

TPS25940xx-Q1 2.7V~18V eFuse、バッテリー短絡保護機能内蔵

1 特長

- 車載アプリケーション認定済み
- 下記内容で AEC-Q100 認定済み:
 - デバイス温度グレード 1: -40°C ~ +125°C の動作時 周囲温度範囲
 - デバイス HBM ESD 分類レベル 2
 - デバイス CDM ESD 分類レベル C5
- 動作電圧 2.7V~18V、20V (最大値)
- 全 R_{ON} : 40mΩ (標準値)
- 調整可能な電流制限: 0.6A~5.3A (±8%)
- IMON 電流インジケータ出力
 - TPS25940-Q1/TPS25940L-Q1 で ±8% の精度
- 調整可能な低電圧 / 過電圧スレッシュホールド (±2%)
- 逆電流ブロッキング
- 1μs の逆電圧シャットオフ
- プログラム可能な dV_{O}/dt 制御
- パワーグッドおよびフォルト出力
- バッテリー短絡保護
- グランド短絡保護
- TPS25940-Q1/TPS259401A-Q1: 自動再試行
- TPS25940L-Q1: ラッチオフ

2 アプリケーション

- 車載インフォテインメント
- ADAS カメラおよびレーダーのセンサ
- USB ハブ
- パワー・マルチプレクシング
- ホールドアップ電力管理

概略回路図

3 概要

TPS25940xx-Q1 eFuse 電力スイッチは、小型で豊富な機能を持つ電力管理デバイスで、完全な保護機能のセットが内蔵されています。動作電圧範囲が広いので、多くの一般的な DC バス電圧の制御が可能です。バック・ツー・バックの FET が内蔵され、双方向の電流制御を行います。それにより、障害が発生した電源バスに対して負荷側のホールドアップ・エネルギーの逆流が許容されないようなシステムに最適です。

負荷、ソース、およびデバイス保護が提供され、過電流、 dV_{O}/dt ランプ、過電圧と低電圧のスレッシュホールドなど、多くの機能がプログラム可能です。システム・ステータスの監視や下流負荷の制御のため、PGOOD、FLT、および高精度の電流監視出力を備えています。高精度でプログラム可能な低電圧および過電圧のスレッシュホールドとモードにより、電力管理の設計が容易になります。

TPS25940xx-Q1 は、 $V_{(IN)}$ および $V_{(OUT)}$ を監視し、 $V_{(IN)} < (V_{(OUT)} - 66mV)$ のときに真の逆電流保護を提供します。この機能によって、出力とバッテリーとの短絡障害が発生したとき、電源バスが過電圧から保護されます。

製品情報⁽¹⁾

部品番号	パッケージ	本体サイズ (公称)
TPS25940-Q1	WQFN (20)	3.00mm×4.00mm
TPS25940L-Q1		
TPS259401A-Q1

6 Pin Configuration and Functions

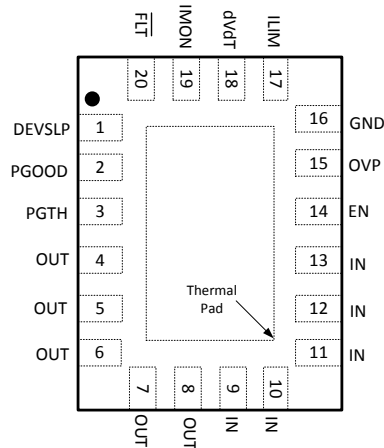

图 6-1. RVC Package 20-Pin WQFN Top View

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	DEVSLP	I	Active high. DevSleep mode control. A high at this pin activates the DevSleep mode (low power mode). If unused, leave floating or connect it to GND.
2	PGOOD	O	Active high. A high indicates PGTH has crossed the threshold value. It is an open drain output. If unused, leave floating.
3	PGTH	I	Positive input of PGOOD comparator. If unused connect to OUT or GND.
4	OUT	O	Power output of the device.
5			
6			
7			
8	IN	I	Power input and supply voltage of the device.
9			
10			
11			
12	EN/UVLO	I	Input for setting programmable undervoltage lockout threshold. An undervoltage event opens internal FET and assert FLT to indicate power-failure.
13			
14	OVP	I	Input for setting programmable overvoltage protection threshold. An overvoltage event opens the internal FET and assert FLT to indicate overvoltage.
15	GND	—	Ground. The GND terminal must be connected to the exposed PowerPAD. This PowerPAD must be connected to a PCB ground plane using multiple vias for good thermal performance.
16	ILIM	I/O	A resistor from this pin to GND sets the overload and short-circuit current limit.
17	dVdT	I/O	A capacitor from this pin to GND sets the ramp rate of output voltage.
18	IMON	O	This pin sources a scaled down ratio of current through the internal FET. A resistor from this pin to GND converts current to proportional voltage, used as analog current monitor. If unused, leave floating.
19	FLT	O	Fault event indicator, goes low to indicate fault condition because of undervoltage, overvoltage, reverse voltage and thermal shutdown event. It is an open drain output. If unused, leave floating.
20			

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	IN, OUT, PGTH, PGOOD, EN/UVLO, OVP, DEVSLP, FLT	-0.3	20	V
	IN, OUT (10 ms transient)		22	
	dVdT, ILIM	-0.3	3.6	
	IMON	-0.3	7	
Sink current	PGOOD, FLT, dVdT		10	mA
Maximum continuous switch current, T _A = 85°C ⁽²⁾	I _{MAX}		4.78	A
Source current	dVdT, ILIM, IMON	Internally Limited		
Continuous power dissipation	See the Thermal Information table			
Maximum junction temperature	T _J	-40	150	°C
Storage temperature	T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Assumes 15 K power-on-hours at 100% duty cycle. This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI's semiconductor products.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±3000	V
	Charged-device model (CDM), per AEC Q100-011	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IN	Input voltage	2.7		18	V
EN/UVLO, OVP, DEVSLP, OUT, PGTH, PGOOD, FLT		0		18	
dVdT, ILIM		0		3	
IMON		0		6	
ILIM	Resistance	16.9		150	kΩ
IMON		1			
OUT	External capacitance	0.1			μF
dVdT				470	
T _J	Operating junction temperature	-40	25	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS25940xx-Q1	UNIT
		RVC (WQFN)	
		20 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	38.1	°C/W
R _{θJCTop}	Junction-to-case (top) thermal resistance	40.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	13.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.6	°C/W
ψ _{JB}	Junction-to-board characterization parameter	13.7	°C/W
R _{θJCbott}	Junction-to-case (bottom) thermal resistance	3.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

–40°C ≤ T_J = T_A ≤ 125°C, 2.7 V ≤ V_(IN) = 18 V, V_(EN /UVLO) = 2 V, V_(OVP) = V_(DEVSLP) = V_(PGTH) = 0 V, R_(ILIM) = 150 kΩ, C_(OUT) = 1 μF, C_(dVdT) = OPEN, PGOOD = FLT = IMON = OPEN. Positive current into terminals. All voltages referenced to GND (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY VOLTAGE AND INTERNAL UNDERVOLTAGE LOCKOUT

7.5 Electrical Characteristics (continued)

$-40^{\circ}\text{C} \leq T_J = T_A \leq 125^{\circ}\text{C}$, $2.7\text{ V} \leq V_{(\text{IN})} = 18\text{ V}$, $V_{(\text{EN}/\text{UVLO})} = 2\text{ V}$, $V_{(\text{OVP})} = V_{(\text{DEVSLP})} = V_{(\text{PGTH})} = 0\text{ V}$, $R_{(\text{ILIM})} = 150\text{ k}\Omega$, $C_{(\text{OUT})} = 1\text{ }\mu\text{F}$, $C_{(\text{dVdT})} = \text{OPEN}$, $\text{PGOOD} = \overline{\text{FLT}} = \text{IMON} = \text{OPEN}$. Positive current into terminals. All voltages referenced to GND (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
	TPS25940L-Q1		Latch-off		

- These parameters are provided for reference only and do not constitute part of TI's published device specifications for purposes of TI's product warranty.
- Pulse-testing techniques maintain junction temperature close to ambient temperature. Thermal effects must be taken into account separately.

