

# TLV3604、TLV3605、TLV3607 800ps 高速レール・ツー・レール入力コンパレータ、LVDS 出力付き

## 1 特長

- 小さい伝搬遅延時間: 800ps
- 小さいオーバードライブ分散: 350ps
- 静止電流: 12.1mA
- 高いトグル周波数: 1.5GHz/3.0Gbps
- 狭パルス幅検出性能: 600ps
- LVDS 出力
- 電源電圧範囲: 2.4V~5.5V
- 両方のレールから 200mV 拡張された入力同相モード範囲
- 低い入力オフセット電圧:  $\pm 5\text{mV}$
- シングル・チャンネルおよびデュアル・チャンネル選択可能

## 2 アプリケーション

- LIDAR の距離センシング
- タイム・オブ・フライト (ToF) センサ
- オシロスコープとロジック・アナライザの高速トリガ機能
- 高速差動ライン・レシーバ
- ドローン・ビジョン

## 3 概要

TLV3604、TLV3605 (シングル・チャンネル)、および TLV3607 (デュアル・チャンネル) は、LVDS 出力とレール・ツー・レール入力を備えた 800ps の高速コンパレータです。これらの特長と、2.4V~5.5V の動作電圧範囲、3Gbps の高いトグル周波数により、LIDAR、クロック / データの回復アプリケーション、試験および測定システムに最適です。

また、TLV3604、TLV3605 および TLV3607 は、350ps の強力な入力オーバードライブ性能を有しており、わずか

600ps 幅の狭いパルスを検出できます。入力オーバードライブによって伝搬遅延の変動が小さいことと、狭いパルスを検出できることから、システム性能が向上し、タイム・オブ・フライト (ToF) アプリケーションの距離範囲が拡大します。

TLV3604、TLV3605、および TLV3607 の低電圧差動信号 (LVDS) 出力は、データ・スループットの向上と消費電力の最適化にも役立ちます。相補出力で各出力の同相ノイズを抑制することにより、EMI が低減されます。LVDS 出力は、高速 FPGA や CPU など、標準 LVDS 入力を受け入れる下流デバイスの直接駆動およびインターフェイスを可能にします。

TLV3604 は超小型の 6 ピン SC-70 パッケージで提供されているため、光学センサ・モジュールなどスペースの制約が厳しいアプリケーションを容易に実現できます。TLV3605 (シングル) および TLV3607 (デュアル) は TLV3604 と同じ性能を維持し、可変ヒステリシス制御、シャットダウン、ラッチ機能が 12 ピン QFN および 16 ピン WQFN パッケージで供給されるため、試験および測定アプリケーションに最適です。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Input Supply Voltage: $V_{CCI} - V_{EE}$	-0.3	6	V
Output Supply Voltage: $V_{CCO} - V_{EE}$	-0.3	6	V
Supply Voltage Difference: $V_{CCI} - V_{CCO}$	-6	6	V
Input Voltage (IN+, IN-) <sup>(2)</sup>	$V_{EE} - 0.3$	$V_{CCI} + 0.3$	V
Differential Input Voltage ( $V_{DI} = IN+, IN-$ )	$-(V_{CCI} + 0.3)$	$+(V_{CCI} + 0.3)$	V
Output Voltage (OUT+, OUT-) <sup>(3)</sup>	$V_{EE} - 0.3$	$V_{CCO} + 0.3$	V
Shutdown Enable (SHDN)	$V_{EE} - 0.3$	$V_{CCO} + 0.3$	V
Latch and Hysteresis Control (LE/HYS)	$V_{EE} - 0.3$	$V_{CCO} + 0.3$	V
Current into Input pins (IN+, IN-, SHDN, LE/HYS) <sup>(2)</sup>	-10	+10	mA
Current into Output pins (OUT+, OUT-) <sup>(3)</sup>	-10	+10	mA
Junction temperature, $T_J$		150	°C
Storage temperature, $T_{stg}$	-65	150	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3 V beyond the supply rails or 6 V, whichever is lower, must be current-limited to 10 mA or less.
- Output terminals are diode-clamped to the power-supply rails. Output signals that can swing more than 0.3 V beyond the supply rails must be current-limited to 10 mA or less.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	TLV3604 Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1500
		TLV3605, TLV3607 Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Input Supply Voltage: $V_{CCI} - V_{EE}$	2.4	5.5	V
Output Supply Voltage: $V_{CCO} - V_{EE}$	2.4	5.5	V

(1) For TLV3605 and TLV3607, the  $V_{IO}$  is tested with  $R_{HYST} = 150\text{ k}\Omega$

(2) Differential propagation delay is defined as the larger of the two:

$$\Delta t_{PDLH} = t_{PDLH}(\text{MAX}) - t_{PDLH}(\text{MIN})$$

$$\Delta t_{PDHL} = t_{PDHL}(\text{MAX}) - t_{PDHL}(\text{MIN})$$

where (MAX) and (MIN) denote the maximum and minimum values of a given measurement across the different comparator channels.

