5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
EN	1	IN	Device enable pin. To enable the device, this pin needs to be pulled high. Pulling this pin low disables the device. This pin has a pulldown resistor of typically 400 k Ω when the device is disabled.
FB	3	IN	Feedback pin. Connect a resistor divider to set the output voltage.
GND	5		Ground pin.
PG	2	OUT	Power good open drain output pin. The pullup resistor can not be connected to any voltage higher than 6 V. If unused, leave it floating.
SW	6	PWR	Switch pin of the power stage.
VIN	7	PWR	Input voltage pin.
VOS	4	IN	Output voltage sense pin. This pin must be directly connected to the output capacitor.

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Voltage at Pins ⁽²⁾	VIN, FB, VOS, EN, PG	– 0.3	7	V
	SW (DC)	– 0.3	VIN + 0.3	
	SW (AC, less than 100ns) ⁽³⁾	– 3	11	
Temperature	Operating Junction, TJ	– 40	150	°C
	Storage, Tstg	– 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.
- (3) While switching.

6.2 ESD Ratings

		VALUE	UNIT
V(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions⁽¹⁾

		MIN	NOM	MAX	UNIT
VIN	Input voltage range	2.5		6	V
VOUT	Output voltage range	0.8		VIN	V
ISINK_PG	Sink current at PG pin			1	mA
VPG	Pullup resistor voltage			6	V
TJ	Operating junction temperature	–40		125	°C

- (1) Refer to [Application and Implementation](#) for further information.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLV62085	UNIT
		RLT [VSON]	
		7 PINS	
RθJA	Junction-to-ambient thermal resistance	107.8	°C/W
RθJC(top)	Junction-to-case (top) thermal resistance	66.2	°C/W
RθJB	Junction-to-board thermal resistance	17.1	°C/W
ψJT	Junction-to-top characterization parameter	2.1	°C/W
ψJB	Junction-to-board characterization parameter	17.1	°C/W
RθJC(bot)	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

T_J = 25 °C, and V_{IN} = 3.6 V, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY						
I _Q	Quiescent current into VIN	No load, device not switching		17		μA
I _{SD}	Shutdown current into VIN	EN = Low		0.7		μA

f _{SW}	PWM switching frequency	I _{OUT} = 1 A		2.4		MHz

6.6 Typical Characteristics

Fig 1. Switching Frequency

7 Detailed Description

7.1 Overview

The TLV62085 synchronous step-down converter is based on the DCS-Control (Direct Control with Seamless transition into Power Save Mode) topology. This is an advanced regulation topology that combines the advantages of hysteretic, voltage, and current mode control schemes.

The DCS-Control topology operates in PWM (pulse width modulation) mode for medium to heavy load conditions and in Power Save Mode at light load currents. In PWM mode, the converter operates with its nominal switching frequency of 2.4 MHz, having a controlled frequency variation over the input voltage range. As the load current decreases, the converter enters Power Save Mode, reducing the switching frequency and minimizing the IC's current consumption to achieve high efficiency over the entire load current range. Because DCS-Control supports both operation modes (PWM and PFM) within a single building block, the transition from PWM mode to Power Save Mode is seamless and without effects on the output voltage. The device offers both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, minimizing interference with RF circuits.

7.2 Functional Block Diagram

2. Functional Block Diagram

7.3 Feature Description

7.3.1 Power Save Mode

As the load current decreases, the TLV62085 enters Power Save Mode (PSM) operation. During Power Save Mode, the converter operates with reduced switching frequency and with a minimum quiescent current maintaining high efficiency. Power Save Mode occurs when the inductor current becomes discontinuous. Power Save Mode is based on a fixed on-time architecture, as related in Equation 1. The switching frequency over the whole load current range is also shown in Figure 1 for a shown typical application.

$$t_{ON} = 420 \text{ ns} \times \frac{V_{OUT}}{V_{IN}}$$

$$f_{PFM} = \frac{2 \times I_{OUT}}{t_{ON}^2 \times \frac{V_{IN}}{V_{OUT}} \times \frac{V_{IN} - V_{OUT}}{L}} \quad (1)$$

In PSM, the output voltage rises slightly above the nominal output voltage, as shown in Figure 10. This effect is minimized by increasing the output capacitor or inductor value.

