

TPS56C231 3.8V~17V 入力、12A 同期整流降圧コンバータ

1 特長

- 入力範囲: 4.5V~17V、外部バイアスなし
- 入力範囲: 3.8V~17V、外部バイアスなし
- 連続 12A の出力電流をサポート
- TPS56C231 は 15A のピーク電流をサポート
- 7.8mΩ および 3.2mΩ の MOSFET を内蔵
- 40°C~125°C の接合部温度範囲全体にわたって 0.6V±1% の基準電圧
- 0.6V~5.5V の出力電圧範囲
- 低い静止電流: 146μA
- D-CAP3™ 制御モードによる高速過渡応答
- セラミック出力コンデンサに対応
- f_{sw} として 400kHz、800kHz、1.2MHz を選択可能
- 厳しい出力電圧リップルに対応する FCCM (強制連続導通モード) を選択可能
- 軽負荷時に高い効率を実現する Eco-mode (自動スキップ・モード) を選択可能
- (オプション) 外部の 5V バイアスのサポートによる効率向上
- プリバイアス付きスタートアップ機能
- 設定可能なソフトスタート、デフォルトのソフトスタート時間は 1.2ms
- パワー・グッド・インジケータにより出力電圧を監視
- 2 つの調整可能な電流制限設定、ヒカップ再起動機能付き TPS56C231 (14.7A、17A) および TPS56C231L (11.5A、13.8A)
- ラッチなしの UV、OV、OT、UVLO 保護
- 12A の TPS56C215、8A の TPS568231、TPS568215 とピン互換
- 動作時接合部温度: -40°C~125°C
- 3.5mm × 3.5mm の 18 ピン HotRod™ QFN パッケージ

2 アプリケーション

- データ・センターおよびエンタープライズ・コンピューティング POL
- ワイヤレス・インフラ
- IPC、ファクトリ・オートメーション、PLC、テスト測定
- ハイエンド DTV

3 概要

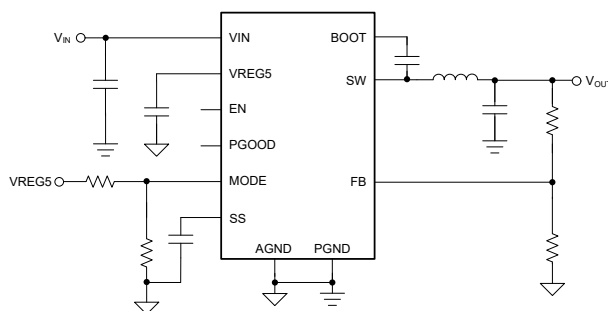

TPS56C231 デバイスは、適応型オン時間 D-CAP3 制御モードを備えた小型で高効率の同期整流降圧コンバータです。外部補償が不要のため、本デバイスは使いやすく、外付け部品をほとんど必要としません。本デバイスは、スペースに制約のあるデータ・センター・アプリケーションに適しています。

TPS56C231 には、非常に正確な基準電圧、高速な負荷過渡応答、外部補償不要、調整可能な電流制限、MODE ピンの設定により軽負荷時に選択できる Eco-mode および FCCM 動作モードなど、競争力のある機能があります。Eco-mode を選択すると、軽負荷時に高い効率を実現できます。厳しい出力電圧リップル要件に対応するには、FCCM を選択できます。TPS56C231 は、-40°C~125°C の接合部温度範囲で動作します。

