## 1 特長

- VDD = 0.7V~6V で  $\overline{\text{RESET}}/\text{RESET}$  を確実に出力
- 遅延時間を修正: 40 $\mu$ s、10ms、50ms、100ms、200ms、400ms
- 消費電流 (IDD): 250nA (標準値)
  - 1 $\mu$ A (VDD = 3.3V での最大値)
- 出力トポロジ
  - TLV809E: プッシュプル・アクティブ LOW
  - TLV803E: オープン・ドレイン・アクティブ LOW
  - TLV810E: プッシュプル・アクティブ HIGH
- 低電圧検出
  - 高精度:  $\pm 0.5\%$  (標準値)
  - (V<sub>IT-</sub>): 1.7V、1.8V、1.9V、2.25V、2.4V、2.64V、2.93V、3.08V、3.3V、4.2V、4.38V、4.55V、4.63V
- パッケージ
  - SOT23-3 (DBZ) (ピン 1 = GND)
  - SOT23-3 (DBZ) (ピン 1 =  $\overline{\text{RESET}}/\text{RESET}$ )
  - SOT23-3 (DBZ) (ピン 3 = GND)
  - SC-70 (DCK)
  - X2SON-5 (DPW)
- 温度範囲: -40°C~+125°C
- MAX803/809/810、APX803/809/810 とピン互換

## 2 アプリケーション

- 電気メーター
- ファクトリ・オートメーション
- 携帯用、バッテリー駆動機器
- セットトップ・ボックス、テレビ
- ビル・オートメーション
- ノートブック / デスクトップ PC、サーバー

## 3 概要

TLV803E、TLV809E、TLV810E は、TLV803、TLV853、TLV809、LM809、TPS3809、TLV810 を改良した代替品です。TLV80xE および TLV81xE は、小さい静止電流 I<sub>Q</sub>、高い精度、広い温度範囲、低いパワーオン・リセット電圧 (V<sub>POR</sub>) を備えており、システムの安定性を高めます。

TLV80xE および TLV81xE ファミリーは、VDD 電圧レベルを監視する低 I<sub>Q</sub> (標準値 250nA、最大値 1 $\mu$ A) の電圧監視回路 (リセット IC) です。これらのデバイスは、出荷時にプログラムされた下降時のスレッショルド電圧 V<sub>IT-</sub> を電源電圧 VDD が下回ると、リセット信号を出力します。このリセット出力は、VDD 電圧が上昇時の電圧スレッショルド (V<sub>IT+</sub>) を上回った後、固定のリセット遅延時間 t<sub>D</sub> の間 LOW に維持されます。上昇時の電圧スレッショルドは、下降時のスレッショルド電圧 (V<sub>IT-</sub>) にヒステリシス (V<sub>HYS</sub>) を加えたものです。

VDD ピンの高速な過渡変動を無視するために、これらのデバイスにはグリッチ耐性が組み込まれています。これらの電圧監視 IC は、I<sub>Q</sub> が小さく精度が高い ( $\pm 0.5\%$ 、標準値) ため、低消費電力および携帯型アプリケーションでの使用に理想的です。TLV80xE および TLV81xE デバイスは、最低 V<sub>POR</sub> = 0.7V までの電源電圧で、定義された出力ロジック状態を保つことが規定されています。TLV80xE および TLV81xE デバイスは業界標準の 3 ピン SOT23 (DBZ) パッケージ、SC70 (DCK) パッケージおよび非常に小型の X2SON (DPW) パッケージで供給されます。