During PAUSE period in PSM (shown in Figure 3), the device does not change the PG pin state nor does it detect an UVLO event, in order to achieve a minimum quiescent current and maintain high efficiency at light loads.

Figure 3. Power Save Mode Waveform Diagram

7.3.2 100% Duty Cycle Low Dropout Operation

The device offers low input-to-output voltage difference by entering 100% duty cycle mode. In this mode, the high-side MOSFET switch is constantly turned on and the low-side MOSFET is switched off. This is particularly useful in battery powered applications to achieve the longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage to maintain output regulation, depending on the load current and output voltage can be calculated as:

$$V_{IN,MIN} = V_{OUT} + I_{OUT,MAX} \times (R_{DS(on)} + R_L)$$

with

- $V_{IN,MIN}$ = Minimum input voltage to maintain an output voltage
- $I_{OUT,MAX}$ = Maximum output current
- $R_{DS(on)}$ = High-side FET ON-resistance
- R_L = Inductor ohmic resistance (DCR) (2)

7.3.3 Soft Start

The TLV62085 has an internal soft-start circuitry which monotonically ramps up the output voltage and reaches the nominal output voltage during a soft-start time of typically 0.8 ms. This avoids excessive inrush current and creates a smooth output voltage slope. It also prevents excessive voltage drops of primary cells and rechargeable batteries with high internal impedance. The device is able to start into a prebiased output capacitor. The device starts with the applied bias voltage and ramps the output voltage to its nominal value.

Feature Description (continued)

7.3.4 Switch Current Limit and Hiccup Short-Circuit Protection

The switch current limit prevents the device from high inductor current and from drawing excessive current from the battery or input voltage rail. Excessive current might occur with a shorted or saturated inductor or a heavy load or shorted output circuit condition. If the inductor current reaches the threshold I_{LIM} , the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current. When this switch current limit is triggered 32 times, the device stops switching and enables the output discharge. The device then automatically starts a new start-up after a typical delay time of 66 μ s has passed. This is named HICCUP short-circuit protection. The device repeats this mode until the high load condition disappears.

7.3.5 Undervoltage Lockout

To avoid misoperation of the device at low input voltages, an undervoltage lockout (UVLO) is implemented, which shuts down the device at voltages lower than V_{UVLO} with a hysteresis of 200 mV.

7.3.6 Thermal Shutdown

The device goes into thermal shutdown and stops switching when the junction temperature exceeds T_{JSD} . When the device temperature falls below the threshold by 20°C, the device returns to normal operation automatically.

7.4 Device Functional Modes

7.4.1 Enable and Disable

The device is enabled by setting the EN pin to a logic HIGH. Accordingly, shutdown mode is forced if the EN pin is pulled LOW with a shutdown current of typically 0.7 μ A.

In shutdown mode, the internal power switches as well as the entire control circuitry are turned off. An internal resistor of 260 Ω discharges the output through the VOS pin smoothly. The output discharge function also works when thermal shutdown, UVLO, or short-circuit protection are triggered.

An internal pulldown resistor of 400 k Ω is connected to the EN pin when the EN pin is LOW. The pulldown resistor is disconnected when the EN pin is HIGH.

7.4.2 Power Good

The TLV62085 has a power good output. The power good goes high impedance once the output is above 95% of the nominal voltage, and is driven low once the output voltage falls below typically 90% of the nominal voltage. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power good output requires a pull-up resistor connecting to any voltage rail less than 6 V. The PG signal can be used for sequencing of multiple rails by connecting it to the EN pin of other converters. Leave the PG pin unconnected when not used. 表 1 shows the PG pin logic.

表 1. PG Pin Logic

DEVICE CONDITIONS		LOGIC STATUS	
		HIGH Z	LOW
Enable	EN = High, $V_{FB} \geq V_{PG}$	√	
	EN = High, $V_{FB} \leq V_{PG}$		√
Shutdown	EN = Low		√
Thermal Shutdown	$T_J > T_{JSD}$		√
UVLO	$0.5 V < V_{IN} < V_{UVLO}$		√
Power Supply Removal	$V_{IN} \leq 0.5 V$	√	

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TLV62085 is a synchronous step-down converter in which output voltage is adjusted by component selection. The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using the typical applications as a reference.