5 Pin Configuration and Functions

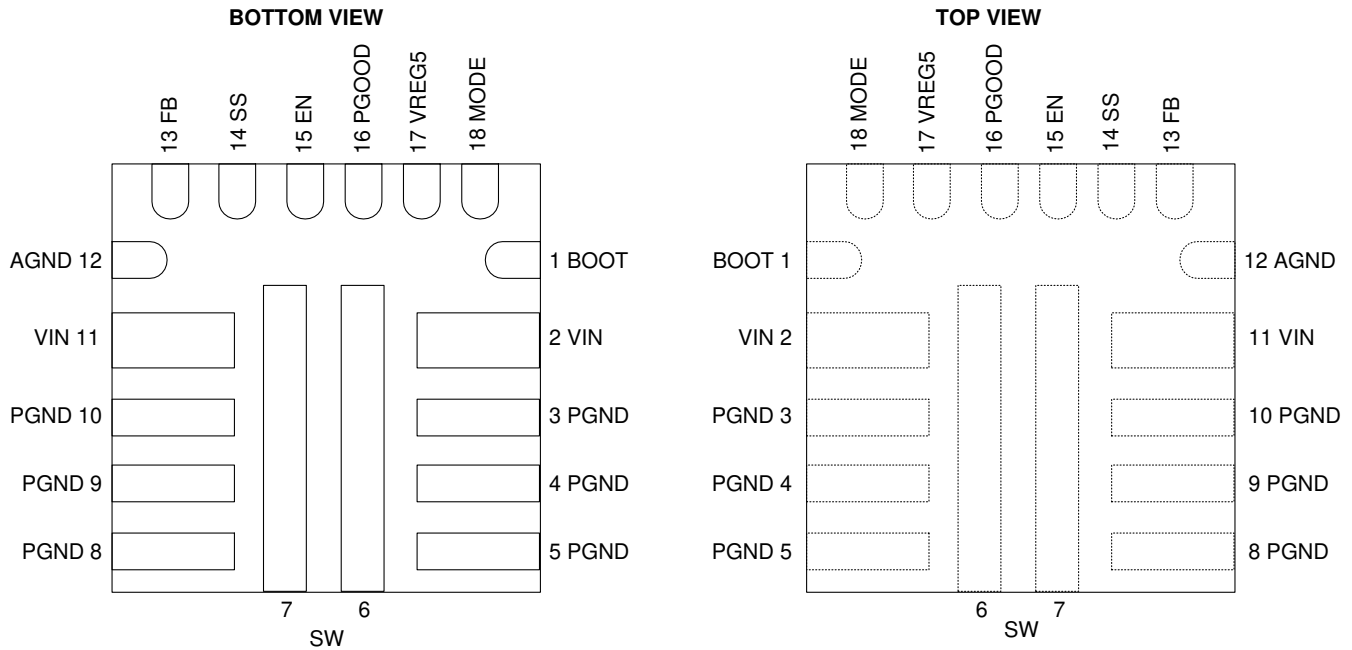

图 5-1. 18-Pin VQFN RNN Package (Bottom View and Top View)

表 5-1. Pin Functions

Pin		Type (1)	Description
Name	No.		
BOOT	1	I	Supply input for the gate drive voltage of the high-side MOSFET. Connect the bootstrap capacitor between BOOT and SW.
VIN	2,11	P	Input voltage supply pin for the control circuitry. Connect the input decoupling capacitors between VIN and PGND.
PGND	3, 4, 5, 8, 9, 10	G	Power GND pin for the controller circuit and the internal circuitry. Connect to AGND with a short trace.
SW	6, 7	O	Switch node pin. Connect the output inductor to this pin.
AGND	12	G	Ground of internal analog circuitry. Connect AGND to the PGND plane with a short trace.
FB	13	I	Converter feedback input. Connect to the center tap of the resistor divider between output voltage and AGND.
SS	14	O	Soft-start time selection pin. Connecting an external capacitor sets the soft-start time and if no external capacitor is connected, the converter starts up in 1.2 ms.
EN	15	I	Enable input control, leaving this pin floating enables the converter. This pin can also be used to adjust the input UVLO by connecting to the center tap of the resistor divider between VIN and EN.
PGOOD	16	O	Open-drain power-good indicator. The pin is asserted low if output voltage is out of the PGOOD threshold, overvoltage, or if the device is under thermal shutdown, EN shutdown, or during soft start.
VREG5	17	I/O	4.7-V internal LDO output that can also be driven externally with a 5-V input. This pin supplies voltage to the internal circuitry and gate driver. Bypass this pin with a 4.7- μ F capacitor.
MODE	18	I	Switching frequency, current limit selection, and light load operation mode selection pin. Connect this pin to a resistor divider from VREG5 and AGND for different MODE options shown in 表 7-2.

(1) I = input, P = power, G = ground, O = output

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Pin voltage	V _{IN}	-0.3	20	V
	SW	-2	19	
	SW (10-ns transient)	-5	25	
	V _{IN-SW}		22	
	V _{IN-SW} (10-ns transient)		25	
	EN	-0.3	6.5	
	BOOT-SW	-0.3	6.5	
	BOOT-SW (10-ns transient)	-0.3	7.5	
	BOOT	-0.3	25.5	
	SS, MODE, FB	-0.3	6.5

7 Detailed Description

7.1 Overview

The TPS56C231x is a high-density, synchronous step-down buck converter that can operate from 3.8-V to 17-V input voltage (V_{IN}). The device has 7.8-m Ω and 3.2-m Ω integrated MOSFETs that enable high efficiency up to 12 A. The device employs D-CAP3 control mode that provides fast transient response with no external compensation components and an accurate feedback voltage. The control topology provides a seamless transition between FCCM operating mode at higher load condition and Eco-mode operation at lighter load condition. Eco-mode allows the TPS56C231x to maintain high efficiency at light load. The TPS56C231x can adapt to both low equivalent series resistance (ESR) output capacitors such as POSCAP or SP-CAP, and ultra-low ESR ceramic capacitors.

The TPS56C231x has three selectable switching frequencies (f_{SW}): 400 kHz, 800 kHz, and 1200 kHz. These frequencies give the flexibility to optimize the design for higher efficiency or smaller size. There are two selectable current limits. All these options are configured by choosing the right voltage on the MODE pin. The TPS56C231 has higher OCP to support higher peak current requirement.