## 7 Detailed Description

### 7.1 Overview

The TLV3604 and TLV3605 are 800-ps, high-speed comparators with LVDS outputs and rail-to-rail inputs. These features, along with an operating voltage range of 2.4 V to 5.5 V and a high toggle frequency of 3 Gbps, make the TLV3604 and TLV3605 well suited for LIDAR, clock and data recovery applications, and test and measurement systems.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

The TLV3604 and TLV3605 (single channel) and TLV3607 (dual channel) are high-speed comparators with rail-to-rail inputs and LVDS outputs. The rail-to-rail input stage is capable of operating up to 200 mV beyond each power supply rail with minimal input offset. The TLV3605 (single) and TLV3607 (dual) have similar performance as the TLV3604 while providing adjustable hysteresis, latching function, and shutdown mode.

### 7.4 Device Functional Modes

The TLV3604 has a single functional mode and is operational when the power supply voltage is greater than the minimum operating voltage. On the other hand, the TLV3605 and TLV3607 have an active and shutdown mode. The TLV3605 and TLV3607 are in shutdown mode when the  $\overline{\text{SHDN}}$  pin is logic low. To allow for easy interface with 1.8V FPGAs and CPUs, the  $\overline{\text{SHDN}}$  pin is 1.8 V logic compliant and independent of the comparator power supply.

#### 7.4.1 Rail-to-Rail Inputs

The TLV3604, TLV3605, and TLV3607 feature input stages capable of operating 200mV below or above the power supply rails, allowing for zero cross detection and maximizing input dynamic range. With low input offset voltage, the comparators improve system performance in high sensitivity signal detection.

#### 7.4.2 LVDS Output

The TLV3604, TLV3605, and TLV3607 outputs are LVDS compliant. When the input of the downstream device is terminated with a 100  $\Omega$  resistor, it provides a  $\pm 350$  mV LVDS swing. Fully differential outputs enable fast digital toggling and reduce EMI compared to single-ended output standards.

## 8 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 8.1 Application Information

The TLV3604, TLV3605, and TLV3607 comparators feature rail-to-rail inputs and a LVDS output stage that is well-suited for high speed applications that require low power consumption. The 800 ps propagation delay of the comparators improve performance and extend the range for applications involving optical reception, triggers for test and measurement systems, and transceivers that require a high speed signal to be carried over a certain distance.

#### 8.1.1 Comparator Inputs

The TLV3604, TLV3605, and TLV3607 are rail-to-rail input comparators, with an input common-mode range that exceeds the supply rails by 200 mV for both positive and negative supplies.

#### 8.1.2 Capacitive Loads

Under reasonable capacitive loads, the device maintains specified propagation delay. However, excessive capacitive loading under high switching frequencies may increase supply current, propagation delay, or induce decreased slew rate.

#### 8.1.3 Latch Functionality

The latch pin for the TLV3605 and TLV3607 holds the output state of the device when the voltage at the LEB/HYST pin is less than 800mV above  $V_{EE}$ . This is particularly useful when the output state is intended to remain unchanged. An important consideration of the latch functionality is the latch hold time. Latch hold time is the minimum time (after the latch pin is asserted) required for properly latching the comparator output.