8.2 Typical Application

图 4. 1.8-V Output Voltage Application

8.2.1 Design Requirements

For this design example, use the parameters listed in 表 2 as the input parameters.

表 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.5 V to 6 V
Output voltage	1.8 V
Output current	≤ 3 A
Output ripple voltage	<30 mV

表 3 lists the components used for the example.

表 3. List of Components⁽¹⁾

REFERENCE	DESCRIPTION	MANUFACTURER
C1	10 µF, Ceramic capacitor, 10 V, X7R, size 0805, GRM21BR71A106ME51L	Murata
C2	22 µF, Ceramic capacitor, 6.3 V, X5R, size 0805, GRM21BR60J226ME39L	Murata
L1	0.47 µH, Power Inductor, size 4 mm × 4 mm × 1.5 mm, XFL4015-471ME	Coilcraft
R1	Depending on the output voltage, 1%, size 0603;	Std
R2	110 kΩ, Chip resistor, 1/16 W, 1%, size 0603;	Std
R3	1 MΩ, Chip resistor, 1/16 W, 1%, size 0603	Std

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the TLV62085 device with the WEBENCH® Power Designer.

1. Start by entering your V_{IN} , V_{OUT} , and I_{OUT} requirements.
2. Optimize your design for key parameters like efficiency, footprint and cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. The WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you will also be able to:
 - Run electrical simulations to see important waveforms and circuit performance
 - Run thermal simulations to understand the thermal performance of your board
 - Export your customized schematic and layout into popular CAD formats
 - Print PDF reports for the design, and share your design with colleagues
5. Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Setting The Output Voltage

The output voltage is set by an external resistor divider according to [Equation 3](#):

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) = 0.8 \text{ V} \times \left(1 + \frac{R1}{R2}\right) \quad (3)$$

R2 must not be higher than 180 kΩ to achieve high efficiency at light load while providing acceptable noise sensitivity.

8.2.2.3 Output Filter Design

The inductor and the output capacitor together provide a low-pass filter. To simplify the selection process, [表 4](#) outlines possible inductor and capacitor value combinations for most applications.

表 4. Matrix of Output Capacitor and Inductor Combinations

NOMINAL L [μH] ⁽¹⁾	NOMINAL C _{OUT} [μF] ⁽²⁾				
	10	22	47	100	150
0.47		+ ⁽³⁾	+	+	+
1	+	+	+	+	+
2.2					

- (1) Inductor tolerance and current derating is anticipated. The effective inductance can vary by 20% and –30%.
- (2) Capacitance tolerance and bias voltage derating is anticipated. The effective capacitance can vary by 20% and –50%.
- (3) Typical application configuration. Other '+' mark indicates recommended filter combinations.

8.2.2.4 Inductor Selection

The main parameter for the inductor selection is the inductor value and then the saturation current of the inductor. To calculate the maximum inductor current under static load conditions, [Equation 4](#) is given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2}$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}}$$

where

- $I_{OUT,MAX}$ = Maximum output current
- ΔI_L = Inductor current ripple

- f_{sw} = Switching frequency
 - L = Inductor value
- (4)

TI recommends choosing the saturation current for the inductor 20% to 30% higher than the $I_{L,MAX}$, out of Equation 4. A higher inductor value is also useful to lower ripple current but increases the transient response time as well. The following inductors are recommended to be used in designs.

表 5. List of Recommended Inductors⁽¹⁾

INDUCTANCE [μH]	CURRENT RATING [A]	DIMENSIONS L x W x H [mm ³]	DC RESISTANCE [mΩ typical]	PART NUMBER
0.47	6.6	4 x 4 x 1.5	7.6	Coilcraft XFL4015-471
0.47	4.7	3.2 x 2.5 x 1.2	21	TOKO DFE322512-R47N
1	5.1	4 x 4 x 2	10.8	Coilcraft XFL4020-102

(1) See [Third-Party Products](#) disclaimer.

8.2.2.5 Capacitor Selection

The input capacitor is the low-impedance energy source for the converter which helps to provide stable operation. A low ESR multilayer ceramic capacitor is recommended for best filtering and must be placed between VIN and GND as close as possible to those pins. For most applications, 10 μF is sufficient, though a larger value reduces input current ripple.