## 4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision I (Feb 2021) to Revision J (May 2021)	Page
• Updated Device Naming Nomenclature figure by adding <i>Pinout Indicator (DBZ Package Only)</i> from <i>Pinout Indicator</i> .....	3
• Updated pin numbering of Figure 6-5 (X2SON) package and updated Pin Functions Table.....	4
• Updated X2SON (DPW) Layout Example.....	24
Changes from Revision H (December 2020) to Revision I (February 2021)	Page
• Remove duplicate package.....	27
Changes from Revision G (October 2020) to Revision H (December 2020)	Page
• Added Reset time delay variant F specification.....	9
Changes from Revision F (June 2020) to Revision G (October 2020)	Page
• 文書全体にわたって表、図、相互参照の採番方法を更新.....	1
• スレッショルド電圧 ( $V_{IT-}$ ) を追加し、新しいパッケージ情報を追加.....	1
• Updated Device Naming Nomenclature figure to include (DBZ) V pinout option.....	3
• Added new (DBZ) package option (Pin 3 = GND, V pinout) and updated Pin Functions Table.....	4
• Added layout example for (DBZ) V pinout package.....	24
• Modified Device Naming Convention table to include additional threshold voltages ( $V_{IT-}$ ), reset time delay options and pinout indicator options.....	26

表 6-1. Pin Functions

NAME	PIN				I/O	DESCRIPTION
	DCK, DBZ	DBZ (V PINOUT)	DBZ (R PINOUT)	DPW		
GND	1	3	2	4	—	<b>Ground</b>
RESET	2	1	1	1	O	<b>Active-low output reset signal:</b> This pin is driven low logic when VDD voltage falls below the negative voltage threshold ( $V_{IT-}$ ). RESET remains low (asserted) for the delay time period ( $t_D$ ) after VDD voltage rise above $V_{IT+}$ .
RESET	2	1	1	1	O	<b>Active-High output reset signal (TLV810E only):</b> This pin is driven high logic when VDD voltage falls below the negative voltage threshold ( $V_{IT-}$ ). RESET remains high (asserted) for the delay time period ( $t_D$ ) after VDD voltage rise above $V_{IT+}$ .
VDD	3	2	3	5	I	<b>Input supply voltage.</b> TLV803E, TLV809E, TLV810E monitor VDD voltage.
$\overline{MR}$	N/A	N/A	N/A	2	I	<b>Active-low manual reset input.</b> Pull this pin to a logic low ( $V_{MR\_L}$ ) to assert a reset signal in the output pin. After the $\overline{MR}$ pin is left floating or pulled to $V_{MR\_H}$ the output goes to the nominal state after the reset delay time ( $t_D$ ) expires. $\overline{MR}$ can be left floating when not in use.
PAD	N/A	N/A	N/A	3	—	<b>No Connection.</b> Thermal pad helps with thermal dissipation. PAD does not need to be soldered down. PAD can be connected to GND.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range, unless otherwise noted<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VDD pin	-0.3	6.5	V
	RESET (TLV809E), RESET (TLV810E)	-0.3	$V_{DD} + 0.3$ <sup>(2)</sup>	V
	RESET (TLV803E)	-0.3	6.5	V
Voltage	MR	-0.3	$V_{DD} + 0.3$ <sup>(2)</sup>	V
Current	Output sink and source current	-20	20	mA
Temperature <sup>(3)</sup>	Operating ambient, $T_A$	-40	125	°C
	Storage, $T_{stg}$	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions (above the Recommended Operating Conditions) for extended periods may affect device reliability.
- (2) The absolute maximum rating is  $(V_{DD} + 0.3)$  V or 6.5 V, whichever is smaller.
- (3) As a result of the low dissipated power in this device, the junction temperature is assumed to be equal to the ambient temperature.

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	± 2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{DD}$	Input supply voltage	1.7		6	V
$V_{RESET}$ , $V_{\overline{RESET}}$	RESET pin and RESET pin voltage	0		6	V
$I_{RESET}$ , $I_{\overline{RESET}}$	RESET pin and RESET pin current	0		±5	mA
$T_J$	Junction temperature (free air temperature)	-40		125	°C
$V_{MR}$	Manual reset pin voltage	0		$V_{DD}$	V

## 7.4 Thermal Information

## 8 Detailed Description

### 8.1 Overview

The TLV803E, TLV809E, TLV810E is a family of easy to implement low power, small size voltage supervisors (Reset ICs) with fixed threshold voltage and fixed reset delay. The TLV803E has open-drain active-low output topology which requires an external pull-up resistor, TLV809E has push-pull active-low output topology and TLV810E has push-pull active-high output topology. This family of devices features include integrated resistor divider threshold with hysteresis and a glitch immunity filter.

