

# TPS1H200A-Q1 40V、200mΩ、シングルチャネルのスマート・ハイサイド・スイッチ

## 1 特長

- 車載アプリケーション認定済み
- 下記内容で AEC-Q100 認定済み:
  - デバイス温度グレード 1:  $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$  の動作時周囲温度範囲
  - デバイス HBM ESD 分類レベル H2
  - デバイス CDM ESD 分類レベル C4B
- 機能安全対応
  - 機能安全システムの設計に役立つ資料を利用可能
- シングル・チャネル 200mΩ スマート・ハイサイド・スイッチ
- 広い動作電圧範囲: 3.4V~40V
- 非常に低いスタンバイ時電流: 500nA 未満
- 外付け抵抗で電流制限を調整可能
  - 500mA 以上のとき  $\pm 15\%$
  - 1.5A 以上のとき  $\pm 10\%$
- 電流制限後の動作を設定可能
  - ホールド・モード
  - ラッチオフ・モード、遅延時間を設定可能
  - 自動再試行モード
- MCU なしのスタンドアロン動作をサポート
- 保護機能:
  - GND への短絡および過負荷保護
  - サーマル・シャットダウンおよびサーマル・スリング
  - 誘導性負荷の負電圧クランプ
  - GND 消失およびバッテリー消失時の保護

- 診断機能:
  - 過負荷および GND への短絡の検出
  - オンまたはオフ状態での開放負荷およびバッテリーへの短絡の検出
  - サーマル・シャットダウンおよびサーマル・スリング

## 2 アプリケーション

- 車体 / 照明
- インフォテインメント・システム
- 先進運転支援システム (ADAS)
- サブモジュール用のシングル・チャネルのハイサイド・スイッチ
- 一般的な抵抗性、誘導性、容量性負荷

## 3 概要

TPS1H200A-Q1 デバイスは、完全に保護されたシングル・チャネルのハイサイド・パワー・スイッチで、200mΩ の NMOS パワー FET を内蔵しています。

電流制限を調整可能なため、突入電流や過負荷電流を制限し、システムの信頼性を向上できます。電流制限の精度が高いため、過負荷保護が強化され、前段の電源設計が簡単になります。電流制限以外の設定も変更できるため、機能、コスト、放熱について柔軟な設計が可能です。

このデバイスは完全な診断機能をサポートし、状態をデジタル出力します。開放負荷検出は、オンとオフの両方の状態で利用可能です。このデバイスは、MCU ありでも、なしでも動作できます。スタンドアロン・モードにより、孤立したシステムでもこのデバイスを使用できます。

### 製品情報(1)

## 5 Pin Configuration and Functions

图 5-1. DGN PowerPAD™ Package 8-Pin HVSSOP With Exposed Thermal Pad Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CL	4	O	Adjustable current limit. Connect to device GND if external current limit is not used.
DELAY	5	I/O	Function configuration when current limit; internal pullup
DIAG_EN	2	I	Enable the diagnostic function
FAULT	3	O	Open-drain diagnostic status output. Leave floating if not used.
GND	6	—	Ground
IN	1	I	Input control for output activation; internal pulldown
OUT	7	O	Output, source of the high-side switch, connected to the load
VS	8	I	Power supply, drain for the high-side switch
Thermal pad	—	—	Thermal pad. Connect to device GND or leave floating.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)<sup>(1)</sup> <sup>(2)</sup>

		MIN	MAX	UNIT
Supply voltage VS pin	t < 400 ms	—	42	V
Reverse polarity voltage <sup>(3)</sup>	t < 1 minute	-36	—	V
Current on GND	t < 2 minutes	-100	250	mA
Voltage on IN and DIAG_EN pins		-0.3	VS	V
Current on IN and DIAG_EN pins		-10	—	mA
Voltage on DELAY pin		-0.3	7	V
Current on DELAY pin		-60	—	mA
Voltage on FAULT pin		-0.3	7	V
Current on FAULT pin		-30	10	mA
Voltage on CL pin		-0.3	7	V
Current on CL pin		—	6	mA
Voltage on OUT pin		—	42	V
Inductive load switch-off energy dissipation single pulse <sup>(4)</sup>		—	40	mJ
Operating junction temperature, T <sub>J</sub>		-40	150	°C
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to ground.
- (3) Reverse polarity condition: V<sub>IN</sub> = 0 V, reverse current < I<sub>R(2)</sub>, GND pin 1-kΩ resistor in parallel with diode.
- (4) Test condition: V<sub>VS</sub> = 13.5 V, L = 8 mH, T<sub>J</sub> = 150°C. FR4 2s2p board, 2 × 70-μm Cu, 2 × 35-μm Cu. 600 mm<sup>2</sup> thermal pad copper area.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	All pins except VS, OUT, and GND	±2000
		Pins VS, OUT, and GND	±3000
	Charged-device model (CDM), per AEC Q100-011	±750	V

- (1) AEC-Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specifications.

