

# TLVM13630 高密度、3V~36V 入力、1V~6V 出力、3A パワー・モジュール、Enhanced HotRod™ QFN パッケージ

## 1 特長

- 多用途な同期整流降圧 DC/DC モジュール
  - MOSFET、インダクタ、コントローラを内蔵
  - 広い入力電圧範囲: 3V~36V
  - 出力電圧を調整可能 1V~6V、温度範囲全体にわたってセットポイント精度 1%
  - 4mm × 6mm × 1.8mm の オーバーモールド・パッケージ
  - 接合部温度範囲: -40°C~125°C
  - 200kHz~2.2MHz の範囲で周波数を調整可能
  - 負電圧出力に対応可能
- 全負荷範囲にわたって極めて高い効率を実現
  - 93% のピーク効率 (12V<sub>IN</sub>、5V<sub>OUT</sub>、1MHz)
  - 外部バイアス・オプションによる効率向上
  - シャットダウン時静止電流: 0.6μA (標準値)
  - 3A 負荷でのドロップアウト電圧: 0.4V (標準値)
- 非常に小さい伝導および放射 EMI シグネチャ
  - デュアル入力バスと内蔵コンデンサを備えた低ノイズ・パッケージにより、スイッチのリングングが減少
  - 固定周波数 FPWM 動作モード
  - CISPR 11 および 32 Class B の放射規格に準拠
- スケーラブルな電源に好適
  - TLVM13620 (36V、2A) とピン互換
- 本質的な保護機能による堅牢な設計
  - 高精度のイネーブル入力とオープン・ドレインの PGOOD インジケータによるシーケンシング、制御、V<sub>IN</sub> UVLO
  - ヒックアップ・モードによる過電流保護
  - ヒステリシス付きのサーマル・シャットダウン保護
- WEBENCH® Power Designer により、TLVM13630 を使用するカスタム設計を作成

## 2 アプリケーション

- 試験および測定、航空宇宙および防衛
- ファクトリ・オートメーション / 制御
- 降圧および反転型の昇降圧電源

代表的な回路図

## 3 概要

TLVM13630 同期整流降圧パワー・モジュールは、パワー MOSFET、シールド付きインダクタ、受動部品を Enhanced HotRod™ QFN パッケージに実装した、高集積 36V、3A DC/DC ソリューションです。このモジュールは、VIN と VOUT のピンをパッケージの角に配置し、入力および出力コンデンサのレイアウト配置を最適化しています。モジュールの下面には大きな 4 つのサーマル・パッドがあるため、単純なレイアウトが可能で、製造時の扱いも容易です。

出力電圧範囲が 1V~6V であるため、TLVM13630 は小さな PCB フットプリントで低 EMI の設計を迅速かつ容易に実装できるようになっています。このトータル・ソリューションを使用すると、外付け部品はわずか 4 個で済み、設計プロセスで磁気および補償のための部品選択も不要です。

TLVM13630 モジュールは、スペースが制約される用途での小型化と簡素化をめざして設計されているだけでなく、堅牢性の高い性能を実現するためのさまざまな機能を備えています。その例としては、可変入力電圧 UVLO 用のヒステリシス付き高精度イネーブル、内蔵 VCC ブートストラップおよび入力コンデンサによる信頼性向上と高密度化、全負荷電流範囲にわたって一定のスイッチング周波数による負荷過渡性能の強化、反転アプリケーションでの負電圧出力能力、シーケンシング、障害保護、出力電圧監視用の PGOOD インジケータがあります。

### 製品情報

部品番号 <sup>(1)</sup>	パッケージ	本体サイズ (公称)
TLVM13630	B0QFN (30)	4.0mm × 6.0mm

- (1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

代表的な効率 (V<sub>OUT</sub> = 5V、f<sub>SW</sub> = 1MHz)

## 5 Pin Configuration and Functions

**5-1. 30-Pin QFN, RDH Package (Top View)**

表 5-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NO.	NAME		
1	RT	I	Frequency setting pin. This analog pin is used to set the switching frequency between 200 kHz and 2.2 MHz by placing an external resistor from this pin to AGND. Do not leave open or connect to ground.
2	EN	I	Precision enable input pin. High = on, low = off. Can be connected to VIN. Precision enable allows the pin to be used as an adjustable UVLO. Place an external voltage divider between this pin, AGND, and VIN to create an external UVLO.
3, 4, 18, 19	VIN	P	Input supply voltage. Connect the input supply to these pins. Connect input capacitors between these pins and PGND in close proximity to the device. Refer to <a href="#">セクション 10.2</a> for input capacitor placement example.
5, 6, 16, 17, 28, 29	PGND	G	Power ground. This is the return current path for the power stage of the device. Connect this pad to the input supply return, the load return, and the capacitors associated with the VIN and VOUT pins. See <a href="#">セクション 10.2</a> for a recommended layout.
7-10, 12-15, 30	VOUT	P	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external output capacitors between these pins and PGND.
11	SW	O	Switch node. Do not place any external component on this pin or connect to any signal. The amount of copper placed on these pins must be kept to a minimum to prevent issues with noise and EMI.
20,21	DNC	–	Do Not Connect. Do not connect these pins to ground, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
22	VLDOIN	P	Optional LDO supply input. Connect to VOUT or to other voltage rail to improve efficiency. Connect an optional high quality 0.1- $\mu$ F to 1- $\mu$ F capacitor from this pin to ground for improved noise immunity. Do not connect to a voltage above 12 V or to a voltage greater than VIN. If unused, connect this pin to ground..
23	VCC	O	Internal LDO output. Used as supply to internal control circuits. Do not connect to any external loads. Connect a high-quality 1- $\mu$ F ceramic capacitor from this pin to PGND.
24, 27	AGND	G	Analog ground. Zero voltage reference for internal references and logic. All electrical parameters are measured with respect to this pin. <b>This pin must be connected to PGND at a single point.</b> See <a href="#">セクション 10.2</a> for a recommended layout.
25	FB	I	Feedback input. For the adjustable output version, connect the mid-point of the feedback resistor divider to this pin. Connect the upper resistor ( $R_{FBT}$ ) of the feedback divider to $V_{OUT}$ at the desired point of regulation. Connect the lower resistor ( $R_{FBB}$ ) of the feedback divider to AGND. When connecting with feedback resistor divider, keep this FB trace short and as small as possible to avoid noise coupling. See <a href="#">セクション 10.2</a> for a feedback resistor placement.
26	PG	O	Power-good monitor. Open-drain output that asserts low if the feedback voltage is not within the specified window thresholds. A 10-k $\Omega$ to 100-k $\Omega$ pullup resistor is required to a suitable pullup voltage. If not used, this pin can be left open or connected to PGND.

(1) P = Power, G = Ground, I = Input, O = Output

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Limits apply over  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  (unless otherwise noted). <sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage	VIN to AGND, PGND	-0.3	40	V
	VLDOIN to AGND, PGND	-0.3	16	V
	EN to AGND, PGND	-0.3	40	V
	RT to AGND, PGND	-0.3	5.5	V
	FB to AGND, PGND	-0.3	16	V
	PG to AGND, PGND	0	20	V
	PGND to AGND	-1	2	V
Output voltage	VCC to AGND, PGND	-0.3	5.5	V
	SW to AGND, PGND <sup>(2)</sup>	-0.3	40	V
	VOUT to AGND, PGND	-0.3	6	V
Input current	PG	-	10	mA
$T_J$	Junction temperature	-40	125	$^{\circ}\text{C}$
$T_A$	Ambient temperature	-40	105	$^{\circ}\text{C}$
$T_{stg}$	Storage temperature	-55	150	$^{\circ}\text{C}$
Peak reflow case temperature			260	$^{\circ}\text{C}$
Maximum number of reflows allowed			3	
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		1500	G
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20 to 2000 Hz		20	G

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) A voltage of 2 V below PGND and 2 V above VIN can appear on this pin for  $\leq 200$  ns with a duty cycle of  $\leq 0.01\%$ .