The TPS56C231x has a 4.7-V internal LDO that creates bias for all internal circuitry. There is a feature to overdrive this internal LDO with an external voltage on the VREG5 pin, which improves the efficiency of the converter. The undervoltage lockout (UVLO) circuit monitors the VREG5 pin voltage to protect the internal circuitry from low input voltages. The device has an internal pullup current source on the EN pin, which can enable the device even with the pin floating.

Soft-start time can be selected by connecting a capacitor to the SS pin. The device is protected from output short, undervoltage, and overtemperature conditions.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 PWM Operation and D-CAP3 Control Mode

The TPS56C231x operates using the adaptive on-time PWM control with a proprietary D-CAP3 control mode, which enables low external component count with a fast load transient response while maintaining a good output voltage accuracy. At the beginning of each switching cycle, the high-side MOSFET is turned on for an on time set by an internal one-shot timer. This on time is set based on the input voltage of the converter, output voltage of the converter, and the pseudo-fixed frequency, hence this type of control topology is called an adaptive on-time control. The one-shot timer resets and turns on again once the feedback voltage (V_{FB}) falls below the internal reference voltage (V_{REF}). An internal ramp is generated, which is fed to the FB pin to simulate the output voltage ripple, enabling the use of very low-ESR output capacitors such as multi-layered ceramic caps (MLCC). No external current sense network or loop compensation is required for D-CAP3 control mode topology.

The TPS56C231x includes an error amplifier that makes the output voltage very accurate. This error amplifier is absent in other flavors of D-CAP3 control mode. For any control topology that is compensated internally, there is a range of the output filter it can support. The output filter used with the TPS56C231x is a low-pass L-C circuit. This L-C filter has double pole that is described in 式 1.

$$f_P = \frac{1}{2 \times \pi \times \sqrt{L_{OUT} \times C_{OUT}}} \quad (1)$$

At low frequencies, the overall loop gain is set by the output set-point resistor divider network and the internal gain of the TPS56C231x. The low frequency L-C double pole has a 180 degree in-phase. At the output filter frequency, the gain rolls off at a -40 dB per decade rate and the phase drops rapidly. The internal ripple generation network introduces a high-frequency zero that reduces the gain roll off from -40 dB to -20 dB per decade and increases the phase to 90 degree one decade above the zero frequency. The internal ripple injection high frequency zero is changed according to the switching frequency selected as shown in 表 7-1. The inductor and capacitor selected for the output filter must be such that the double pole is located close enough to the high-frequency zero so that the phase boost provided by this high-frequency zero provides adequate phase margin for the stability requirement. The crossover frequency of the overall system usually must be targeted to be less than one-fifth of the switching frequency (f_{SW}).

表 7-1. Ripple Injection Zero

Switching Frequency (kHz)	Zero Location (kHz)
400	17.8
800	27.1
1200	29.8

7.3.2 Eco-mode Control

The TPS56C231x is designed with Eco-mode control to increase efficiency at light loads. This option can be chosen using the MODE pin as shown in 表 7-2. As the output current decreases from heavy load condition, the inductor current is also reduced. If the output current is reduced enough, the valley of the inductor current reaches the zero level, which is the boundary between continuous conduction and discontinuous conduction modes. The low-side MOSFET is turned off when a zero inductor current is detected. As the load current further decreases, the converter runs into discontinuous conduction mode. The on time is kept approximately the same as it is in continuous conduction mode. The off time increases as it takes more time to discharge the output with a smaller load current. Use 式 2 to calculate the light load current where the transition to Eco-mode operation happens ($I_{OUT(LL)}$).

$$I_{OUT(LL)} = \frac{1}{2 \times L_{OUT} \times F_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (2)$$

After identifying the application requirements, design the output inductance (L_{OUT}) so that the inductor peak-to-peak ripple current is approximately between 20% and 30% of the $I_{OUT(max)}$ (peak current in the application). Size the inductor properly so that the valley current does not hit the negative low-side current limit.

7.3.3 4.7-V LDO

The VREG5 pin is the output of the internal 4.7-V linear regulator that creates the bias for all the internal circuitry and MOSFET gate drivers. The VREG5 pin must be bypassed with a 4.7- μ F capacitor. An external voltage that is above the internal output voltage of the LDO can override the internal LDO, switching it to the external rail after a higher voltage is detected. This action enhances the efficiency of the converter because the quiescent current now runs off this external rail instead of the input power supply. The UVLO circuit monitors the VREG5 pin voltage and disables the output when VREG5 falls below the UVLO threshold. When using an external bias on the VREG5 rail, any power-up and power-down sequencing can be applied but it is important to understand that if there is a discharge path on the VREG5 rail that can pull a current higher than the internal current limit of the LDO (ILIM5) from the VREG5, then the VREG5 LDO turns off thereby, shutting down the output of TPS56C231x. If such condition does not exist and if the external VREG5 rail is turned off, the VREG5 voltage switches over to the internal LDO voltage, which is 4.7 V typically in a few nanoseconds.

