TEXAS INSTRUMENTS
TMP390
JAJSHF6A – MAY 2019 – REVISED AUGUST 2020

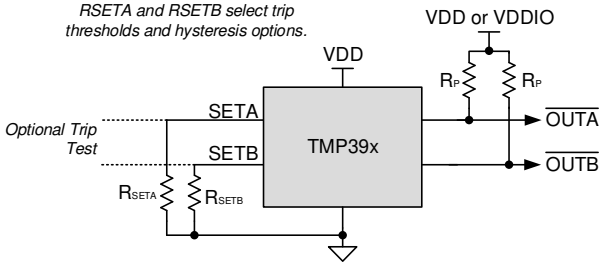
TMP390 超小型、2 チャネル (ホットおよびコールド・トリップ)、0.5µA、抵抗によりプログラム可能な温度スイッチ

1 特長

- 温度トリップ・ポイントとヒステリシス選択を抵抗によりプログラム可能
  - 抵抗の公差がゼロ誤差に寄与
  - ヒステリシスの選択肢：5℃、10℃、20℃
- 過熱検出用と低温検出用の独立した出力
  - チャネル A (過熱)：+30～+124℃、2℃刻み
  - チャネル B (低温)：–50～+25℃、5℃刻み
- 精度レベルの選択肢 (最大値、−55℃～+130℃)
  - A2 レベル：±3.0℃ (0℃～+70℃では ±1.5℃)
  - A3 レベル：±3.5℃ (0℃～+70℃では ±2.0℃)
- 超低消費電力：25℃で 0.5µA (標準値)
- 電源電圧：1.62～5.5V
- オープン・ドレイン出力
- トリップ・テスト機能によりインシステム・テストが可能
- SOT-563 (1.60mm × 1.20mm)、6 ピンのパッケージで供給

2 アプリケーション

- DC/AC インバータ
- DC/DC コンバータ
- 温度トランスミッタ
- 環境制御システム (ECS)
- 電動工具
- 外付けバッテリ
- ワイヤレス・インフラ
  - WLAN/Wi-Fi アクセス・ポイント
  - コア・ルータ
  - エッジ・ルータ
  - マクロ・リモート無線ユニット (RRU)



概略回路図

3 概要

TMP390 デバイスは、–50℃～130℃のシステム・サーマル・イベントを保護および検出できる、抵抗でプログラム可能な 2 チャネル超低消費電力温度スイッチ・ファミリの製品です。TMP390 は過熱 (ホット) と低温 (コールド) を個別に検出できます。トリップ温度 (T_{TRIP}) と熱ヒステリシス (T_{HYST}) は、SETA ピンと SETB ピンに 2 個の E96 系列抵抗 (公差 1%) を接続することで設定できます。チャネル A の抵抗の範囲は 1.05kΩ～909kΩ で、48 の固有の値の 1 つを表します。チャネル B の抵抗の範囲は 10.5kΩ～909kΩ です。

SETA 入力をグランドに接続する抵抗の値でチャネル A の T_{TRIP} スレッショルドを設定し、SETB 入力をグランドに接続する抵抗の値でチャネル B の T_{TRIP} スレッショルドを設定します。また、両方のチャネルの T_{HYST} に 5℃または 10℃を選択することで、デジタル出力の不要なスイッチングを防止できます。SETB 入力がグランドに接続されると、チャネル A は 20℃のヒステリシスで動作します。抵抗の精度は、T_{TRIP} の精度に影響しません。

顧客がボード・レベルの製造を行えるように、TMP390 は、SETA ピンまたは SETB ピンを使用してデジタル出力を駆動するトリップ・テスト機能をサポートしています。

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision * (May 2019) to Revision A (August 2020)	Page
• 文書全体にわたって表、図、相互参照の採番方法を更新	1
• タイトルに「ホットおよびコールド・トリップ」を追加	1
• Updated T_J to 150°C from 155°C	4
• Updated T_{stg} to 150°C from 155°C	4
• Removed T_A section on unspecified performance	4
• Updated $R_{\Theta JA}$ from 210.3 °C/W to 230 °C/W	4
• Updated $R_{\Theta JC(top)}$ from 105 °C/W to 103.4 °C/W	4
• Updated $R_{\Theta JB}$ from 87.5 °C/W to 111.6 °C/W	4
• Updated ψ_{JT} from 6.1 °C/W to 5.3 °C/W	4
• Updated ψ_{JB} from 87 °C/W to 110.5 °C/W	4
• Added Thermal Mass paramater	4
• Added 20°C hysteresis option for single channel operation	5
• Updated to separate SETA and SETB resistor ranges	5
• Added test condition for average quiescent current	5
• Changed standby current from 0.2µA to 0.25µA	5
• Changed power-on reset threshold voltage from 1.55V to 1.5V	5