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	$\pm 2500$	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	$\pm 1500$	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

Limits apply over  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  (unless otherwise noted).

		MIN	NOM	MAX	UNIT
Input voltage	VIN (Input voltage range after start-up)	3		36	V
Input voltage	VLD0IN			12	V
Output voltage	VOUT <sup>(1)</sup>	1		6	V
Output current	IOUT <sup>(2)</sup>	0		3	A
Frequency	F <sub>SW</sub> set by RT	200		2200	kHz
Input current	PG			2	mA
Output voltage	PG	0		16	V
T <sub>J</sub>	Operating junction temperature	-40		125	°C
T <sub>A</sub>	Operating ambient temperature	-40		105	°C

- (1) Under no conditions should the output voltage be allowed to fall below 0 V.
- (2) Maximum continuous DC current may be derated when operating with high switching frequency, high ambient temperature, or both. Refer to the *Typical Characteristics* section for details.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TLVM13630	UNIT
		RDH (QFN)	
		30 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance (TPSM63603 EVM)	29.1	°C/W
R <sub>θJA</sub>	Junction-to-ambient thermal resistance <sup>(2)</sup>	33.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter <sup>(3)</sup>	4.1	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter <sup>(4)</sup>	21.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance, R<sub>θJA</sub>, applies to devices soldered directly to a 64-mm x 83-mm four-layer PCB with 2 oz. copper and natural convection cooling. Additional airflow and PCB copper area reduces R<sub>θJA</sub>. For more information see the Layout section.
- (3) The junction-to-top board characterization parameter, ψ<sub>JT</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JE5D51-2A (section 6 and 7).  $T_J = \psi_{JT} \times P_{dis} + T_T$ ; where P<sub>dis</sub> is the power dissipated in the device and T<sub>T</sub> is the temperature of the top of the device.
- (4) The junction-to-board characterization parameter, ψ<sub>JB</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JE5D51-2A (sections 6 and 7).  $T_J = \psi_{JB} \times P_{dis} + T_B$ ; where P<sub>dis</sub> is the power dissipated in the device and T<sub>B</sub> is the temperature of the board 1mm from the device.

## 6.5 Electrical Characteristics

Limits apply over  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $V_{IN} = 24\text{ V}$ ,  $V_{OUT} = 3.3\text{ V}$ ,  $V_{LDOIN} = 5\text{ V}$ ,  $F_{SW} = 800\text{ kHz}$  (unless otherwise noted). Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm and are provided for reference only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY VOLTAGE</b>						
$V_{IN}$	Input operating voltage range	Needed to start up (over $I_{OUT}$ range)	3.95		36	V
		Once operating (over $I_{OUT}$ range)	3		36	V
$V_{IN\_HYS}$	Hysteresis <sup>(1)</sup>			1.0		V
$I_{Q\_VIN}$	Input operating quiescent current (non-switching)	$T_A = 25^{\circ}\text{C}$ , $V_{EN} = 3.3\text{ V}$ , $V_{FB} = 1.5\text{ V}$		4		$\mu\text{A}$
$I_{SDN\_VIN}$	VIN shutdown quiescent current	$V_{EN} = 0\text{ V}$ , $T_A = 25^{\circ}\text{C}$		3		$\mu\text{A}$
<b>ENABLE</b>						
$V_{EN\_RISE}$	EN voltage rising threshold		1.161	1.263	1.365	V
$V_{EN\_FALL}$	EN voltage falling threshold			0.91		V
$V_{EN\_HYS}$	EN voltage hysteresis		0.275	0.353	0.404	V
$V_{EN\_WAKE}$	EN wake-up threshold		0.4			V
$I_{EN}$	Input current into EN (non-switching)	$V_{EN} = 3.3\text{ V}$ , $V_{FB} = 1.5\text{ V}$		1.65		$\mu\text{A}$
$t_{EN}$	EN HIGH to start of switching delay <sup>(1)</sup>			0.7		ms
<b>INTERNAL LDO VCC</b>						
$V_{CC}$	Internal LDO VCC output voltage	$3.4\text{ V} \leq V_{LDOIN} \leq 12.5\text{ V}$		3.3		V
		$V_{LDOIN} = 3.1\text{ V}$ , non-switching		3.1		V
$V_{CC\_UVLO}$	VCC UVLO rising threshold	$V_{LDOIN} < 3.1\text{ V}$ <sup>(1)</sup>		3.6		V
		$V_{IN} < 3.6\text{ V}$ <sup>(2)</sup>		3.6		V
$V_{CC\_UVLO\_HYS}$	VCC UVLO hysteresis <sup>(2)</sup>	Hysteresis below $V_{CC\_UVLO}$		1.1		V
$I_{VLDOIN}$	Input current into the VLDOIN pin (non-switching, maximum at $T_A = 125^{\circ}\text{C}$ ) <sup>(3)</sup>	$V_{EN} = 3.3\text{ V}$ , $V_{FB} = 1.5\text{ V}$		25	31.2	$\mu\text{A}$
<b>FEEDBACK</b>						
$V_{OUT}$	Adjustable output voltage range	Over the $I_{OUT}$ range	1		6	V
$V_{FB}$	Feedback voltage	$T_A = 25^{\circ}\text{C}$ , $I_{OUT} = 0\text{ A}$		1.0		V
$V_{FB\_ACC}$	Feedback voltage accuracy	Over the $V_{IN}$ range, $V_{OUT} = 1\text{ V}$ , $I_{OUT} = 0\text{ A}$ , $F_{SW} = 200\text{ kHz}$	-1%		+1%	
$V_{FB}$	Load regulation	$T_A = 25^{\circ}\text{C}$ , $0\text{ A} \leq I_{OUT} \leq 3\text{ A}$		0.1%		
$V_{FB}$	Line regulation	$T_A = 25^{\circ}\text{C}$ , $I_{OUT} = 0\text{ A}$ , $4.0\text{ V} \leq V_{IN} \leq 36\text{ V}$		0.1%		
$I_{FB}$	Input current into the FB pin	$V_{FB} = 1.0\text{ V}$		10		nA
<b>CURRENT</b>						
$I_{OUT}$	Output current	$T_A = 25^{\circ}\text{C}$	0		3.0	A
$I_{OCL}$	Output overcurrent (DC) limit threshold			4.9		A
$I_{L\_HS}$	High-side switch current limit	Duty cycle approaches 0%	5.6	6.2	6.8	A
$I_{L\_LS}$	Low-side switch current limit		2.9	3.4	3.8	A
$I_{L\_NEG}$	Negative current limit			-3		A
$V_{HICCUP}$	Ratio of FB voltage to in-regulation FB voltage to enter hiccup	Not during soft start		40%		
$t_W$	Short circuit wait time ("hiccup" time before soft start) <sup>(1)</sup>			80		ms
<b>SOFT START</b>						
$t_{SS}$	Time from first SW pulse to $V_{REF}$ at 90%	$V_{IN} \geq 4.2\text{ V}$	3.5	5	7	ms
$t_{SS2}$	Time from first SW pulse to release of FPWM lockout if output not in regulation <sup>(1)</sup>	$V_{IN} \geq 4.2\text{ V}$	9.5	13	17	ms