7.3.4 MODE Selection

The TPS56C231x has a MODE pin that can offer 12 different states of operation as a combination of current limit, switching frequency, and light load operation. The device can operate at two different current limits (ILIM-1 and ILIM) to support an output continuous current of 12 A, respectively.

The TPS56C231x is designed to compare the valley current of the inductor against the current limit thresholds, so make sure to understand that the output current is half the ripple current higher than the valley current. Take the TPS56C231 as an example, with the ILIM current limit selection, the OCL threshold is 14 A minimum, which means that a pk-pk inductor ripple current of 2 A minimum is needed to draw 15 A out of the converter without entering an overcurrent condition.

The TPS56C231x can operate at three different frequencies of 400 kHz, 800 kHz, and 1200 kHz and also can choose between Eco-mode and FCCM mode. In Eco-mode, TPS56C231x works in DCM (discontinuous conduction mode) with high efficiency in light loading. In FCCM mode, TPS56C231x works in forced PWM (forced continuous conduction mode) with tight output voltage ripple. The device reads the voltage on the MODE pin during start-up and latches onto one of the MODE options listed in [表 7-2](#). The voltage on the MODE pin can be set by connecting this pin to the center tap of a resistor divider connected between VREG5 and AGND. A guideline for the top resistor (R_{M_H}) and the bottom resistor (R_{M_L}) in 1% resistors is shown in [表 7-2](#). Ensure that the voltage for the MODE pin is derived from the VREG5 rail only because, internally, this voltage is referenced to detect the MODE option. The MODE pin setting can be reset only by a VIN power cycling.

表 7-2. MODE Pin Resistor Settings

R_{M_L} (k Ω)	R_{M_H} (k Ω)	Light Load Operation	Current Limit	Frequency (kHz)

Figure 7-1 shows the typical start-up sequence of the device after the EN pin voltage crosses the EN turn-on threshold. After the voltage on VREG5 pin crosses the rising UVLO threshold, it takes 144 μs to read the first MODE setting and a maximum of approximately 180 μs from accomplishing MODE to soft start. The output voltage starts ramping after the MODE setting reading is completed.