5 Pin Configuration and Functions

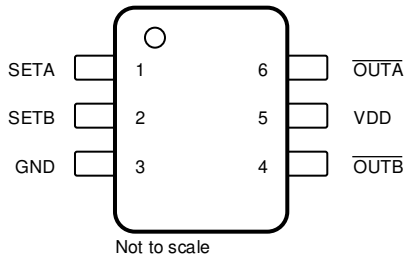

図 5-1. DRL Package 6-Pin SOT-563 Top View

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SETA	Input	Channel A temperature set point. Connect a standard E96, 1% resistance between SETA and GND.
2	SETB	Input	Channel B temperature and Hysteresis set point. Connect a standard E96, 1% resistance between SETB and GND.
3	GND	Ground	Device ground.
4	$\overline{\text{OUTB}}$	Logic Output	Channel B logic open-drain active low output. If unused, the output can be left floating or connected to GND.
5	VDD	Supply	Power supply voltage (1.62 V – 5.5 V).
6	$\overline{\text{OUTA}}$	Logic Output	Channel A logic open-drain active low output. If unused, the output can be left floating or connected to GND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1) (2)

		MIN	MAX	UNIT
Supply voltage	VDD	–0.3	6	V
Voltage at	$\overline{OUTA}$, $\overline{OUTB}$	-0.3	6	V
Voltage at	SETA, SETB	–0.3	VDD + 0.3	V
Junction temperature, T_J		–55	150	°C
Storage temperature, T_{stg}		–60	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Powering the device when the operating junction temperature is outside the *Recommended Operating Conditions*, may affect the functional operation of the device. The device must be power cycled after the system has returned to conditions as indicated under *Recommended Operating Conditions*.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
VDD	Supply voltage	1.62	3.3	5.5	V
V_{OUTA}	Channel A output pull-up voltage (open-drain)			VDD + 0.3	V
V_{OUTB}	Channel B output pull-up voltage (open-drain)			VDD + 0.3	V
I_{SETA}	SETA pin circuit leakage current	-20		20	nA
I_{SETB}	SETB pin circuit leakage current	-20		20	nA
R_{PA}	Pullup resistor connected from $\overline{OUTA}$ to VDDIO(1)	1	10		kΩ
R_{PB}	Pullup resistor connected from $\overline{OUTB}$ to VDDIO(1)				
T_A	Operating free-air temperature (specified performance)	–55		130	°C

(1) Where VDDIO is an independent power supply other than VDD, and shall not exceed (VDD + 0.3) V.

6.4 Thermal Information

THERMAL METRIC(1)		TMP390 DRL (SOT) 6 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	230	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	103.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	111.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	5.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	110.5	°C/W
M_T	Thermal Mass	1.83	mJ/°C

(1) For more information about traditional and new thermal metrics, see the *Semiconductor IC Package Thermal Metrics* application report, (SPRA953).

6.5 Electrical Characteristics

Minimum and maximum specifications are over -55°C to 130°C and VDD = 1.62V - 5.5V (unless otherwise noted); typical specifications are at T_A = 25°C and VDD = 3.3 V.

7 Detailed Description

7.1 Overview

The TMP390 ultra-low power, dual channel, resistor programmable temperature switches enable detection and protection of system thermal events over a wide temperature range. The TMP390 offers independent overtemperature (hot) and undertemperature (cold) detection. The trip temperatures and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The TMP390 can enable a customer board-level manufacturing test through the trip test function that can force the SETA or SETB pins to logic high to activates the digital outputs.