These devices are available in SOT-23 (3) and SC70 (3) industry standard package and pinout as well as a very small X2SON (5) package.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Input Voltage (VDD)

VDD pin is monitored by the internal comparator with integrated reference to indicate when VDD falls below the fixed threshold voltage. VDD also functions as the supply for the following:

- Internal bandgap (reference voltage)
- Internal regulator
- State machine
- Buffers
- Other control logic blocks

Good design practice involves placing a 0.1- $\mu$ F to 1- $\mu$ F bypass capacitor at VDD input for noisy applications and to ensure enough charge is available for the device to power up correctly. The reset output is undefined when VDD is below  $V_{POR}$ .

### 8.3.2 VDD Hysteresis

The internal comparator has built-in hysteresis to avoid erroneous output reset release. If the voltage at the VDD pin falls below the falling voltage threshold  $V_{IT-}$ , the output reset is asserted. When the voltage at the VDD pin rises above the rising voltage threshold ( $V_{IT+}$ ) equivalent to  $V_{IT-}$  plus hysteresis ( $V_{HYS}$ ), the output reset is deasserted after  $t_D$  reset time delay.

### 8.3.3 VDD Glitch Immunity

These devices are immune to quick voltage transient or excursion on VDD. Sensitivity to transients depends on both pulse duration ( $t_{GI}$ ) found in [セクション 7.6](#) and transient overdrive. Overdrive is defined by how much VDD exceeds the specified threshold. Threshold overdrive is calculated as a percent of the threshold in question, as shown in [式 1](#).

$$\text{Overdrive} = | (VDD / (V_{IT-} - 1)) \times 100\% | \quad (1)$$

where

- $V_{IT-}$  is the threshold voltage
- VDD is the input voltage crossing  $V_{IT-}$

図 8-1. Overdrive Versus Pulse Duration

TLV803E, TLV809E, and TLV810E devices have built-in glitch immunity ( $t_{GI}$ ) of 10  $\mu$ s typical as shown in [セクション 7.6](#). [図 8-2](#) shows that VDD must fall below  $V_{IT-}$  for  $t_{GI}$ , otherwise the falling transition is ignored. When VDD falls below  $V_{IT-}$  for  $t_{GI}$ ,  $\overline{\text{RESET}}$  transitions low to indicate a fault condition after the propagation delay high-to-low ( $t_{PDHL}$ ). When VDD rises above  $V_{IT+}$ ,  $\overline{\text{RESET}}$  only deasserts to logic high indicating there is no more fault condition only if VDD remains above  $V_{IT+}$  for longer than the reset delay ( $t_D$ ).

図 8-2. Glitch Immunity when VDD Rises Above  $V_{IT+}$  for Less than  $\overline{\text{RESET}}$  Delay (TLV803EA29)

### 8.3.4 Manual Reset ( $\overline{\text{MR}}$ ) Input for X2SON (DPW) Package Only

The manual reset ( $\overline{\text{MR}}$ ) input allows a processor GPIO or other logic circuits to initiate a reset. A logic low on  $\overline{\text{MR}}$  with pulse duration longer than  $t_{\text{MR\_RES}}$  will cause reset output to assert. After  $\overline{\text{MR}}$  returns to a logic high ( $V_{\text{MR\_H}}$ ) and VDD is above  $V_{\text{IT+}}$ , reset is deasserted after the user programmed reset time delay ( $t_{\text{D}}$ ) expires.