## 6.5 Electrical Characteristics (continued)

Limits apply over  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $V_{IN} = 24\text{ V}$ ,  $V_{OUT} = 3.3\text{ V}$ ,  $V_{LDOIN} = 5\text{ V}$ ,  $F_{SW} = 800\text{ kHz}$  (unless otherwise noted). Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm and are provided for reference only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER GOOD</b>						
PG <sub>OV</sub>	PG upper threshold – rising	% of V <sub>OUT</sub> setting	105%	107%	110%	
PG <sub>UV</sub>	PG lower threshold – falling	% of V <sub>OUT</sub> setting	92%	94%	96.5%	
PG <sub>HYS</sub>	PG upper threshold hysteresis (rising and falling)	% of V <sub>OUT</sub> setting		1.3%		
V <sub>IN_PG_VALID</sub>	Input voltage for valid PG output	46- $\mu$ A pullup, V <sub>EN</sub> = 0 V	1.0			V
V <sub>PG_LOW</sub>	Low level PG function output voltage	2-mA pullup to the PG pin, V <sub>EN</sub> = 3.3 V			0.4	V
I <sub>PG</sub>	Input current into PG pin when open-drain output is high	V <sub>PG</sub> = 3.3 V		10		nA
I <sub>OV</sub>	Pulldown current at the SW node under overvoltage condition			0.5		mA
t <sub>PG_FLT_RISE</sub>	Delay time to PG high signal		1.5	2.0	2.5	ms
t <sub>PG_FLT_FALL</sub>	Glitch filter time constant for PG function			120		$\mu$ s
<b>SWITCHING FREQUENCY</b>						
f <sub>SW_RANGE</sub>	Switching frequency range by R <sub>T</sub> or SYNC		200		2200	kHz
f <sub>SW_RT1</sub>	Default switching frequency by R <sub>T</sub>	R <sub>RT</sub> = 66.5 k $\Omega$	180	200	220	kHz
f <sub>SW_RT2</sub>	Default switching frequency by R <sub>T</sub>	V <sub>IN</sub> = 12 V, R <sub>RT</sub> = 5.76 k $\Omega$	1980	2200	2420	kHz
<b>SYNCHRONIZATION</b>						
t <sub>B</sub>	Blanking of EN after rising or falling edges <sup>(1)</sup>		4		28	$\mu$ s
t <sub>SYNC_EDGE</sub>	Enable sync signal hold time after edge for edge recognition <sup>(1)</sup>		100			ns
<b>POWER STAGE</b>						
V <sub>BOOT_UVLO</sub>	Voltage on CBOOT pin compared to SW which will turn off the high-side switch			2.1		V
t <sub>ON_MIN</sub>	Minimum ON pulse width <sup>(1)</sup>	V <sub>OUT</sub> = 1 V, I <sub>OUT</sub> = 1 A		55	70	ns
t <sub>ON_MAX</sub>	Maximum ON pulse width <sup>(1)</sup>			9		$\mu$ s
t <sub>OFF_MIN</sub>	Minimum OFF pulse width	V <sub>IN</sub> = 4 V, I <sub>OUT</sub> = 1 A		65	85	ns
<b>THERMAL SHUTDOWN</b>						
T <sub>SDN</sub>	Thermal shutdown threshold <sup>(1)</sup>	Temperature rising	158	168	180	$^{\circ}\text{C}$
T <sub>HYST</sub>	Thermal shutdown hysteresis <sup>(1)</sup>			10		$^{\circ}\text{C}$

(1) Parameter specified by design, statistical analysis and production testing of correlated parameters. Not production tested.

(2) Production tested with V<sub>IN</sub> = 3 V

(3) This is the current used by the device while not switching, open loop, with FB pulled to +5% of nominal. It does not represent the total input current to the system while regulating. For additional information, reference the *System Characteristics* and the *Input Supply Current* section.

## 6.6 System Characteristics

The following specifications apply only to the typical applications circuit, with nominal component values. Specifications in the typical (TYP) column apply to  $T_J = 25^\circ\text{C}$  only. These specifications are not ensured by production testing.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY</b>						
$I_{IN}$	Input supply current when in regulation	$V_{IN} = 24\text{ V}$ , $V_{OUT} = 3.3\text{ V}$ , $V_{EN} = V_{IN}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 800\text{ kHz}$ , $I_{OUT} = 0\text{ A}$		10		mA
<b>OUTPUT VOLTAGE</b>						
$V_{FB}$	Load regulation	$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 24\text{ V}$ , $I_{OUT} = 0.1\text{ A}$ to full load		1		mV
$V_{FB}$	Line regulation	$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 4\text{ V}$ to $36\text{ V}$ , $I_{OUT} = 3\text{ A}$		6		mV
$V_{OUT}$	Load transient	$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 24\text{ V}$ , $I_{OUT} = 1\text{ A}$ to $2.5\text{ A}$ at $2\text{ A}/\mu\text{s}$ , $C_{OUT(derated)} = 49\text{ }\mu\text{F}$		50		mV
<b>EFFICIENCY</b>						
$\eta$	Efficiency	$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 12\text{ V}$ , $I_{OUT} = 2.5\text{ A}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 800\text{ kHz}$		89.5%		
		$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 24\text{ V}$ , $I_{OUT} = 2.5\text{ A}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 800\text{ kHz}$		87.5%		
		$V_{OUT} = 5\text{ V}$ , $V_{IN} = 24\text{ V}$ , $I_{OUT} = 2.5\text{ A}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 1\text{ MHz}$		91%		
		$V_{OUT} = 5\text{ V}$ , $V_{IN} = 36\text{ V}$ , $I_{OUT} = 2.5\text{ A}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 1\text{ MHz}$		88.1%		
		$V_{OUT} = 12\text{ V}$ , $V_{IN} = 24\text{ V}$ , $I_{OUT} = 1.5\text{ A}$ , $V_{LDOIN} = V_{OUT}$ , $F_{SW} = 2\text{ MHz}$		94.1%		

## 6.7 Typical Characteristics

$V_{IN} = 24\text{ V}$ , unless otherwise specified.

## 6.8 Typical Characteristics: $V_{IN} = 12\text{ V}$

Refer to セクション 8.2 for circuit designs.

Figure 6-7. Efficiency

Figure 6-8. Power Dissipation

Figure 6-9. Output Voltage Ripple

Figure 6-10. Safe Operating Area  
 $V_{OUT} = 1.8\text{ V}$ ,  $F_{SW} = 600\text{ kHz}$

Figure 6-11. Safe Operating Area  
 $V_{OUT} = 3.3\text{ V}$ ,  $F_{SW} = 800\text{ kHz}$

Figure 6-12. Safe Operating Area  
 $V_{OUT} = 5.0\text{ V}$ ,  $F_{SW} = 1\text{ MHz}$

## 7 Detailed Description

### 7.1 Overview

The TLVM13630 is an easy-to-use, synchronous buck, DC-DC power module that operates from a 3-V to 36-V supply voltage. The device is intended for step-down conversions from 5-V, 12-V, and 24-V supply rails. With an integrated power controller, inductor, and MOSFETs, the TLVM13630 delivers up to 3-A DC load current, with high efficiency and ultra-low input quiescent current, in a very small solution size. Although designed for simple implementation, this device offers flexibility to optimize its usage according to the target application. Control-loop compensation is not required, reducing design time and external component count.

With a programmable switching frequency from 200 kHz to 2.2 MHz using its RT pin, the TLVM13630 incorporates specific features to improve EMI performance in noise-sensitive applications:

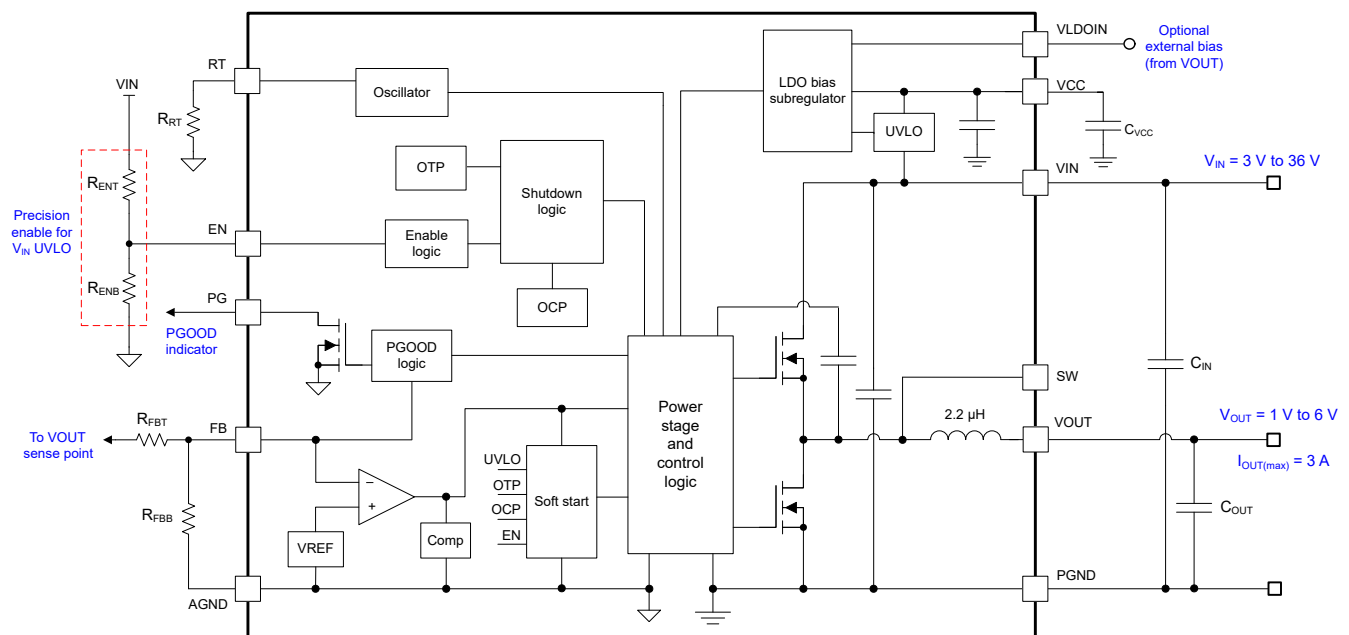

- An optimized package and pinout design enables a shielded switch-node layout that mitigates radiated EMI
- Parallel input and output paths with symmetrical capacitor layouts minimize parasitic inductance, switch-voltage ringing, and radiated field coupling
- Clock synchronization and FPWM mode enable constant switching frequency across the load current range
- Integrated power MOSFETs with enhanced gate drive control enable low-noise PWM switching
- Adjustable switch-node slew rate, which allows optimization of EMI at higher frequency harmonics

The TLVM13630 module also includes inherent protection features for robust system requirements:

- An open-drain PGOOD indicator for power-rail sequencing and fault reporting
- Precision enable input with hysteresis, providing
  - Programmable line undervoltage lockout (UVLO)
  - Remote ON/OFF capability
- Internally fixed output-voltage soft start with monotonic startup into prebiased loads
- Hiccup-mode overcurrent protection with cycle-by-cycle peak and valley current limits
- Thermal shutdown with automatic recovery.

These features enable a flexible and easy-to-use platform for a wide range of applications. The pin arrangement is designed for simple layout, requiring few external components. See [セクション 10](#) for layout example.

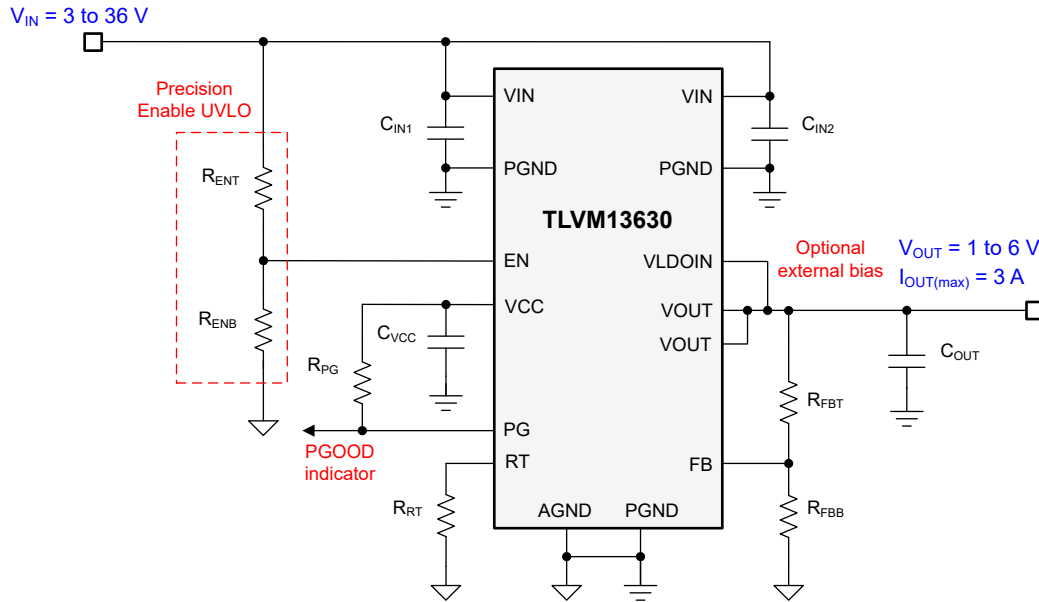

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Input Voltage Range

With a steady-state input voltage range from 3 V to 36 V, the TLVM13630 module is intended for step-down conversions from typical 12-V, 24-V, and 28-V input supply rails. The schematic circuit in [Figure 7-1](#) shows all the necessary components to implement a TLVM13630-based buck regulator using a single input supply.

**Figure 7-1. TLVM13630 Schematic Diagram with Input Voltage Operating Range of 3 V to 36 V**

Take extra care to make sure that the voltage at the VIN pins of the module does not exceed the absolute maximum voltage rating of 40 V during line or load transient events. Voltage ringing at the VIN pins that exceeds the absolute maximum ratings can damage the IC.

### 7.3.2 Adjustable Output Voltage (FB)

The TLVM13630 has an adjustable output voltage range of 1 V to 6 V. Setting the output voltage requires two resistors,  $R_{FBT}$  and  $R_{FBB}$  (see [Figure 7-2](#)). Connect  $R_{FBT}$  between VOUT, at the regulation point, and the FB pin. Connect  $R_{FBB}$  between the FB pin and AGND (pin 10). The recommended value of  $R_{FBB}$  is 10 k $\Omega$ . The value for  $R_{FBT}$  can be calculated using [Equation 1](#). [Table 7-1](#) lists the standard resistor values for several output voltages and the recommended switching frequency. The minimum required output capacitance for each output voltage is also included in [Table 7-1](#). The capacitance values listed represent the effective capacitance, taking into account the effects of DC bias and temperature variation.

$$R_{FBT} [\text{k}\Omega] = R_{FBB} [\text{k}\Omega] \cdot \left( \frac{V_{OUT} [\text{V}]}{1\text{V}} - 1 \right) \quad (1)$$

図 7-2. FB Resistor Divider

表 7-1. Standard  $R_{FBT}$  Values, Recommended  $F_{SW}$  and Minimum  $C_{OUT}$

$V_{OUT}$ (V)	$R_{FBT}$ (k $\Omega$ ) <sup>(1)</sup>	RECOMMENDED $F_{SW}$ (kHz)	$C_{OUT(MIN)}$ ( $\mu$ F) (EFFECTIVE)	$V_{OUT}$ (V)	$R_{FBT}$ (k $\Omega$ ) <sup>(1)</sup>	RECOMMENDED $F_{SW}$ (kHz)	$C_{OUT(MIN)}$ ( $\mu$ F) (EFFECTIVE)
1.0	Short	400	300	2.5	15	750	65
1.2	2	500	200	3.0	20	750	50
1.5	4.99	500	160	3.3	23.2	800	40
1.8	8.06	600	120	5.0	40.2	1000	25
2.0	10	600	100	6.0	49.9	1000	22

(1)  $R_{FBB} = 10$  k $\Omega$ .

Note that higher feedback resistances consume less DC current, which is mandatory if light-load efficiency is critical. However,  $R_{FBT}$  larger than 1 M $\Omega$  is not recommended as the feedback path becomes more susceptible to noise. High feedback resistance generally requires more careful layout of the feedback path. It is important to keep the feedback trace as short as possible while keeping the feedback trace away from the noisy area of the PCB. For more layout recommendations, see [セクション 10](#).

