TLVx369 コスト最適化された800nA、1.8V、クロスオーバー歪み0のレール・ツー・レールI/Oオペアンプ

1 特長

- コスト最適化された高精度アンプ*nano*Power: 800nA/Ch (標準値)
- 低いオフセット電圧: 400µV (標準値)
- レール・ツー・レールの入出力
- クロスオーバー歪みが0
- 低いオフセット・ドリフト: 0.5 µV/°C (標準値)
- ゲイン帯域幅積: 12kHz
- 電源電圧: 1.8V～5.5V
- *micro*Sizeパッケージ: SC70-5、VSSOP-8

2 アプリケーション

- 血糖値計
- 試験用機器
- 低電力のセンサ・シグナル・コンディショニング
- ポータブル・デバイス

3 概要

TLV369ファミリはシングルおよびデュアルのオペアンプで、コスト最適化された世代の1.8V nanopowerアンプを代表する製品です。

クロスオーバー歪みが0の回路により、これらのアンプは同相モードの入力範囲全体にわたって高い直線性を持ち、クロスオーバー歪みがないため、真のレール・ツー・レール入力が可能で、1.8V～5.5Vの単一電源で動作します。このファミリは、業界標準の公称電圧3.0V、3.3V、5.0Vとも互換性があります。

TLV369 (シングル・バージョン)は5ピンのSC70パッケージで提供されます。TLV2369 (デュアル・バージョン)は8ピンのVSSOPおよびSOICパッケージで提供されます。

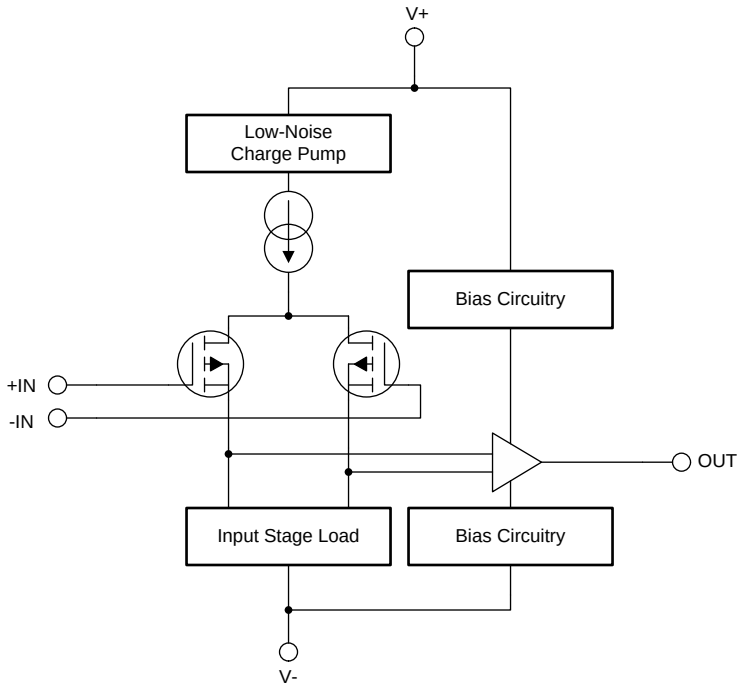
7 Detailed Description

7.1 Overview

The TLVx369 family of operational amplifiers minimizes power consumption and operates on supply voltages as low as 1.8 V. The zero-crossover distortion circuitry enables high linearity over the full input common-mode range, achieving true rail-to-rail input from a 1.8-V to 5.5-V single supply.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Operating Voltage

The TLV369 series os op amps are fully specified and tested from 1.8 V to 5.5 V (±0.9 V to ±2.75 V). Parameters that vary significantly with supply voltage are described in the *Typical Characteristics* section.

7.3.2 Input Common-Mode Voltage Range

The TLV369 family is designed to eliminate the input offset transition region typically present in most rail-to-rail, complementary-stage operational amplifiers, allowing the TLV369 family of amplifiers to provide superior common-mode performance over the entire input range.

The input common-mode voltage range of the TLV369 family typically extends to each supply rail. CMRR is specified from the negative rail to the positive rail; see Figure 1, *Normalized Offset Voltage vs Common-Mode Voltage*.

7.3.3 Protecting Inputs from Overvoltage

Input currents are typically 10 pA. However, large inputs (greater than 500 mV beyond the supply rails) can cause excessive current to flow in or out of the input pins. Therefore, in addition to keeping the input voltage between the supply rails, the input current must also be limited to less than 10 mA. This limiting is easily accomplished with an input resistor, as shown in Figure 14.