If  $\overline{\text{MR}}$  is not controlled externally, then  $\overline{\text{MR}}$  can be left disconnected.  $\overline{\text{MR}}$  is internally connected to VDD through a pull-up resistor  $R_{\text{MR}}$  shown in [セクション 8.2](#). If the logic signal controlling  $\overline{\text{MR}}$  is less than VDD, then additional current flows from VDD into  $\overline{\text{MR}}$  internally. For minimum current consumption, drive  $\overline{\text{MR}}$  to either VDD or GND.  $V_{\text{MR}}$  should not be higher than VDD voltage.

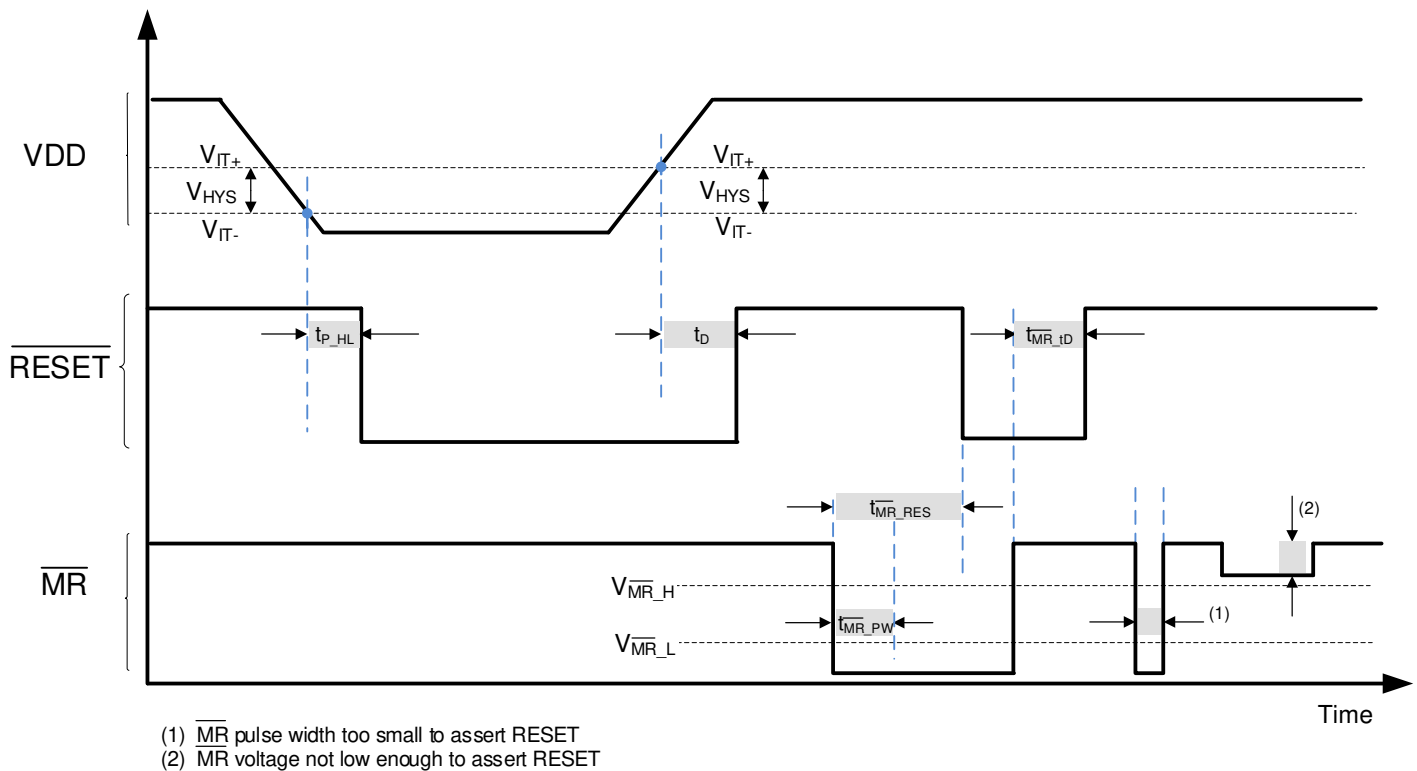

図 8-3. Timing Diagram  $\overline{\text{MR}}$  and  $\overline{\text{RESET}}$  for X2SON (DPW) Package