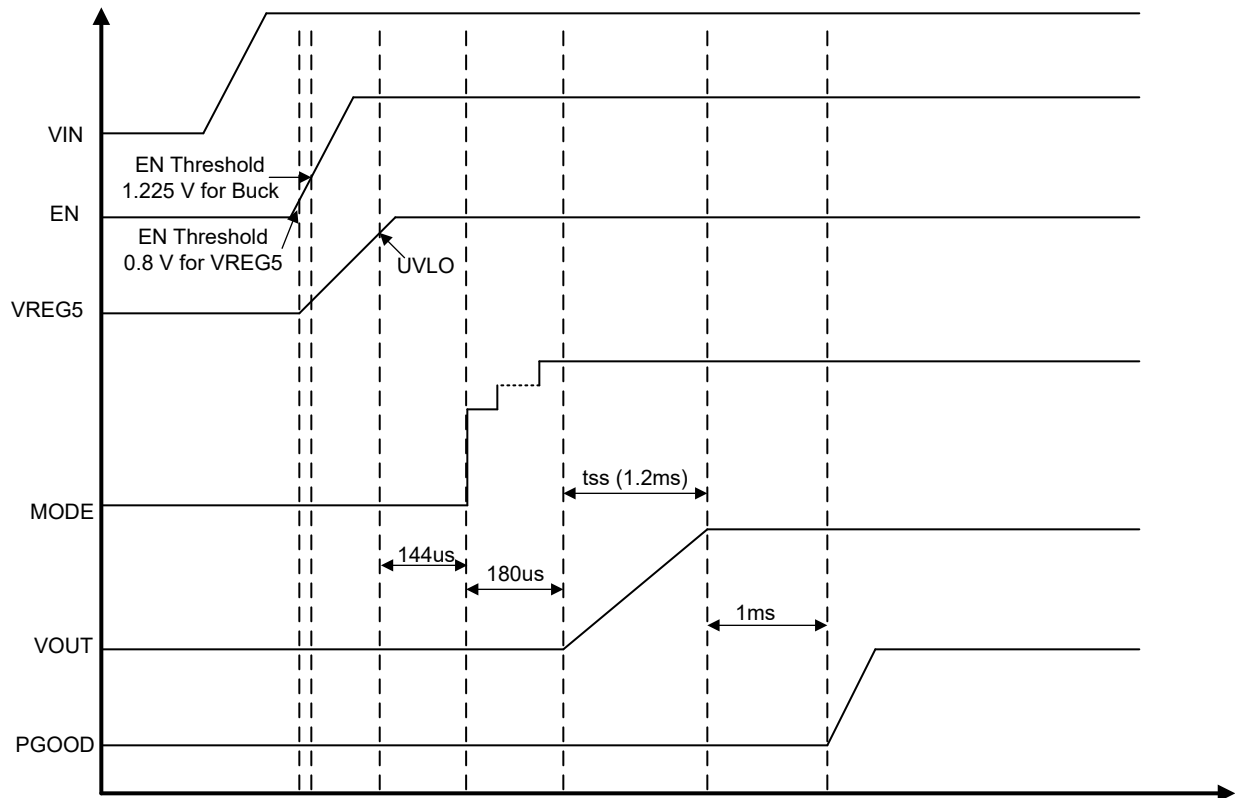

Figure 7-1. Power-Up Sequence

7.3.5 Soft Start and Prebiased Soft Start

The TPS56C231x has an internal 1.2-ms soft-start time and an external adjustable soft-start time that can be set by connecting a capacitor on the SS pin. When the EN pin becomes high, the soft-start charge current (I_{SS}) begins charging the external capacitor (C_{SS}) connected between SS and AGND. The device tracks the lower of the internal soft-start voltage or the external soft-start voltage as the reference. Equation 3 is the equation for the soft-start time (t_{SS}):

$$T_{SS(S)} = \frac{C_{SS} \times V_{REF}}{I_{SS}} \quad (3)$$

where

- V_{REF} is 0.6 V and I_{SS} is 6 μA .

If the output capacitor is prebiased at start-up, the device initiates switching and starts ramping up only after the internal reference voltage becomes greater than the feedback voltage, V_{FB} . This scheme ensures that the converters ramp up smoothly into the regulation point.

7.3.6 Enable and Adjustable UVLO

The EN pin controls the turn-on and turn-off of the device. When EN pin voltage is above the turn-on threshold, which is approximately 1.2 V, the device starts switching and when the EN pin voltage falls below the turn-off threshold, which is approximately 1.1 V, it stops switching. If the user application requires a different turn-on (V_{START}) and turn-off thresholds (V_{STOP}), respectively, the EN pin can be configured as shown in Figure 7-2 by

connecting a resistor divider between VIN and EN. The EN pin has a pullup current, I_{p1} , that sets the default state of the pin when it is floating. This current increases to I_{p2} when the EN pin voltage crosses the turn-on threshold. Use 式 4 and 式 5 to set the UVLO thresholds.

图 7-2. Adjustable V_{IN} Undervoltage Lockout

$$R1 = \frac{V_{START} \left(\frac{V_{ENFALLING}}{V_{ENRISING}} \right) - V_{STOP}}{I_{p1} \left(1 - \frac{V_{ENFALLING}}{V_{ENRISING}} \right) + I_h} \quad (4)$$

$$R2 = \frac{R1 \times V_{ENFALLING}}{V_{STOP} - V_{ENFALLING} + R1 I_{p2}} \quad (5)$$

where

- I_{p2} is 4.197 μ A.
- I_{p1} is 1.91 μ A.
- I_h is 2.287 μ A.
- $V_{ENRISING}$ is 1.225 V.
- $V_{ENFALLING}$ is 1.104 V.

7.3.7 Power Good

The power-good (PGOOD) pin is an open-drain output. After the FB pin voltage is between 93% and 108% of the internal reference voltage (V_{REF}), PGOOD is de-asserted and floats after a 14- μ s de-glitch time. TI recommends a 10-k Ω pullup resistor to pull it up to V_{REG5} . The PGOOD pin is pulled low when the FB pin voltage is lower than V_{UVP} or greater than V_{OVP} threshold, in an event of thermal shutdown, or during the soft-start period.

7.3.8 Overcurrent Protection and Undervoltage Protection

The output overcurrent limit (OCL) is implemented using a cycle-by-cycle valley detect control circuit. The switch current is monitored during the off state by measuring the low-side FET drain-to-source voltage. This voltage is proportional to the switch current. During the on time of the high-side FET switch, the switch current increases at a linear rate determined by:

- Input voltage
- Output voltage
- On time

- Output inductor value

During the on time of the low-side FET switch, this current decreases linearly. The average value of the switch current is the load current I_{OUT} . If the measured drain-to-source voltage of the low-side FET is above the voltage proportional to current limit, the low-side FET stays on until the current level becomes lower than the OCL level, which reduces the output current available. When the current is limited, the output voltage tends to drop because the load demand is higher than what the converter can support. When the output voltage falls below 70% of the target voltage, the UVP comparator detects it and shuts down the device after a wait time of 1 ms, the device restarts after a 7-ms hiccup time. In this type of valley detect control, the load current is higher than the OCL threshold by one half of the peak-to-peak inductor ripple current. When the overcurrent condition is removed, the output voltage returns to the regulated value. If an OCL condition happens during start-up, then the device enters hiccup-mode immediately without a 1-ms wait time.