7.2 Functional Block Diagram

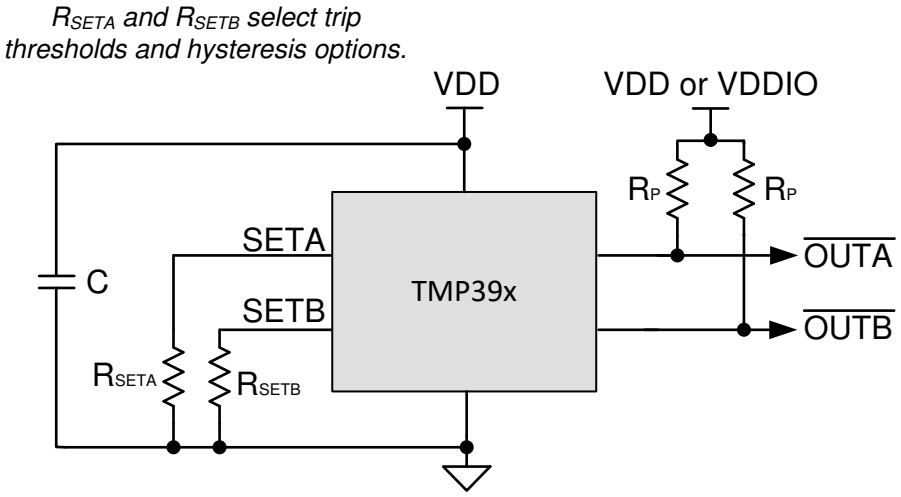

図 7-1. Simplified Schematic

7.3 Feature Description

The TMP390 requires two resistors to set the two trip points and hysteresis, according to 表 7-1 and 表 7-2, for the hot and cold channel device. The output of the TMP390 is open-drain and requires two pullup resistors. TI recommends to use a pullup voltage supply that does not exceed VDD + 0.3 V. The pullup resistors used in between the $\overline{OUTA}$ and $\overline{OUTB}$ pins and the pullup supply should be greater than 1 kΩ. The device powers on when the supply voltage goes beyond 1.5 V, and starts sampling the input resistors to set the two trip points and hysteresis value after power-on. These values will remain the same until the device goes through a power cycle. After the device sets the trip points and hysteresis level, the device will update the output every half a second. The conversion time is typically 0.65 ms when the temperature is checked against the trip points and the outputs are updated. The device remains in standby mode between conversions. If either channel is not used, the output can be grounded or left floating.

7.3.1 TMP390 Programming Tables

The temperature threshold and hysteresis options for the TMP390 device are programmed using two external 1% E96 standard resistors. The specific resistor value to ground on the SETA input sets the temperature threshold of channel A. The specific resistor value to ground on the SETB input sets the temperature threshold of channel B, as well as the hysteresis for both channel A and channel B.

7.3.2 Trip Test

The purpose of the trip test is in system manufacturing test without putting the TMP390 through costly temperature verification of the assembly of TMP390 and pullup resistors. When the SETA or SETB pin is set to a high logic level, the associated output goes low. When the input pin level goes low, the output goes to its previous condition before the trip test. The trip test does not affect the current condition of the device. The trip test signals should stay above 0.8 × VDD for logic high and below 0.2 × VDD for logic low.

The trip test operation is shown in 図 7-2. The trip test must be performed with a single toggle when the device is operating at a temperature that will not cause the corresponding output to trip. The trip test is intended for production testing after assembly, and must not be used as a functional feature.