### 8.3.5 Output Logic

#### 8.3.5.1 RESET Output, Active-Low

$\overline{\text{RESET}}$  remains high (deasserted) as long as VDD is above the negative threshold ( $V_{\text{IT-}}$ ). If VDD falls below the negative threshold ( $V_{\text{IT-}}$ ), then reset is asserted and  $\overline{\text{RESET}}$  transitions to logic low ( $V_{\text{OL}}$ ).

When VDD rises above  $V_{\text{IT+}}$ , the delay circuit holds  $\overline{\text{RESET}}$  active and logic low for the specified reset delay period ( $t_{\text{D}}$ ). When the reset delay has elapsed, the  $\overline{\text{RESET}}$  pin transitions to high voltage ( $V_{\text{OH}}$ ).

The open-drain version requires an external pull-up resistor to hold the  $\overline{\text{RESET}}$  pin high because the internal MOSFET turns off causing  $\overline{\text{RESET}}$  output to pull-up to the pull-up voltage. Connect the pull-up resistor to the desired interface voltage logic.  $\overline{\text{RESET}}$  can be pulled up to any voltage up to maximum voltage independent of the VDD voltage. To ensure proper voltage levels, take care when choosing the pull-up resistor values. The pull-up resistor value is determined by  $V_{\text{OL}}$ , the output capacitive loading, and the output leakage current ( $I_{\text{lk}}(\text{OD})$ ).

The push-pull variant does not require an external pull-up resistor.

### 8.3.5.2 RESET Output, Active-High

RESET remains logic low (deasserted) as long as VDD is above the positive threshold ( $V_{IT+}$ ). If VDD falls below the negative threshold ( $V_{IT-}$ ), then reset is asserted and RESET transitions to logic high ( $V_{OH}$ ).

When VDD rises above  $V_{IT+}$ , the delay circuit holds RESET active and logic high for the specified reset delay period ( $t_D$ ). When the reset delay has elapsed the RESET pin transitions to low voltage ( $V_{OL}$ ).

## 8.4 Device Functional Modes

表 8-1 summarizes the various functional modes of the device.

表 8-1. Truth Table

V <sub>DD</sub>	MR (X2SON package only)	RESET (Active-High)	RESET(Active-Low)
$V_{DD} < V_{POR}$	N/A	Undefined	Undefined
$V_{POR} < V_{DD} < V_{IT-}$ <sup>(1)</sup>	N/A	H	L
$V_{DD} \geq V_{IT-}$	L	H	L
$V_{DD} \geq V_{IT-}$	H	L	H

(1) When V<sub>DD</sub> falls below V<sub>DD(MIN)</sub>, output reset is held asserted until V<sub>DD</sub> falls below V<sub>POR</sub>.

### 8.4.1 Normal Operation (VDD > V<sub>DD(min)</sub>)

When VDD voltage is greater than V<sub>DD(min)</sub>, the reset signal is determined by the voltage on the VDD pin with respect to the trip point ( $V_{IT-}$ ) and the MR pin voltage (X2SON package only).

### 8.4.2 VDD Between VPOR and V<sub>DD(min)</sub>

When the voltage on VDD is less than the V<sub>DD(min)</sub> voltage and greater than the power-on-reset voltage (V<sub>POR</sub>), the reset signal is asserted.

### 8.4.3 Below Power-On-Reset (VDD < V<sub>POR</sub>)

When the voltage on VDD is lower than V<sub>POR</sub>, the device does not have enough bias voltage to internally pull the asserted output low or high and reset voltage level is undefined.