7.6 Timing Requirements

$-40^{\circ}\text{C} \leq T_J = T_A \leq 125^{\circ}\text{C}$, $2.7\text{ V} \leq V_{(\text{IN})} = 18\text{ V}$, $V_{(\text{EN}/\text{UVLO})} = 2\text{ V}$, $V_{(\text{OVP})} = V_{(\text{DEVSLP})} = V_{(\text{PGTH})} = 0\text{ V}$, $R_{(\text{ILIM})} = 150\text{ k}\Omega$, $C_{(\text{OUT})} = 1\text{ }\mu\text{F}$, $C_{(\text{dVdT})} = \text{OPEN}$, $\text{PGOOD} = \overline{\text{FLT}} = \text{IMON} = \text{OPEN}$. Positive current into terminals. All voltages referenced to GND (unless otherwise noted). See [8-1](#) for the timing diagrams.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
ENABLE and UVLO INPUT						
$t_{\text{ON(dly)}}$	EN turnon delay	EN/UVLO \uparrow (100 mV above $V_{(\text{ENR})}$) to $V_{(\text{OUT})} = 100\text{ mV}$, $C_{(\text{dVdT})} < 0.8\text{ nF}$		220	μs	
		EN/UVLO \uparrow (100 mV above $V_{(\text{ENR})}$) to $V_{(\text{OUT})} = 100\text{ mV}$, $C_{(\text{dVdT})} \geq 0.8\text{ nF}$, [$C_{(\text{dVdT})}$ in nF]		$100 + 150 \times C_{(\text{dVdT})}$	μs	
$t_{\text{OFF(dly)}}$	EN turnoff delay	EN/UVLO \downarrow (100 mV below $V_{(\text{ENF})}$) to $\overline{\text{FLT}} \downarrow$		2	μs	
OVERVOLTAGE PROTECTION INPUT (OVP)						
$t_{\text{OVP(dly)}}$	OVP disable delay	OVP \uparrow (100 mV above $V_{(\text{OVPR})}$) to $\overline{\text{FLT}} \downarrow$		2	μs	
OUTPUT RAMP CONTROL (dV/dT)						
t_{dVdT}	Output ramp time	EN/UVLO \uparrow to $V_{(\text{OUT})} = 4.5\text{ V}$, with $C_{(\text{dVdT})} = \text{open}$		0.12	ms	
		EN/UVLO \uparrow to $V_{(\text{OUT})} = 11\text{ V}$, with $C_{(\text{dVdT})} = \text{open}$	0.25	0.37		0.5
		EN/UVLO \uparrow to $V_{(\text{OUT})} = 11\text{ V}$, with $C_{(\text{dVdT})} = 1\text{ nF}$		0.97		
CURRENT LIMIT						
$t_{\text{FAST RIP(dly)}}$	Fast-trip comparator delay	$I_{(\text{OUT})} > I_{(\text{FAST RIP})}$		200	ns	
REVERSE PROTECTION COMPARATOR						
$t_{\text{REV(dly)}}$	Reverse protection comparator delay	$(V_{(\text{IN})} - V_{(\text{OUT})}) \downarrow$ (1 mV overdrive below $V_{(\text{REVTH})}$) to $\overline{\text{FLT}} \downarrow$		10	μs	
		$(V_{(\text{IN})} - V_{(\text{OUT})}) \downarrow$ (10 mV overdrive below $V_{(\text{REVTH})}$) to $\overline{\text{FLT}} \downarrow$		1		
$t_{\text{FWD(dly)}}$		$(V_{(\text{IN})} - V_{(\text{OUT})}) \uparrow$ (10 mV overdrive above $V_{(\text{FWDTH})}$) to $\overline{\text{FLT}} \uparrow$		3.1		
POWER-GOOD COMPARATOR OUTPUT (PGOOD): ACTIVE HIGH						
t_{PGOODR}	PGOOD delay (de-glitch) time	Rising edge	0.42	0.54	0.66	ms
t_{PGOODF}		Falling edge	0.42	0.54	0.66	ms
THERMAL SHUT DOWN (TSD)						
	Retry delay in TSD	TPS25940-Q1/TPS259401A-Q1 Only		128	ms	

7.7 Typical Characteristics

Conditions are $-40^{\circ}\text{C} \leq T_A = T_J \leq 125^{\circ}\text{C}$, $V_{(IN)} = 12\text{ V}$, $V_{(EN/UVLO)} = 2\text{ V}$, $V_{(OVP)} = V_{(DEVSLP)} = V_{(PGTH)} = 0\text{ V}$, $R_{(ILIM)} = 150\text{ k}\Omega$, $C_{(OUT)} = 1\text{ }\mu\text{F}$, $C_{(dVdT)} = \text{OPEN}$, $\text{PGOOD} = \text{FLT} = \text{IMON} = \text{OPEN}$. (unless stated otherwise)

8-1. Timing Diagrams

9 Detailed Description

9.1 Overview

The TPS25940xx-Q1 device is a smart eFuse with integrated back-to-back FETs and enhanced built-in protection circuitry. It provides robust protection for all systems and applications powered from 2.7 V to 18 V.

For hot-plug-in boards, the device provides hot-swap power management with in-rush current control and programmable output ramp-rate. The device integrates overcurrent and short circuit protection. The precision overcurrent limit helps to minimize over design of the input power supply, while the fast response short circuit protection immediately isolates the load from input when a short circuit is detected. The device allows the user to program the overcurrent limit threshold between 0.6 A and 5.3 A via an external resistor.