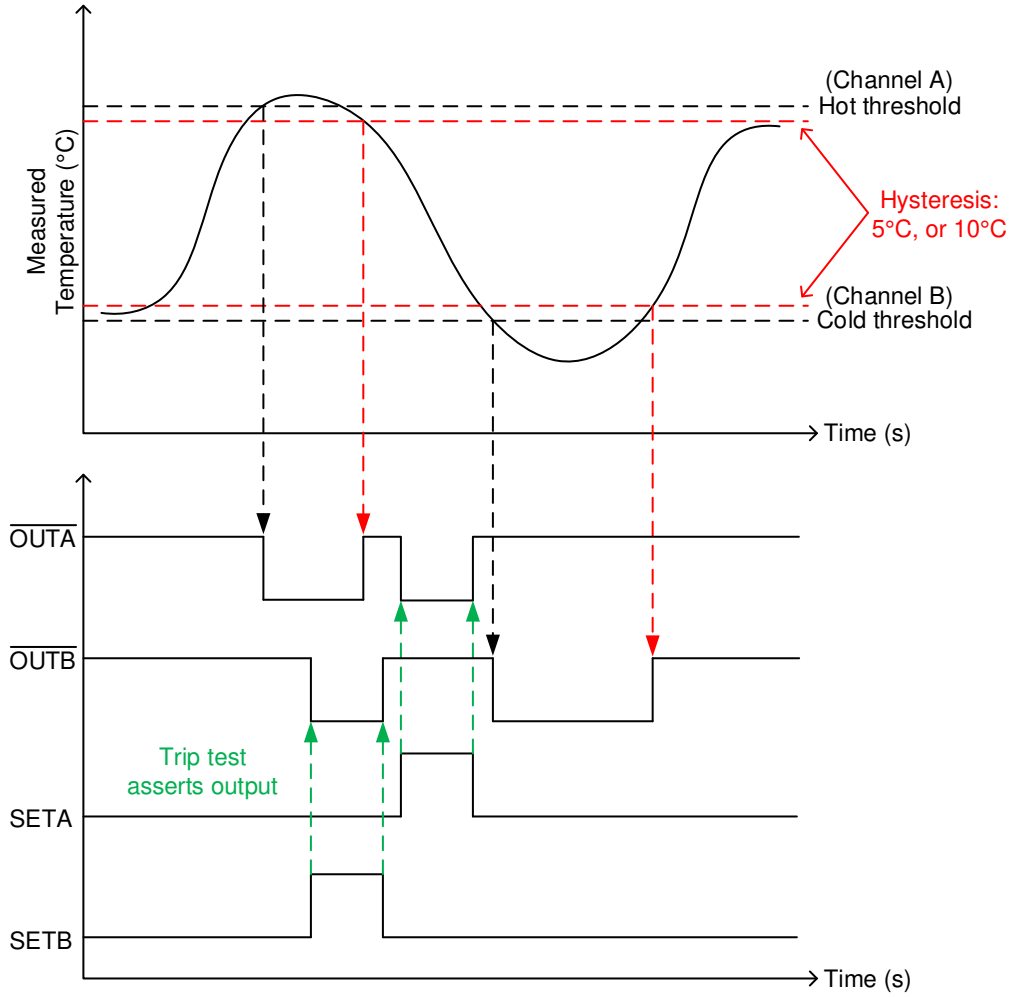

図 7-2. TMP390 Trip Test Operation

7.3.3 20°C Hysteresis

The 20°C hysteresis feature is only available on Channel A. To activate the feature, the SETB pin must be connected to ground and SETA pin connected to the resistor to set the appropriate trip point on Channel A.

7.4 Device Functional Modes

The device has one mode of operation, as described above, that applies when operated within the *Recommended Operating Conditions*.

8 Application and Implementation

Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Applications Information

The TMP390 device is part of a family of ultra-low power, dual channel, resistor programmable temperature switches that can enable detection and protection of system thermal events over a wide temperature range. The trip temperatures (T_{TRIP}) and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The thermal hysteresis (T_{HYST}) function is to prevent undesired digital output switching due to small temperature changes.

8.2 Typical Applications

8.2.1 Simplified Application Schematic

図 8-1 shows the simplified schematic where R_{SETA} and R_{SETB} are used to set channel A trip point (SETA) and channel B trip point and hysteresis for both channels (SETB). SETA and SETB can be programmed at a variety of temperatures based on the device, as described in 表 7-1 for channel A trip point, and 表 7-2 for channel B trip point and hysteresis for both channels. $\overline{OUTA}$ and $\overline{OUTB}$ outputs correspond to the temperature threshold detection at SETA and SETB, respectively.

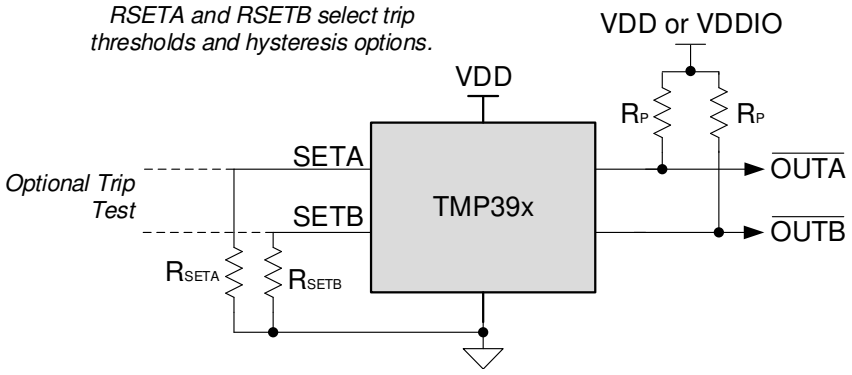

図 8-1. Simplified Schematic

8.2.1.1 Design Requirements

The TMP390 requires two resistors to set the high and low trip points and hysteresis, and two pullup resistors for the open-drain device. TI also highly recommends to place a 0.1-µF, power-supply bypassing capacitor close to the VDD supply pin. To minimize the internal power dissipation, use two pullup resistors greater than 1 kΩ from the $\overline{OUTA}$ and $\overline{OUTB}$ pins to the VDD pin. A separate supply, VDDIO, may be used for the pullup voltage to set the output voltage level to the level required by the MCU, as shown in 図 8-1. The open-drain output gives flexibility of pulling up to any voltage independent of VDD (VDDIO must be less than or equal to VDD + 0.3 V). This allows for use of longer cables or different power supply options. If a separate voltage level is not required, TI recommends to tie the pullup to the TMP390 VDD.