### 6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	MAX	UNIT
$V_S$	Operating voltage	4	40	V
	Voltage on IN and DIAG_EN pins	0	40	V
	Voltage on FAULT pin	0	5	V
$I_{o,nom}$	Nominal DC load current	0	2.5	A
$T_J$	Operating junction temperature	-40	150	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS1H200A-Q1	UNIT
		DGN (HVSSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	47.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	49.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	18.3	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.8	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	18.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	5.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

## 6.5 Electrical Characteristics

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>OPERATING VOLTAGE</b>						
$V_{VS(nom)}$	Nominal operating voltage		4		40	V
$V_{VS(uvr)}$	Undervoltage restart	$V_{VS}$ rising	3.5	3.7	4	V
$V_{VS(uvf)}$	Undervoltage shutdown	$V_{VS}$ falling	3	3.2	3.4	V
$V_{(uv,hys)}$	Undervoltage shutdown, hysteresis			0.5		V
<b>OPERATING CURRENT</b>						
$I_{(op)}$	Nominal operating current	$V_{VS} = 13.5\text{ V}$ , $V_{IN} = 5\text{ V}$ $V_{DIAG\_EN} = X\text{ V}$ , $I_{OUT} = 0.5\text{ A}$ $I_{CL} = 2\text{ A}$			5	mA
$I_{(off)}$	Standby current	$V_{VS} = 13.5\text{ V}$ $V_{IN} = V_{DIAG\_EN} = V_{CL} = V_{OUT} = 0\text{ V}$ $T_J = 25^\circ\text{C}$			0.5	$\mu\text{A}$
		$V_{VS} = 13.5\text{ V}$ $V_{IN} = V_{DIAG\_EN} = V_{CL} = V_{OUT} = 0\text{ V}$ $T_J = 125^\circ\text{C}$			3	
$I_{(off,diag)}$	Standby current with diagnostics enabled	$V_{VS} = 13.5\text{ V}$ $V_{IN} = 0\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$			3	mA
$t_{(off,deg)}$	Standby-mode deglitch time <sup>(1)</sup>	IN from high to low if deglitch time $\geq t_{(off,deg)}$ , then the device enters into standby mode.		12.5		ms
$I_{lkg(out)}$	Output leakage current in OFF state	$V_{VS} = 13.5\text{ V}$ $V_{IN} = V_{DIAG\_EN} = V_{OUT} = 0\text{ V}$			3	$\mu\text{A}$
<b>POWER STAGE</b>						
$r_{DS(on)}$	ON state resistance	$V_{VS} \geq 3.5\text{ V}$ , $T_J = 25^\circ\text{C}$		200		m $\Omega$
		$V_{VS} \geq 3.5\text{ V}$ , $T_J = 150^\circ\text{C}$			400	
$I_{CL(int)}$	Internal current limit	CL pin connected to GND	3.5	4.8	6	A
$I_{CL(TSD)}$	Current-limit value percentage during thermal shutdown			60%		
$V_{DS(clamp)}$	Drain-to-source voltage internally clamped		45		65	V
<b>OUTPUT DIODE CHARACTERISTICS</b>						
$V_F$	Drain-to-source diode voltage	IN = 0, $I_{OUT} = -0.15\text{ A}$	0.3	0.7	1	V
$I_{R(1)}$	Continuous reverse current from source to drain during a short-to-battery condition <sup>(1)</sup>	$t < 60\text{ s}$ , $V_{IN} = 0\text{ V}$ , $T_J = 25^\circ\text{C}$ .			2	A
$I_{R(2)}$	Continuous reverse current from source to drain during a reverse-polarity condition <sup>(1)</sup>	$t < 60\text{ s}$ , $V_{IN} = 0\text{ V}$ , $T_J = 25^\circ\text{C}$ GND pin 1-k $\Omega$ resistor in parallel with diode.			2	A
<b>LOGIC INPUT (IN, DIAG_EN)</b>						
$V_{IH}$	Logic high-level voltage		1.8			V
$V_{IL}$	Logic low-level voltage				0.8	V
$R_{pd,in}$	Logic-pin pulldown resistor	IN. $V_{IN} = 5\text{ V}$	150		400	k $\Omega$
		DIAG_EN. $V_{VS} = V_{DIAG\_EN} = 5\text{ V}$	350		850	
<b>DIAGNOSTICS</b>						
$I_{lkg(loss,GND)}$	Loss of ground output leakage current				100	$\mu\text{A}$
$t_{d(ol,on)}$	Open-load deglitch time in ON state	$V_{IN} = 5\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$ when $I_{OUT} < I_{(ol,on)}$ , duration longer than $t_{d(ol,on)}$ , open load is detected.	200	300	450	$\mu\text{s}$