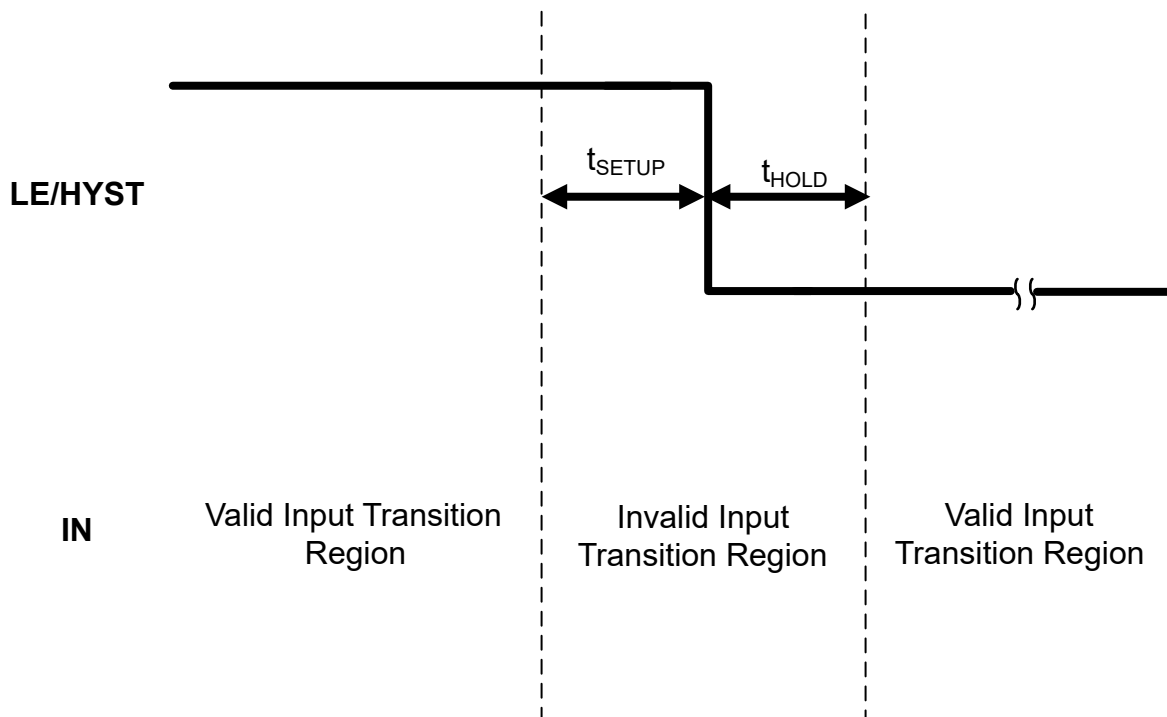

图 8-1. Valid Latch Diagram

Likewise, latch setup time is defined as the time that the input must be stable before the latch pin is asserted low. The figure above illustrates when the input can transition for a valid latch. Note that the typical setup time in the EC table is negative; this is due to the internal trace delays of the LEB/HYST pin relative to the input pin trace delays.

A small delay in the output response is shown below when the TLV3605 and TLV3607 exits a latched output stage.

**8-2. Latch Disable with Input Change**

### 8.1.4 Adjustable Hysteresis

As a result of a comparator’s high open loop gain, there is a small band of input differential voltage where the output can toggle back and forth between “logic high” and “logic low” states. This can cause design challenges for inputs with slow rise and fall times or systems with excessive noise.

These challenges can be overcome by adding hysteresis to the comparator. Since the TLV3604 does not have internal hysteresis, external hysteresis can be applied in the form of a positive feedback loop that adjusts the trip point of the comparator depending on its current output state. See the Typical Application section for more details.

The TLV3605 and TLV3607 on the other hand has a LEB/HYST pin that can be used to increase the internal hysteresis of the comparator. In order to change the internal hysteresis of the TLV3605 and TLV3607, connect a single resistor as shown in the [adjusting hysteresis figure](#) between the LEB/HYST pin and VEE. A curve of hysteresis versus resistance is provided below to provide guidance in setting the desired amount of hysteresis.

**8-3. Adjusting Hysteresis with an External Resistor (R)**

图 8-4.  $V_{HYST}$  (mV) vs  $R_{HYST}$  (kΩ),  $V_{CC} = 3.3V$

## 8.2 Typical Application

### 8.2.1 Non-Inverting Comparator With Hysteresis

A way to implement external hysteresis to the TLV3604 is to add two resistors to the circuit: one in series between the reference voltage and the inverting pin, and another from the inverting pin to one of the differential output pins.

图 8-5. Non-Inverting Comparator with Hysteresis Circuit

#### 8.2.1.1 Design Requirements

表 8-1. Design Parameters

PARAMETER	VALUE
$V_{HYS}$	20mV
$V_{REF}$	5V
$V_{T1}$	3.6V
$V_{T2}$	3.4V
Q	1.375V
$\bar{Q}$	1.025V

### 8.2.1.2 Detailed Design Procedure

First, create an equation for  $V_T$  that covers both output voltages when the output is high or low.

$$V_{INN\_LOW} = V_{REF} - (V_{REF} - V_{OL}) \times R_1 / (R_1 + R_2) \quad (1)$$

$$V_{INN\_HI} = V_{REF} - (V_{REF} - V_{OH}) \times R_1 / (R_1 + R_2) \quad (2)$$

The hysteresis voltage in this network is equal to the difference in the two threshold voltage equations.