If the SETA or SETB connected resistor value is outside the legal range, the associated output goes to permanent output zero stage and the channel cannot be used. The other channel still will be in operating condition, and device can be used in one channel mode. If the SETB input is grounded or left floating, the Channel B cannot be used and the hysteresis for Channel A will be 20°C. The SETA and SETB connected resistors are measured during POR. If two consecutive measurements are not matching each other, then the device sets the associated channel output to zero and repeats the resistor measurements until the

measurements match. When the measurements match, the channel output is released. Note that it is possible to connect some device outputs together by shorting the $\overline{OUTA}$ or $\overline{OUTB}$ line.

8.2.1.2 Detailed Design Procedure

The resistor to ground values on the SETA input sets the T_{TRIP} threshold of Channel A. The resistor to ground value on the SETB input sets the T_{TRIP} threshold of Channel B as well as the T_{HYST} 5°C and 10°C options. TI recommends that the resistors at SETA and SETB have a 1% tolerance at room temperature. Each resistor can range from 1.05 KΩ to 909 KΩ, representing one of 48 unique values. The exact temperature thresholds and trip points are shown in 表 7-1 and 表 7-2. The pullup resistors should be at least 1 kΩ to minimize internal power dissipation. To get the correct threshold for resistor values, take care to minimize the board level capacitance and leakage at the SETA and SETB pins.

The waveform for the TMP390 output under the hot/cold thresholds is shown in 図 8-2. The hysteresis can be set to 5°C, 10°C or 20°C. When the temperature exceeds the hot trip point threshold, $\overline{OUTA}$ goes low until the temperature drops below the hysteresis threshold. When the temperature drops below the cold trip threshold, $\overline{OUTB}$ goes low and returns high after the temperature rises above the hysteresis threshold. If the switch has already tripped and the temperature is in the hysteresis band, a POR event will cause the output to go high after the power is restored.