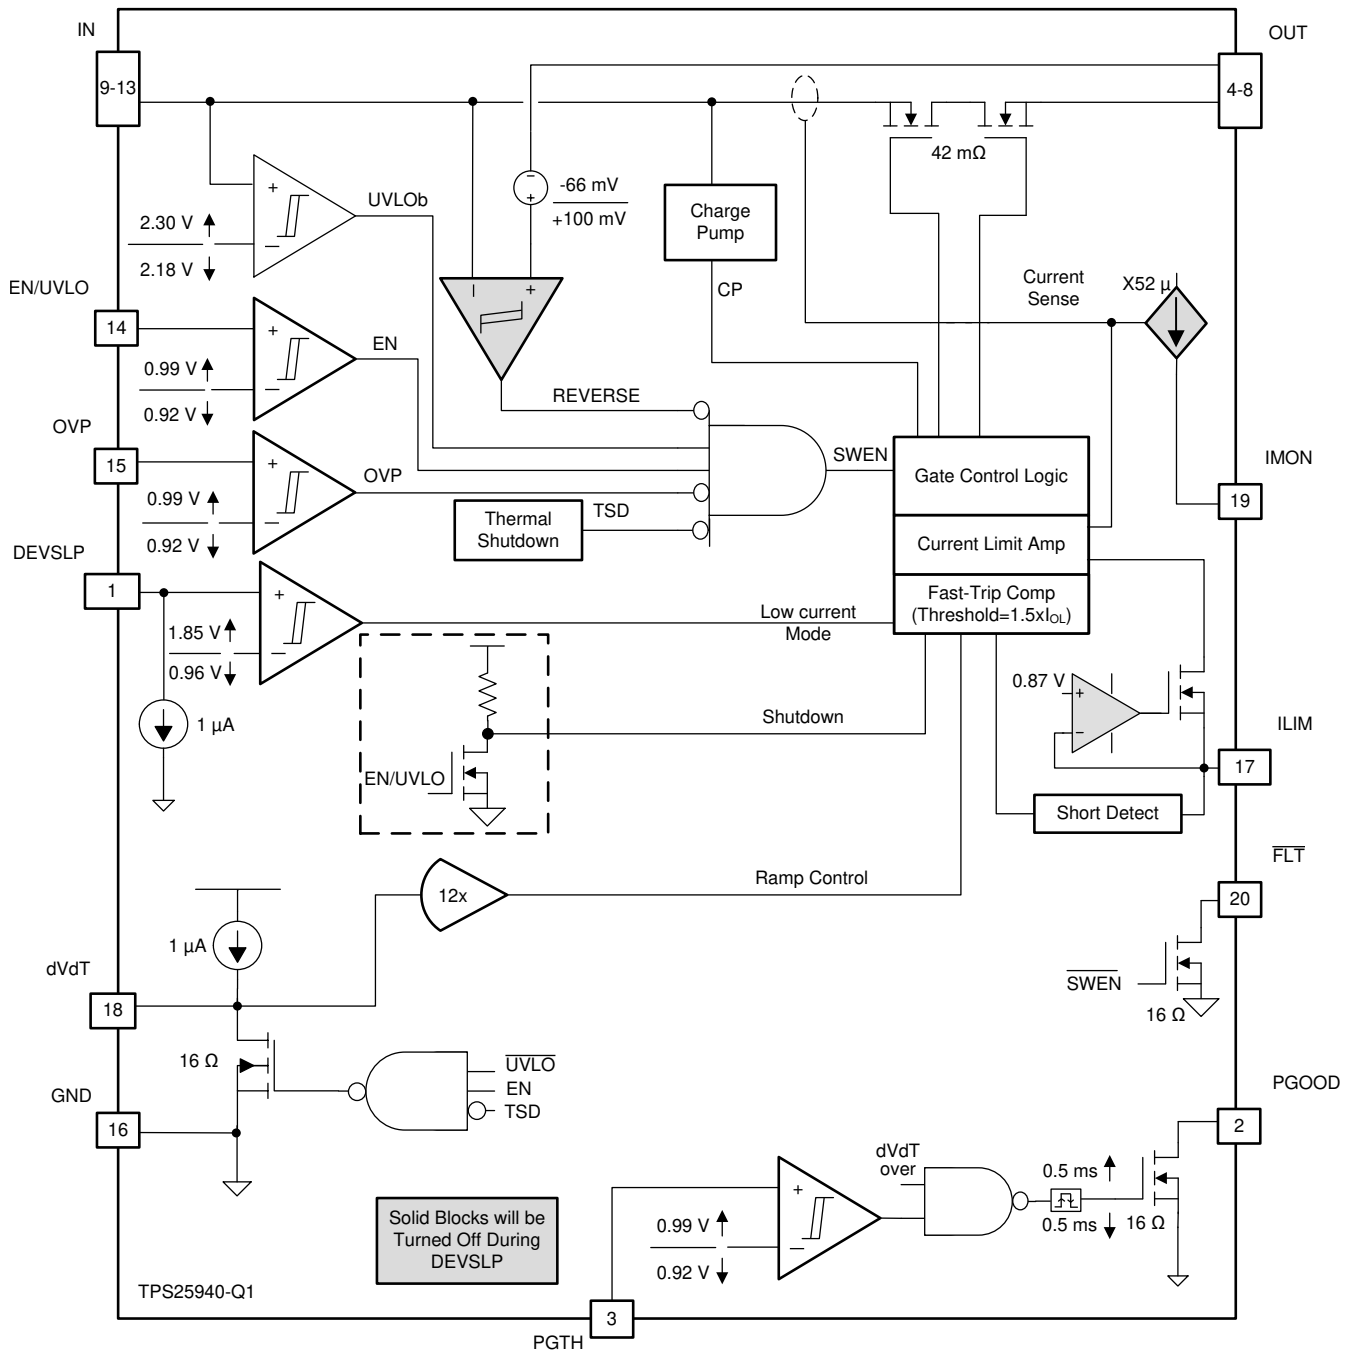

The device provides precise monitoring of voltage bus for brown-out and overvoltage conditions and asserts fault for downstream system. Its overall threshold accuracy of 2% ensures tight supervision of bus, eliminating the need for a separate supply voltage supervisor chip.

The device is designed to protect systems such as USB hubs against sudden output short to battery events. The device monitors $V_{(IN)}$ and $V_{(OUT)}$ to provide true reverse blocking from output when output short to battery fault condition or input power fail condition is detected.

The additional features include:

- Precise current monitor output for health monitoring of the system
- Additional power good comparator with precision internal reference for output or any other rail voltage monitoring
- Over temperature protection to safely shutdown in the event of an overcurrent event
- De-glitched fault reporting for brown-out and overvoltage faults
- A choice of latched or automatic restart mode

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Enable and Adjusting Undervoltage Lockout

The EN/UVLO pin controls the ON and OFF state of the internal FET. A voltage $V_{(EN/UVLO)} < V_{(ENF)}$ on this pin turns off the internal FET, thus disconnecting IN from OUT, while voltage below $V_{(SHUTF)}$ takes the device into shutdown mode, with I_Q less than 15 μA to ensure minimal power loss. Cycling EN/UVLO low and then back high resets the TPS25940L-Q1 that has latched off due to a fault condition.

The internal de-glitch delay on EN/UVLO falling edge is kept low for quick detection of power failure. For applications where a higher de-glitch delay on EN/UVLO is desired, or when the supply is particularly noisy, it is recommended to use an external bypass capacitor from EN/UVLO terminal to GND.

The undervoltage lock out can be programmed by using an external resistor divider from supply IN terminal to EN/UVLO terminal to GND as shown in [Figure 9-1](#). When an undervoltage or input power fail event is detected, the internal FET is quickly turned off, and $\overline{\text{FLT}}$ is asserted. If the Under-Voltage Lock-Out function is not needed, the EN/UVLO terminal must be connected to the IN terminal. EN/UVLO terminal must not be left floating.

The device also implements internal undervoltage-lockout (UVLO) circuitry on the IN terminal. The device disables when the IN terminal voltage falls below internal UVLO Threshold $V_{(UVF)}$. The internal UVLO threshold has a hysteresis of 115 mV.

Figure 9-1. UVLO and OVP Thresholds Set By R_1 , R_2 and R_3

9.3.2 Overvoltage Protection (OVP)

The device incorporates circuit to protect system during overvoltage conditions. A resistor divider connected from the supply to OVP terminal to GND (as shown in [Figure 9-1](#)) programs the overvoltage threshold. A voltage more than $V_{(OVPR)}$ on OVP pin turns off the internal FET and protects the downstream load. This pin must be tied to GND when not used.

9.3.3 Hot Plug-In and In-Rush Current Control

The device is designed to control the in-rush current upon insertion of a card into a live backplane or other "hot" power source. This limits the voltage sag on the backplane's supply voltage and prevents unintended resets of the system power. A slew rate controlled startup (dVdT) also helps to eliminate conductive and radiative interferences. An external capacitor connected from the dVdT pin to GND defines the slew rate of the output voltage at power-on (as shown in [Figure 9-2](#)). Equation governing slew rate at start-up is shown in [Equation 1](#).

Figure 9-2. Output Ramp Up Time t_{dVdT} is Set by $C_{(dVdT)}$

$$I_{(dVdT)} = \left(\frac{C_{(dVdT)}}{GAIN_{(dVdT)}} \right) \times \left(\frac{dV_{(OUT)}}{dt} \right) \quad (1)$$

where

- $I_{(dVdT)} = 1 \mu A$ (typical)
- $\frac{dV_{(OUT)}}{dt}$ = Desired output slew rate
- $GAIN_{(dVdT)} = dVdT$ to OUT gain = 12

The total ramp time (t_{dVdT}) of $V_{(OUT)}$ for 0 to $V_{(IN)}$ can be calculated using 式 2.

$$t_{dVdT} = 8.3 \times 10^4 \times V_{(IN)} \times C_{(dVdT)} \quad (2)$$

The inrush current, $I_{(INRUSH)}$ can be calculated as shown in 式 3.

$$I_{(INRUSH)} = C_{(OUT)} \times V_{(IN)} / t_{dVdT}. \quad (3)$$

The dVdT pin can be left floating to obtain a predetermined slew rate (t_{dVdT}) on the output. When terminal is left floating, the device sets an internal ramp rate of 30 V/ms for output ($V_{(OUT)}$) ramp.

