

TLV1117LV 正側固定電圧出力の 1A 低ドロップアウト・レギュレータ

1 特長

- 標準精度: 1.5%
- 低 I_Q : 100 μ A 以下
 - 標準の 1117 デバイスに比べて 1/500 の低い値
- V_{IN} : 2V~5.5V
 - V_{IN} の絶対最大定格: 6V
- 出力電流が 0mA 時でも安定動作
- 低いドロップアウト: $V_{OUT} = 3.3V$ で 1A 出力時に 455mV
- 高 PSRR: 1kHz 時に 65dB
- 最小電流制限規定値: 1.1A
- コスト効率の優れたセラミック・コンデンサ使用時に安定動作:
 - ESR 0 Ω に対応
- 温度範囲: -40°C~+125°C
- サーマル・シャットダウン機能と過電流保護機能
- アップグレードされた機能を持つドロップイン代替品については、[TLV761](#) を参照してください
- SOT-223 パッケージで供給
 - 利用可能な電圧オプションの詳細なリストについては、このドキュメントの最後にある「[メカニカル、パッケージ、および注文情報](#)」セクションを参照してください。

2 アプリケーション

- セット・トップ・ボックス
- テレビ、モニター
- PC 周辺機器、ノートブック、マザーボード
- モデム、その他の通信製品
- スイッチング電源のポスト・レギュレーション

3 概要

TLV1117LV 低ドロップアウト (LDO) リニア・レギュレータは、一般的な TLV1117 電圧レギュレータの低入力電圧版です。

TLV1117LV は非常に低消費電力のデバイスで、従来の 1117 電圧レギュレータと比べて静止時に消費する電流は 1/500 です。この設計のため本デバイスは、非常に低いスタンバイ電流を必要とするアプリケーションに適しています。また、TLV1117LV LDO は、負荷電流が 0mA の状態で安定します。最小の負荷要件はないため、通常動作時に 1A という大きな負荷電流に対応するだけでなく、スタンバイ時の非常に小さい負荷に対して、レギュレータから電力を供給する必要があるアプリケーション用としても、有効な選択肢となります。TLV1117LV はライン過渡特性と負荷過渡特性が優れており、その結果、要求される負荷電流が 1mA 未満から 500 mA を超える範囲で変化する場合でも、出力電圧振幅のアンダーシュートやオーバーシュートは非常に小さく抑えられます。

高精度のバンドギャップとエラー・アンプにより、1.5% の精度を実現しています。本デバイスの電源電圧変動除去比 (PSRR) は非常に高いので、スイッチング・レギュレータの後段に配置するポスト・レギュレーションにも使用できます。他の有用な特徴としては、低出力ノイズ、低ドロップアウト電圧などが挙げられます。

また、等価直列抵抗 (ESR) 0 Ω のコンデンサでも安定するよう内部的に補償されています。これらの主な長所が、コスト効率の優れた小型のセラミック・コンデンサの使用を可能にしています。必要に応じて、コスト効率が優れていて、バイアス電圧が高く温度ディレーティングが大きいタイプのコンデンサを使用することもできます。

TLV1117LV は SOT-223 パッケージで供給されます。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	本体サイズ (公称)
TLV1117LV	DCY (SOT-223, 4)	6.50mm × 3.50mm

6 Specifications

6.1 Absolute Maximum Ratings

at $T_J = 25^\circ\text{C}$ (unless otherwise noted); all voltages are with respect to GND⁽¹⁾

		MIN	MAX	UNIT
Voltage	V_{IN}	-0.3	6	V
	V_{OUT}	-0.3	6	V
Current	I_{OUT}	Internally limited		
Output short-circuit duration		Indefinite		
Continuous total power dissipation	P_{DISS}	See Thermal Information		
Temperature	Operating junction, T_J	-55	150	$^\circ\text{C}$
	Storage, T_{stg}	-55	150	$^\circ\text{C}$

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	± 2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input voltage	2		5.5	V
V_{OUT}	Output voltage	0		5.5	V
I_{OUT}	Output current	0		1	A

6.4 Thermal Information

7 Detailed Description

7.1 Overview

The TLV1117LV is a low quiescent current, high PSRR LDO capable of handling up to 1 A of load current. This device features an integrated current limit, thermal shutdown, band-gap reference, and undervoltage lockout (UVLO) circuit blocks.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Internal Current Limit

The TLV1117LV internal current limit helps protect the regulator during fault conditions. During current limit, the output sources a fixed amount of current that is largely independent of the output voltage. In such a case, the output voltage is not regulated, and can be calculated by the formula: $V_{OUT} = I_{LIMIT} \times R_{LOAD}$. The PMOS pass transistor dissipates $(V_{IN} - V_{OUT}) \times I_{LIMIT}$ until thermal shutdown is triggered and the device turns off. When the device cools down, the internal thermal shutdown circuit turns the device back on. If the fault condition continues, the device cycles between current limit and thermal shutdown. See the [Thermal Protection](#) section for more details.

