratings [IEC] table</i>	4
• Updated the V_{IH} max specification for the logic input pins from V_{CC} to 5.5 V in the <i>Recommended Operating Conditions table</i>	5
• Updated IEC ESD Contact rating from 8 kV to 12 kV in the <i>Features Description</i> section.....	13
• Updated IEC ESD Contact rating from 8 kV to 12 kV in the <i>Transient Protection</i> section.....	17

Changes from Revision * (December 2020) to Revision A (April 2021)	Page
• 「特長」に「...レイアウト例を参照」を追加.....	1
• 「製品情報」表の THVD1420 から「事前情報」の注記を削除	1
• Added 図 5-7 , 図 5-8 and 図 5-9	9
• Added test conditions for 図 5-1 , 図 5-2 , 図 5-4 and 図 5-5	9
• Added 図 10-2	21

4 Pin Configuration and Functions

图 4-1. SOIC-8 (D), SOT-8 (DRL) Package, Top View

表 4-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
R	1	Digital output	Receive data output
RE	2	Digital input	Receiver enable, active low (internal 2-MΩ pull-up)
DE	3	Digital input	Driver enable, active high (internal 2-MΩ pull-down)
D	4	Digital input	Driver data input
GND	5	Ground	Device ground
A	6	Bus input/output	Bus I/O port, A (complementary to B)
B	7	Bus input/output	Bus I/O port, B (complementary to A)
V _{CC}	8	Power	3.3-V to 5-V supply

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range, unless otherwise noted (see ⁽¹⁾)

		MIN	MAX	UNIT
V _{CC}	Supply voltage	-0.5	7	V
V _L	Input voltage at any logic pin (D, DE or RE)	-0.3	5.7	V
V _A , V _B	Voltage at A or B inputs	-16	16	V
I _O	Receiver output current	-24	24	mA
T _J	Junction temperature		170	°C
T _{STG}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If briefly operating outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±16,000	V
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4,000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1,500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 ESD Ratings [IEC]

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	IEC 61000-4-2 ESD (Contact Discharge), bus terminals and GND	±12,000	V
	Electrostatic discharge	IEC 61000-4-2 ESD (Air-Gap Discharge), bus terminals and GND	±15,000	
	Electrostatic discharge	IEC 61000-4-4 EFT (Fast transient or burst), bus terminals and GND	±4,000	

5.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	3	5	5.5	V
V _{ID}	Differential input voltage	-12		12	V
V _I	Input voltage at any bus terminal ⁽¹⁾	-7		12	V
V _{IH}	High-level input voltage (driver, driver-enable, and receiver-enable inputs)	2		5.5	V
V _{IL}	Low-level input voltage (driver, driver-enable, and receiver-enable inputs)	0		0.8	V
I _O	Output current	Driver		60	mA
		Receiver		8	
R _L	Differential load resistance	54	60		Ω
1/t _{UI}	Signaling rate: THVD1400			500	kbps
1/t _{UI}	Signaling rate: THVD1420			12	Mbps
T _J	Junction temperature	-40		150	°C
T _A ⁽²⁾	Operating ambient temperature	-40		125	°C
T _{SHDN}	Thermal shutdown threshold (temperature rising)	150	170		°C
T _{HYS}	Thermal shutdown hysteresis		15		°C

- (1) The algebraic convention in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
(2) Operation is specified for internal (junction) temperatures up to 150°C. Self-heating due to internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shut-down (TSD) circuit which disables the driver outputs when the junction temperature reaches 170°C.