Figure 10-7 and Figure 10-8 illustrate the inrush current control behavior of the device. For systems where load is present during start-up, the current never exceeds the overcurrent limit set by $R_{(ILIM)}$ resistor for the application. For defining appropriate charging time-rate under different load conditions, see the [Setting Output Voltage Ramp Time \(\$T_{dVdT}\$ \)](#) section.

9.3.4 Overload and Short Circuit Protection

At all times load current is monitored by sensing voltage across an internal sense resistor. During overload events, current is limited to the current limit ($I_{(LIM)}$) programmed by $R_{(ILIM)}$ resistor as shown in 式 4.

$$I_{(LIM)} = \frac{89}{R_{(ILIM)}} \quad (4)$$

where

- $I_{(LIM)}$ is overload current limit in Ampere
- $R_{(ILIM)}$ is the current limit resistor in k Ω

The device incorporates two distinct levels: a current limit ($I_{(LIM)}$) and a fast-trip threshold ($I_{(FASTTRIP)}$). Fast trip and current limit operation are shown in Figure 9-3.

Bias current on ILIM pin directly controls current-limiting behavior of the device, and PCB routing of this node must be kept away from any noisy (switching) signals.

9.3.4.1 Overload Protection

For overload conditions, the internal current-limit amplifier regulates the output current to $I_{(LIM)}$. The output voltage droops during the current regulation, resulting in increased power dissipation in the device. If the device junction temperature reaches the thermal shutdown threshold ($T_{(TSD)}$), the internal FET is turned off. When in thermal shutdown, the TPS25940L-Q1 version stays latched off, whereas the TPS25940-Q1/TPS259401A-Q1 versions commence an auto-retry cycle 128 ms after $T_J < [T_{(TSD)} - 12^\circ\text{C}]$. During thermal shutdown, the fault pin \overline{FLT} pulls low to signal a fault condition. [☒ 10-11](#) and [☒ 10-12](#) illustrate overload behavior.

9.3.4.2 Short Circuit Protection

During a transient short circuit event, the current through the device increases very rapidly. As current-limit amplifier cannot respond quickly to this event because of its limited bandwidth, the device incorporates a fast-trip comparator, with a threshold $I_{(FASTRIP)}$. This comparator shuts down the pass device within $1\mu\text{s}$, when the current through internal FET exceeds $I_{(FASTRIP)}$ ($I_{(OUT)} > I_{(FASTRIP)}$), and terminates the rapid short-circuit peak current. The trip threshold is set to more than 50% of the programmed overload current limit ($I_{(FASTRIP)} = 1.5 \times I_{(LIM)} + 0.375$). The fast-trip circuit holds the internal FET off for only a few microseconds, after which the device turns back on slowly, allowing the current-limit loop to regulate the output current to $I_{(LIM)}$. Then, device behaves similar to overload condition. [☒ 10-13](#) through [☒ 10-14](#) illustrate the behavior of the system when the current exceeds the fast-trip threshold.

9.3.4.3 Start-Up with Short on Output

During start-up into a short circuit current is limited to $I_{(LIM)}$. [☒ 9-3](#) and [☒ 10-15](#) illustrate start-up with a short on the output. This feature helps in quick fault isolation and hence ensures stability of the DC bus.

9.3.4.4 Constant Current Limit Behavior During Overcurrent Faults

When power dissipation in the internal FET [$P_D = (V_{(IN)} - V_{(OUT)}) \times I_{(OUT)}$] $> 10\text{ W}$, there is approximately 0% to 5% thermal fold back in the current limit value so that $I_{(LIM)}$ drops to I_{OS} . Eventually, the device shuts down because of over temperature.

☒ 9-3. Fast-Trip Current

9.3.5 FAULT Response

The \overline{FLT} open-drain output is asserted (active low) during undervoltage, overvoltage, reverse voltage-current and thermal shutdown conditions. The \overline{FLT} signal remains asserted until the fault condition is removed and the device resumes normal operation. The device is designed to eliminate false fault reporting by using an internal "de-glitch" circuit for undervoltage and overvoltage ($2.2\text{-}\mu\text{s}$ typical) conditions without the need for external circuitry. This ensures that fault is not accidentally asserted during transients on input bus.

Connect \overline{FLT} with a pull up resistor to Input or Output voltage rail. \overline{FLT} may be left open or tied to ground when not used. $V_{(IN)}$ falling below $V_{(UVF)} = 2.1\text{ V}$ resets \overline{FLT} .

9.3.6 Current Monitoring

The current source at IMON terminal is configured to be proportional to the current flowing from IN to OUT. This current can be converted to a voltage using a resistor $R_{(IMON)}$ from IMON terminal to GND terminal. This voltage, computed using 式 6, can be used as a means of monitoring current flow through the system.

The maximum voltage range for monitoring the current ($V_{(IMONmax)}$) is limited to minimum($[V_{(IN)} - 2.2 \text{ V}], 6 \text{ V}$) to ensure linear output. This puts limitation on maximum value of $R_{(IMON)}$ resistor and is determined by 式 5.

$$R_{(IMONmax)} = \frac{\text{minimum}(V_{(IN)} - 2.2, 6)}{1.6 \times I_{(LIM)} \times \text{GAIN}_{(IMON)}} \quad (5)$$

The output voltage at IMON terminal is calculated from 式 6.

$$V_{(IMON)} = [I_{(OUT)} \times \text{GAIN}_{(IMON)} + I_{(IMON_OS)}] \times R_{(IMON)} \quad (6)$$

where

- $\text{GAIN}_{(IMON)}$ = Gain factor $I_{(IMON)}:I_{(OUT)} = 52 \mu\text{A}/\text{A}$
- $I_{(OUT)}$ = Load current
- $I_{(IMON_OS)}$ = 0.8 μA (typical)

This pin must not have a bypass capacitor to avoid delay in the current monitoring information.

The voltage at IMON pin can be digitized using an ADC (such as ADS1100, SBAS239) to read the current monitor information over an I²C bus.

9.3.7 Power Good Comparator

The device incorporates a Power Good comparator for co-ordination of status to downstream DC-DC converters or system monitoring circuits. The comparator has an internal reference of $V_{(PGTHR)} = 0.99 \text{ V}$ at negative terminal and positive terminal PGTH can be utilized for monitoring of either input or output of the device. The comparator output PGOOD is an open-drain active high signal, which can be used to indicate the status to downstream units. PGOOD is asserted high when internal FET is fully enhanced and PGTH pin voltage is higher than internal reference $V_{(PGTHR)}$.

The PGOOD signal has deglitch time incorporated to ensure that internal FET is fully enhanced before heavy load is applied by downstream converters. Rising de-glitch delay is determined by 式 7.

$$t_{PGOOD(decl)} = \text{Maximum}\{(3.5 \times 10^6 \times C_{(dVdT)}), t_{PGOODR}\} \quad (7)$$

Connect the PGOOD pin with a pull up resistor to Input or Output voltage rail. PGOOD may be left open or tied to ground when not used.

9.3.8 IN, OUT and GND Pins

The device has multiple pins for input (IN) and output (OUT).

All IN pins must be connected together and to the power source. A ceramic bypass capacitor close to the device from IN to GND is recommended to alleviate bus transients. The recommended operating voltage range is 2.7 V – 18 V.

Similarly all OUT pins must be connected together and to the load. $V_{(OUT)}$ in the ON condition, is calculated using 式 8.

$$V_{(OUT)} = V_{(IN)} - (R_{ON} \times I_{(OUT)}) \quad (8)$$

where, R_{ON} is the total ON resistance of the internal FET.

GND terminal is the most negative voltage in the circuit and is used as a reference for all voltage reference unless otherwise specified.

9.3.9 Thermal Shutdown

Internal over temperature shutdown disables turns off the FET when $T_J > 160^\circ\text{C}$ (typical). The TPS25940L-Q1 version stays latched off, whereas TPS25940-Q1/TPS259401A-Q1 versions commence an auto-retry cycle 128 ms after T_J drops below $[T_{(TSD)} - 12^\circ\text{C}]$. During the thermal shutdown, the fault pin $\overline{\text{FLT}}$ pulls low to signal a fault condition.