### 7.3.3 Input Capacitors

Input capacitors are necessary to limit the input ripple voltage to the module due to switching-frequency AC currents. TI recommends using ceramic capacitors to provide low impedance and high RMS current rating over a wide temperature range. [式 2](#) gives the input capacitor RMS current. The highest input capacitor RMS current occurs at  $D = 0.5$ , at which point the RMS current rating of the capacitors should be greater than half the output current.

$$I_{CIN,rms} = \sqrt{D \cdot \left( I_{OUT}^2 \cdot (1-D) + \frac{\Delta I_L^2}{12} \right)} \quad (2)$$

where

- $D = V_{OUT} / V_{IN}$  = the module duty cycle

Ideally, the DC and AC components of input current to the buck stage are provided by the input voltage source and the input capacitors, respectively. Neglecting inductor ripple current, the input capacitors source current of amplitude  $(I_{OUT} - I_{IN})$  during the  $D$  interval and sink  $I_{IN}$  during the  $1 - D$  interval. Thus, the input capacitors conduct a square-wave current of peak-to-peak amplitude equal to the output current. The resultant capacitive

component of AC ripple voltage is a triangular waveform. Together with the ESR-related ripple component, 式 3 gives the peak-to-peak ripple voltage amplitude:

$$\Delta V_{IN} = \frac{I_{OUT} \cdot D \cdot (1-D)}{F_{SW} \cdot C_{IN}} + I_{OUT} \cdot R_{ESR} \quad (3)$$

式 4 gives the input capacitance required for a particular load current:

$$C_{IN} \geq \frac{D \cdot (1-D) \cdot I_{OUT}}{F_{SW} \cdot (\Delta V_{IN} - R_{ESR} \cdot I_{OUT})} \quad (4)$$

where

- $\Delta V_{IN}$  is the input voltage ripple specification.

The TLVM13630 requires a minimum of  $2 \times 4.7 \mu\text{F}$  of ceramic type input capacitance. Only use high-quality ceramic type capacitors with sufficient voltage and temperature rating. The ceramic input capacitors provide a low impedance source to the converter in addition to supplying the ripple current and isolating switching noise from other circuits. Additional capacitance can be required for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage. To compensate for the derating of ceramic capacitors, TI recommends a voltage rating of twice the maximum input voltage or placing multiple capacitors in parallel. 表 7-2 includes a preferred list of capacitors by vendor.

**表 7-2. Recommended Input Capacitors**

VENDOR <sup>(1)</sup>	DIELECTRIC	PART NUMBER	CASE SIZE	CAPACITOR CHARACTERISTICS

 (2) Nameplate capacitance values (the effective values are lower based on the applied DC voltage and temperature).

### 7.3.4 Output Capacitors

表 7-1 lists the TLVM13630 minimum amount of required output capacitance. The effects of DC bias and temperature variation must be considered when using ceramic capacitance. For ceramic capacitors, the package size, voltage rating, and dielectric material contribute to differences between the standard rated value and the actual effective value of the capacitance.

When adding additional capacitance above  $C_{OUT(MIN)}$ , the capacitance can be ceramic type, low-ESR polymer type, or a combination of the two. See 表 7-3 for a preferred list of output capacitors by vendor.

**表 7-3. Recommended Output Capacitors**

(2) Nameplate capacitance values (the effective values are lower based on the applied DC voltage and temperature).

### 7.3.5 Switching Frequency (RT)

The switching frequency range of the TLVM13630 is 200 kHz to 2.2 MHz. The switching frequency can easily be set by connecting a resistor ( $R_{RT}$ ) between the RT pin and AGND. Use 式 5 to calculate the  $R_{RT}$  value for a desired frequency or simply select from 表 7-4. Note that a resistor value outside of the recommended range can cause the device to shut down. This prevents unintended operation if RT pin is shorted to ground or left open. Do not apply a pulsed signal to this pin to force synchronization.

The switching frequency must be selected based on the output voltage setting of the device. See 表 7-4 for  $R_{RT}$  resistor values and the allowable output voltage range for a given switching frequency for common input voltages.

$$R_{RT} [\text{k}\Omega] = \frac{13.46}{F_{SW} [\text{MHz}]} - 0.44 \quad (5)$$

表 7-4. Switching Frequency Versus Output Voltage ( $I_{OUT} = A$ )

$F_{SW}$ (kHz)	$R_{RT}$ (k $\Omega$ )	$V_{IN} = 5 V$		$V_{IN} = 12 V$		$V_{IN} = 24 V$		$V_{IN} = 36 V$	
		$V_{OUT}$ RANGE (V)		$V_{OUT}$ RANGE (V)		$V_{OUT}$ RANGE (V)		$V_{OUT}$ RANGE (V)

### 7.3.6 Output ON/OFF Enable (EN) and $V_{IN}$ UVLO

The EN pin provides precision ON and OFF control for the TLVM13630. Once the EN/SYNC pin voltage exceeds the threshold voltage and  $V_{IN}$  is above the minimum turn-on threshold, the device starts operation. The simplest way to enable the TLVM13630 is to connect EN directly to  $V_{IN}$ . This allows the TLVM13630 to start up when  $V_{IN}$  is within its valid operating range. However, many applications benefit from the employment of an enable divider network as shown in [Figure 7-3](#), which establishes a precision input undervoltage lockout (UVLO). This can be used for sequencing, to prevent re-triggering the device when used with long input cables, or to reduce the occurrence of deep discharge of a battery power source. An external logic signal can also be used to drive the enable input to toggle the output on and off and for system sequencing or protection.

**Figure 7-3.  $V_{IN}$  UVLO Using the EN Pin**

$R_{ENB}$  can be calculated using [Equation 6](#).

$$R_{ENB} [k\Omega] = R_{ENT} [k\Omega] \cdot \left( \frac{V_{EN\_RISE} [V]}{V_{IN(on)} [V] - V_{EN\_RISE} [V]} \right) \quad (6)$$

where

- A typical value for  $R_{ENT}$  is 100 k $\Omega$ .
- $V_{EN}$  is 1.263 V (typical).
- $V_{IN(ON)}$  is the desired start-up input voltage.

### 7.3.7 Power Good Monitor (PG)

The TLVM13630 provides a PGOOD signal to indicate when the output voltage is within regulation. Use the PGOOD signal for output monitoring, fault protection, or start-up sequencing of downstream converters. The PGOOD pin voltage goes low when the feedback voltage is outside of the PGOOD thresholds. This occurs during the following:

- While the device is disabled
- In current limit
- In thermal shutdown
- During normal start-up, when the output voltage has not reach its regulation value

A glitch filter prevents false flag operation for short excursions (<120  $\mu$ s typical) of the output voltage, such as during line and load transients.

PGOOD is an open-drain output that requires a pullup resistor to a DC supply not greater than 20 V. The typical range of pullup resistance is 10 k $\Omega$  to 100 k $\Omega$ . When EN is pulled low, the flag output is also forced low. With EN low, power good remains valid as long as the input voltage is above 1 V (typical). Use the PG signal for start-up sequencing of downstream regulators, as shown in [Figure 7-4](#), or for fault protection and output monitoring.

**7-4. TLVM13630 Sequencing Implementation Using PG and EN**

### 7.3.8 Internal LDO, VCC Output, and VLDOIN Input

The TLVM13630 has an internal LDO to power internal circuitry. The VCC pin is the output of the internal LDO. This pin must not be used to power external circuitry. Connect a high-quality, 1- $\mu$ F capacitor from this pin to AGND, close to the device pins. Do not load the VCC pin or short it to ground.

The VLDOIN pin is an optional input to the internal LDO. Connect an optional high quality 0.1- $\mu$ F to 1- $\mu$ F capacitor from this pin to ground for improved noise immunity.

The LDO generates the VCC voltage from one of the two inputs:  $V_{IN}$  or the VLDOIN input. When VLDOIN is tied to ground or below 3.1 V, the LDO is powered from  $V_{IN}$ . When VLDOIN is tied to a voltage higher than 3.1 V, the LDO input is powered from VLDOIN. VLDOIN voltage must be lower than both  $V_{IN}$  and 12.5 V.

