

TPS4H160-Q1 40V、160mΩ、クワッド・チャネルのスマート・ハイサイド・スイッチ

1 特長

- 車載アプリケーションに対応
- 下記内容でAEC-Q100認定済み：
 - デバイス温度グレード 1:動作時周囲温度範囲 –40°C~125°C
 - デバイスHBM ESD分類レベルH3A
 - デバイスCDM ESD分類レベルC4B
- 機能安全対応
 - 機能安全システムの設計に役立つ資料を利用可能
- 完全な診断機能を持つクワッド・チャネル、160mΩのスマート・ハイサイド・スイッチ
 - バージョンA: オープン・ドレインのデジタル出力
 - バージョンB: 電流検出アナログ出力
- 広い動作電圧範囲: 3.4V~40V
- 非常に低いスタンバイ電流: 500nA未満
- 高精度の電流検出: 25mAを超える負荷について±15%
- 500mAを超える負荷について、外付け抵抗により±15%で電流制限を変更可能
- 保護
 - 電流制限(内部または外部)によるGNDへの短絡保護
 - ラッチオフ・オプションおよびサーマル・スイング付きのサーマル・シャットダウン機能
 - スルー・レートが最適化された、誘導性負荷の負の電圧クランプ

- GND消失およびバッテリー消失保護
 - 診断機能
 - 過電流およびグラウンドへの短絡の検出
 - 開放負荷およびバッテリーへの短絡の検出
 - グローバル・フォルト・レポートによる高速割り込み
 - 熱特性強化型28ピンPWPパッケージ
- ## 2 アプリケーション
- マルチチャネルLEDドライバ、電球ドライバ
 - サブモジュール用のマルチチャネルのハイサイド・スイッチ
 - マルチチャネルのハイサイド・リレー、ソレノイド・ドライバ
 - PLCデジタル出力ドライバ

3 概要

TPS4H160-Q1デバイスは、完全に保護されたクワッド・チャネルのスマート・ハイサイド電源スイッチで、160mΩのNMOSパワーFETが4つ組み込まれています。

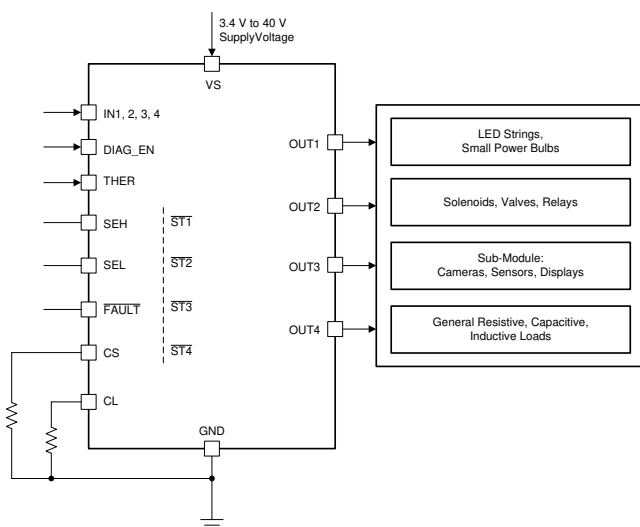

包括的な診断機能と高精度の電流検出によって、インテリジェントな負荷制御が可能です。

Pin Functions

NAME	PIN NO.		I/O	DESCRIPTION
	VERSION A	VERSION B		
CL	11	11	O	Adjustable current limit. Connect to device GND if external current limit is not used.
CS	—	10	O	Current-sense output
DIAG_EN	14	14	I	Enable-disable pin for diagnostics; internal pull-down
$\overline{\text{FAULT}}$	—	9	O	Global fault report with open-drain structure, ORed logic for quad-channel fault conditions
GND	1, 12	1, 12	—	Ground pin
IN1	3	3	I	Input control for channel 1 activation; internal pull-down
IN2	4	4	I	Input control for channel 2 activation; internal pull-down
IN3	5	5	I	Input control for channel 3 activation; internal pull-down
IN4	6	6	I	Input control for channel 4 activation; internal pull-down
NC	2, 19, 24	2, 19, 24	—	No internal connection
$\overline{\text{ST1}}$	7	—	O	Open-drain diagnostic status output for channel 1

Pin Functions (continued)

NAME	PIN		I/O	DESCRIPTION
	NO.			
	VERSION A	VERSION B		
$\overline{\text{ST2}}$	8	—	O	Open-drain diagnostic status output for channel 2
$\overline{\text{ST3}}$	9	—	O	Open-drain diagnostic status output for channel 3
$\overline{\text{ST4}}$	10	—	O	Open-drain diagnostic status output for channel 4
SEH	—	7	I	CS channel-selection high bit; internal pulldown
SEL	—	8	I	CS channel-selection low bit; internal pulldown
THER	13	13	I	Thermal shutdown behavior control, latch off or auto-retry; internal pulldown
OUT1	27, 28	27, 28	O	Output of the channel 1 high side-switch, connected to the load
OUT2	25, 26	25, 26	O	Output of the channel 2 high side-switch, connected to the load
OUT3	17, 18	17, 18	O	Output of the channel 3 high side-switch, connected to the load
OUT4	15, 16	15, 16	O	Output of the channel 4 high side-switch, connected to the load
VS	20, 21, 22, 23	20, 21, 22, 23	I	Power supply
Thermal pad	—	—	—	Connect to device GND or leave floating

8 Specifications

8.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted) ⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Supply voltage	t < 400 ms		48	V
Reverse polarity voltage ⁽³⁾		-36		V
Current on GND pin	t < 2 minutes	-100	250	mA
Voltage on INx, DIAG_EN, SEL, SEH, and THER pins		-0.3	7	V
Current on INx, DIAG_EN, SEL, SEH, and THER pins		-10	—	mA
Voltage on $\overline{\text{STx}}$ or $\overline{\text{FAULT}}$ pins		-0.3	7	V
Current on $\overline{\text{STx}}$ or $\overline{\text{FAULT}}$ pins		-30	10	mA
Voltage on CS pin		-2.7	7	V
Current on CS pin		—	30	mA
Voltage on CL pin		-0.3	7	V
Current on CL pin		—	6	mA
Inductive load switch-off energy dissipation, single pulse, single channel ⁽⁴⁾		—	40	mJ
Operating junction temperature		-40	150	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the ground plane.
- (3) Reverse polarity condition: t < 60 s, reverse current < I_{R(2)}, V_{INx} = 0 V, all channels reverse, GND pin 1-kΩ resistor in parallel with diode.
- (4) Test condition: V_{VS} = 13.5 V, L = 8 mH, R = 0 Ω, T_J = 150°C. FR4 2s2p board, 2 x 70-μm Cu, 2 x 35-μm Cu. 600 mm² thermal pad copper area.