7.3.9 UVLO Protection

Undervoltage lockout protection (UVLO) monitors the internal VREG5 regulator voltage. When the VREG5 voltage is lower than UVLO threshold voltage, the device is shut off. This protection is non-latching.

7.3.10 Thermal Shutdown

The device monitors the internal die temperature. If this temperature exceeds the thermal shutdown threshold value (T_{SDN} typically 160°C), the device shuts off. This protection is a non-latch protection. During start-up, if the device temperature is higher than 160°C , the device does not start switching and does not load the MODE settings. If the device temperature goes higher than T_{SDN} threshold after start-up, it stops switching with SS reset to ground and an internal discharge switch turns on to quickly discharge the output voltage. The device restarts switching when the temperature goes below the thermal shutdown threshold but the MODE settings are not re-loaded again.

7.3.11 Output Voltage Discharge

The device has a $370\text{-}\Omega$ discharge switch that discharges the output V_{OUT} through the SW node during any event of fault like output overvoltage, output undervoltage, T_{SD} , and if VREG5 voltage below the UVLO, and when the EN pin voltage (V_{EN}) is below the turn-on threshold.

7.4 Device Functional Modes

7.4.1 Light Load Operation

When the MODE pin is selected to operate in FCCM mode, the converter operates in continuous conduction mode (FCCM) during light-load conditions. During FCCM, the switching frequency (f_{SW}) is maintained at an almost constant level over the entire load range, which is suitable for applications requiring tight control of the switching frequency and output voltage ripple at the cost of lower efficiency under light load. If the MODE pin is selected to operate in Eco-mode, the device enters pulse skip mode after the valley of the inductor ripple current crosses zero. The Eco-mode maintains higher efficiency at light load with a lower switching frequency.

7.4.2 Standby Operation

The TPS56C231x can be placed in standby mode by pulling the EN pin low. The device operates with a shutdown current of approximately $9\ \mu\text{A}$ when in standby condition.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The schematic of [Figure 8-1](#) shows a typical application for the TPS56C231x. This design converts an input voltage range of 4.5 V to 17 V down to 1.2 V with a maximum output current of 12 A.

8.2 Typical Application

图 8-1. Application Schematic

8.2.1 Design Requirements

表 8-1. Design Parameters

Parameter		Conditions	Min	Typ	Max	Unit
V_{OUT}	Output voltage			1.2		V
I_{OUT}	Output current			12		A
ΔV_{OUT}	Transient response			40		mV
V_{IN}	Input voltage		4.5	12	17	V
$V_{OUT(ripple)}$	Output voltage ripple			20		mV(P-P)
	Start input voltage	Input voltage rising		Internal UVLO		V
	Stop input voltage	Input voltage falling		Internal UVLO		V
f_{SW}	Switching frequency			800		kHz
Operating mode				DCM		
T_A	Ambient temperature			25		°C

8.2.2 Detailed Design Procedure

8.2.2.1 External Component Selection

8.2.2.1.1 Output Voltage Set Point

To change the output voltage of the application, change the value of the upper feedback resistor. By changing this resistor, the user can change the output voltage above 0.6 V. See [Figure 6](#).

$$V_{OUT} = 0.6 \times \left(1 + \frac{R_{UPPER}}{R_{LOWER}} \right) \quad (6)$$

8.2.2.1.2 Switching Frequency and MODE Selection

Switching frequency, current limit, and switching mode (DCM or FCCM) are set by a voltage divider from VREG5 to GND connected to the MODE pin. See 表 7-2 for possible MODE pin configurations. Switching frequency selection is a trade-off between higher efficiency and smaller system solution size. Lower switching frequency yields higher overall efficiency but relatively bigger external components. Higher switching frequencies cause additional switching losses, which impact efficiency and thermal performance. For this design, 800 kHz is chosen as the switching frequency. The switching mode is DCM and the output current is 12 A.

8.2.2.1.3 Inductor Selection

The inductor ripple current is filtered by the output capacitor. A higher inductor ripple current means the output capacitor must have a ripple current rating higher than the inductor ripple current. See 表 8-2 for recommended inductor values.

Use 式 7 and 式 8 to calculate the RMS and peak currents through the inductor. Make sure that the inductor is rated to handle these currents.

$$I_{L(rms)} = \sqrt{\left(I_{OUT}^2 + \frac{1}{12} \times \left(\frac{V_{OUT} \times (V_{IN(max)} - V_{OUT})}{V_{IN(max)} \times L_{OUT} \times F_{SW}} \right)^2 \right)} \quad (7)$$

$$I_{L(peak)} = I_{OUT} + \frac{I_{OUT(ripple)}}{2} \quad (8)$$

During transient, short-circuit conditions, the inductor current can increase up to the current limit of the device, so it is safe to choose an inductor with a saturation current higher than the peak current under current limit condition.