The VLDOIN input is designed to reduce the LDO power loss. The LDO power loss is:

$$P_{\text{LDO-LOSS}} = I_{\text{LDO}} \times (V_{\text{IN\_LDO}} - V_{\text{VCC}}) \quad (7)$$

The higher the difference between the input and output voltages of the LDO, the more loss occurs to supply the same LDO output current. The VLDOIN input provides an option to supply the LDO with a lower voltage than  $V_{IN}$ , to reduce the difference of the input and output voltages of the LDO and reduce power loss. For example, if the LDO current is 10 mA at a certain frequency with  $V_{IN} = 24$  V and  $V_{OUT} = 5$  V. The LDO loss with VLDOIN tied to ground is equal to  $10 \text{ mA} \times (24 \text{ V} - 3.3 \text{ V}) = 207 \text{ mW}$ , while the loss with VLDOIN tied to  $V_{OUT}$  (5 V) is equal to  $10 \text{ mA} \times (5 \text{ V} - 3.3 \text{ V}) = 17 \text{ mW}$ .

The efficiency improvement is more significant at light and mid loads because the LDO loss is a higher percentage of the total loss. The improvement is more significant with higher switching frequency because the LDO current is higher at higher switching frequency. The improvement is more significant when  $V_{IN} \gg V_{OUT}$  because the voltage difference is higher.

**7-5** shows typical efficiency waveforms with VLDOIN powered by different input voltages.

$V_{IN} = 24\text{ V}$

$V_{OUT} = 5\text{ V}$

$F_{SW} = 1\text{ MHz}$

$I_{LDO} = 10\text{ mA}$

☒ 7-5. Efficiency improvements with VLDOIN ( $V_{OUT} = 5\text{ V}$ )

### 7.3.9 Overcurrent Protection (OCP)

The TLVM13630 is protected from overcurrent conditions using cycle-by-cycle current limiting of the peak inductor current. The current is compared every switching cycle to the current limit threshold. During an overcurrent condition, the output voltage decreases.

The TLVM13630 employs hiccup overcurrent protection if there is an extreme overload. In hiccup mode, the regulator is shut down and kept off for 80 ms (typical) before the TLVM13630 tries to start again. If an overcurrent or short-circuit fault condition still exists, hiccup repeats until the fault condition is removed. Hiccup mode reduces power dissipation under severe overcurrent conditions, and prevents overheating and potential damage to the device. Once the fault is removed, the module automatically recovers and returns to normal operation.

### 7.3.10 Thermal Shutdown

Thermal shutdown is an integrated self-protection used to limit junction temperature and prevent damage related to overheating. Thermal shutdown turns off the device when the junction temperature exceeds 168°C (typical) to prevent further power dissipation and temperature rise. Junction temperature decreases after shutdown, and the TLVM13630 attempts to restart when the junction temperature falls to 158°C (typical).

## 7.4 Device Functional Modes

### 7.4.1 Shutdown Mode

The EN/SYNC pin provides ON and OFF control for the TLVM13630. When  $V_{EN}$  is below approximately 0.4 V, the device is in shutdown mode. Both the internal LDO and the switching regulator are off. The input quiescent current in shutdown mode drops to 0.6  $\mu$ A (typical). The TLVM13630 also employs internal undervoltage protection. If the input voltage is below its UV threshold, the regulator remains off.

### 7.4.2 Standby Mode

The internal LDO has a lower enable threshold than the regulator itself. When  $V_{EN}$  is above 1.1 V (maximum) and below the precision enable threshold of 1.263 V (typical), the internal LDO is on and regulating. The precision enable circuitry is turned on once the internal  $V_{CC}$  is above its UVLO threshold. The switching action and voltage regulation are not enabled until  $V_{EN/SYNC}$  rises above the precision enable threshold.

### 7.4.3 Active Mode

The TLVM13630 is in active mode when  $V_{IN}$  and  $V_{EN}$  are above their relevant thresholds and no fault conditions are present. The simplest way to enable the operation is to connect the EN pin to  $V_{IN}$ , which allows self start-up when the applied input voltage exceeds the minimum start-up voltage.

## 8 Applications and Implementation

### Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 8.1 Application Information

The TLVM13630 only requires a few external components to convert from a wide range of supply voltages to a fixed output voltage. The following section describes the design procedure to configure the TLVM13630 power module. To expedite and streamline the design process, WEBENCH® online software is available to generate complete designs, leveraging iterative design procedures and access to comprehensive component databases.

As mentioned previously, the TLVM13630 also integrates several optional features to meet system design requirements, including the following:

- Precision enable with hysteresis
- External adjustable UVLO
- Adjustable SW node slew rate
- Power-good indicator

The following application circuit detailed shows the TLVM13630 configuration options suitable for several application use cases.

### 8.2 Typical Applications

The following are sample typical applications along with design procedure for the implementation of TLVM13630.

#### 8.2.1 Design 1: 3-A Synchronous Buck Regulator for Industrial Applications

Figure 8-1 shows the schematic diagram of a 5-V, 3-A buck regulator with a switching frequency of 1 MHz. The nominal input voltage for the sample design is 24 V. A resistor  $R_{RT}$  of 13 k $\Omega$  sets the free-running switching frequency at 1 MHz. An optional SYNC input signal allows adjustment of the switching frequency for this specific application.

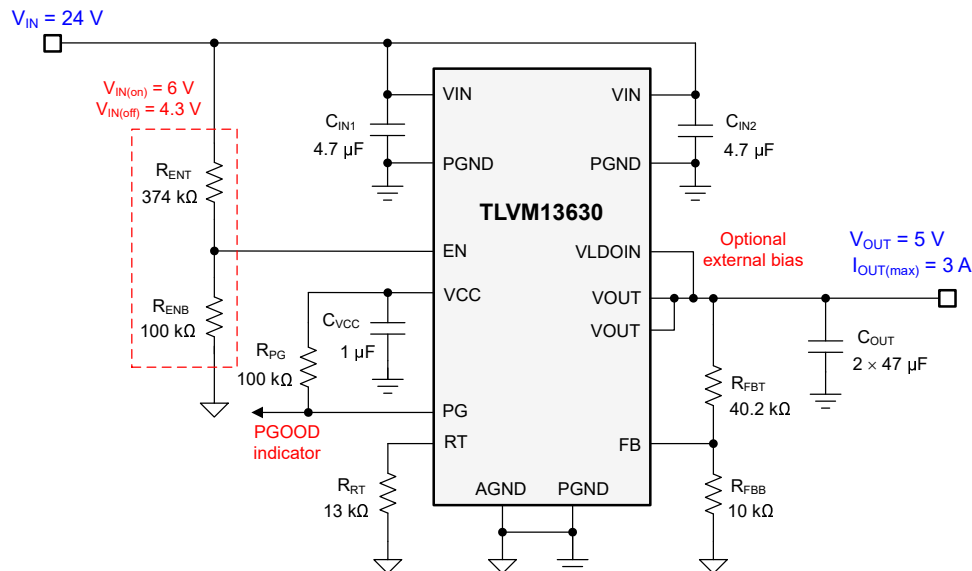

Figure 8-1. Circuit Schematic

### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 8-1 as the input parameters and follow the design procedures in セクション 8.2.1.2.

表 8-1. Design Example Parameters

DESIGN PARAMETER	VALUE
Input voltage	24 V
Output voltage	5 V
Output current	0 A to 3 A
Switching Frequency	1 MHz

表 8-2 gives the selected buck module power-stage components with availability from multiple vendors. This design uses an all-ceramic output capacitor implementation.