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins except VS, OUTx, GND	±4000	V
		Pins VS, OUTx, GND	±5000	
	Charged-device model (CDM), per AEC Q100-011	All pins	±750	
		Corner pins (1, 14, 15, and 28)	±750	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

8.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{VS}	Supply operating voltage	4	40	V
	Voltage on INx, DIAG_EN, SEL, SEH, and THER pins	0	5	V
	Voltage on \overline{STx} and \overline{FAULT} pins	0	5	V
	Nominal dc load current	0	2.5	A
T_A	Operating ambient temperature range	-40	125	°C

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS4H160-Q1		UNIT
		PWP (HTSSOP)		
		28 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	32.7		°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	17.1		°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	14.4		°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.5		°C/W
Ψ_{JB}	Junction-to-board characterization parameter	14.3		°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.1		°C/W

9 Detailed Description

9.1 Overview

The TPS4H160-Q1 device is a smart high-side switch, with internal charge pump and quad-channel integrated NMOS power FETs. Full diagnostics and high-accuracy current-sense features enable intelligent control of the load. The adjustable current-limit function greatly improves the reliability of whole system. The device has two versions with different diagnostic reporting, the open-drain digital output (version A) and the current-sense analog output (version B).

For version A, the device implements the digital fault report with an open-drain structure. When a fault occurs, the device pulls \overline{STx} down to GND. A 3.3- or 5-V external pullup is required to match the microcontroller supply level. The digital status of each channel can report individually, or globally by connecting the \overline{STx} pins together.

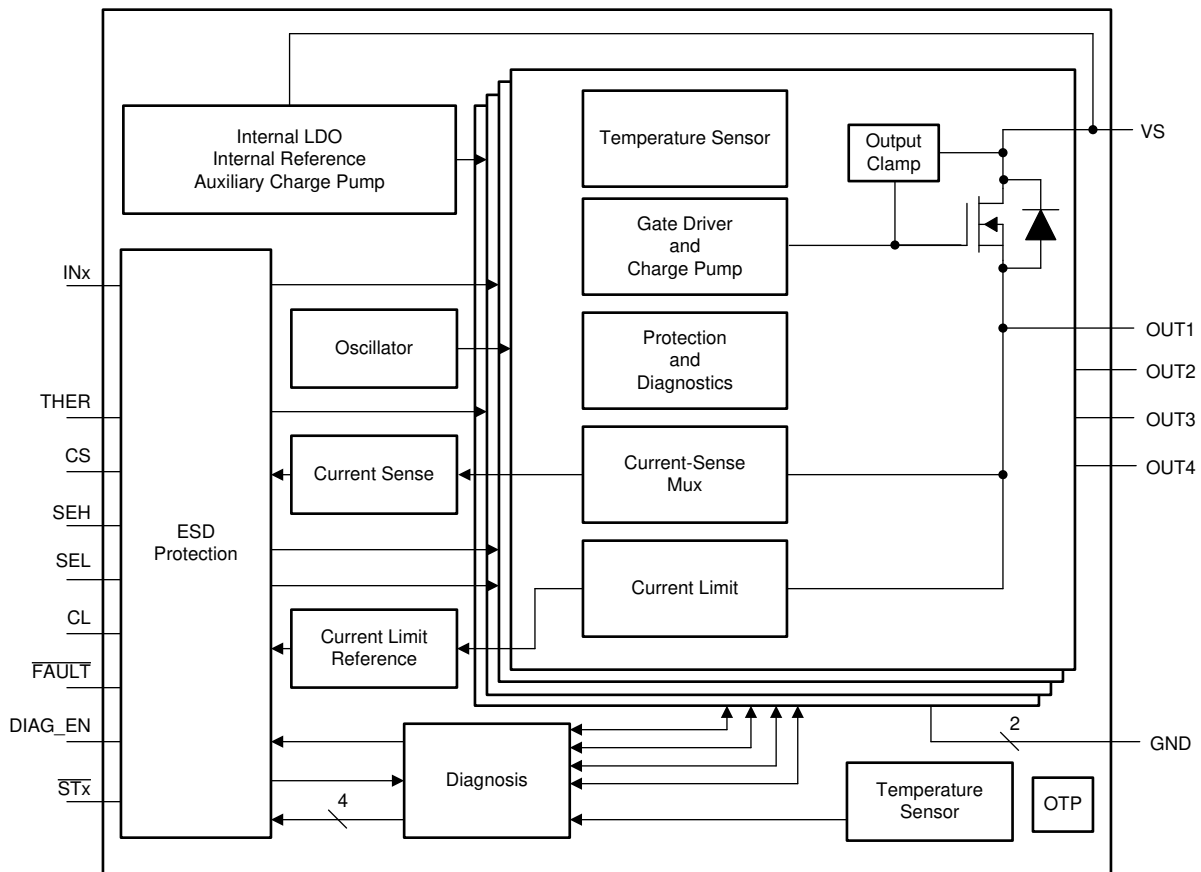

For version B, high-accuracy current sense makes the diagnostics more accurate without further calibration. One integrated current mirror can source $1 / K_{(CS)}$ of the load current. The mirrored current flows into the CS-pin resistor to become a voltage signal. $K_{(CS)}$ is a constant value across temperature and supply voltage. A wide linear region from 0 V to 4 V allows a better real-time load-current monitoring. The CS pin can also report a fault with pullup voltage of $V_{CS(H)}$.

The external high-accuracy current limit allows setting the current-limit value by applications. When overcurrent occurs, the device improves system reliability by clamping the inrush current effectively. The device can also save system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage. Besides, the device also implements an internal current limit with a fixed value.

For inductive loads (relays, solenoids, valves), the device implements an active clamp between drain and source to protect itself. During the inductive switching-off cycle, both the energy of the power supply and the load are dissipated on the high-side switch. The device also optimizes the switching-off slew rate when the clamp is active, which helps the system design by keeping the effects of transient power and EMI to a minimum.

The TPS4H160-Q1 device is a smart high-side switch for a wide variety of resistive, inductive, and capacitive loads, including low-wattage bulbs, LEDs, relays, solenoids, heaters, and sub-modules.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Pin Current and Voltage Conventions

For reference purposes throughout the data sheet, current directions on their respective pins are as shown by the arrows in [Figure 20](#). All voltages are measured relative to the ground plane.

Feature Description (continued)

Figure 20. Voltage and Current Conventions

9.3.2 Accurate Current Sense

High-accuracy current sense is implemented in the version-B device. It allows a better real-time monitoring effect and more-accurate diagnostics without further calibration.