### 9.1 Application Information

The TLV803E, TLV809E, and TLV810E devices are used for voltage monitoring. These devices have only three pins: VDD, GND, and  $\overline{\text{RESET}}$  (or RESET for TLV810E). There are at the most two external components: a capacitor on the VDD pin and a pull-up resistor on the  $\overline{\text{RESET}}$ /RESET to VDD or another pull-up voltage for the open-drain variants. The design involves choosing the device with the desired voltage threshold and output topology and adding these components, if needed, as explained in the following sections.

### 9.2 Typical Application - Voltage Rail Monitoring

A typical application for TLV803E, TLV809E, and TLV810E devices is voltage rail monitoring. This rail can be the input power supply or the output of an LDO or DC/DC converter.  shows the TLV803EA29 monitoring the supply rail for a DSP, FPGA, or ASIC. This rail is at 3.3 V and generated by an LDO with an input power supply of 5 V. The supervisor is needed to make sure that the supply to the MCU/ASIC/FPGA/DSP is above a certain voltage threshold. If the supply voltage drops below a certain threshold, supervisor generates a reset output to indicate to the MCU that the supply is going down so that the MCU can take actions to save register data before supply enters brown-out conditions.

**図 9-1. The Output of LDO Powering the MCU is Monitored by the TLV803EA29**

#### 9.2.1 Design Requirements

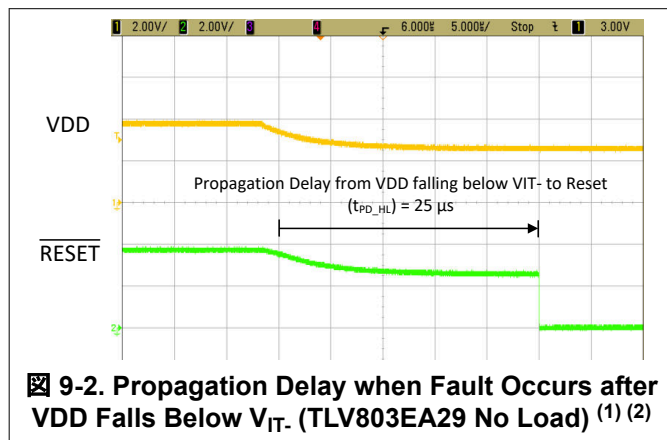

This design monitors a 3.3-V rail and flags an undervoltage fault at the  $\overline{\text{RESET}}$  output when supply rail falls approximately 12% below the nominal rail voltage. The TLV803E device has an open-drain output topology so an external pull-up resistor is required and is calculated to ensure that  $V_{OL}$  does not exceed max limit given the  $I_{\overline{\text{RESET}}/\text{RESET}}$  spec of  $\pm 5$  mA is not violated at the expected supply voltage. [セクション 7.5](#) table provides 500  $\mu\text{A}$   $I_{\text{sink}}$  for 1.7 V VDD, which is the closest voltage to this design example. Using 500  $\mu\text{A}$  of  $I_{\text{sink}}$  and 300 mV max  $V_{OL}$ , gives us 5.36k $\Omega$  for the external pull-up resistor. Any value greater than 5.36k $\Omega$  would ensure that  $V_{OL}$  will not exceed 300 mV max specification. If you are using the TLV809E device variant, no pull-up resistor is required because TLV809E has push-pull output topology.

### 9.2.2 Detailed Design Procedure

Select the TLV803EA29DBZR to satisfy the voltage threshold requirement for 3.3-V rail monitoring. As mentioned in 表 12-1, the TLV803EA29DBZR triggers an undervoltage fault at the  $\overline{\text{RESET}}$  output when VDD falls below  $V_{IT-}$ , which is 2.93 V for this device variant. Place a pull-up resistor on  $\overline{\text{RESET}}$  to VDD to satisfy the output logic requirement while not violating the  $I_{\text{RESET}}$  recommended limit.