## 6.5 Electrical Characteristics (continued)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{(ol,on)}$	Open-load detection threshold in ON state	$V_{IN} = 5\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$ when $I_{OUT} < I_{(ol,on)}$ duration longer than $t_{d(ol,on)}$ open load is detected.		10	20	mA
$V_{(ol,off)}$	Open-load detection threshold in OFF state	$V_{IN} = 0\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$ when $V_{VS} - V_{OUT} < V_{(ol,off)}$ duration longer than $t_{d(ol,off)}$ open load is detected.	1.4		2.6	V
$t_{d(ol,off)}$	Open-load deglitch time in OFF state	$V_{IN} = 0\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$ when $V_{VS} - V_{OUT} < V_{(ol,off)}$ duration longer than $t_{d(ol,off)}$ open load is detected.	200	300	450	$\mu\text{s}$
$I_{(ol,off)}$	OFF state output sink current	$V_{IN} = 0\text{ V}$ , $V_{DIAG\_EN} = 5\text{ V}$ $V_{VS} = V_{OUT} = 13.5\text{ V}$	-75			$\mu\text{A}$

## 7 Detailed Description

### 7.1 Overview

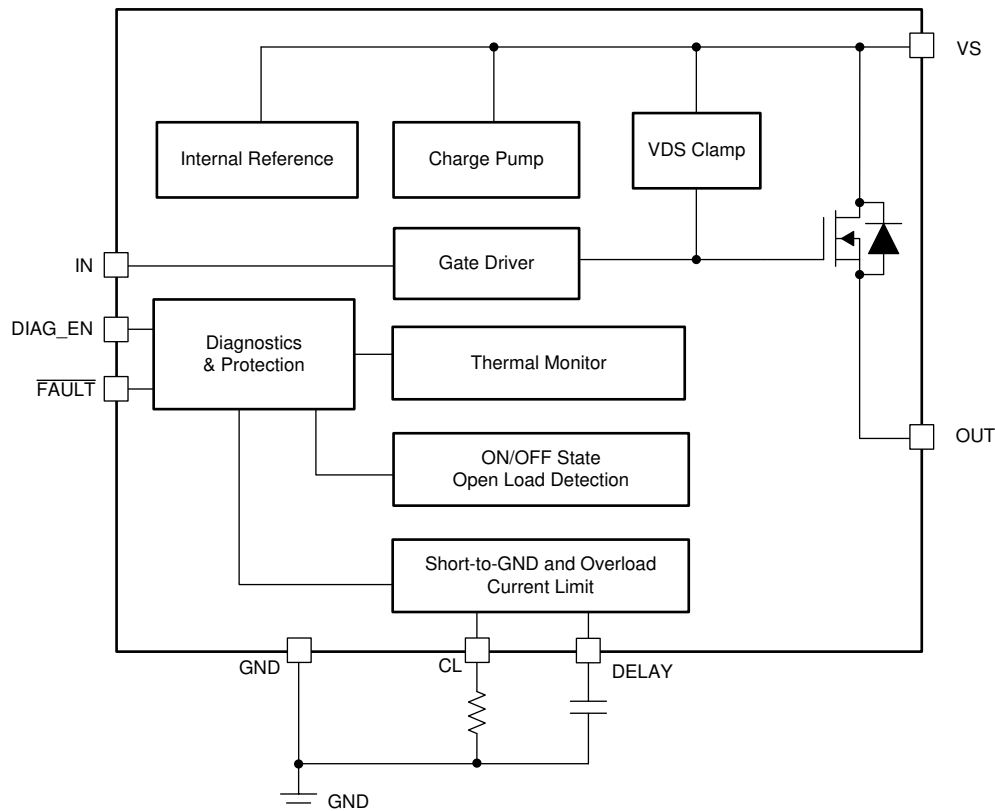

The TPS1H200A-Q1 device is a smart high-side switch with an internal charge pump and single-channel integrated NMOS power FET. The adjustable current limit function improves the reliability of the whole system. Full diagnostic features enable intelligent control of the load.