One integrated current mirror can source $1 / K_{(CS)}$ of the load current, and the mirrored current flows into the external current sense resistor to become a voltage signal. The current mirror is shared by the four channels. $K_{(CS)}$ is the ratio of the output current and the sense current. It is a constant value across the temperature and supply voltage. Each device is calibrated accurately during production, so post-calibration is not required. See [Figure 21](#) for more details.

Feature Description (continued)

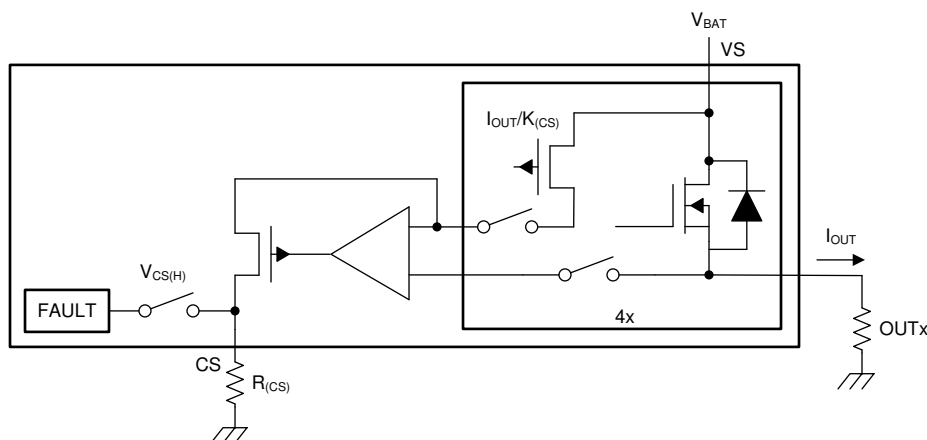

Figure 21. Current-Sense Block Diagram

When a fault occurs, the CS pin also works as a fault report with a pullup voltage, $V_{CS(H)}$. See Figure 22 for more details.

Figure 22. Current-Sense Output-Voltage Curve

Use Equation 1 to calculate $R_{(CS)}$.

$$R_{(CS)} = \frac{V_{CS}}{I_{CS}} = \frac{V_{CS} \times K_{(CS)}}{I_{OUTx}} \tag{1}$$

Take the following points into consideration when calculating $R_{(CS)}$.

- Ensure V_{CS} is within the current-sense linear region (V_{CS} , $I_{OUTx(lin)}$) across the full range of the load current. Check $R_{(CS)}$ with Equation 2.

$$R_{(CS)} = \frac{V_{CS}}{I_{CS}} \leq \frac{V_{CS(lin)}}{I_{CS}} \tag{2}$$

- In fault mode, ensure I_{CS} is within the source capacity of the CS pin ($I_{CS(H)}$). Check $R_{(CS)}$ with Equation 3.

$$R_{(CS)} = \frac{V_{CS}}{I_{CS}} \geq \frac{V_{CS(H,min)}}{I_{CS(H,min)}} \tag{3}$$

Feature Description (continued)

9.3.3 Adjustable Current Limit

A high-accuracy current limit allows high reliability of the design. It protects the load and the power supply from overstressing during short-circuit-to-GND or power-up conditions. The current limit can also save system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage.

When a current-limit threshold is hit, a closed loop activates immediately. The output current is clamped at the set value, and a fault is reported out. The device heats up due to the high power dissipation on the power FET. If thermal shutdown occurs, the current limit is set to $I_{CL(TSD)}$ to reduce the power dissipation on the power FET. See Figure 23 for more details.

The device has two current-limit thresholds.

- Internal current limit – The internal current limit is fixed at $I_{CL(int)}$. Tie the CL pin directly to the device GND for large-transient-current applications.
- External adjustable current limit – An external resistor is used to set the current-limit threshold. Use the Equation 4 to calculate the $R_{(CL)}$. $V_{CL(th)}$ is the internal band-gap voltage. $K_{(CL)}$ is the ratio of the output current and the current-limit set value. It is constant across the temperature and supply voltage. The external adjustable current limit allows the flexibility to set the current limit value by applications.

$$I_{CL} = \frac{V_{CL(th)}}{R_{(CL)}} = \frac{I_{OUT}}{K_{(CL)}}$$

$$R_{(CL)} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}}$$

(4)

Figure 23. Current-Limit Block Diagram

Feature Description (continued)

Note that if using a GND network which causes a level shift between the device GND and board GND, the CL pin must be connected with device GND.

For better protection from a hard short-to-GND condition (when the INx pins are enabled, a short to GND occurs suddenly), the device implements a fast-trip protection to turn off the related channel before the current-limit closed loop is set up. The fast-trip response time is less than 1 μ s, typically. With this fast response, the device can achieve better inrush current-suppression performance.

9.3.4 Inductive-Load Switching-Off Clamp

When switching an inductive load off, the inductive reactance tends to pull the output voltage negative. Excessive negative voltage could cause the power FET to break down. To protect the power FET, an internal clamp between drain and source is implemented, namely $V_{DS(\text{clamp})}$.

$$V_{DS(\text{clamp})} = V_{VS} - V_{OUT} \tag{5}$$

During the period of demagnetization (t_{decay}), the power FET is turned on for inductance-energy dissipation. The total energy is dissipated in the high-side switch. Total energy includes the energy of the power supply ($E_{(VS)}$) and the energy of the load ($E_{(\text{load})}$). If resistance is in series with inductance, some of the load energy is dissipated on the resistance.

$$E_{(\text{HSS})} = E_{(VS)} + E_{(\text{load})} = E_{(VS)} + E_{(L)} - E_{(R)} \tag{6}$$

When an inductive load switches off, $E_{(\text{HSS})}$ causes high thermal stressing on the device.. The upper limit of the power dissipation depends on the device intrinsic capacity, ambient temperature, and board dissipation condition.