### 9.2.3 Application Curves

Figure 9-2 and Figure 9-3 show the TLV803EA29 functionality. In Figure 9-2, the VDD supply voltage drops from 30% above  $V_{IT-} = 3.8$  V to 10% below  $V_{IT-} = 2.6$  V with a 0.1- $\mu\text{F}$  capacitor on VDD. The  $\overline{\text{RESET}}$  output is connected to VDD through the pull-up resistor so when the VDD supply voltage drops. The  $\overline{\text{RESET}}$  output discharges down to the VDD supply voltage through the pull-up resistor and  $\overline{\text{RESET}}$  pin capacitance. Once the high-to-low propagation delay  $t_{\text{PD\_HL}}$  expires, the internal MOSFET turns on and asserts  $\overline{\text{RESET}}$  to logic low. Note that  $t_{\text{PD\_HL}}$  varies with VDD specifically on how much VDD drops and how quickly in addition to the VDD and  $\overline{\text{RESET}}$  pin capacitances. In Figure 9-3, VDD rises from 2 V to 4 V and the  $\overline{\text{RESET}}$  output deasserts to logic high after the reset delay time ( $t_D$ ) expires.

1. Typical  $t_{\text{PD\_HL}} = 30 \mu\text{s}$  for VDD falling from ( $V_{IT+} + 30\%$ ) to ( $V_{IT-} - 10\%$ ).
2. VDD does not fall all the way to 0 V so  $\overline{\text{RESET}}$  momentarily discharges to VDD until  $t_{\text{PD\_HL}}$  expires.

### 9.3 Typical Application - Overvoltage Monitoring

A typical use case for the push-pull active-high device variant TLV810E is overvoltage monitoring. The TLV810E can monitor a power supply, a MCU power rail, or a battery during charging for example. The VDD pin monitors the voltage rail and once VDD rises above  $V_{IT+}$ , the RESET output deactivates to logic low after the reset delay time  $t_D$ . If VDD falls below  $V_{IT-}$ , the RESET output activates to logic high after the propagation delay ( $t_{PD\_HL}$ ). The voltage thresholds and the reset delay time depends on the device variant. See [セクション 5](#) for device variant naming nomenclature.

☒ 9-4. TLV810E Overvoltage Monitor Circuit for Battery Charger

#### 9.3.1 Design Requirements

In this application design, the TLV810E device is monitoring a 3 V battery connected to a battery charger. The battery charger turns on when the battery voltage is below 2.93 V and turns off once the battery charges to 2.96 V and remains above 2.96 V for at least 200 ms. The design must be low power and not consume more than 500 nA typical.

#### 9.3.2 Detailed Design Procedure

Select the TLV810EA29 to accomplish this design. The TLV810EA29 is a push-pull active-high device with a  $V_{IT-} = 2.9$  V and  $V_{IT+} = 2.9 + 1.2\% = 2.93$  V. Because the device is a push-pull output and the device threshold meets the design requirements, no external resistors are needed. The TLV810EA29 device variant comes with 200 ms reset delay time meaning VDD must be above  $V_{IT+}$  for at least 200 ms for the RESET output to transition to logic low to turn off the battery charger. This device meets the low power requirement because the TLV810E only consumes 250 nA typical.

## 10 Power Supply Recommendations

These devices are designed to operate from an input supply range of 1.7 V to 6 V. An input supply capacitor is recommended between the VDD pin and GND pin. If the voltage supply that provides power to VDD is susceptible to any large voltage transient that can exceed VDD maximum, the user must take additional precautions.

## 11 Layout

### 11.1 Layout Guidelines

Make sure that the connection to the VDD pin is low impedance. Good analog design practice recommends placing a minimum 0.1- $\mu$ F ceramic capacitor as close to the VDD pin as possible. A pull-up resistor is required for the open-drain output. Place the pull-up resistor on the  $\overline{\text{RESET}}$  pin as close to the pin as possible.

### 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# DBZ0003A

# PACKAGE OUTLINE

SOT-23 - 1.12 mm max height

SMALL OUTLINE TRANSISTOR

4214838/E 06/2024

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
4. Support pin may differ or may not be present.
5. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25mm per side