The external high-accuracy current limit sets the current limit value for the application. When overcurrent occurs, the device improves system reliability by clamping the inrush current effectively. The device saves system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage. The TPS1H200A-Q1 device allows three modes when a current limit occurs. Users can set the output to consistently hold the current, to immediately latch off, or to automatically retry through the configuration on the DELAY pin. The configurable behaviors during a current limit provide design flexibility. This includes functionality, cost, and thermal dissipation.

This device supports full diagnostics with the digital status output. High-accuracy and low-threshold open-load detection enables real-time ON state monitoring. The device supports operation without an MCU (stand-alone mode) which allows the system to locally implement full functionality.

The TPS1H200A-Q1 device is a smart high-side switch for a wide variety of resistive, inductive, and capacitive loads, including LEDs, bulbs, relays, solenoids, and submodules.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Current limit

A high-accuracy current limit allows high reliability of the design. The current limit protects the load and the power supply from overstressing during short-circuit-to-GND or power-up conditions. The current limit can also save system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage.

When a current limit threshold is hit, a closed loop immediately activates. The output current is clamped at the set value, and a fault is reported. The device heats up because of high power dissipation on the power FET.

The device has two current limit thresholds.

- Internal current limit: The internal current limit is fixed at  $I_{CL(int)}$ . Tie the CL pin directly to the device GND for large-transient-current applications.
- External adjustable current limit: An external resistor is used to set the current limit threshold. Use 式 1 to calculate  $R_{CL}$ . The external adjustable current limit allows the flexibility to set the current limit value by application.

$$R_{CL} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}} \quad (1)$$

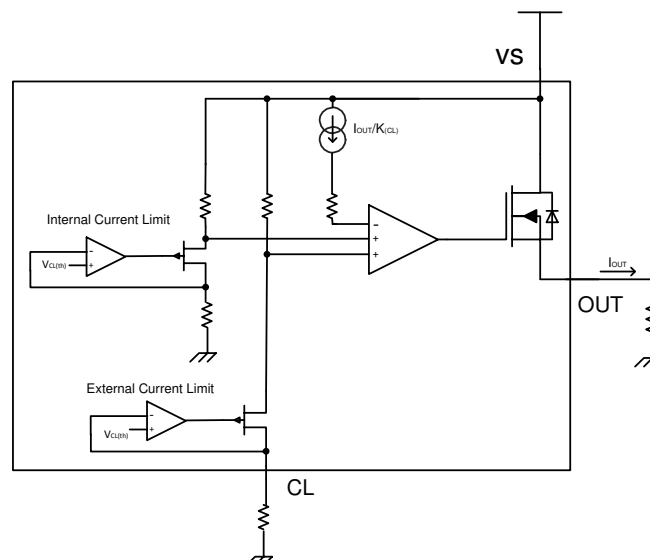

where

- $V_{CL(th)}$  is the internal band-gap voltage.
- $K_{(CL)}$  is the ratio of the output current and the current limit set value.
- $K_{(CL)}$  is constant across temperature and supply voltage.

#### Note

When a GND network is used, that causes a level shift between the device GND and board GND, so the CL pin must be connected to the device GND.

For better protection from a hard short-to-GND condition (when the IN pin is enabled, a short-to-GND occurs suddenly), the device will implement a fast-trip protection to turn off the output before the current limit closed loop is set up. Typically, the fast-trip response time is less than 1  $\mu$ s. With a fast response like this, the device can achieve a better inrush current-suppression performance.

**7-1. Current Limit**

### 7.3.2 DELAY Pin Configuration

When a current limit occurs, the TPS1H200A-Q1 device supports three different outcomes of the output. 表 7-1 lists the current limit configurations and these outcomes behaviors.