Figure 24. Drain-to-Source Clamping Structure

Feature Description (continued)

Figure 25. Inductive Load Switching-Off Diagram

From the perspective of the high-side switch, $E_{(HSS)}$ equals the integration value during the demagnetization period.

$$E_{(HSS)} = \int_0^{t_{(decay)}} V_{DS(clamp)} \times I_{OUT}(t) dt$$

$$t_{(decay)} = \frac{L}{R} \times \ln \left(\frac{R \times I_{OUT(max)} + |V_{OUT}|}{|V_{OUT}|} \right)$$

$$E_{(HSS)} = L \times \frac{V_{VS} + |V_{OUT}|}{R^2} \times \left[R \times I_{OUT(max)} - |V_{OUT}| \ln \left(\frac{R \times I_{OUT(max)} + |V_{OUT}|}{|V_{OUT}|} \right) \right] \quad (7)$$

When R approximately equals 0, $E_{(HSD)}$ can be given simply as:

$$E_{(HSS)} = \frac{1}{2} \times L \times I_{OUT(max)}^2 \frac{V_{VS} + |V_{OUT}|}{|V_{OUT}|} \quad (8)$$

Figure 26 is a waveform of the device driving an inductive load, and Figure 27 is waveform with an expanded time scale. Channel 1 is the IN signal, channel 2 is the supply voltage V_{VS} , channel 3 is the output voltage V_{OUT} , channel 4 is the output current I_{OUT} , and channel M is the measured power dissipation $E_{(HSS)}$.

On the waveform, the duration of V_{OUT} from V_{VS} to $(V_{VS} - V_{DS(clamp)})$ is around 120 μ s. The device also optimizes the switching-off slew rate when the clamp is active. This optimization can help the system design by keeping the effects of transient power and EMI to a minimum. As shown in Figure 26 and Figure 27, the controlled slew rate is around 0.5 V/ μ s.

Feature Description (continued)

Note that for PWM-controlled inductive loads, it is recommended to add the external freewheeling circuitry shown in Figure 28 to protect the device from repetitive power stressing. TVS is used to achieve the fast decay. See Figure 28 for more details.

Figure 28. Protection With External Circuitry

9.3.5 Fault Detection and Reporting

9.3.5.1 Diagnostic Enable Function

The DIAG_EN pin enables or disables the diagnostic functions. If multiple devices are used, but the ADC resource is limited in the microcontroller, the MCU can use GPIOs to set DIAG_EN high to enable the diagnostics of one device while disabling the diagnostics of the other devices by setting DIAG_EN low. In addition, the device can keep the power consumption to a minimum by setting DIAG_EN and INx low.

9.3.5.2 Multiplexing of Current Sense

For version B, SEL and SEH are two pins to multiplex the shared current-sense function among the four channels. See Table 1 for more details.

Feature Description (continued)
Table 1. Diagnosis Configuration Table

DIAG_EN	INx	SEH	SEL	CS ACTIVATED CHANNEL	CS, $\overline{\text{FAULT}}$, $\overline{\text{STx}}$	PROTECTIONS AND DIAGNOSTICS
L	H	—	—	—	High impedance	Diagnostics disabled, full protection
	L					Diagnostics disabled, no protection
H	—	0	0	Channel 1	See Table 2	See Table 2
		0	1	Channel 2		
		1	0	Channel 3		
		1	1	Channel 4		

9.3.5.3 Fault Table

[Table 2](#) applies when the DIAG_EN pin is enabled.

Table 2. Fault Table

CONDITIONS	INx	OUTx	THER	CRITERION	$\overline{\text{STx}}$ (VER. A)	CS (VER. B)	$\overline{\text{FAULT}}$ (VER. B)	FAULT RECOVERY
Normal	L	L	—	—	H	0	H	—
	H	H	—	—	H	In linear region	H	—
Overload, short to ground	H	L	—	Current limit triggered	L	$V_{\text{CS(H)}}$	L	Auto

Thermal shutdown	H	—	L	T_{SD} triggered	L	$V_{\text{CS(H)}}$	L	Output auto-retry. Fault recovers when $T_{\text{J}} < T_{\text{(SD,rst)}}$ or when INx toggles.
			H					Output latch off. Fault recovers when INx toggles.
Thermal swing	H	—	—	T_{SW} triggered	L	$V_{\text{CS(H)}}$	L	Auto

(1) An external pullup is required for open-load detection.

9.3.5.4 $\overline{\text{STx}}$ and $\overline{\text{FAULT}}$ Reporting

For version A, four individual $\overline{\text{STx}}$ pins report the fault conditions, each pin for its respective channel. When a fault condition occurs, it pulls $\overline{\text{STx}}$ down to GND. A 3.3- or 5-V external pullup is required to match the supply level of the microcontroller. The digital status of each channel can be reported individually, or globally by connecting all the $\overline{\text{STx}}$ pins together.

For version B, a global $\overline{\text{FAULT}}$ pin is used to monitor the global fault condition among all the channels. When a fault condition occurs on any channel, the $\overline{\text{FAULT}}$ pin is pulled down to GND. A 3.3-V or 5-V external pullup is required to match the supply level of the microcontroller.

After the $\overline{\text{FAULT}}$ report, the microcontroller can check and identify the channel in fault status by multiplexed current sensing. The CS pin also works as a fault report with an internal pullup voltage, $V_{\text{CS(H)}}$.

9.3.6 Full Diagnostics
9.3.6.1 Short-to-GND and Overload Detection

When a channel is on, a short to GND or overload condition causes overcurrent. If the overcurrent triggers either the internal or external current-limit threshold, the fault condition is reported out. The microcontroller can handle the overcurrent by turning off the switch. The device heats up if no actions are taken. If a thermal shutdown occurs, the current limit is $I_{\text{CL(TSD)}}$ to keep the power stressing on the power FET to a minimum. The device automatically recovers when the fault condition is removed.

9.3.6.2 Open-Load Detection

9.3.6.2.1 Channel On

When a channel on, benefiting from the high-accuracy current sense in a small current range, if an open-load event occurs, it can be detected as an ultralow V_{CS} and handled by the microcontroller. Note that the detection is not reported on the \overline{STx} or \overline{FAULT} pins. The microcontroller must multiplex the SEL and SEH pins to detect the channel-on open-load fault proactively.

9.3.6.2.2 Channel Off

When a channel is off, if a load is connected, the output is pulled down to GND. But if an open load occurs, the output voltage is close to the supply voltage ($V_{VS} - V_{OUTx} < V_{(ol,off)}$), and the fault is reported out.

There is always a leakage current $I_{(ol,off)}$ present on the output due to internal logic control path or external humidity, corrosion, and so forth. Thus, TI recommends an external pullup resistor to offset the leakage current when an open load is detected. The recommended pullup resistance is 20 k Ω .

Figure 29. Open-Load Detection in Off-State

9.3.6.3 Short-to-Battery Detection

Short-to-battery has the same detection mechanism and behavior as open-load detection, in both the on-state and off-state. See [Table 2](#) for more details.

In the on-state, reverse current flows through the FET instead of the body diode, leading to less power dissipation. Thus, the worst case occurs in the off-state.