The PMOS pass transistor in the TLV1117LV has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not limited; if extended reverse voltage operation is anticipated, external limiting to 5% of the rated output current is recommended.

7.3.2 Dropout Voltage

The TLV1117LV uses a PMOS pass transistor to achieve low dropout. When $(V_{IN} - V_{OUT})$ is less than the dropout voltage (V_{DO}), the PMOS pass transistor is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass transistor. V_{DO} scales approximately with output current because the PMOS transistor behaves like a resistor in dropout.

As with any linear regulator, PSRR and transient response are degraded when $(V_{IN} - V_{OUT})$ approaches dropout.

7.3.3 Undervoltage Lockout

The TLV1117LV uses an undervoltage lockout (UVLO) circuit to keep the output shut off until internal circuitry is operating properly.

7.4 Device Functional Modes

7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage is greater than the nominal output voltage added to the dropout voltage
- The output current is less than the current limit
- The device die temperature is lower than the thermal shutdown temperature

7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass transistor is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

表 7-1 shows the conditions that lead to the different modes of operation.

表 7-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER	
	V_{IN}	I_{OUT}
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$	$I_{OUT} < I_{CL}$
Dropout mode	$V_{IN} < V_{OUT(nom)} + V_{DO}$	$I_{OUT} < I_{CL}$

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The TLV1117LV is a low quiescent current linear regulator designed for high current applications. Unlike typical high current linear regulators, the TLV1117LV consumes significantly less quiescent current. This device delivers excellent line and load transient performance. The device is low noise, and exhibits a very good PSRR. As a result, this device is designed for high current applications that require very sensitive power-supply rails.

This regulators offer both current limit and thermal protection. The operating junction temperature range of the device is -40°C to $+125^{\circ}\text{C}$.

8.2 Typical Application

図 8-1 shows a typical application circuit.

図 8-1. Typical Application Circuit

8.2.1 Design Requirements

For this design example, use the parameters listed in 表 8-1 as the input parameters.

表 8-1. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	2.5 V to 3.3 V
Output voltage	1.8 V
Output current	500 mA

8.2.2 Detailed Design Procedure

8.2.2.1 Input and Output Capacitor Requirements

For stability, 1.0- μF ceramic capacitors are required at the output. Higher-valued capacitors improve transient performance. Use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature. Unlike traditional linear regulators that need a minimum ESR for stability, the TLV1117LV is specified to be stable with no ESR. Therefore, cost-effective ceramic capacitors can be used with this device. Effective output capacitance that takes bias, temperature, and aging effects into consideration must be greater than 0.5 μF to ensure stability of the device.

Although an input capacitor is not required for stability, good analog design practice is to connect a 0.1- μF to 1.0- μF , low-ESR capacitor across the IN pin and GND pin of the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor can be necessary if large, fast rise-time load transients are anticipated, or if the device is not located physically close to

the power source. If source impedance is greater than $2\ \Omega$, a $0.1\text{-}\mu\text{F}$ input capacitor can also be necessary to ensure stability.

8.2.2.2 Transient Response

As with any regulator, increasing the size of the output capacitor reduces overshoot and undershoot magnitude.

8.2.3 Application Curves

8.3 Best Design Practices

Place input and output capacitors as close to the device as possible.

Use a ceramic output capacitor.

Do not use an electrolytic output capacitor.

Do not exceed the device absolute maximum ratings.

8.4 Power Supply Recommendations

Connect a low output impedance power supply directly to the INPUT pin of the TLV1117LV. Inductive impedances between the input supply and the INPUT pin can create significant voltage excursions at the INPUT pin during start-up or load transient events.

8.5 Layout

8.5.1 Layout Guidelines

Place input and output capacitors as close to the device pins as possible. To improve characteristic AC performance (such as PSRR, output noise, and transient response), design the board with separate ground planes for V_{IN} and V_{OUT} , with the ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor must be connected directly to the GND pin of the device. Higher value ESR capacitors can degrade PSRR performance.

8.5.1.1 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 165°C , allowing the device to cool. When the junction temperature cools to approximately 145°C , the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the regulator, protecting the regulator from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat sink. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heat sink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The internal protection circuitry of the TLV1117LV is designed to protect against overload conditions. This circuitry is not intended to replace proper heat sinking. Continuously running the TLV1117LV into thermal shutdown degrades device reliability.

8.5.1.2 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low and high-K boards are given in the [Thermal Information](#) table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heat-sink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation (P_D) is equal to the product of the output current and the voltage drop across the output pass element, as shown in [式 1](#):

$$P_D = (V_{IN} - V_{OUT}) I_{OUT} \tag{1}$$

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DCY (R-PDSO-G4)

PLASTIC SMALL-OUTLINE

- NOTES: A. All linear dimensions are in millimeters (inches).
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion.
 D. Falls within JEDEC TO-261 Variation AA.

DCY (R-PDSO-G4)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil recommendations. Refer to IPC 7525 for stencil design considerations.