8.2.2.1.4 Output Capacitor Selection

After selecting the inductor, the output capacitor must be optimized. In D-CAP3 control mode, the regulator reacts within one cycle to the change in the duty cycle so the good transient performance can be achieved without needing large amounts of output capacitance. 表 8-2 gives the recommended output capacitance range.

Ceramic capacitors have very low ESR, otherwise the maximum ESR of the capacitor must be less than $V_{OUT(ripple)} / I_{OUT(ripple)}$.

表 8-2. Recommended Component Values

V _{OUT} (V)	R _{LOWER} (kΩ)	R _{UPPER} (kΩ)	f _{SW} (kHz)	L _{OUT} (μH)	C _{OUT(min)} (μF)	C _{OUT(max)} (μF)	C _{FF} (pF)
0.6	10	0	400	0.68	300	500	—
			800	0.47	100	500	—
			1200	0.33	88	500	—
1.2	10	10	400	1.2	100	500	—
			800	0.68	88	500	—
			1200	0.47	88	500	—
3.3	10	45.3	400	2.4	88	500	100 – 220
			800	1.5	88	500	100 – 220
			1200	1.2	88	500	100 – 220

表 8-2. Recommended Component Values (continued)

V _{OUT} (V)	R _{LOWER} (kΩ)	R _{UPPER} (kΩ)	f _{SW} (kHz)	L _{OUT} (μH)	C _{OUT(min)} (μF)	C _{OUT(max)} (μF)	C _{FF} (pF)
5.5	10	82.5	400	3.3	88	500	100 – 220
			800	2.4	88	500	100 – 220
			1200	1.5	88	700	100 – 220

8.2.2.1.5 Input Capacitor Selection

式 9 gives the minimum input capacitance required.

$$C_{IN(min)} = \frac{I_{OUT} \times V_{OUT}}{V_{INripple} \times V_{IN} \times F_{SW}} \quad (9)$$

TI recommends using a high quality X5R or X7R input decoupling capacitors of 40 μF on the input voltage pin. The voltage rating on the input capacitor must be greater than the maximum input voltage. The capacitor must also have a ripple current rating greater than the maximum input current ripple of the application. Use 式 10 to calculate the input ripple current:

$$I_{CIN(rms)} = I_{OUT} \times \sqrt{\frac{V_{OUT}}{V_{IN(min)}} \times \frac{(V_{IN(min)} - V_{OUT})}{V_{IN(min)}}} \quad (10)$$

8.2.3 Application Curves

$V_{IN} = 12\text{ V}$. $T_a = 25^\circ\text{C}$ (unless otherwise specified).

8-2. Efficiency

8-3. Load Regulation

8-4. Output Voltage Ripple, $I_{OUT} = 10\text{ mA}$, Time = $80\ \mu\text{S/div}$

8-5. Output Voltage Ripple, $I_{OUT} = 12\text{ A}$, Time = $1\ \mu\text{S/div}$

8-6. Start-Up Relative to EN Rising, Time = $2\ \text{ms/div}$

8-7. Shutdown Relative to EN Falling, Time = $200\ \mu\text{S/div}$

☒ 8-8. Transient Response, Load Step = 3 A – 9 A – 3 A, Slew Rate Setting = 2.5 A/μS, Time = 100 μS/div

☒ 8-9. Transient Response, Load Step = 1.2 A – 10.8 A – 1.2 A, Slew Rate Setting = 2.5 A/μS, Time = 100 μS/div