表 8-2. List of Materials for Application Circuit 1

REFERENCE DESIGNATOR	QTY	SPECIFICATION	MANUFACTURER <sup>(1)</sup>	PART NUMBER
C <sub>IN1</sub> , C <sub>IN2</sub>	2	4.7 μF, 50 V, X7R, 1210, ceramic	Taiyo Yuden	UMK325B7475KN-TR
		4.7 μF, 100 V, X7S, 1206, ceramic	TDK	CGA6P3X7R1H475K250AB
			Murata	GRM31CC72A475KE11L
C <sub>OUT1</sub> , C <sub>OUT2</sub>	2	47 μF, 10 V, X7R, 1210, ceramic	Murata	GRM32ER71A476ME15L
			AVX	1210ZC476MAT2A
C <sub>VCC</sub>	1	1 μF, 16 V, X7R, 0603, ceramic	Murata	GCM188R71C105KA64J
		1 μF, 16 V, X5R, 0402, ceramic	Taiyo Yuden	EMK105BJ105KVHF
U <sub>1</sub>	1	TLVM13630 36-V, 3-A synchronous buck module	Texas Instruments	TLVM13630RDLR

(1) See the [Third-Party Products Disclaimer](#).

More generally, the TLVM13630 module is designed to operate with a wide range of external components and system parameters. However, the integrated loop compensation is optimized for a certain range of output capacitance.

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPSM63603 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance.
- Export customized schematic and layout into popular CAD formats.
- Print PDF reports for the design, and share the design with colleagues.

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

#### 8.2.1.2.2 Output Voltage Setpoint

The output voltage of the TLVM13630 device is externally adjustable using a resistor divider. The recommended value of  $R_{FBB}$  is 10 kΩ. The value for  $R_{FBB}$  can be selected from 表 7-1 or calculated using 式 8:

$$R_{\text{FBT}} [\text{k}\Omega] = R_{\text{FBB}} [\text{k}\Omega] \cdot \left( \frac{V_{\text{OUT}} [\text{V}]}{1\text{V}} - 1 \right) \quad (8)$$

For the desired output voltage of 5 V, the formula yields a value of 40.2 kΩ. Choose the closest available standard value of 40.2 kΩ for R<sub>FBT</sub>.

#### 8.2.1.2.3 Switching Frequency Selection

The recommended switching frequency for standard output voltages can be found in [表 7-1](#). For a 5-V output, the recommended switching frequency is 1 MHz. To set the switching frequency to 1 MHz, connect a 13.0-kΩ resistor between the RT pin and AGND.

#### 8.2.1.2.4 Input Capacitor Selection

The TLVM13630 requires a minimum input capacitance of 2 × 4.7-μF ceramic type. High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. The voltage rating of input capacitors must be greater than the maximum input voltage.

For this design, select two 4.7-μF, 50-V, 1210 case size, ceramic capacitors.

#### 8.2.1.2.5 Output Capacitor Selection

For a 5-V output, the TLVM13630 requires a minimum of 25 μF of effective output capacitance for proper operation (see [表 7-1](#)). High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. Additional output capacitance can be added to reduce ripple voltage or for applications with transient load requirements.

For this design example, select two 47-μF, 10-V, 1210 case size, ceramic capacitors, which have a total effective capacitance of approximately 48 μF at 5 V.

#### 8.2.1.2.6 Other Connections

- Connect VLDOIN to VOUT to improve efficiency.
- Place a 1-μF capacitor between the VCC pin and PGND, located near to the device.

### 8.2.1.3 Application Curves

Unless otherwise indicated,  $V_{IN} = 24\text{ V}$ ,  $V_{OUT} = 5\text{ V}$ ,  $I_{OUT} = 3\text{ A}$ , and  $F_{SW} = 1\text{ MHz}$ .

$V_{IN} = 24\text{ V}$   $V_{OUT} = 5\text{ V}$

### 8.2.2 Design 2: Inverting Buck-Boost Regulator with a -5-V Output

Figure 8-12 shows the schematic diagram of a -5-V inverting buck-boost regulator with a switching frequency of 1 MHz. The input voltage range for the sample design is 12 V to 24 V.

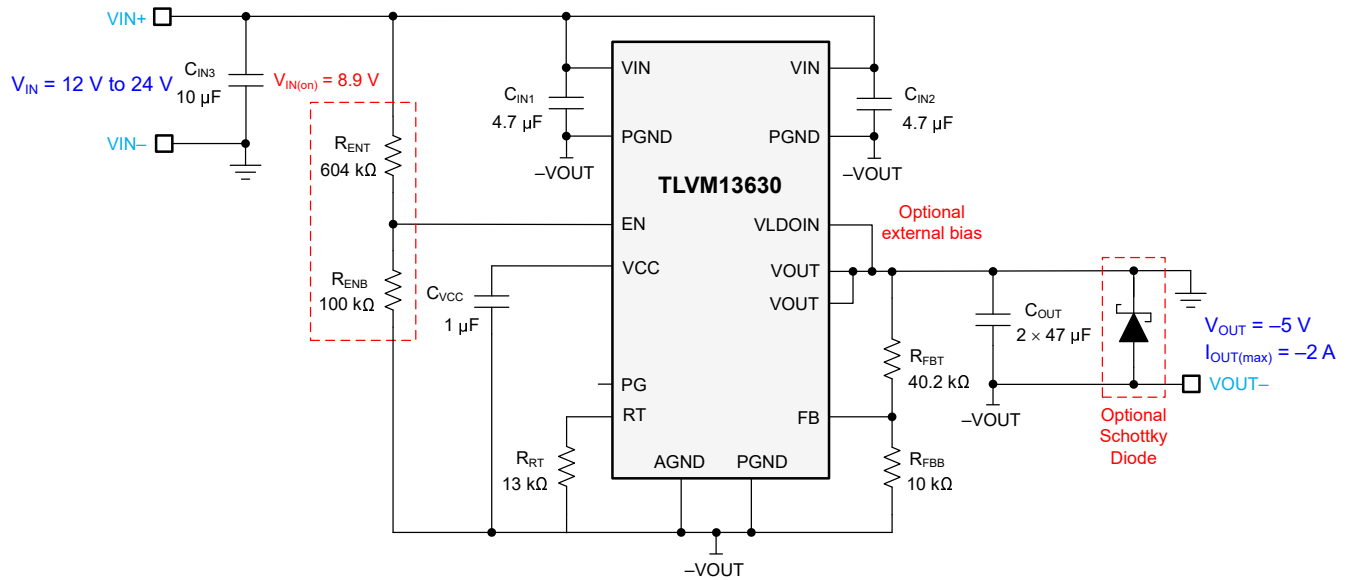

Figure 8-12. Circuit Schematic

#### 8.2.2.1 Design Requirements

For this design example, use the parameters listed in Table 8-3 as the input parameters and follow the design procedures in Section 8.2.2.2.

Table 8-3. Design Example Parameters

DESIGN PARAMETER	VALUE
Input voltage	12 to 24 V
Output voltage	-5 V
Output current	0 A to 2 A
Switching frequency	1 MHz

Table 8-4 gives the selected module power-stage components with availability from multiple vendors. This design uses an all-ceramic output capacitor implementation.

Table 8-4. List of Materials for Application Circuit 2

REFERENCE DESIGNATOR	QTY	SPECIFICATION	MANUFACTURER <sup>(1)</sup>	PART NUMBER
C <sub>IN1</sub> , C <sub>IN2</sub> , C <sub>IN3</sub>	3	4.7 µF, 50 V, X7R, 1210, ceramic	Taiyo Yuden	UMK325B7475KN-TR
			TDK	CGA6P3X7R1H475K250AB
		4.7 µF, 50 V, X7S, 1206, ceramic	Murata	GCM31CC71H475KA03K
C <sub>OUT1</sub> , C <sub>OUT2</sub>	2	47 µF, 10 V, X7R, 1210, ceramic	Murata	GRM32ER71A476ME15L
			AVX	1210ZC476MAT2A
C <sub>VCC</sub>	1	1 µF, 16 V, X7R, 0603, ceramic	Murata	GCM188R71C105KA64J
U <sub>1</sub>	1	TLVM13630 36-V, 3-A synchronous buck module	Texas Instruments	TLVM13630RDLR

More generally, the TLVM13630 module is designed to operate with a wide range of external components and system parameters. However, the integrated loop compensation is optimized for a certain range of output capacitance.