9.4 Device Functional Modes

9.4.1 DevSleep Mode

The TPS25940xx-Q1 device provides a dedicated DevSleep interface terminal (DEVSLP) to drive the device in low power mode. When pulled high, it puts the device in low power DevSleep mode. In this mode, the quiescent current consumption of the device is limited to less than 130 μA (95- μA typical). During this mode, the output voltage remains active, the overload current limit is set to $I_{(\text{DEVSLP}(\text{LIM}))}$ and functionality of reverse comparator and current monitoring is disabled. All other protections are kept active ensuring the safety of the system even in DevSleep mode.

User must ensure that load currents on the bus are limited to less than $I_{(\text{DEVSLP}(\text{LIM}))}$, when the device is driven to DevSleep mode. Also, while coming out of DevSleep, it is important to sequence the TPS25940xx-Q1 earlier than the load. Otherwise, the load can exceed $I_{(\text{DEVSLP}(\text{LIM}))}$ and cause the TPS25940xx-Q1 to enter the overload mode.

☒ 9-4 through ☒ 9-7 illustrate the behavior of the system in DevSleep mode.

9.4.2 Shutdown Control

The internal FET and hence the load current can be remotely switched off by taking the UVLO pin below its 0.6-V threshold with an open collector or open drain device as shown in [Figure 9-8](#). The device quiescent current is reduced to less than 20 μA in this state. Upon releasing the UVLO pin the device turns on with soft-start cycle.

10 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。また、お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

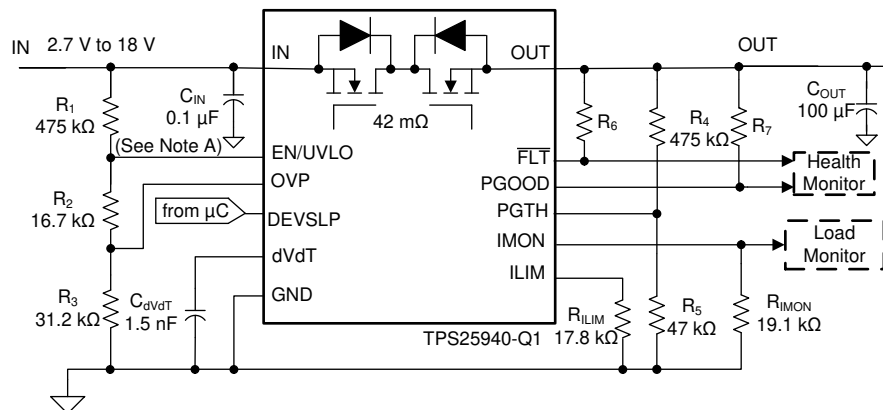

10.1 Application Information

The TPS25940xx-Q1 device is a smart eFuse. It is typically used for Hot-Swap and Power rail protection applications. It operates from 2.7 V to 18 V with programmable current limit, overvoltage and undervoltage protection. The device aids in controlling the in-rush current and provides fast turn-off during reverse voltage conditions for systems such as USB ports prone to Short-to-Battery faults, Servers, Power Back-up Storage units and RAID cards. The device also provides robust protection for multiple faults on the sub-system rail.

The [Detailed Design Procedure](#) section can be used to select component values for the device.

Alternatively, the WEBENCH® software may be used to generate a complete design. The WEBENCH® software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. Additionally, a spreadsheet design tool [TPS25940 Design Calculator](#) is available on web folder.

10.2 Typical Application

A. C_{IN} : Optional and only for noise suppression.

☒ 10-1. Typical Application Schematic

10.2.1 Design Requirements

表 10-1 lists the Design Parameters.

表 10-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage, $V_{(IN)}$	12 V
Undervoltage lockout set point, $V_{(UV)}$	10.8 V
Oversvoltage protection set point, $V_{(LIM)}$	16.5 V
Load at Start-Up, $R_{L(SU)}$	4.8 Ω
Current limit, $I_{(LIM)}$	5 A
Load capacitance, $C_{(OUT)}$	100 μ F
Maximum ambient temperatures, T_A	85°C

10.2.2 Detailed Design Procedure

The following design procedure can be used to select component values for the TPS25940xx-Q1.

10.2.2.1 Step by Step Design Procedure

To begin the design process a few parameters must be decided upon. The designer must know the following:

- Normal input operation voltage
- Maximum output capacitance
- Maximum current Limit
- Load during start-up
- Maximum ambient temperature of operation

This design procedure below seeks to control the junction temperature of device under both static and transient conditions by proper selection of output ramp-up time and associated support components. The designer can adjust this procedure to fit the application and design criteria.

10.2.2.2 Programming the Current-Limit Threshold: $R_{(ILIM)}$ Selection

The $R_{(ILIM)}$ resistor at the ILIM pin sets the over load current limit, this can be set using 式 9.

$$R_{(ILIM)} = \frac{89}{5} = 17.8k\Omega \quad (9)$$

Choose closest standard value: 17.8-k, 1% standard value resistor.

10.2.2.3 Undervoltage Lockout and Oversvoltage Set Point

The undervoltage lockout (UVLO) and oversvoltage trip point are adjusted using the external voltage divider network of R_1 , R_2 and R_3 as connected between IN, EN, OVP and GND pins of the device. The values required for setting the undervoltage and oversvoltage are calculated solving 式 10 and 式 11.

$$V_{(OVPR)} = \frac{R_3}{R_1 + R_2 + R_3} \times V_{(OV)} \quad (10)$$

$$V_{(ENR)} = \frac{R_2 + R_3}{R_1 + R_2 + R_3} \times V_{(UV)} \quad (11)$$

For minimizing the input current drawn from the power supply $\{I_{(R123)} = V_{(IN)}/(R_1 + R_2 + R_3)\}$, it is recommended to use higher values of resistance for R_1 , R_2 and R_3 .

However, leakage currents because of the external active components connected to the resistor string can add error to these calculations. So, the resistor string current, $I_{(R123)}$ must be chosen to be 20 times greater than the leakage current expected.

From the device electrical specifications, $V_{(OVPR)} = 0.99$ V and $V_{(ENR)} = 0.99$ V. For design requirements, $V_{(OV)}$ is 16.5 V and $V_{(UV)}$ is 10.8 V. To solve the equation, first choose the value of $R_3 = 31.2$ k Ω and use 式 10 to solve for $(R_1 + R_2) = 488.8$ k Ω . Use 式 11 and value of $(R_1 + R_2)$ to solve for $R_2 = 16.47$ k Ω and finally $R_1 = 472.33$ k Ω .

Using the closest standard 1% resistor values gives $R_1 = 475$ k Ω , $R_2 = 16.7$ k Ω , and $R_3 = 31.2$ k Ω .

The power failure threshold is detected on the falling edge of supply. This threshold voltage is 7% lower than the rising threshold, $V_{(UV)}$. This is calculated using 式 12.

$$V_{(PFAIL)} = 0.93 \times V_{(UV)} \quad (12)$$

10.2.2.4 Programming Current Monitoring Resistor— $R_{(IMON)}$

Voltage at IMON pin $V_{(IMON)}$ represents the voltage proportional to load current. This can be connected to an ADC of the downstream system for health monitoring of the system. The $R_{(IMON)}$ need to be configured based on the maximum input voltage range of the ADC used. $R_{(IMON)}$ is set using 式 13.

$$R_{(IMON)} = \frac{V_{(IMONmax)}}{I_{(LIM)} \times 52 \times 10^{-6}} \text{ k}\Omega \quad (13)$$

For $I_{(LIM)} = 5$ A, and considering the operating range of ADC from 0 V to 5 V, $V_{(IMONmax)}$ is 5 V and $R_{(IMON)}$ is determined by:

$$R_{(IMON)} = \frac{5}{5 \times 52 \times 10^{-6}} = 19.23 \text{ k}\Omega \quad (14)$$

Selecting $R_{(IMON)}$ value less than determined by 式 14 ensures that ADC limits are not exceeded for maximum value of load current.