- If $V_{OUTx} - V_{VS} < V_{(F)}$ (body diode forward voltage), no reverse current occurs.
- If $V_{OUTx} - V_{VS} > V_{(F)}$, reverse current occurs. The current must be limited to less than $I_{R(1)}$. Setting an INx pin high can minimize the power stress on its channel. Also, for external reverse protection, see [Reverse-Current Protection](#) for more details.

9.3.6.4 Reverse Polarity Detection

Reverse polarity detection has the same detection mechanism and behavior as open-load detection both in the on-state and off-state. See [Table 2](#) for more details.

In the on-state, the reverse current flows through the FET instead of the body diode, leading to less power dissipation. Thus, the worst case occurs in the off-state. The reverse current must be limited to less than $I_{R(2)}$. Set the related INx pin high to keep the power dissipation to a minimum. For external reverse-blocking circuitry, see [Reverse-Current Protection](#) for more details.

9.3.6.5 Thermal Fault Detection

To protect the device in severe power stressing cases, the device implements two types of thermal fault detection, absolute temperature protection (thermal shutdown) and dynamic temperature protection (thermal swing). Respective temperature sensors are integrated close to each power FET, so the thermal fault is reported by each channel. This arrangement can help the device keep the cross-channel effect to a minimum when some channels are in a thermal fault condition.

9.3.6.5.1 Thermal Shutdown

Thermal shutdown is active when the absolute temperature $T_J > T_{(SD)}$. When thermal shutdown occurs, the respective output turns off. The THER pin is used to configure the behavior after the thermal shutdown occurs.

- When the THER pin is low, thermal shutdown operates in the auto-retry mode. The output automatically recovers when $T_J < T_{(SD)} - T_{(hys)}$, but the current is limited to $I_{CL(TSD)}$ to avoid repetitive thermal shutdown. The thermal shutdown fault signal is cleared when $T_J < T_{(SD,rst)}$ or after toggling the related INx pin.
- When the THER pin is high, thermal shutdown operates in the latch mode. The output latches off when thermal shutdown occurs. When the THER pin goes from high to low, thermal shutdown changes to auto-retry mode. The thermal shutdown fault signal is cleared after toggling the related INx pin.

Thermal swing activates when the power FET temperature is increasing sharply, that is, when $\Delta T = T_{(FET)} - T_{(Logic)} > T_{(sw)}$, then the output turns off. The output automatically recovers and the fault signal clears when $\Delta T = T_{(FET)} - T_{(Logic)} < T_{(sw)} - T_{(hys)}$. Thermal swing function improves the device reliability when subjected to repetitive fast thermal variation. As shown in Figure 30, multiple thermal swings are triggered before thermal shutdown occurs.

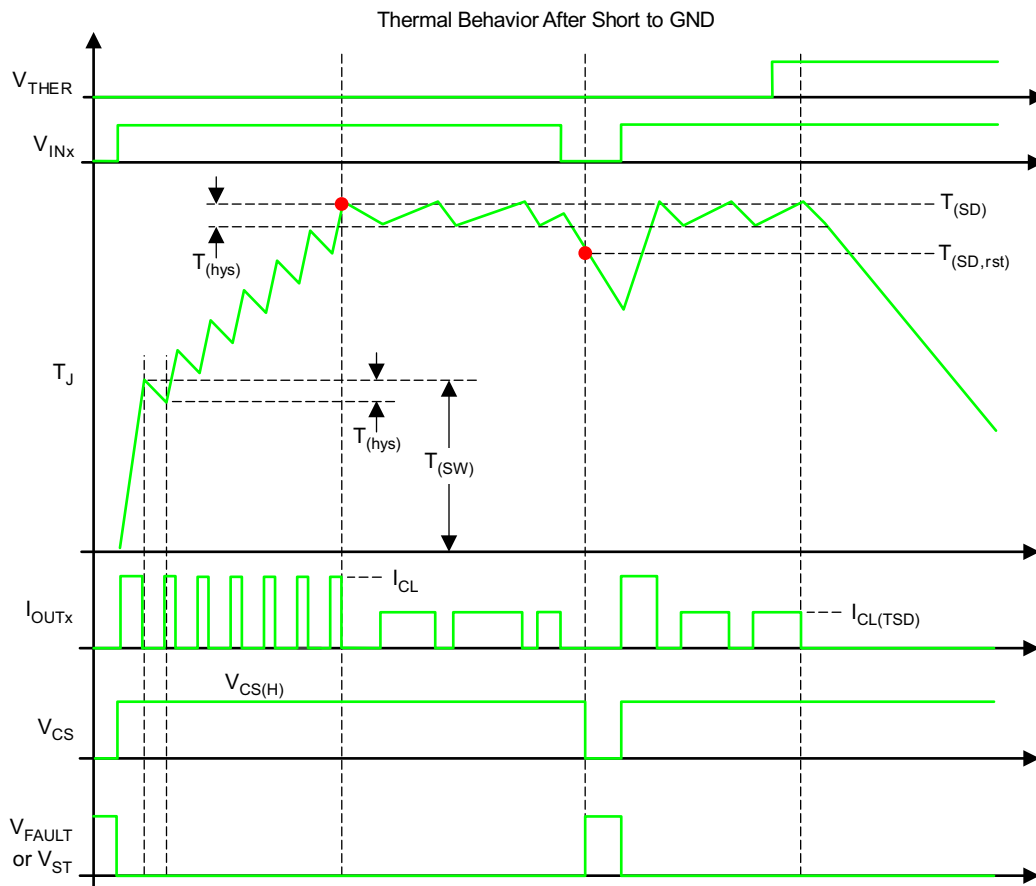

Figure 30. Thermal Behavior Diagram

9.3.7 Full Protections

9.3.7.1 UVLO Protection

The device monitors the supply voltage V_{VS} , to prevent unpredicted behaviors when V_{VS} is too low. When V_{VS} falls down to $V_{VS(uvf)}$, the device shuts down. When V_{VS} rises up to $V_{VS(uvr)}$, the device turns on.

9.3.7.2 Loss-of-GND Protection

When loss of GND occurs, output is shut down regardless of whether the INx pin is high or low. The device can protect against two ground-loss conditions, loss of device GND and loss of module GND.

9.3.7.3 Protection for Loss of Power Supply

When loss of supply occurs, the output is shut down regardless of whether the INx pin is high or low. For a resistive or a capacitive load, loss of supply has no risk. But for a charged inductive load, the current is driven from all the I/O pinss to maintain the inductance current. To protect the system in this condition, TI recommends two types of external protections: the GND network or the external free-wheeling diode.