8.2.1.3 Application Curves

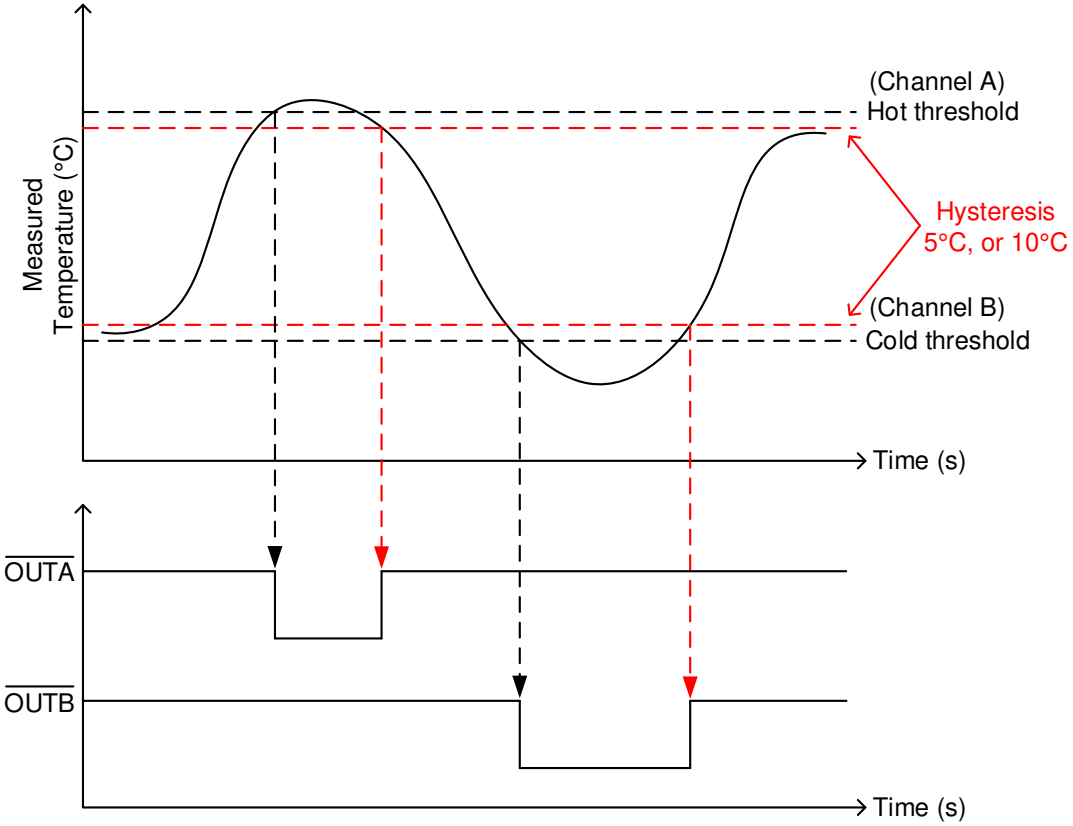

図 8-2. TMP390 Output With Hot/Cold Thresholds With Hysteresis

8.2.2 TMP390 With 10°C Hysteresis

図 8-3 shows an example circuit for overtemperature and undertemperature protection using the TMP390. In this example, the trip points are set at –25°C and +90°C with 10°C hysteresis.

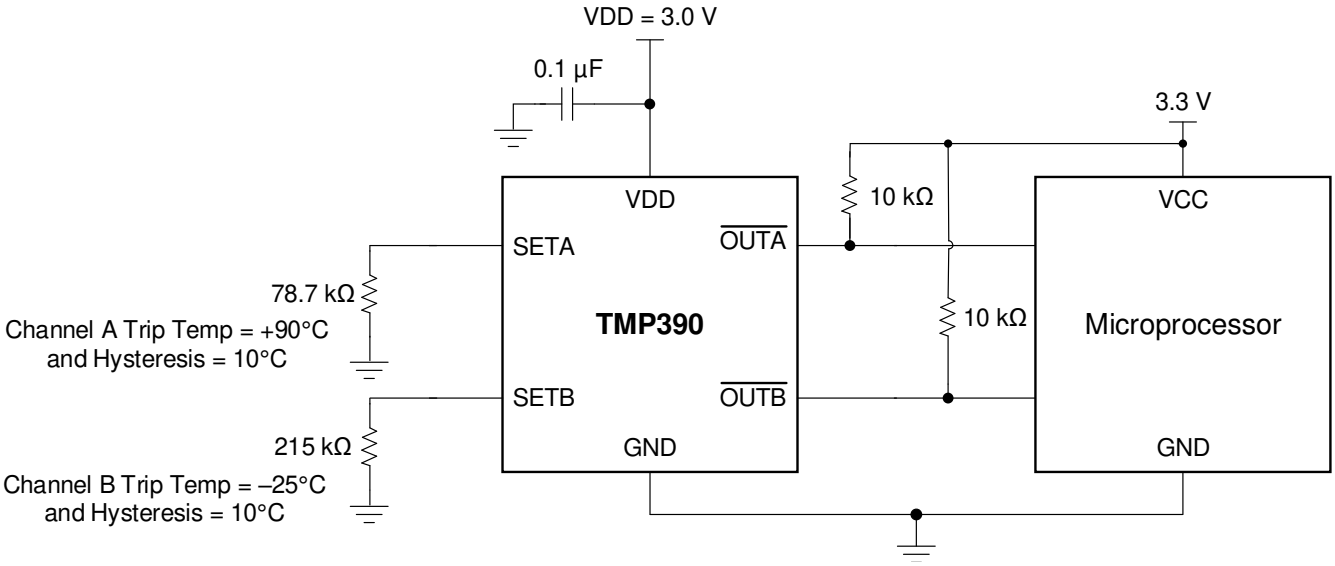

図 8-3. TMP390 Example Circuit at +90°C and –25°C Thresholds With 10°C Hysteresis

8.2.2.1 Design Requirements

In this example, VDD can be ≥ 3 V. The output pins may be tied to a switch to control a fan or other analog circuitry. 図 8-3 uses 10-kΩ pullup resistors at the $\overline{\text{OUTA}}$ and $\overline{\text{OUTB}}$ outputs. Place a 0.1-µF bypass capacitor close to the TMP390 device to reduce noise coupled from the power supply. If needed, the output of multiple parts can be connected together.

8.2.2.2 Detailed Design Procedure

SETA sets the +90°C threshold using 78.7 kΩ. SETB sets the –25°C trip point and 10°C hysteresis using 215 kΩ. These values were determined using 表 7-1 and 表 7-2. These resistors should have maximum of 1% tolerance and 100 ppm/°C or less over the desired temperature range. A summary of the resistor settings used in this example is shown in 表 8-1. See 表 7-1 and 表 7-2 for additional trip points and hysteresis configurations.