If the IMON pin voltage is not being digitized with an ADC, $R_{(IMON)}$ can be selected to produce a 1V/1A voltage at the IMON pin, using 式 13.

Choose closest 1 % standard value: 19.1 k Ω .

If current monitoring up to $I_{(FASTRIP)}$ is desired, $R_{(IMON)}$ can be reduced by a factor of 1.6, as in 式 5.

10.2.2.5 Setting Output Voltage Ramp Time (t_{dVdT})

For a successful design, the junction temperature of device must be kept below the absolute-maximum rating during both dynamic (start-up) and steady state conditions. Dynamic power stresses often are an order of magnitude greater than the static stresses, so it is important to determine the right start-up time and in-rush current limit required with system capacitance to avoid thermal shutdown during start-up with and without load.

The ramp-up capacitor $C_{(dVdT)}$ needed is calculated considering the two possible cases [Case 1: Start-up Without Load: Only Output Capacitance \$C_{\(OUT\)}\$ Draws Current During Start-up](#) and [Case 2: Start-Up With Load: Output Capacitance \$C_{\(OUT\)}\$ and Load Draws Current During Start-Up](#).

10.2.2.5.1 Case1: Start-Up Without Load: Only Output Capacitance $C_{(OUT)}$ Draws Current During Start-Up

During start-up, as the output capacitor charges, the voltage difference across the internal FET decreases, and the power dissipated decreases as well. Typical ramp-up of output voltage $V_{(OUT)}$ with inrush current limit of 1.2 A and power dissipated in the device during start-up is shown in 图 10-2. The average power dissipated in the device during start-up is equal to area of triangular plot (red curve in 图 10-2) averaged over t_{dVdT} .

For the TPS25940-Q1 device, the inrush current is determined as shown in 式 15.

$$I = C \times \frac{dV}{dT} \Rightarrow I_{(INRUSH)} = C_{(OUT)} \times \frac{V_{(IN)}}{t_{dVdT}} \quad (15)$$

Power dissipation during start-up is given by 式 16.

$$P_{D(INRUSH)} = 0.5 \times V_{(IN)} \times I_{(INRUSH)} \quad (16)$$

式 16 assumes that load does not draw any current until the output voltage has reached its final value.

10.2.2.5.2 Case 2: Start-Up With Load: Output Capacitance $C_{(OUT)}$ and Load Draws Current During Start-Up

When load draws current during the turn-on sequence, there is additional power dissipated. Considering a resistive load $R_{L(SU)}$ during start-up, load current ramps up proportionally with increase in output voltage during t_{dVdT} time. Typical ramp-up of output voltage, Load current and power dissipation in the device is shown in 10-4 and power dissipation with respect to time is plotted in 10-5. The additional power dissipation during start-up phase is calculated as shown in 式 17 and 式 18.

$$(V_I - V_O)(t) = V_{(IN)} \times \left(1 - \frac{t}{t_{dVdT}}\right) \quad (17)$$

$$I_L(t) = \left(\frac{V_{(IN)}}{R_{L(SU)}}\right) \times \frac{t}{t_{dVdT}} \quad (18)$$

Where $R_{L(SU)}$ is the load resistance present during start-up. Average energy loss in the internal FET during charging time due to resistive load is given by 式 19.

$$W_t = \int_0^{t_{dVdT}} V_{(IN)} \times \left(1 - \frac{t}{t_{dVdT}}\right) \times \left(\frac{V_{(IN)}}{R_{L(SU)}} \times \frac{t}{t_{dVdT}}\right) dt \quad (19)$$

On solving 式 19 the average power loss in the internal FET due to load is shown in 式 20.

$$P_{D(Load)} = \left(\frac{1}{6}\right) \times \frac{V_{(IN)}^2}{R_{L(SU)}} \quad (20)$$

Total power dissipated in the device during startup is shown is 式 21.

$$P_{D(STARTUP)} = P_{D(INRUSH)} + P_{D(Load)} \quad (21)$$

Total current during startup is given by 式 22.

$$I_{(STARTUP)} = I_{(INRUSH)} + I_L(t) \quad (22)$$

If $I_{(STARTUP)} > I_{(LIM)}$, the device limits the current to $I_{(LIM)}$ and the current limited charging time is determined by 式 23.

$$t_{dVdT(\text{current limited})} = C_{(OUT)} \times \frac{V_{(IN)}}{I_{(LIM)}} \quad (23)$$

The power dissipation, with and without load, for selected start-up time must not exceed the shutdown limits as shown in 10-6.

Taken on 2-Layer board, 2oz.(0.08-mm thick) with GND plane area: 14 cm² (Top) and 20 cm² (bottom)

Figure 10-6. Thermal Shutdown Limit Plot

For the design example under discussion,

Select ramp-up capacitor $C_{(dVdT)} = 1\text{nF}$, using 式 24.

$$t_{dVdT} = 8.3 \times 10^4 \times 12 \times 1 \times 10^{-9} = 0.996\text{ms} = \sim 1\text{ms} \quad (24)$$

The inrush current drawn by the load capacitance ($C_{(OUT)}$) during ramp-up using 式 25.

$$I_{(INRUSH)} = (100 \times 10^{-6}) \times \left(\frac{12}{1 \times 10^{-3}} \right) = 1.2 \text{ A} \quad (25)$$

The inrush Power dissipation is calculated, using 式 26.

$$P_{D(INRUSH)} = 0.5 \times 12 \times 1.2 = 7.2 \text{ W} \quad (26)$$

For 7.2 W of power loss, the thermal shut down time of the device must not be less than the ramp-up time t_{dVdT} to avoid the false trip at maximum operating temperature. From thermal shutdown limit graph 图 10-6 at $T_A = 85^\circ\text{C}$, for 7.2 W of power the shutdown time is approximately 60 ms. So it is safe to use 1 ms as start-up time without any load on output.

Considering the start-up with load 4.8 Ω , the additional power dissipation, when load is present during start up is calculated, using 式 27.

$$P_{D(Load)} = \left(\frac{1}{6} \right) \times \frac{12 \times 12}{4.8} = 5 \text{ W} \quad (27)$$

The total device power dissipation during start up is given by 式 28.

$$P_{D(STARTUP)} = (7.2 + 5) = 12.2 \text{ W} \quad (28)$$

From thermal shutdown limit graph at $T_A = 85^\circ\text{C}$, the thermal shutdown time for 12.2 W is close to 7.5 ms. It is safe to have 30% margin to allow for variation of system parameters such as load, component tolerance, and input voltage. So it is well within acceptable limits to use the 1 nF capacitor with start-up load of 4.8 Ω .

If there is a need to decrease the power loss during start-up, it can be done with increase of $C_{(dVdT)}$ capacitor.

To illustrate, choose $C_{(dVdT)} = 1.5 \text{ nF}$ as an option and recalculate:

$$t_{dVdT} = 1.5\text{ms} \quad (29)$$

$$I_{(INRUSH)} = (100 \times 10^{-6}) \times \left(\frac{12}{1.5 \times 10^{-3}} \right) = 0.8 \text{ A} \quad (30)$$

$$P_{D(INRUSH)} = 0.5 \times 12 \times 0.8 = 4.8 \text{ W} \quad (31)$$

$$P_{D(LOAD)} = \left(\frac{1}{6} \right) \times \left(\frac{12 \times 12}{4.8} \right) = 5 \text{ W} \quad (32)$$

$$P_{D(STARTUP)} = 4.8 + 5 = 9.8 \text{ W} \quad (33)$$

From thermal shutdown limit graph at $T_A = 85^\circ\text{C}$, the shutdown time for 10-W power dissipation is approximately 17 ms, which increases the margins further for shutdown time and ensures successful operation during start up and steady state conditions.

The spreadsheet tool available on the web can be used for iterative calculations.