表 7-1. Current Limit Configurations

MODE	DELAY CONFIGURATION	OUTPUT CURRENT BEHAVIOR	FAULT RECOVERY
Holding	Connects to GND directly	When hitting a current limit, the output current holds at the setting current. The device enters into thermal shutdown mode when $T_J > T_{(SD)}$ .	FAULT clears when IN turns low for a duration of time longer than $t_{FAULT}$ or when the current limit is removed when IN is high.
Latch-off	Connects to GND through a capacitor	When hitting a current limit, the output current holds at the setting current, but latches off after a preset DELAY time ( $t_{dl1} + t_{dl2}$ ). $t_{dl1}$ is the default delay time, and $t_{dl2}$ is a capacitor-configurable delay time. The output stays latched off regardless of whether the current limit is removed. The output recovers only when IN is toggling.	FAULT clears when IN turns low for a duration of time longer than $t_{FAULT}$ .
Auto-retry	External pullup	When hitting a current limit, the output current holds at the setting current, but periodically comes on for $t_{hic(on)}$ and turns off for $t_{hic(off)}$ .	FAULT clears when IN turns low for a duration of time longer than $t_{FAULT}$ OR when the current limit is removed for $t_{hic(on)}$ .

#### 7.3.2.1 Holding Mode

Holding mode is active when the DELAY pin connects directly to GND. When a current limit is reached, the output current holds at the setting current. The device then enters thermal shutdown mode when  $T_J > T_{(SD)}$ .

图 7-2. Holding Mode Connection

图 7-3. Holding Mode Example

### 7.3.2.2 Latch-Off Mode

Latch-off mode is active when the DELAY pin connects to GND through a capacitor. When a current limit is reached, the output current holds at the setting current, but latches off after a preset DELAY time ( $t_{dl1} + t_{dl2}$ ).  $t_{dl1}$  is the default delay time, and  $t_{dl2}$  is a configurable delay time set by a capacitor. Regardless of whether the current limit is removed or not, the output remains latched off. The output only recovers when IN is toggling.

$t_{dl2}$  can be calculated by 式 2.

$$C_{DELAY} = \frac{I_{dl(chg)} \times t_{dl2}}{V_{dl(ref)}} \tag{2}$$

where

- $C_{DELAY}$  is the capacitor connected on the DELAY pin.
- The  $I_{dl(chg)}$  is the device that charges the current in latch-off mode.
- $t_{dl2}$  is the user-setting delay time.
- $V_{dl(ref)}$  is the internal reference voltage in latch-off mode.

图 7-4. Latch-Off-Mode Connection

图 7-5. Latch-Off-Mode Example

### 7.3.2.3 Auto-Retry Mode

Auto-retry mode is active when the DELAY pin is externally pulled up. The pullup voltage must be higher than  $V_{dI(th)}$ . When the current limit is reached, the output current holds at the setting current, but periodically turns on for  $t_{hic(on)}$  and turns off for  $t_{hic(off)}$ . The device checks the current limit status at the falling edge of  $t_{hic(on)}$  clock. If current limit status is captured, the device shuts down for  $t_{hic(off)}$ . If the current limit status is not captured because of the off window during the thermal conditions, the device keeps turning on for additional  $t_{hic(on)}$  or more until the current limit status is captured.

 **7-6. Auto-Retry-Mode Connection**

 **7-7. Auto-Retry-Mode Example**

### 7.3.3 Stand-alone Operation

In a typical application, the TPS1H200A-Q1 device is controlled by a microcontroller. The device also supports stand-alone operation. IN and DIAG\_EN have a 40-V maximum DC rating, and can be connected to the VS pin directly. When in auto-retry mode, the DELAY pin is connected to the VS pin through a 100-kΩ resistor.

**7-8. Stand-Alone Operation in Latch-Off Mode**

**7-9. Stand-Alone Operation in Auto-Retry Mode**

### 7.3.4 Fault Truth Table

The DIAG\_EN pin enables or disables the diagnostic functions. If multiple devices are used, but the ADC resource is limited in the microcontroller, the microcontroller uses GPIOs to set DIAG\_EN high to enable the diagnostics of one device, and disables the diagnostics of the other devices by setting DIAG\_EN low. Additionally, the device can keep power consumption to a minimum by setting DIAG\_EN and IN low.

表 7-2 applies when the DIAG\_EN pin is enabled, and 表 7-3 applies when the DIAG\_EN pin is disabled.