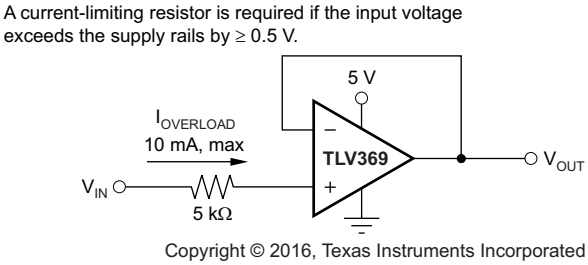


Figure 14. Input Current Protection for Voltages That Exceed the Supply Voltage

7.4 Device Functional Modes

The TLV369 family has a single functional mode. These devices are powered on as long as the power-supply voltage is between 1.8 V (±0.9 V) and 5.5 V (±2.75 V).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

When designing for ultra-low power, choose system components carefully. To minimize current consumption, select large-value resistors. Any resistors can react with stray capacitance in the circuit and the input capacitance of the operational amplifier. These parasitic RC combinations can affect the stability of the overall system. Use of a feedback capacitor assures stability and limits overshoot or gain peaking.

8.2 Typical Application

A typical application for an operational amplifier is an inverting amplifier, as shown in Figure 15. An inverting amplifier takes a positive voltage on the input and outputs a signal inverted to the input, making a negative voltage of the same magnitude. In the same manner, the amplifier also makes negative input voltages positive on the output. In addition, amplification can be added by selecting the input resistor R_I and the feedback resistor R_F.

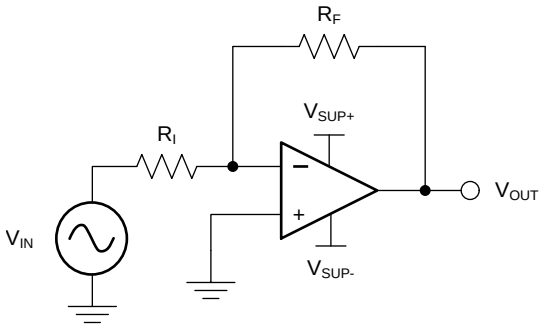

Figure 15. Application Schematic

8.2.1 Design Requirements

The supply voltage must be chosen to be larger than the input voltage range and the desired output range. The limits of the input common-mode range (V_{CM}) and the output voltage swing to the rails (V_O) must also be considered. For instance, this application scales a signal of ±0.5 V (1 V) to ±1.8 V (3.6 V). Setting the supply at ±2.5 V is sufficient to accommodate this application.

Typical Application (continued)

8.2.2 Detailed Design Procedure

Determine the gain required by the inverting amplifier using Equation 1 and Equation 2:

$$A_V = \frac{V_{OUT}}{V_{IN}} \tag{1}$$

$$A_V = \frac{1.8}{-0.5} = -3.6 \tag{2}$$

When the desired gain is determined, choose a value for R_I or R_F. Choosing a value in the kilohm range is desirable for general-purpose applications because the amplifier circuit uses currents in the milliamp range. This milliamp current range ensures that the device does not draw too much current. The trade-off is that very large resistors (100s of kilohms) draw the smallest current but generate the highest noise. Very small resistors (100s of ohms) generate low noise but draw high current. This example uses 10 kΩ for R_I, meaning 36 kΩ is used for R_F. These values are determined by Equation 3:

$$A_V = -\frac{R_F}{R_I} \tag{3}$$

8.3 System Examples

8.3.1 Battery Monitoring

The low operating voltage and quiescent current of the TLV369 series make the family an excellent choice for battery-monitoring applications, as shown in Figure 17.

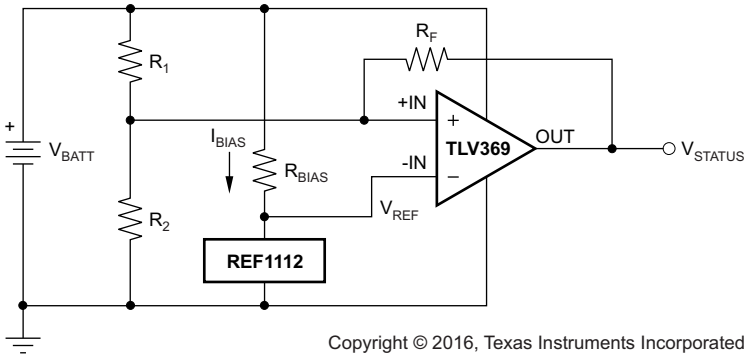

Figure 17. Battery Monitor

In this circuit, V_{STATUS} is high as long as the battery voltage remains above 2 V. A low-power reference is used to set the trip point. Resistor values are selected as follows:

1. Selecting R_F: Select R_F such that the current through R_F is approximately 1000 times larger than the maximum bias current over temperature, as given by Equation 4:

$$R_F = \frac{V_{REF}}{1000\ (I_{BMAX})} = \frac{1.2\ V}{1000\ (50\ pA)} = 24\ M\Omega \approx 20\ M\Omega \quad (4)$$

2. Choose the hysteresis voltage, V_{HYST}. For battery-monitoring applications, 50 mV is adequate.
3. Calculate R_1 as calculated by Equation 5:

$$R_1 = R_F \left[\frac{V_{HYST}}{V_{BATT}}\right] = 20\ M\Omega \left[\frac{50\ mV}{2.4\ V}\right] = 420\ k\Omega \quad (5)$$

4. Select a threshold voltage for V_{IN} rising (V_{THRS}) = 2.0 V.
5. Calculate R_2 as given by Equation 6:

$$R_2 = \frac{1}{\left[\left(\frac{V_{THRS}}{V_{BATT}}\right) - \frac{1}{R_1} - \frac{1}{R_1}\right]} = \frac{1}{\left[\left(\frac{2\ V}{1.2\ V \times 420\ k\Omega}\right) - \frac{1}{420\ k\Omega} - \frac{1}{20\ M\Omega}\right]} = 650\ k\Omega \quad (6)$$

6. Calculate R_{BIAS}: The minimum supply voltage for this circuit is 1.8 V. The REF1112 has a current requirement of 1.2 μA (max). Providing the REF1112 with 2 μA of supply current assures proper operation. Therefore, R_{BIAS} is as given by Equation 7.

$$R_{BIAS} = \frac{V_{BATTMIN}}{I_{BIAS}} = \frac{1.8\ V}{2\ \mu A} = 0.9\ M\Omega \quad (7)$$

System Examples (continued)

8.3.2 Window Comparator

Figure 18 shows the TLV2369 used as a window comparator. The threshold limits are set by V_H and V_L, with V_H greater than V_L. When V_{IN} is less than V_H, the output of A1 is low. When V_{IN} is greater than V_L, the output of A2 is low. Therefore, both op amp outputs are at 0 V as long as V_{IN} is between V_H and V_L. This architecture results in no current flowing through either diode, Q1 is in cutoff, with the base voltage at 0 V, and V_{OUT} forced high.

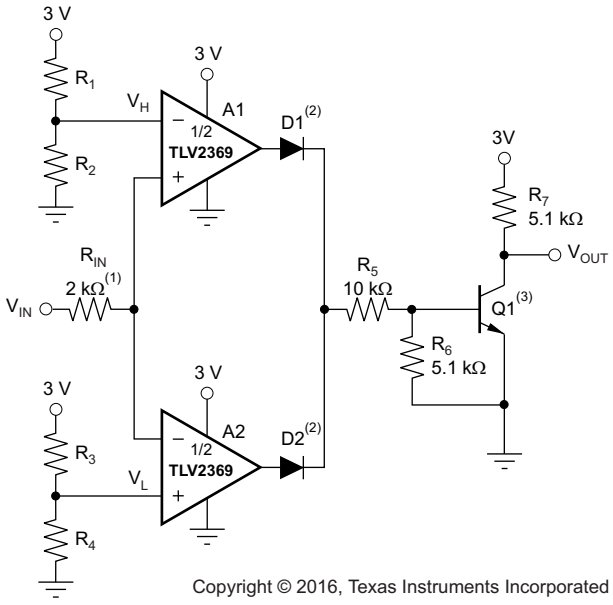

Figure 18. TLV2369 as a Window Comparator

If V_{IN} falls below V_L, the output of A2 is high, current flows through D2, and V_{OUT} is low. Likewise, if V_{IN} rises above V_H, the output of A1 is high, current flows through D1, and V_{OUT} is low. The window comparator threshold voltages are set as shown by Equation 8 and Equation 9:

$$V_H = \frac{R_2}{R_1 + R_2} \quad (8)$$

$$V_L = \frac{R_4}{R_3 + R_4} \quad (9)$$

9 Power Supply Recommendations

The TLV369 family is specified for operation from 1.8 V to 5.5 V (±0.9 V to ±2.75 V); many specifications apply from –40°C to +125°C. The *Typical Characteristics* section presents parameters that can exhibit significant variance with regard to operating voltage or temperature.

CAUTION

Supply voltages larger than 7 V can permanently damage the device (see the *Absolute Maximum Ratings* table).

Place 0.1-µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement; see the *Layout Guidelines* section.

10 Layout

10.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and the operational amplifier. Use bypass capacitors to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1-µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of the circuitry is one of the simplest and most effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see *Circuit Board Layout Techniques*, SLOA089.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicularly is much better than crossing in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keep R_F and R_G close to the inverting input in order to minimize parasitic capacitance, as shown in Figure 19.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