10.2.2.6 Programing the Power Good Set Point

As shown in [Figure 10-1](#), R_4 and R_5 sets the required limit for PGOOD signal as needed for the downstream converters. Considering a power good threshold of 11 V for this design, the values of R_4 and R_5 are calculated using [Equation 34](#).

$$V_{(PGTH)} = 0.99 \times \left(1 + \frac{R_4}{R_5} \right) \quad (34)$$

It is recommended to have high values for these resistors to limit the current drawn from the output node. Choosing a value of $R_4 = 475 \text{ k}\Omega$, $R_5 = 47 \text{ k}\Omega$ provides $V_{(PGTH)} = 11 \text{ V}$.

10.2.2.7 Support Component Selections— R_6 , R_7 and C_{IN}

Reference to application schematics, R_6 and R_7 are required only if PGOOD and $\overline{\text{FLT}}$ are used; these resistors serve as pull-ups for the open-drain output drivers. The current sunk by each of these pins must not exceed 10 mA (refer to the [Absolute Maximum Ratings](#) table). C_{IN} is a bypass capacitor to help control transient voltages, unit emissions, and local supply noise. Where acceptable, a value in the range of 0.001 μF to 0.1 μF is recommended for $C_{(IN)}$.

10.2.4 System Examples

10.2.4.1 V_{BUS} Short-to-Battery, Short-to-Ground Protection of USB Port in Automotive Systems

The TPS25940xx-Q1 eFuse offers robust protection for the 5-V Power rail of USB ports under faults conditions like Short-to-Ground, Short-to-Battery and Overload.

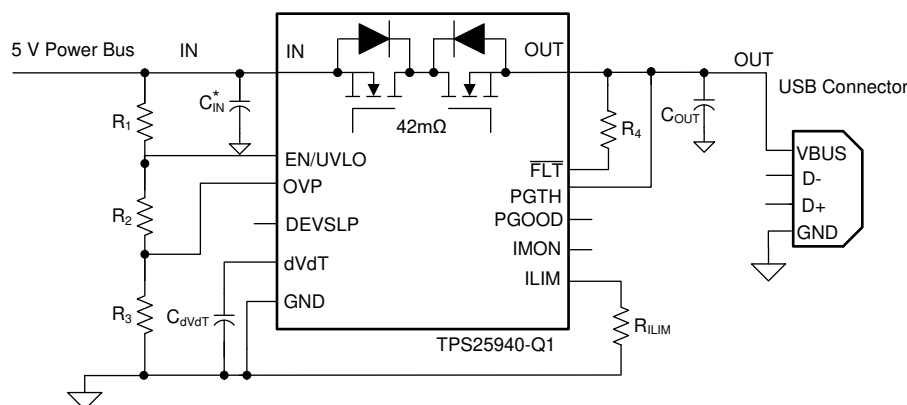

5-V Power rail gets disconnected from the output within approximately 200 ns during short circuit to Ground fault.

TPS25940-Q1

JAJSC83E – MAY 2016 – REVISED JANUARY 2021

The eFuse monitors the reverse voltage from IN to OUT and when it exceeds -66 mV , it stops the flow of reverse current. This operation protects the 5-V power rail from Short-to-Battery faults.

Typical application schematic of TPS25940xx-Q1 usage in USB port protection for automotive application is shown in [10-20](#).

10-20. Automotive USB Hub-Port – V_{BUS} Short-to-Battery, V_{BUS} Short-to-GND Protection

[10-21](#) and [10-22](#) show the performance of TPS25940-Q1 under Short-to-Battery and Short-to-Ground faults.

$V_{(IN)} = 5\text{ V}$

$C_{(OUT)} = 4.7\text{ }\mu\text{F}$

10-21. V_{BUS} Short-to-Battery Protection

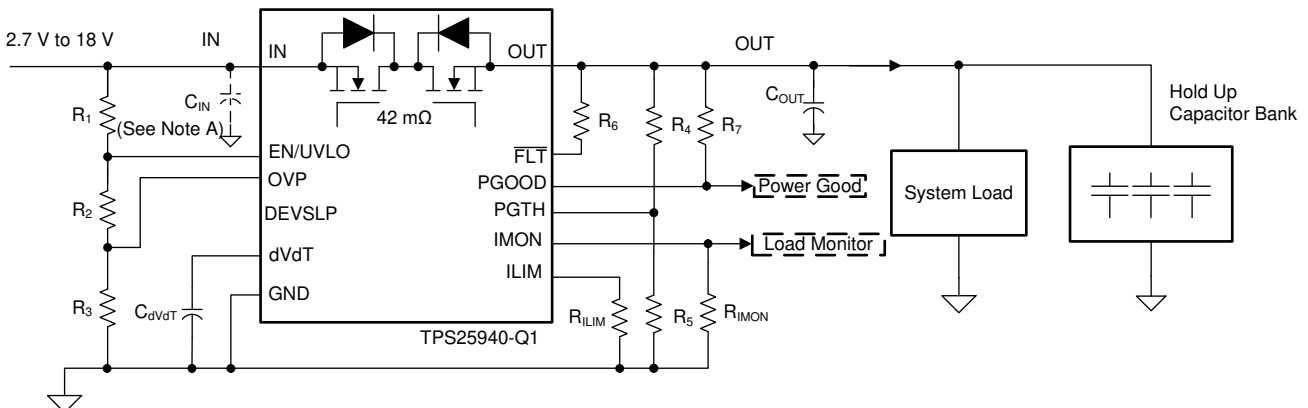

10-22. V_{BUS} Short-to-Ground Protection

10.2.4.2 Power Failure Protection for Holdup Power

For certain applications, it is necessary to have hold-up circuit and capacitor bank to ensure that critical user data is never lost during power-failure to the drive. The power-failure event could be because of the momentary loss of power regulation (transient brown-out condition) or because of the loss of power when system is hot-plugged out.

The TPS25940xx-Q1 device continuously monitors the supply voltage at EN/UVLO pin and swiftly disconnects the input bus from output when the voltage drops below a predefined threshold (power fail detection). Reverse current flow from output side to input supply gets blocked when reverse voltage from IN to OUT exceeds -66 mV. In addition, it provides an instant warning signal (FLT) to the controller. Its swift true reverse blocking feature reacts in $1 \mu\text{s}$ (typical) ensuring that the capacitor bank charge is retained. This helps the drive to have power for longer time to harden data and reduces the capacitance required in the hold-up bank, saving system cost.

The typical application diagram of TPS25940xx-Q1 usage for holdup power is shown in 10-23.

A. C_{IN} : Optional and only for noise suppression.

10-23. Holdup Capacitor Implementation Using TPS25940xx-Q1

The oscilloscope plots demonstrating the true reverse blocking, fast turn-off and FLT signal delay are shown in 10-24 through 10-26.

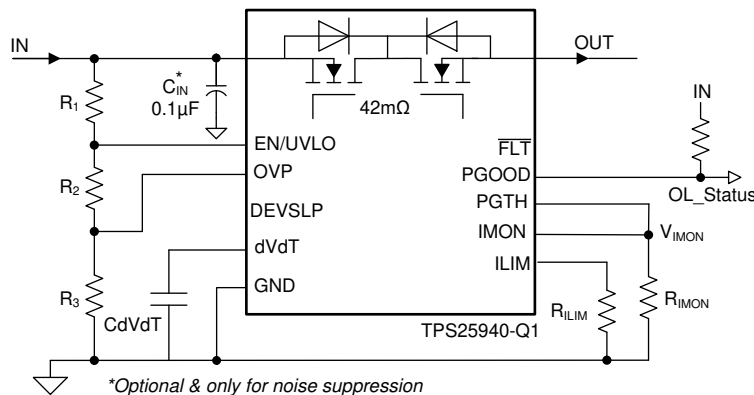

TPS25940-Q1

JAJSC83E – MAY 2016 – REVISED JANUARY 2021

10.2.4.3 Overload Detection Using TPS25940xx-Q1

The TPS25940xx-Q1 device has enhanced features such as load current monitoring output IMON and an integrated power good comparator for voltage monitoring. These two functional blocks can be utilized as per circuit configuration shown in 10-27, to FLAG the overload event.