8.3 Power Supply Recommendations

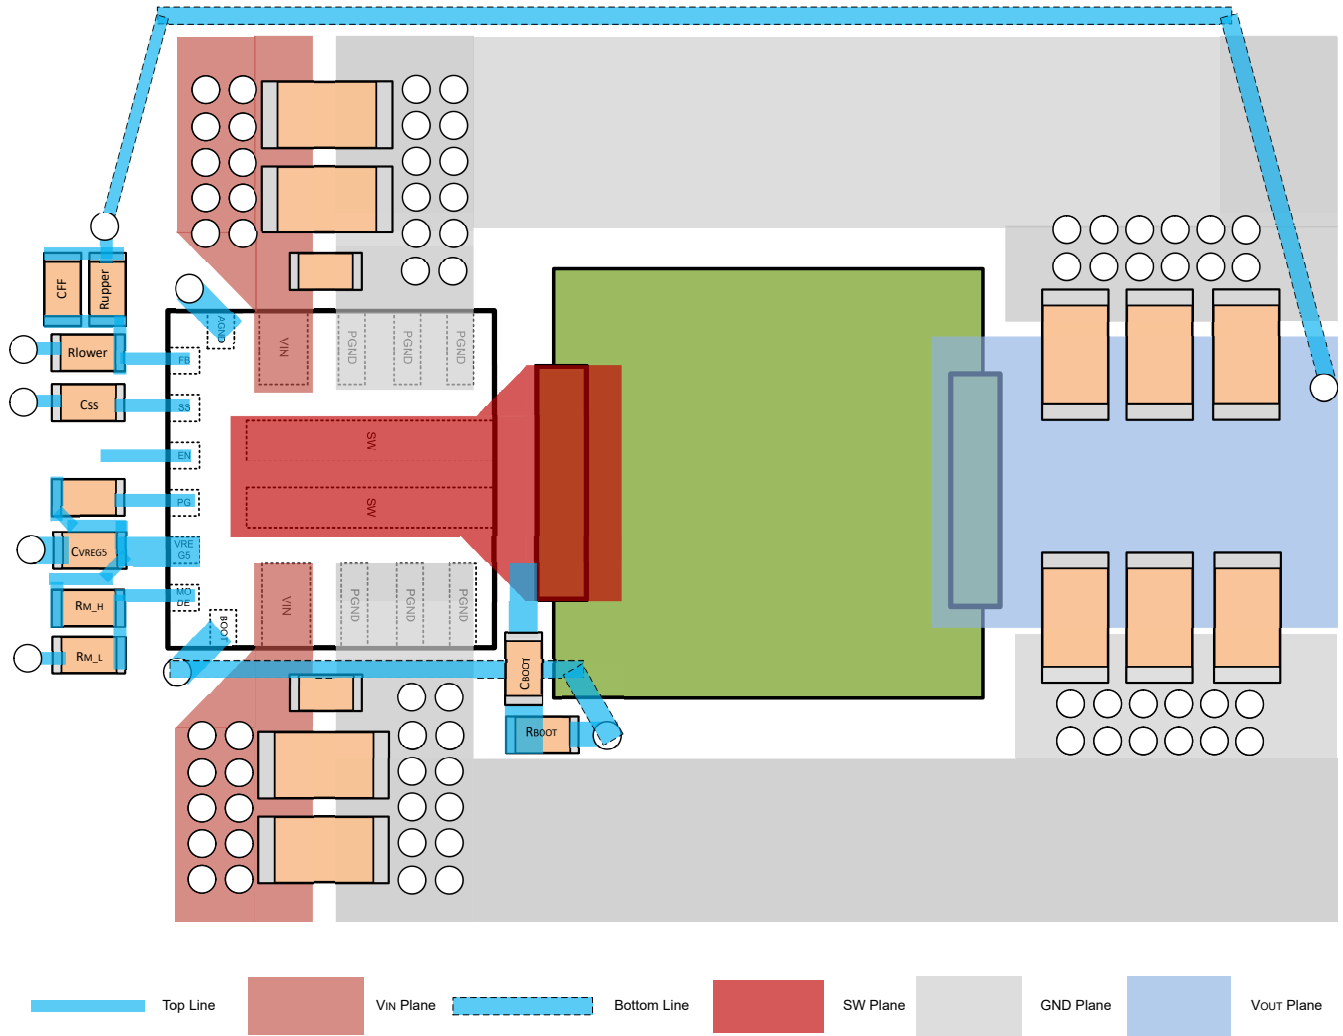

The TPS56C231x is intended to be powered by a well regulated DC voltage. The input voltage range is 3.8 V to 17 V. The TPS56C231x is a buck converter. The input supply voltage must be greater than the desired output voltage for proper operation. Input supply current must be appropriate for the desired output current. If the input voltage supply is located far from the TPS56C231x circuit, TI recommends some additional input bulk capacitance. Typical values are 100 μF to 470 μF.

8.4 Layout

8.4.1 Layout Guidelines

- Use a four-layer or six-layer PCB for good thermal performance and with maximum ground plane. 3-inch × 3-inch, four-layer PCB with 2-oz. copper is used as an example.
- VIN, PGND, and SW traces must be as wide as possible to reduce trace impedance and improve heat dissipation.
- Place equal capacitors on each side of the IC. Place them right from each VIN to PGND pin as close as possible to the device on the same side of the PCB.
- Use vias near both VIN pins and provide a low impedance connection between them through an internal layer.
- Use multiple vias near both PGND pins and use the layer directly below the device to connect them together, which helps to minimize noise and can help heat dissipation.
- Inner layer 1 is ground with the PGND to AGND net tie.
- Inner layer 2 has VIN copper pour that has vias to the top layer VIN.
- Bottom layer is GND with the BOOT trace routing.
- Reference feedback to the quiet AGND and route away from the switch node. Also keep feedback resistors and the feedforward capacitor near the IC.

8.4.2 Layout Example

8-10. Layout Example

9 Device and Documentation Support

9.1 Device Support

9.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.3 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS56C231LRNNR	ACTIVE	VQFN-HR	RNN	18	3000	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 125	C231L	Samples
TPS56C231RNNR	ACTIVE	VQFN-HR	RNN	18	3000	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 125	56C231	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