5.5 Thermal Information

THERMAL METRIC ⁽¹⁾		THVD1400, THVD1420		UNIT
		DRL (SOT)	D (SOIC)	
		8 PINS	8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	112.2	126.0	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	28.4	66.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	22.1	69.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	1.2	18.7	°C/W
ψ _{JB}	Junction-to-board characterization parameter	22.0	68.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

5.6 Power Dissipation Characteristics

PARAMETER		TEST CONDITIONS		VALUE	UNIT
P _D	Power dissipation, driver and receiver enabled, V _{CC} = 5.5 V, T _A = 125°C, 50% duty cycle square-wave signal at maximum signaling rate (THVD1400)	Unterminated	R _L = 300 Ω, C _L = 50 pF	145	mW

7 Detailed Description

7.1 Overview

The THVD1400 is a low-power, half-duplex RS-485 transceiver suitable for data transmission up to 500 kbps. The THVD1420 is a low-power, half-duplex RS-485 transceiver suitable for data transmission up to 12 Mbps.

7.2 Functional Block Diagrams

7.3 Feature Description

Internal ESD protection circuits protect the transceiver against Electrostatic Discharges (ESD) according to IEC 61000-4-2 of up to ± 12 kV (Contact Discharge), ± 15 kV (Air Gap Discharge) and against electrical fast transients (EFT) according to IEC 61000-4-4 of up to ± 4 kV.

7.4 Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case, the differential output voltage defined as $V_{OD} = V_A - V_B$ is positive. When D is low, the output states reverse, B turns high, A becomes low, and V_{OD} is negative.

When DE is low, both outputs turn high-impedance. In this condition, the logic state at D is irrelevant. The DE pin has an internal pull-down resistor to ground; thus, when left open, the driver is disabled (high-impedance) by default. The D pin has an internal pull-up resistor to V_{CC} , thus, when left open while the driver is enabled, output A turns high and B turns low.

表 7-1. Driver Function Table

INPUT	ENABLE	OUTPUTS		FUNCTION
		A	B	
H	H	H	L	Actively drive bus high
L	H	L	H	Actively drive bus low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

When the receiver enable pin, \overline{RE} , is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_A - V_B$ is positive and higher than the positive input threshold, V_{IT+} , the receiver output, R, turns high. When V_{ID} is negative and lower than the negative input threshold, V_{IT-} , the receiver output, R, turns low. If V_{ID} is between V_{IT+} and V_{IT-} the output is indeterminate.

When \overline{RE} is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 7-2. Receiver Function Table

DIFFERENTIAL INPUT	ENABLE	OUTPUT	FUNCTION
$V_{ID} = V_A - V_B$	RE	R	
$V_{IT+} < V_{ID}$	L	H	Receive valid bus high
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output
Idle (terminated) bus	L	H	Fail-safe high output

8 Application Information Disclaimer

Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The THVD1400 is a half-duplex RS-485 transceiver commonly used for asynchronous data transmissions. The driver and receiver enable pins allow for the configuration of different operating modes.

8.2 Typical Application

An RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T , whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

図 8-1. Typical RS-485 Network With Half-Duplex Transceivers

8.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

8.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the shorter the cable length; and conversely, the lower the data rate, the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 300 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

8.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in 式 1.

$$L_{(\text{STUB})} \leq 0.1 \times t_r \times v \times c \quad (1)$$

where

- t_r is the 10/90 rise time of the driver
- c is the speed of light (3×10^8 m/s)
- v is the signal velocity of the cable or trace as a factor of c

8.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to driver 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 kΩ. Because the THVD1400 consists of 1/8 UL transceivers, connecting up to 256 receivers to the bus is possible.

8.2.1.4 Receiver Failsafe

The differential receivers of the THVD1400 are *failsafe* to invalid bus states caused by the following:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver outputs a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and must output a low when V_{ID} is more negative than -200 mV. The receiver parameters which determine the failsafe performance are V_{IT+} , V_{IT-} , and V_{HYS} (the separation between V_{IT+} and V_{IT-}). As shown in the [Receiver Function Table](#), differential signals more negative than -200 mV always causes a low receiver output, and differential signals more positive than 200 mV always causes a high receiver output.