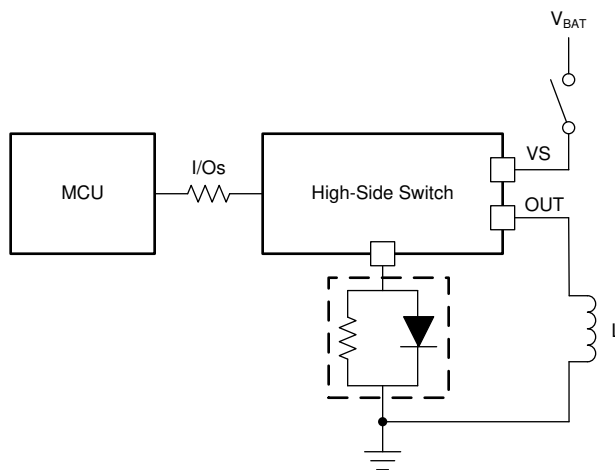

Figure 31. Protection for Loss of Power Supply, Method 1

Figure 32. Protection for Loss of Power Supply, Method 2

9.3.7.4 Reverse-Current Protection

Reverse current occurs in two conditions: short to battery and reverse polarity.

- When a short to the battery occurs, there is only reverse current through the body diode. $I_{R(1)}$ specifies the limit of the reverse current.
- In a reverse-polarity condition, there are reverse currents through the body diode and the device GND pin. $I_{R(2)}$ specifies the limit of the reverse current. The GND pin maximum current is specified in the [Absolute](#)

Maximum Ratings.

To protect the device, TI recommends two types of external circuitry.

- Adding a blocking diode. Both the IC and load are protected when in reverse polarity.

Copyright © 2016, Texas Instruments Incorporated

Figure 33. Reverse-Current External Protection, Method 1

- Adding a GND network. The reverse current through the device GND is blocked. The reverse current through the FET is limited by the load itself. TI recommends a resistor in parallel with the diode as a GND network. The recommended selection are 1-k Ω resistor in parallel with an >100-mA diode. If multiple high-side switches are used, the resistor and diode can be shared among devices. The reverse current protection diode in the GND network forward voltage should be less than 0.6 V in any circumstances. In addition a minimum resistance of 4.7 K is recommended on the I/O pins.

Figure 34. Reverse-Current External Protection, Method 2

9.3.7.5 MCU I/O Protection

In some severe conditions, such as the ISO7637-2 test or the loss of battery with inductive loads, a negative pulse occurs on the GND pin. This pulse can cause damage on the connected microcontroller. TI recommends serial resistors to protect the microcontroller, for example, 4.7-k Ω when using a 3.3-V microcontroller and 10-k Ω for a 5-V microcontroller.

Figure 35. MCU I/O External Protection

9.4 Device Functional Modes

9.4.1 Working Modes

The device has three working modes, the normal mode, the standby mode, and the standby mode with diagnostics.

Note that IN must be low for $t > t_{(off,deg)}$ to enter the standby mode, where $t_{(off,deg)}$ is the standby mode deglitch time used to avoid false triggering. Figure 36 shows a working-mode diagram.

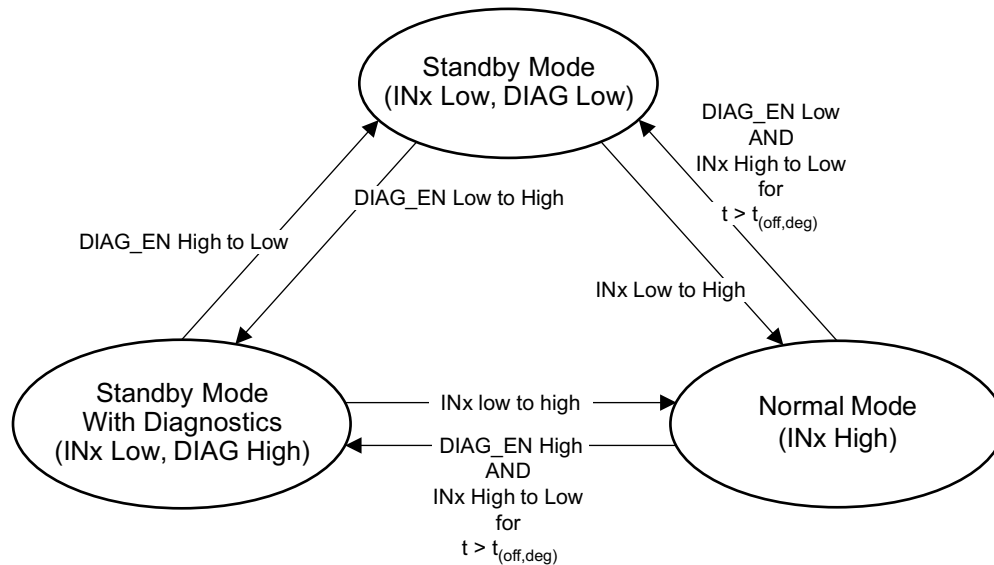

Figure 36. Working Modes

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The TPS4H160-Q1 device is capable of driving a wide variety of resistive, inductive, and capacitive loads, including the low-wattage bulbs, LEDs, relays, solenoids, heaters, and sub-modules. Full diagnostics and high-accuracy current-sense features enable intelligent control of the load. An external adjustable current limit improves the reliability of the whole system by clamping the inrush or overload current.

10.2 Typical Application

The following figure shows an example of the external circuitry connections based on the version-B device.