**表 7-2. Fault Truth Table**

CONDITION	IN	OUT	CRITERION	FAULT	FAULT RECOVERY
Normal	L	L	N/A	H	N/A
	H	H	N/A	H	
Overload or short to GND	H	L	current limit triggered	L	See 表 7-1.
Open load or short to battery	H	H	$I_{OUT} < I_{(ol,on)}$	L	FAULT clears when IN turns low for a duration longer than $t_{FAULT}$ . OR FAULT clears when the open load is removed.
	L <sup>(1)</sup>	H	$V_{VS} - V_{OUT} < V_{(ol,off)}$	L	FAULT clears when IN is toggling OR FAULT clears when the open load is removed.
Thermal shutdown	H	N/A	Thermal shutdown triggered	L	FAULT clears when IN turns low for a duration longer than $t_{FAULT}$ . OR FAULT clears when thermal shutdown quits.
Thermal swing	H	N/A	Thermal swing triggered	L	FAULT clears when IN turns low for a duration longer than $t_{FAULT}$ . OR FAULT clears when thermal swing quits.

(1) An external pullup is required for open-load detection.

**表 7-3. DIAG\_EN Disabled Condition**

DIAG_EN	IN CONDITION	PROTECTIONS AND DIAGNOSTICS
LOW	ON	Diagnostics disabled, full protections
	OFF	Diagnostics disabled, no protection

### 7.3.5 Full Diagnostics

#### 7.3.5.1 Short-to-GND and Overload Detection

When the output is on, a short-to-GND or overload condition causes an overcurrent. If the overcurrent triggers the internal or external current limit threshold, the fault condition is reported as  $\overline{FAULT}$  pin = low.

### 7.3.5.2 Open-Load Detection

#### 7.3.5.2.1 Output On

When the output is on, the device recognizes an open-load fault if the current flowing through the output  $I_{OUT} < I_{(ol,on)}$ . For open-load detection when output is on, no external circuitry is required.

#### 7.3.5.2.2 Output Off

When the output is off, the output is pulled down to GND if a load is connected. But if an open load occurs, the output voltage is close to the supply voltage ( $V_{VS} - V_{OUT} < V_{(ol,off)}$ ), and the device recognizes an open-load fault.

There is always a leakage current  $I_{(ol,off)}$  on the output due to the internal logic control path or external humidity, corrosion, and so forth. As a result, TI recommends using an external pullup resistor to offset the leakage current when an open load is detected. The recommended pullup resistance is 15 k $\Omega$ .

7-10. Open-Load Detection in Output OFF State

#### 7.3.5.3 Short-to-Battery Detection

Short-to-battery has the same detection mechanism and behavior as open-load detection in the ON state and the OFF state.

#### 7.3.5.4 Thermal Fault Detection

To protect the device in severe power stressing cases, the device implements two types of thermal fault detection, absolute temperature protection (thermal shutdown) and dynamic temperature protection (thermal swing).

7-11. Thermal Behavior Diagram

#### 7.3.5.4.1 Thermal Shutdown

Thermal shutdown is active when the absolute temperature  $T_J > T_{(SD)}$ . When thermal shutdown occurs, the output turns off.

#### 7.3.5.4.2 Thermal Swing

Thermal swing activates when the power FET temperature sharply increases, that is, when  $\Delta T = T_{(FET)} - T_{(Logic)} > T_{(sw)}$ , then the output turns off. The output automatically recovers and the fault signal clears when  $\Delta T = T_{(FET)} - T_{(Logic)} < T_{(sw)} - T_{(hys)}$ . The thermal swing function improves the reliability of the device when subjected to repetitively fast thermal variation.

#### 7.3.5.4.3 Fault Report Holding

When using PWM dimming,  $\overline{FAULT}$  is easily cleared by the PWM falling edge. Even if the fault condition remains all the time,  $\overline{FAULT}$  is discontinuous. To avoid this unexpected fault report behavior, the device implements fault report holding time. 7-12 shows an issue that typically occurs during PWM dimming, the  $\overline{FAULT}$  is cleared unexpectedly even when the short-to-GND still exists. The TPS1H200A-Q1 device with fault-report holding function allows the right behavior as shown in 7-13.