The switching output of the TMP390 can be visualized with the output diagram shown in 図 8-4. It is key to notice that hysteresis is subtracted from the Channel A threshold and added to the Channel B threshold values. $\overline{\text{OUTA}}$ remains high until the sensor reaches +90°C where the output goes low, and returns high after the temperature drops back down to +80°C. $\overline{\text{OUTB}}$ trips when the temperature stays below –25°C and goes low until the temperature rises above –15°C.

8.2.3.1 Application Curve

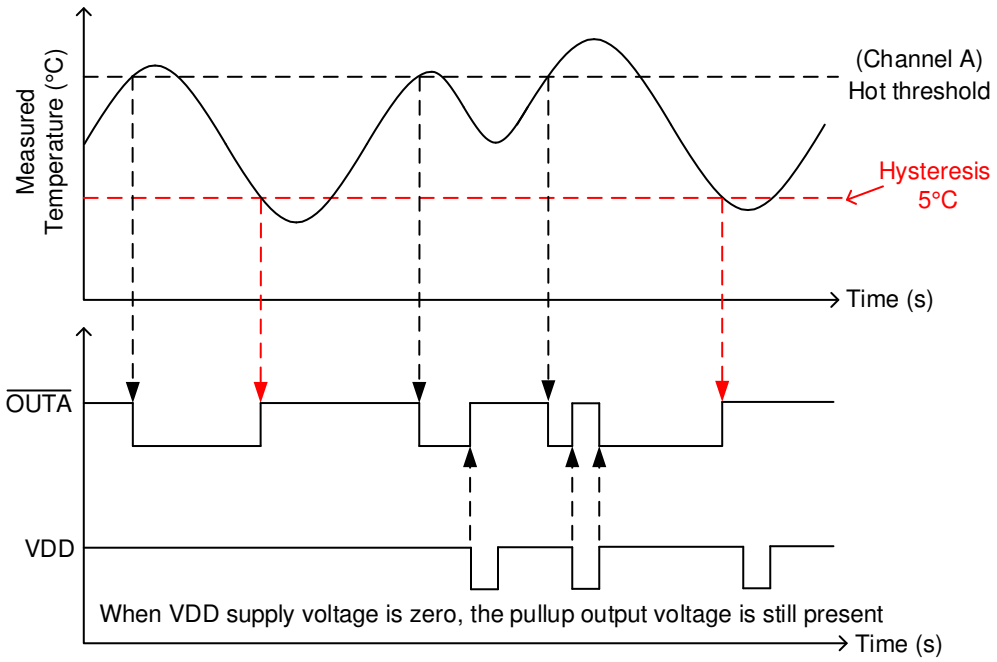

図 8-6. TMP390 One Channel (Hot) Operation Thresholds and Hysteresis

8.2.4 One Channel Operation for Cold Trip Point

図 8-7 shows the TMP390 configured for one channel operation, with a single resistor to set the warm trip point and hysteresis. The resistor values for one channel warm trip point is same as described in 表 7-2.