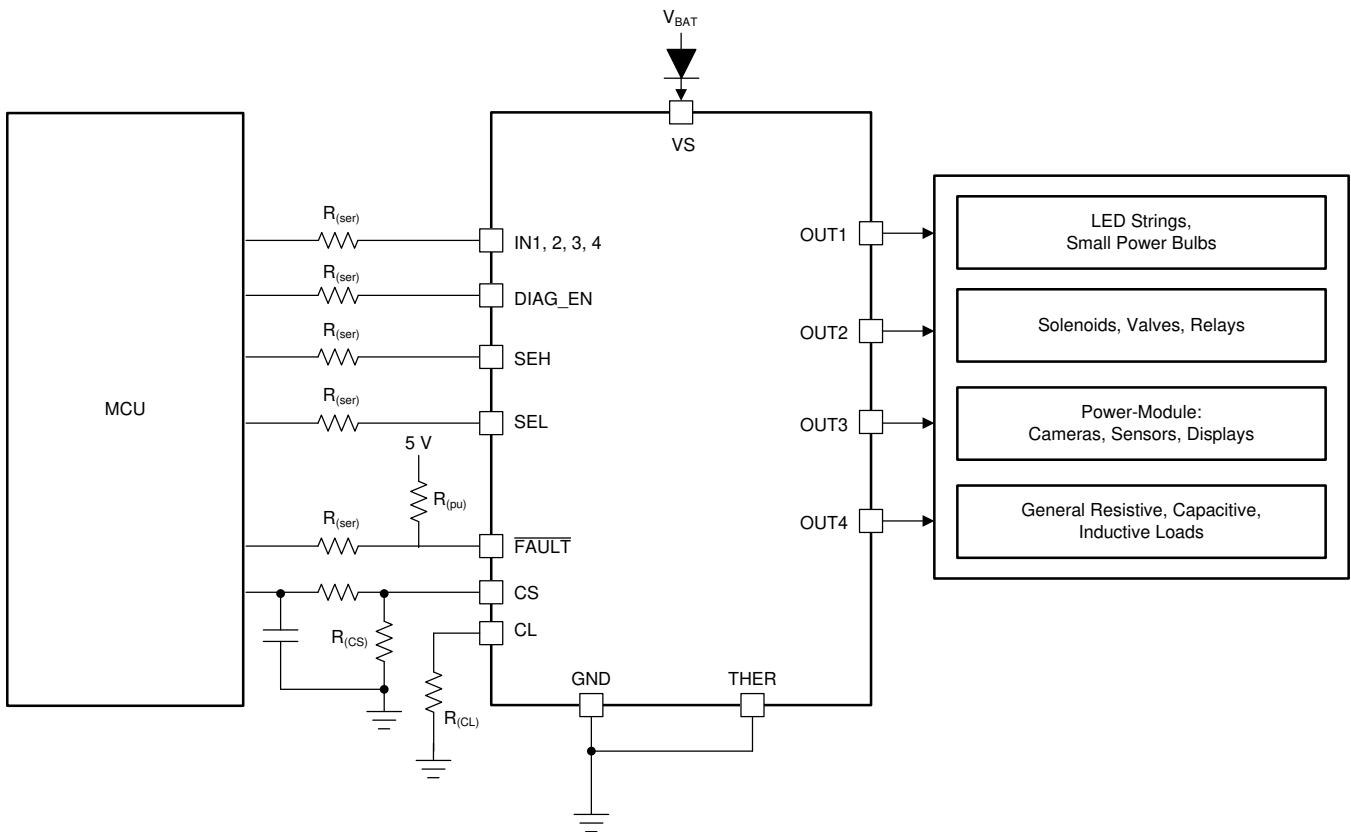

Figure 37. Typical Application Diagram

10.2.1 Design Requirements

- V_{VS} range from 9 V to 16 V
- Load range is from 0.1 A to 1 A for each channel
- Current sense for fault monitoring
- Expected current-limit value of 2.5 A
- Automatic recovery mode when thermal shutdown occurs
- Full diagnostics with 5-V MCU

Typical Application (continued)

- Reverse-voltage protection with a blocking diode in the power-supply line

10.2.2 Detailed Design Procedure

To keep the 1-A nominal current in the 0 to 4-V current-sense range, calculate the $R_{(CS)}$ resistor using Equation 9. To achieve better current-sense accuracy, a 1% tolerance or better resistor is preferred.

$$R_{(CS)} = \frac{V_{CS}}{I_{CS}} = \frac{V_{CS} \times K_{(CS)}}{I_{OUT}} = \frac{4 \times 300}{1} = 1200 \Omega \tag{9}$$

To set the adjustable current limit value at 2.5-A, calculate $R_{(CL)}$ using Equation 10.

$$R_{(CL)} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}} = \frac{0.8 \times 2500}{2.5} = 800 \Omega \tag{10}$$

TI recommends $R_{(ser)} = 10 \text{ k}\Omega$ for 5-V MCU, and $R_{(pu)} = 10 \text{ k}\Omega$ as the pullup resistor.

10.2.3 Application Curves

Figure 38 shows a test example of soft-start when driving a big capacitive load. Figure 39 shows an expanded waveform of the output current.

Typical Application (continued)

Figure 40 shows a test example of PWM-mode driving. Figure 41 shows the expanded waveform of the rising edge. Figure 42 shows the expanded waveform of the falling edge.

11 Power Supply Recommendations

The device is qualified for both automotive and industrial applications. The normal power supply connection is a 12-V automotive system or 24-V industrial system. Detailed supply voltage should be within the range specified in the *Recommended Operating Conditions*.

12 Layout

12.1 Layout Guidelines

To prevent thermal shutdown, T_J must be less than 150°C . The HTSSOP package has good thermal impedance. However, the PCB layout is very important. Good PCB design can optimize heat transfer, which is absolutely essential for the long-term reliability of the device.

- Maximize the copper coverage on the PCB to increase the thermal conductivity of the board. The major heat flow path from the package to the ambient is through the copper on the PCB. Maximum copper is extremely important when there are not any heat sinks attached to the PCB on the other side of the package.
- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- All thermal vias should either be plated shut or plugged and capped on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage should be at least 85%.

12.2 Layout Examples

12.2.1 Without a GND Network

Without a GND network, tie the thermal pad directly to the board GND copper for better thermal performance.