7-12. Without Fault-Report Holding

7-13. With Fault-Report Holding

### 7.3.6 Full Protections

#### 7.3.6.1 UVLO Protection

The device monitors the supply voltage,  $V_{VS}$ , to prevent unpredicted behaviors when  $V_{VS}$  is too low. When  $V_{VS}$  drops down to  $V_{VS(uvf)}$ , the device shuts down. When  $V_{VS}$  rises up to  $V_{VS(uvr)}$ , the device turns on.

#### 7.3.6.2 Inductive Load Switching Off Clamp

When an inductive load is switched off, the inductive reactance pulls the output voltage negative. However, excessive negative voltage can cause the power FET to break down. To protect the power FET from breaking down, an internal clamp ( $V_{DS(clamp)}$ ) is implemented.

 **7-14. Drain-to-Source Clamping Structure**

 **7-15. Inductive-Load Switching-Off Diagram**

### 7.3.6.3 Loss-of-GND Protection

When a loss-of-GND occurs, the output shuts down, regardless of whether the IN pin is high or low. The device can protect against two ground-loss conditions, loss of device GND and loss of module GND.

### 7.3.6.4 Loss-of-Power-Supply Protection

When a loss-of-power-supply occurs, the output shuts down, regardless of whether the IN pin is high or low. For a resistive or a capacitive load, the loss-of-power-supply has no risk. But for a charged inductive load, the current is driven from all the logic control pins to maintain the inductance current. To protect the system in this condition, TI recommends protection with an external free-wheeling diode.

**7-16. Protection for Loss of Power Supply**

**7.3.6.5 Reverse-Current Protection**

Reverse current occurs in two conditions: short to supply and reverse polarity.

- When a short to the supply occurs, there is only reverse current through the body diode.  $I_{R(1)}$  specifies the limit of the reverse current.
- In a reverse-polarity condition, there are reverse currents through the body diode and the device GND pin.  $I_{R(2)}$  specifies the limit of the reverse current.

To protect the device, TI recommends using two types of external circuitry.

- Adding a blocking diode (method 1). The device and load are protected when in reverse polarity.
- Adding a GND network (method 2). The reverse current through the device GND is blocked. The reverse current through the FET is limited by the load itself. TI recommends a resistor in parallel with the diode as a GND network. The recommended configuration is a 1-kΩ resistor in parallel with a diode that is less than 100 mA.

**7-17. Reverse-Current External Protection Method 1**

**FIG 7-18. Reverse-Current External Protection Method 2**

### 7.3.6.6 MCU I/O Protection

TI recommends using series resistors to protect the microcontroller, for example, 4.7 kΩ when using a 3.3-V microcontroller and 10 kΩ for a 5-V microcontroller.

**FIG 7-19. MCU I/O External Protection**

## 7.4 Device Functional Modes

### 7.4.1 Working Modes

The device has three working modes: the normal mode, the standby mode, and the standby mode with diagnostics, as shown in [Figure 7-20](#).

**Figure 7-20. Working Modes**

#### 7.4.1.1 Normal Mode

When IN is high, the device enters normal mode.

#### 7.4.1.2 Standby Mode

When IN is low and DIAG\_EN is low, the device enters standby mode with ultra-low power consumption.

#### 7.4.1.3 Standby Mode With Diagnostics

When IN is low and DIAG\_EN is high, the device enters standby mode with diagnostics. The device still supports open-load and short-to-battery detection even when IN is low.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS1H200A-Q1 device is a smart high-side switch, with an internal charge pump and single-channel integrated NMOS power FET. The adjustable current limit function greatly improves the reliability of the whole system. Full diagnostic features enable intelligent control of the load. The TPS1H200A-Q1 device applies for a wide variety of resistive, inductive, and capacitive loads, including LEDs, relays, and submodules.

### 8.2 Typical Application

Figure 8-1 shows an example of how to design the external circuitry parameters.