When the differential input signal is close to zero, it is still above the V_{IT+} threshold, and the receiver output is high. Only when the differential input is more than V_{HYS} below V_{IT+} does the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault conditions includes the receiver hysteresis value, V_{HYS} , as well as the value of V_{IT+} .

8.2.1.5 Transient Protection

The bus pins of the THVD1400 transceiver family include on-chip ESD protection against ± 16 -kV HBM and ± 12 -kV IEC 61000-4-2 contact discharge. The International Electrotechnical Commission (IEC) ESD test is far more severe than the HBM ESD test. The 50% higher charge capacitance, $C_{(S)}$, and 78% lower discharge resistance, $R_{(D)}$, of the IEC model produce significantly higher discharge currents than the HBM model.

8-2. HBM and IEC ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur because of human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuit switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

8-3 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. The left hand diagram shows the relative pulse-power for a 0.5-kV surge transient and 4-kV EFT transient, both of which dwarf the 10-kV ESD transient visible in the lower-left corner. 500-V surge transients are representative of events that may occur in factory environments in industrial and process automation.

The right hand diagram shows the pulse-power of a 6-kV surge transient, relative to the same 0.5-kV surge transient. 6-kV surge transients are most likely to occur in power generation and power-grid systems.

8-3. Power Comparison of ESD, EFT, and Surge Transients

In the event of surge transients, high-energy content is characterized by long pulse duration and slow decaying pulse power. The electrical energy of a transient that is dumped into the internal protection cells of a transceiver is converted into thermal energy, which heats and destroys the protection cells, thus destroying the transceiver.

Figure 8-4 shows the large differences in transient energies for single ESD, EFT, surge transients, and an EFT pulse train that is commonly applied during compliance testing.

Figure 8-4. Comparison of Transient Energies

8.2.2 Detailed Design Procedure

In order to protect bus nodes against high-energy transients, the implementation of external transient protection devices is necessary. 8-5 suggests a protection circuit against 1 kV surge (IEC 61000-4-5) transients. 表 8-1 shows the associated bill of materials.

8-5. Transient Protection Against Surge Transients for Half-Duplex Devices

表 8-1. Bill of Materials

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	RS-485 transceiver	THVD1400	TI
R1	10-Ω, pulse-proof thick-film resistor	CRCW0603010RJNEAHP	Vishay
R2			
TVS	Bidirectional 400-W transient suppressor	CDSOT23-SM712	Bourns

8.2.3 Application Curves

8-6. THVD1400 waveforms at 500 kbps, $V_{CC} = 5V$

9 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply should be decoupled with a 100 nF ceramic capacitor located as close to the supply pins as possible. This helps to reduce supply voltage ripple

present on the outputs of switched-mode power supplies and also helps to compensate for the resistance and inductance of the PCB power planes.

10 Layout

10.1 Layout Guidelines

Robust and reliable bus node design often requires the use of external transient protection devices in order to protect against surge transients that may occur in industrial environments. Since these transients have a wide frequency bandwidth (from approximately 3 MHz to 300 MHz), high-frequency layout techniques should be applied during PCB design.

1. Place the protection circuitry close to the bus connector to prevent noise transients from propagating across the board.
2. Use V_{CC} and ground planes to provide low inductance. Note that high-frequency currents tend to follow the path of least impedance and not the path of least resistance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF decoupling capacitors as close as possible to the V_{CC} pins of transceiver, UART and/or controller ICs on the board.
5. Use at least two vias for V_{CC} and ground connections of decoupling capacitors and protection devices to minimize effective via inductance.
6. Use 1-k Ω to 10-k Ω pull-up and pull-down resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
THVD1400DR	ACTIVE	SOIC	D	8	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	1400	Samples
THVD1400DRLR	ACTIVE	SOT-5X3	DRL	8	4000	RoHS & Green	Call TI SN	Level-1-260C-UNLIM	-40 to 125	T400	Samples
THVD1420DR	ACTIVE	SOIC	D	8	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	1420	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