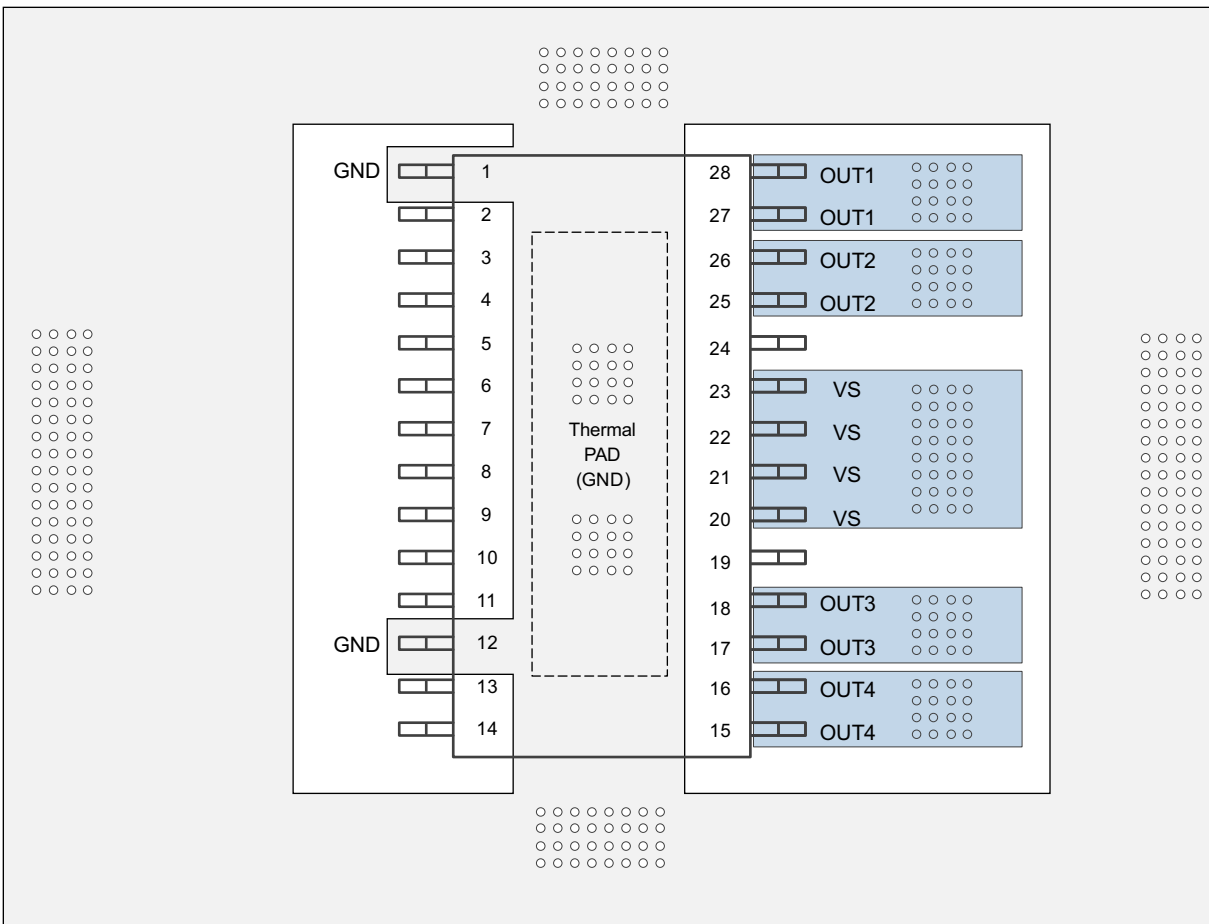

Figure 43. Layout Example Without a GND Network

Layout Examples (continued)

12.2.2 With a GND Network

With a GND network, tie the thermal pad as one trace to the board GND copper.

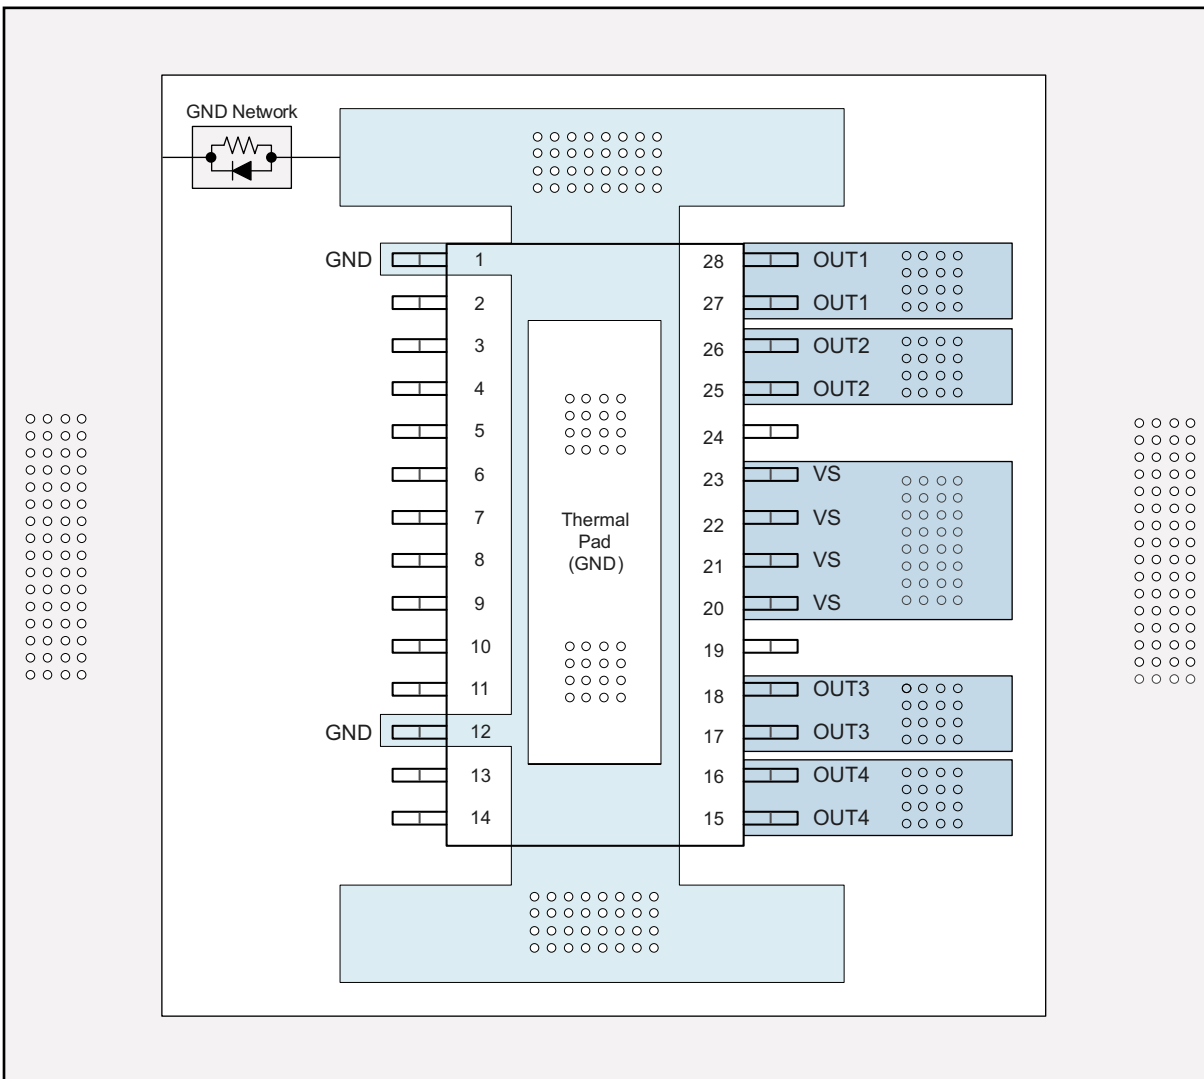

Figure 44. Layout Example With a GND Network

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS4H160AQPWPRQ1	ACTIVE	HTSSOP	PWP	28	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	4H160AQ	Samples
TPS4H160BQPWPRQ1	ACTIVE	HTSSOP	PWP	28	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	4H160BQ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