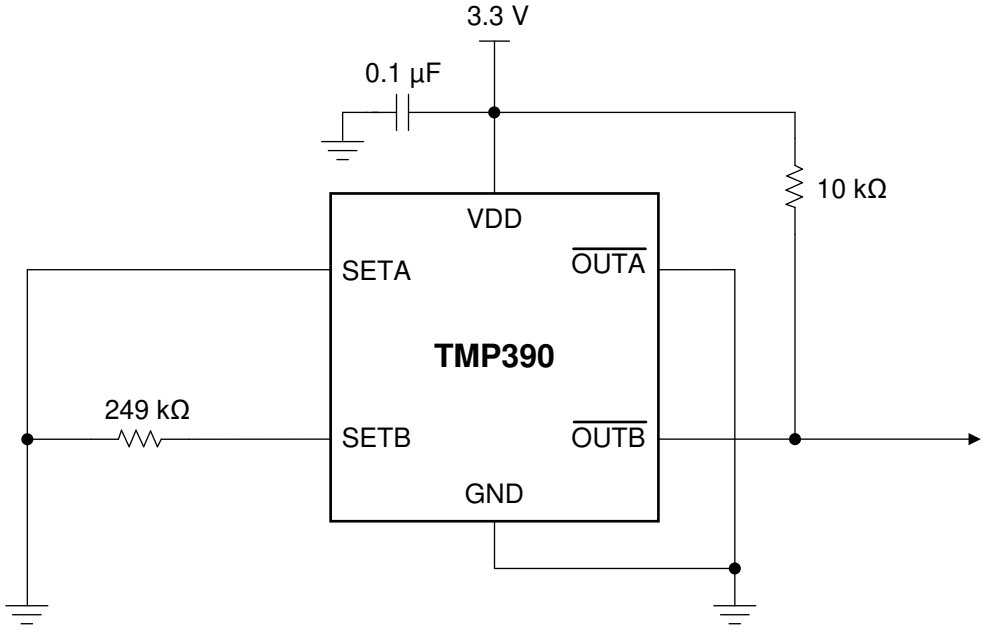

図 8-7. TMP390 One Channel (Cold) Operation Example Circuit With –20°C Trip Point and 10°C Hysteresis

8.2.4.1 Application Curve

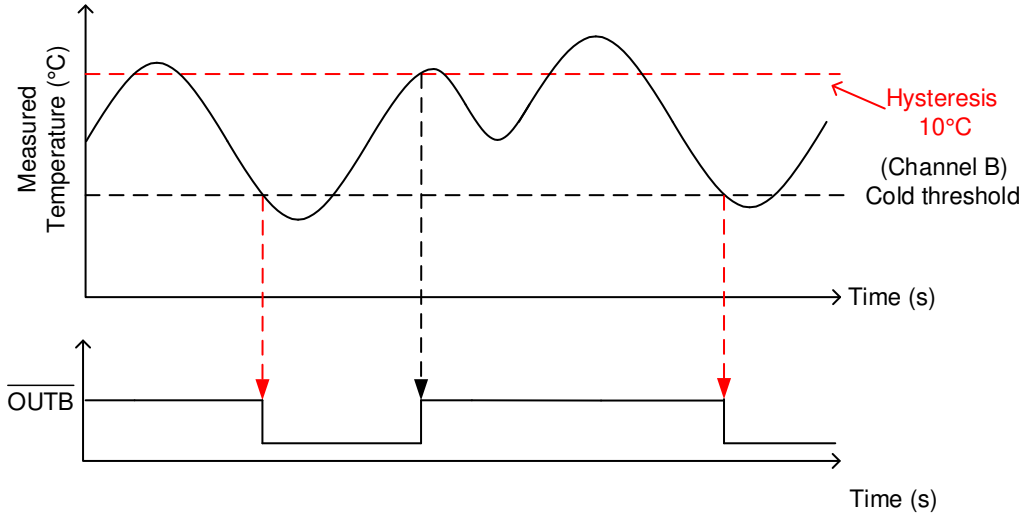

図 8-8. TMP390 One Channel (Cold) Operation Thresholds and Hysteresis

9 Power Supply Recommendations

The low supply current and wide supply range of the TMP390 allow the device to be powered from many sources. VDDIO must always be lower than or equal to VDD + 0.3 V.

Power supply bypassing is strongly recommended by adding a 0.1-µF capacitor from VDD to GND. In noisy environments, TI recommends to add a filter with 0.1-µF capacitor and 100-Ω resistor between external supply and VDD to limit the power supply noise.

10 Layout

10.1 Layout Guidelines

The TMP390 is extremely simple to layout. Place the power supply bypass capacitor as close to the device as possible, and connect the capacitor as shown in 図 10-1. Place the R_{SETA} and R_{SETB} resistors as close to the device as possible. Carefully consider the resistor placement to avoid additional leakage or parasitic capacitance, as this may affect the actual resistor sense value for the trip thresholds and hysteresis. If there is a possibility of moisture condensation on the SETA and SETB circuits, which may lead to additional leakage current, consider adding a conformal coating to the circuits.

10.2 Layout Example

11 Device and Documentation Support

11.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、ti.com のデバイス製品フォルダを開いてください。*「更新通知を受け取る」をクリック*して登録すると、変更されたすべての製品情報の 1 週間分のダイジェストを受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

11.2 サポート・リソース

TI E2E™ サポート・フォーラムは、検証済みの迅速な回答と設計支援をエンジニアがエキスパートから直接得るための頼れる情報源です。既存の回答を検索し、または新たに質問することで、必要とする設計支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の使用条件を参照してください。

11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

TI 用語集　この用語集には、用語や略語の一覧および定義が記載されています。

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP390A2DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-55 to 130	1C4	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF TMP390 :

- Automotive : TMP390-Q1