The architecture of the TLV62085 allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends using X7R or X5R dielectrics. The recommended typical output capacitor value is 22 μF; this capacitance can vary over a wide range as outline in the output filter selection table. Output capacitors above 150uF may be used with a reduced load current during startup to avoid triggering the short circuit protection.

A feed-forward capacitor is not required for device proper operation.

8.2.3 Application Curves

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.5 V to 6 V. Ensure that the input power supply has a sufficient current rating for the application.

10 Layout

10.1 Layout Guidelines

The printed-circuit-board (PCB) layout is an important step to maintain the high performance of the TLV62085 device.

The input and output capacitors and the inductor must be placed as close as possible to the IC. This keeps the traces short. Routing these traces direct and wide results in low trace resistance and low parasitic inductance. The low side of the input and output capacitors must be connected directly to the GND pin to avoid a ground potential shift. The sense traces connected to FB and VOS pins are signal traces. Special care must be taken to avoid noise being induced. By a direct routing, parasitic inductance can be kept small. GND layers might be used for shielding. Keep these traces away from SW nodes. See [Figure 23](#) for the recommended PCB layout.

10.2 Layout Example

Figure 23. PCB Layout Recommendation

10.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component.

Two basic approaches for enhancing thermal performance are:

- Improving the power dissipation capability of the PCB design
- Introducing airflow in the system

The big copper planes connecting to the pads of the IC on the PCB improve the thermal performance of the device. For more details on how to use the thermal parameters, see the *Thermal Characteristics Application Notes*, [SZZA017](#) and [SPRA953](#).

11 デバイスおよびドキュメントのサポート

11.1 開発サポート

11.1.1 WEBENCH®ツールによるカスタム設計

[ここをクリック](#)すると、WEBENCH® Power Designerにより、TLV62085デバイスを使用するカスタム設計を作成できます。

- 最初に、 V_{IN} 、 V_{OUT} 、 I_{OUT} の要件を入力します。
- 設計で効率、占有面積、コストなどの主要パラメータを最適化するため、オプティマイザのダイヤルを使用し、この設計と、テキサス・インスツルメンツによる他の可能なソリューションとを比較します。
- WEBENCH Power Designerでは、カスタマイズされた回路図と部品リストを、リアルタイムの価格や部品の在庫情報と併せて参照できます。
- ほとんどの場合、次の操作も実行できます。
 - 電氣的なシミュレーションを実行し、重要な波形と回路の性能を確認する。
 - 熱的なシミュレーションを実行し、基板の熱特性を把握する。
 - カスタマイズされた回路図やレイアウトを、一般的なCADフォーマットでエクスポートする。
 - 設計のレポートをPDFで印刷し、同僚と設計を共有する。
- WEBENCHツールの詳細は、www.ti.com/WEBENCHでご覧になれます。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLV62085RLTR	ACTIVE	VSON-HR	RLT	7	3000	RoHS & Green	Call TI SN MATTE SN	Level-1-260C-UNLIM	-40 to 125	12Q5	Samples
TLV62085RLTT	ACTIVE	VSON-HR	RLT	7	250	RoHS & Green	Call TI SN MATTE SN	Level-1-260C-UNLIM	-40 to 125	12Q5	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TLV62085RLTR	VSON-HR	RLT	7	3000	180.0	8.4	2.3	2.3	1.15	4.0	8.0	Q2
TLV62085RLTT	VSON-HR	RLT	7	250	180.0	8.4	2.3	2.3	1.15	4.0	8.0	Q2

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TLV62085RLTR	VSON-HR	RLT	7	3000	210.0	185.0	35.0
TLV62085RLTT	VSON-HR	RLT	7	250	210.0	185.0	35.0

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

LAND PATTERN EXAMPLE
SCALE: 30X

SOLDER MASK DETAILS

4220429/A 09/2014

NOTES: (continued)

3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
5. Vias should not be placed on soldering pads unless they are plugged or plated shut.

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL

FOR ALL EXPOSED PADS
 85% PRINTED SOLDER COVERAGE BY AREA
 SCALE: 40X

4220429/A 09/2014

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