$$V_{HYS} = V_{INN\_HI} - V_{INN\_LOW} \quad (3)$$

$$\text{After simplifying: } V_{HYS} = (V_{OH} - V_{OL}) \times R_1 / (R_1 + R_2) \quad (4)$$

Since input bias is typically 1  $\mu$ A, it is best to choose a value for  $R_1$  and then solve for the required  $R_2$  to provided the needed amount of hysteresis. In this example, a value of 500  $\Omega$  was selected to minimize the impact of input bias current on circuit offset voltage. Solving for  $R_2$  provides the equation below. Note that VOD is 350 mV from the EC Table.

$$R_2 = R_1 \times (V_{OD} - V_{HYS}) / V_{HYS} \quad (5)$$

$V_{REF}$  can now be solved for using the equation for  $V_{INN\_LOW}$  or  $V_{INN\_HI}$ . IN this example,  $V_{INN\_HI}$  was chosen.

$$V_{REF} = (V_{INN\_HI} - k \times V_{OH}) / (1 - k) \text{ where } k = R_1 / (R_1 + R_2) \quad (6)$$

The external hysteresis design is now complete with  $R_1 = 500 \Omega$ ,  $R_2 = 8.25 \text{ k}\Omega$ ,  $V_{REF} = 2.8 \text{ V}$ .

### 8.2.1.3 Application Performance Plots

☒ 8-6. Hysteresis Curve for LVDS Comparator

### 8.2.2 Optical Receiver

The TLV3604, TLV3605, and TLV3607 can be used in conjunction with a high performance amplifier such as the OPA855 to create an optical receiver as shown in the ☒ 8-7. The photo diode is connected to a bias voltage and is being driven with a pulsed laser. The OPA855 takes the current conducting through the diode and translates it into a voltage for a high speed comparator to detect. The TLV3604, TLV3605, and TLV3607 will then output the proper LVDS signal according to the threshold set ( $V_{REF2}$ ).

☒ 8-7. Optical Receiver

### 8.2.3 Logic Clock Source to LVDS Transceiver

The [Figure 8-8](#) shows a logic clock source being terminated and driven with the TLV3604, TLV3605, and TLV3607 across a CAT6 Cable to receive an equivalent LVDS clock signal at the receiver end.

**Figure 8-8. LVDS Clock Transceiver**

### 8.2.4 External Trigger Function for Oscilloscopes

[Figure 8-9](#) is a typical configuration for creating an external trigger on oscilloscopes. The user adjusts the trigger level, and a DAC converts this trigger level to a voltage the TLV360x can use as a reference. The input voltage from an oscilloscope channel is then compared to the trigger reference voltage, and the TLV3604, TLV3605, and TLV3607 sends an LVDS signal to a downstream FPGA to begin a capture.

**Figure 8-9. External Trigger Function**

## 9 Power Supply Recommendations

The TLV3604, TLV3605, and TLV3607 are recommended for operation from 2.4 V to 5.5 V. One benefit of the TLV3605 and TLV3607 is that the comparator has separate input and output supply pins (VCCI and VCCO). This provides a system designer the flexibility of powering the input stage with a higher supply voltage such as 5V to maximize the dynamic range of the input while powering the output stage with a 2.5V supply to save power. Regardless of the VCCO supply voltage, the control pins such as LEB and SHDNB are 1.8V logic compliant.

## 10 Layout

### 10.1 Layout Guidelines

Comparators are very sensitive to input noise. For best results, adhere to the following layout guidelines.

1. Use a printed-circuit-board (PCB) with a good, unbroken, low-inductance ground plane. Proper grounding (use of a ground plane) helps maintain specified device performance and input/output trace impedances.
2. To minimize supply noise, place a decoupling capacitor (0.1- $\mu$ F ceramic, surface-mount capacitor) directly between VCCI/VCCO and VEE.
3. On the inputs and outputs, utilize matched trace lengths to minimize timing skew. Also, minimize trace lengths and maximize ground pour spacings around the input and output traces to limit parasitic capacitance.
4. Solder the device directly to the PCB rather than using a socket.
5. For slow-moving input signals, take care to prevent parasitic feedback. A small capacitor (1000 pF or less) placed between the inputs can help eliminate oscillations in the transition region. This capacitor causes minimal degradation to propagation delay when source impedance is low.
6. Use a 100  $\Omega$  termination resistor across the device's LVDS outputs.
7. Use higher performance substrate materials such as Rogers or High-Speed FR4.
8. PCB signal layers from the TLV3604EVM are shown for reference.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