Figure 8-1. Typical Application Circuitry

#### 8.2.1 Design Requirements

- $V_{VS}$  range from 6 V to 18 V
- Nominal current of 500 mA
- Expected current limit value of 2 A
- Thermal sensitive system. When current limit occurs, the output latches off after 0.2 seconds. The 0.2 seconds is to ensure the safe start-up for a capacitive load, clamping the inrush current but without latch-off during start-up.
- Full diagnostics with 5-V MCU, including ON state open-load detection, short-to-GND, or overcurrent detection, and thermal shutdown detection

## 8.2.2 Detailed Design Procedure

To set the adjustable current limit value at 2 A, calculate  $R_{(CL)}$  as follows:

$$R_{(CL)} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}} = \frac{0.8 \times 2500}{2} = 1000 \Omega \quad (3)$$

To set the adjustable latch-off delay at 0.2 s, calculate  $C_{(DELAY)}$  as follows:

$$t_{dl} = t_{CL(deg)} + t_{dl1} + t_{dl2} = 0.2 \gg t_{dl2}$$

$$C_{DELAY} = \frac{I_{dl(chg)} \times t_{dl2}}{V_{dl(ref)}} = \frac{4.5 \times 0.2}{1.45} \times 10^{-6} = 0.62 \mu F \quad (4)$$

TI recommends  $R_{(SER)} = 10 \text{ k}\Omega$  for a 5-V MCU, and  $R_{(pullup)} = 10 \text{ k}\Omega$  as the pullup resistor.

## 8.2.3 Application Curves

The following curves are test examples of hard-short conditions. The load is 0.1 A and the current limit value is 0.6 A. [Figure 8-2](#) shows a waveform of the latch-off mode. [Figure 8-3](#) shows a waveform of the auto-retry mode.

**Figure 8-2. Hard-Short Condition in Latch-Off Mode**

**Figure 8-3. Hard-Short Condition in Auto-Retry Mode**

## 9 Power Supply Recommendations

The device applies to 12-V and 24-V applications. The normal power supply connection is a 12-V or 24-V system.

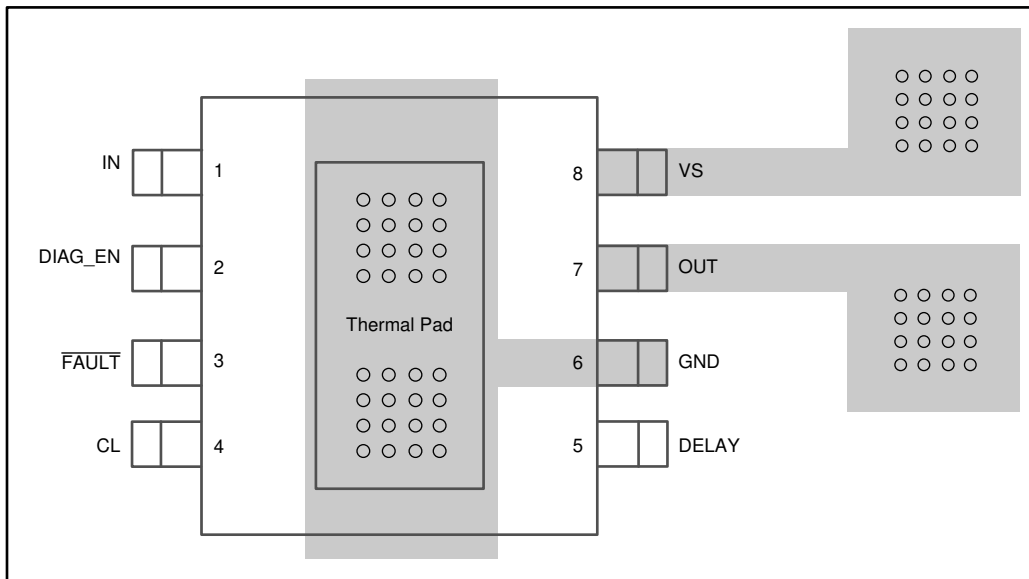

## 10 Layout

### 10.1 Layout Guidelines

To prevent thermal shutdown,  $T_J$  must be less than 175°C. If the output current is high, the power dissipation can be large. However, the PCB layout is very important. A good PCB design optimizes heat transfer, which is essential for the long-term reliability of the device.

- Maximize the copper coverage on the PCB to increase the thermal conductivity of the board. The major heat-flow path from the package to the ambient is through the copper on the PCB. Maximum copper is extremely important when no heat sinks are attached to the PCB on the other side of the board opposite the package.
- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- All thermal vias must either be plated shut or plugged and capped on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage must be at least 85%.

### 10.2 Layout Example

**图 10-1. Layout Example**

## 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation see the following:

PowerPAD™ and TI E2E™ are trademarks of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS1H200AQDGNRQ1	ACTIVE	HVSSOP	DGN	8	2500	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	1EWX	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**