10-27. Circuit Configuration for Overload Detection Using TPS25940xx-Q1

The output voltage at IMON terminal V_{IMON} can be used as a means of monitoring current flow through the system and its value can be calculated from 6.

The power good comparator of TPS25940xx-Q1 has an internal reference of $V_{PGTHR} = 0.99\text{ V}$ at the negative terminal and the positive terminal PGTH can be utilized for monitoring voltage of any specific rail. As shown in the [Figure 10-27](#), the output voltage at IMON terminal (V_{IMON}) is fed to the positive terminal PGTH (V_{PGTH}) of the comparator. When the PGTH pin voltage ($V_{PGTH} = V_{IMON}$) is higher than the internal reference V_{PGTHR} , the open-drain comparator output PGOOD asserts HIGH to indicate overload event.

For example, to detect overcurrent event at load current I_{OUT} of 300 mA, the value of R_{IMON} can be calculated using [Equation 35](#).

$$V_{IMON} = V_{PGTHR} = (I_{OUT} \times GAIN_{IMON} + I_{IMON_OS}) \times R_{IMON} \quad (35)$$

$$R_{IMON} = \frac{V_{PGTHR}}{(I_{OUT} \times GAIN_{IMON} + I_{IMON_OS})} = \frac{0.99\text{ V}}{\left(300\text{ mA} \times 52 \frac{\mu\text{A}}{\text{A}} + 0.8\ \mu\text{A}\right)} = 60.36\text{ k}\Omega \quad (36)$$

A close value of 61.9 kΩ is chosen for R_{IMON} .

[Figure 10-28](#) shows the overload flag status when the load is changed from 150 mA to 600 mA and back. As seen in the [Figure 10-28](#), the overload status (OL_Status) becomes active HIGH when the load current crosses 300 mA.

Figure 10-28. Overload Flag Status for Change in Load from 150 mA to 600 mA and Back

11 Power Supply Recommendations

The TPS25940xx-Q1 device is designed for supply voltage range of $2.7\text{ V} \leq V_{\text{IN}} \leq 18\text{ V}$. If the input supply is located more than a few inches from the device an input ceramic bypass capacitor higher than $0.1\text{ }\mu\text{F}$ is recommended. Power supply must be rated higher than the current limit set to avoid voltage droops during over current and short-circuit conditions.

11.1 Transient Protection

In case of short circuit and over load current limit, when the device interrupts current flow, input inductance generates a positive voltage spike on the input and output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on value of inductance in series to the input or output of the device. In case of sudden Output short-to-Battery faults with a long external cable, the cable inductance and output capacitance generates over voltage spike at the output. Such transients can exceed the *Absolute Maximum Ratings* of the device if steps are not taken to address the issue.

Typical methods for addressing transients include

- Minimizing lead length and inductance into and out of the device
- Using large PCB GND plane
- A 18-V TVS across output to GND to absorb positive spikes. Schottky diode across the output to absorb negative spikes
- A low value ceramic capacitor ($C_{\text{IN}} = 0.001\text{ }\mu\text{F}$ to $0.1\text{ }\mu\text{F}$) to absorb the energy and dampen the transients. The approximate value of input capacitance can be estimated with 式 37.

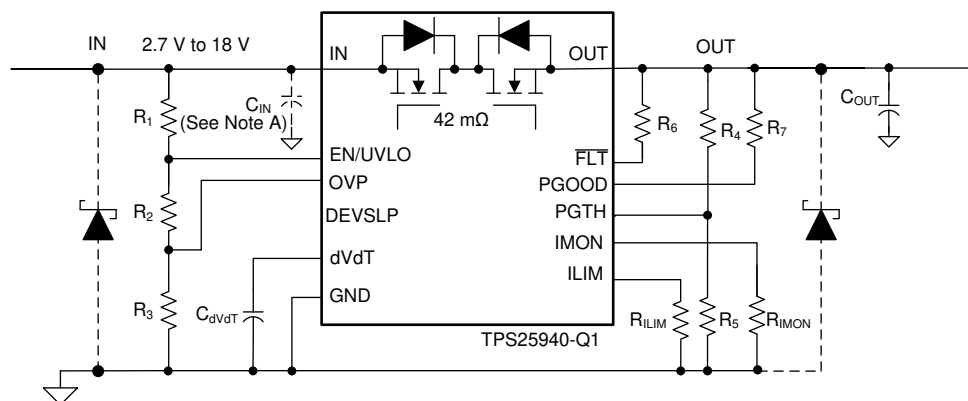

$$V_{\text{SPIKE(Absolute)}} = V_{\text{(IN)}} + I_{\text{(LOAD)}} \times \sqrt{\frac{L_{\text{(IN)}}}{C_{\text{(IN)}}}} \quad (37)$$

where

- $V_{\text{(IN)}}$ is the nominal supply voltage
- $I_{\text{(LOAD)}}$ is the load current,
- $L_{\text{(IN)}}$ equals the effective inductance seen looking into the source
- $C_{\text{(IN)}}$ is the capacitance present at the input

Some applications may require the addition of a Transient Voltage Suppressor (TVS) to prevent transients from exceeding the *Absolute Maximum Ratings* of the device.

The circuit implementation with optional protection components (a ceramic capacitor, TVS and schottky diode) is shown in 图 11-1.

A. Optional components needed for suppression of transients

图 11-1. Circuit Implementation with Optional Protection Components

11.2 Output Short-Circuit Measurements

It is difficult to obtain repeatable and similar short-circuit testing results. Source bypassing, input leads, circuit layout and component selection, output shorting method, relative location of the short, and instrumentation all contribute to variation in results. The actual short itself exhibits a certain degree of randomness as it microscopically bounces and arcs. Care in configuration and methods must be used to obtain realistic results. Do not expect to see waveforms exactly like those in the data sheet; every setup differs.

12 Layout

12.1 Layout Guidelines

- For all applications, a 0.1-uF or greater ceramic decoupling capacitor is recommended between IN terminal and GND. For hot-plug applications, where input power path inductance is negligible, this capacitor can be eliminated/minimized.
- The optimum placement of decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the IC. See [Figure 12-1](#) for a PCB layout example.
- High current carrying power path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- Low current signal ground (SGND), which is the reference ground for the device must be a copper plane or island.
- Locate all TPS25940xx-Q1 support components: $R_{(ILIM)}$, C_{dVdT} , $R_{(IMON)}$, and resistors for UVLO and OVP, close to their connection pin. Connect the other end of the component to the SGND with shortest trace length.
- The trace routing for the $R_{(ILIM)}$ and $R_{(IMON)}$ components to the device must be as short as possible to reduce parasitic effects on the current limit and current monitoring accuracy. These traces must not have any coupling to switching signals on the board.
- The SGND plane must be connected to high current ground (main power ground) at a single point, that is at the negative terminal of input capacitor.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect, and routed with short traces to reduce inductance. For example, a protection Schottky diode is recommended to address negative transients due to switching of inductive loads, and it must be physically close to the OUT pins.
- Thermal Considerations: When properly mounted the PowerPAD™ package provides significantly greater cooling ability than an ordinary package. To operate at rated power, the PowerPAD must be soldered directly to the board GND plane directly under the device. The PowerPAD is at GND potential and can be connected using multiple vias to inner layer GND. Other planes, such as the bottom side of the circuit board can be used to increase heat sinking in higher current applications. See the Technical Briefs, PowerPad™ Thermally Enhanced Package, [SLMA002](#)) and PowerPAD™ Made Easy, [SLMA004](#)) for more information on using this PowerPAD™ package.
- The thermal via land pattern specific to TPS25940xx-Q1 can be downloaded from the [TPS25940 device webpage](#).
- Obtaining acceptable performance with alternate layout schemes is possible; however this layout has been shown to produce good results and is intended as a guideline.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

重要なお知らせと免責事項

TI は、技術データと信頼性データ(データシートを含みます)、設計リソース(リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