## 8.2.2.2 Detailed Design Procedure

### 8.2.2.2.1 Output Voltage Setpoint

The output voltage of the TLVM13630 device is externally adjustable using a resistor divider. The recommended value of  $R_{FBB}$  is 10 k $\Omega$ . Calculate the value for  $R_{FBT}$  using 式 9:

$$R_{FBT} [k\Omega] = R_{FBB} [k\Omega] \cdot \left( \frac{V_{OUT} [V]}{1V} - 1 \right) \quad (9)$$

For the desired output voltage of –5 V, enter the absolute value of 5 V for the  $V_{OUT}$  in 式 9. The formula yields a value of 40.2 k $\Omega$ . Choose the closest available standard value of 40.2 k $\Omega$  for  $R_{FBT}$ .

### 8.2.2.2.2 IBB Maximum Output Current

The achievable output current with an *IBB topology* using the TLVM13630 is  $I_{OUT(max)} = I_{LDC(max)} \times (1 - D)$ , where  $I_{LDC(max)} = 3$  A is the rated current of the module and  $D = |V_{OUT}| / (V_{IN} + |V_{OUT}|)$  is the module duty cycle. Therefore in the case of  $V_{IN} = 12$  V and the  $V_{OUT} = -5$  V, the maximum output current is 2.1 A.

### 8.2.2.2.3 Switching Frequency Selection

To set the switching frequency to 1 MHz, connect a 13.0-k $\Omega$  resistor between the RT pin and AGND pins of the module based on 式 5.

### 8.2.2.2.4 Input Capacitor Selection

The TLVM13630 requires a minimum input capacitance of  $2 \times 4.7$ - $\mu$ F ceramic type between the VIN pins and PGND pins as close as possible to the module. High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. In the inverting buck-boost configuration the maximum voltage between VIN and PGND pin of the module is equal to  $V_{IN} + |V_{OUT}|$ .

For this design, two 4.7- $\mu$ F, 50-V, 1210 case size, ceramic capacitors are selected.

### 8.2.2.2.5 Output Capacitor Selection

The TLVM13630 requires a minimum of 25  $\mu$ F of effective output capacitance for proper operation. High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. Additional output capacitance can be added to reduce ripple voltage or for applications with transient load requirements.

For this design example, a two 47- $\mu$ F, 10-V, 1210 case size, ceramic capacitors are used which have a total effective capacitance of approximately 48  $\mu$ F at 5 V.

### 8.2.2.2.6 Other Connections

Place a 1- $\mu$ F capacitor between the VCC pin and PGND, located near to the device.

The right-half-plane zero of an IBB topology is at its lowest frequency at minimum input voltage. However, it does not appear at low frequency for a –5 V output and thus has minimal effect on the loop response for this application.

In the inverting buck-boost configuration, the input capacitor  $C_{IN}$  and output capacitor  $C_{OUT}$  can formed an AC capacitive divider during a fast  $V_{IN}$  transient or hot-plugged event at the input. This event will resulted in a positive voltage spike at the output that may disturb the load. In this case, an optional Schottky diode may be installed between –VOUT and GND as shown in 图 8-12 to clamp the output spike.

### 8.2.2.3 Application Curves

Unless otherwise indicated,  $V_{IN} = 12\text{ V}$ ,  $V_{OUT} = -5\text{ V}$ , and  $F_{SW} = 1\text{ MHz}$ .

**8-13. Efficiency Curves**

**8-14. Load Regulation**

$V_{IN} = 12\text{ V}$        $V_{OUT} = -5\text{ V}$        $F_{SW} = 1\text{ MHz}$   
 $C_{OUT} = 2 \times 47\text{ }\mu\text{F}$

**8-15. Load Transient -0.5 A to -1.5 A, 1 A/μs**

$V_{IN} = 12\text{ V}$        $V_{OUT} = -5\text{ V}$        $F_{SW} = 1\text{ MHz}$   
 $C_{OUT} = 2 \times 47\text{ }\mu\text{F}$

**8-16. Load Transient 0 A to -2 A, 1 A/μs**

### 8.2.2.3.1 EMI

The TLVM13630 is compliant with EN55011 radiated emissions. [☒ 8-17](#), [☒ 8-18](#), and [☒ 8-19](#) show typical examples of radiated emission plots for the TPSM63603 which is in the same family of parts. The graphs include the plots of the antenna in the horizontal and vertical positions.

#### 8.2.2.3.1.1 EMI Plots

EMI plots were measured using the standard TPSM63603EVM.

**☒ 8-17. Radiated Emissions 24-V Input, 5-V Output, 3-A Load**

**☒ 8-18. Radiated Emissions 24-V Input, 5-V Output, 3-A Load, Spread Spectrum**

**8-19. Radiated Emissions 24-V Input, 3.3-V Output, 3-A Load**

## 9 Power Supply Recommendations

The TLVM13630 buck module is designed to operate over a wide input voltage range of 3 V to 36 V. The characteristics of the input supply must be compatible with the [Absolute Maximum Ratings](#) and [Recommended Operating Conditions](#) in this data sheet. In addition, the input supply must be capable of delivering the required input current to the loaded regulator circuit. Estimate the average input current with 式 10.

$$I_{IN} = \frac{V_{OUT} \cdot I_{OUT}}{V_{IN} \cdot \eta} \quad (10)$$

where

- $\eta$  = efficiency

If the module is connected to an input supply through long wires or PCB traces with a large impedance, take special care to achieve stable performance. The parasitic inductance and resistance of the input cables can have an adverse affect on module operation. More specifically, the parasitic inductance in combination with the low-ESR ceramic input capacitors form an underdamped resonant circuit, possibly resulting in instability, voltage transients, or both, each time the input supply is cycled ON and OFF. The parasitic resistance causes the input voltage to dip during a load transient. If the module is operating close to the minimum input voltage, this dip can cause false UVLO triggering and a system reset.

The best way to solve such issues is to reduce the distance from the input supply to the module and use an electrolytic input capacitor in parallel with the ceramics. The moderate ESR of the electrolytic capacitor helps damp the input resonant circuit and reduce any overshoot or undershoot at the input. A capacitance in the range of 47  $\mu$ F to 100  $\mu$ F is usually sufficient to provide input parallel damping and helps hold the input voltage steady during large load transients. A typical ESR of 0.1  $\Omega$  to 0.4  $\Omega$  provides enough damping for most input circuit configurations.

## 10 Layout

The performance of any switching power supply depends as much upon the layout of the PCB as the component selection. Use the following guidelines to design a PCB with the best power conversion performance, optimal thermal performance, and minimal generation of unwanted EMI.

### 10.1 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required.  10-1 and  10-2 show a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high-frequency noise.
- Locate additional output capacitors between the ceramic capacitors and the load.
- Connect AGND to PGND at a single point.
- Place  $R_{FBT}$  and  $R_{FBB}$  as close as possible to the FB pin.
- Use multiple vias to connect the power planes to internal layers.

### 10.2 Layout Example

 10-1. Typical Top-Layer Layout

 10-2. Typical Top-Layer

#### 10.2.1 Package Specifications

表 10-1. Package Specifications Table

TPSM63603		VALUE	UNIT
Weight		123	mg

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 11.1.2 Development Support

With an input operating voltage from 3 V to 36 V and rated output current from 2 A to 6 A, the TLVM13620/30/40/60 family of synchronous buck power modules specified in 表 11-1 provides flexibility, scalability and optimized solution size for a range of applications. These modules enable DC/DC solutions with high density, low EMI and increased flexibility. Available EMI mitigation features include RBOOT-configured switch-node slew rate control, fixed switching frequency, and integrated input bypass capacitors. All modules are rated for an ambient temperature up to 105°C.

#### 11.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPSM63603 device with WEBENCH® Power Designer.

1. Start by entering the input voltage (V<sub>IN</sub>), output voltage (V<sub>OUT</sub>), and output current (I<sub>OUT</sub>) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.

- Run thermal simulations to understand board thermal performance.
- Export customized schematic and layout into popular CAD formats.
- Print PDF reports for the design, and share the design with colleagues.

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLVM13630RDHR	ACTIVE	B0QFN	RDH	30	3000	RoHS Exempt & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	13630	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
