参考資料

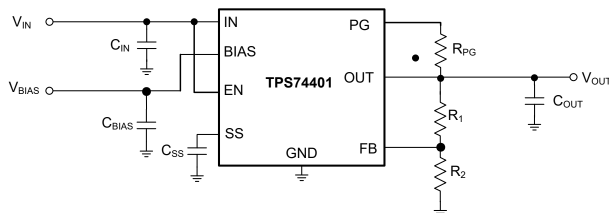
TPS74401 3.0A、超低ドロップアウト レギュレータ、プログラム可能なソフトスタート機能付き

1 特長

- 入力電圧範囲:1.1V～5.5V
- 可変スタートアップ突入電流
- ライン、負荷、温度の全範囲にわたって 1% の精度
- V_{BIAS} により、過渡応答性に優れた低 V_{IN} 動作を実現
- 調整可能な出力:0.8V～3.6V
- 非常に低いドロップアウト:
  - 115mV (標準値) (従来チップ、3.0A 時)
  - 120mV (標準値) (新チップ、3.0A 時)
- 出力コンデンサなし、または任意の値のコンデンサで安定動作 (従来チップ)
- 2.2μF 以上の出力コンデンサで安定動作 (新チップ)
- パワー グッド (PG) 出力により、電源電圧の監視や、他の電源のためのシーケンシング信号の供給が可能
- パッケージ:
  - 5mm × 5mm × 1mm VQFN (RGW)
  - 3.5mm × 3.5mm VQFN (RGR)、および DDPAK-7 (従来チップのみ)

2 アプリケーション

- ネットワーク接続ストレージ (NAS) - エンタープライズ
- ラック サーバー
- ネットワーク インターフェイス カード (NIC)
- 商用ネットワークとサーバーの電源



代表的なアプリケーション回路

3 概要

TPS74401 低ドロップアウト (LDO) リニア レギュレータは、広範なアプリケーション向けの使いやすく堅牢な電力管理の選択肢です。ソフトスタートをユーザーがプログラム可能なため、スタートアップ時の容量性突入電流を低減して、入力電源のストレスを最小限に抑えることができます。ソフトスタートは単調性で、多くの種類のプロセッサおよび特定用途向け IC (ASIC) の電源供給向けに設計されています。イネーブル入力とパワー グッド出力により、外部レギュレータとの間でシーケンシングを簡単に行えます。高い柔軟性により、FPGA や DSP、その他特別なスタートアップ条件を持つアプリケーションのシーケンス制御条件を満たすソリューションを作成できます。

高精度の基準電圧およびエラー アンプは、負荷、ライン、温度、プロセスの全体にわたって 1% の精度を維持します。このデバイスは、出力コンデンサなしで (従来チップ)、あるいは任意の種類のコンデンサ ≥ 2.2μF で (新チップ)、安定動作します。このデバイスは、T_J = -40℃～125℃において完全に動作が規定されています。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ(2)
TPS74401	KTW (TO-263、7)	10.1mm × 15.24mm
	RGR (VQFN、20)	3.5mm × 3.5mm
	RGW (VQFN、20)	5mm × 5mm

(1) 詳細については、「メカニカル、パッケージ、および注文情報」を参照してください。
(2) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

4 Pin Configuration and Functions

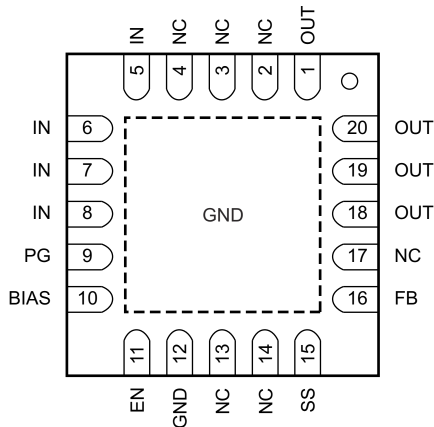

図 4-1. RGW, RGR Package 5mm × 5mm and 3.5mm × 3.5mm, 20-Pin VQFN Top View

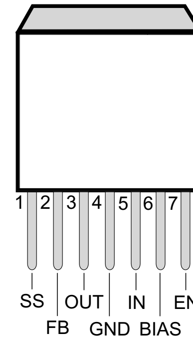

図 4-2. KTW Package 7-Pin DDPAK Top View

表 4-1. Pin Functions

PIN			I/O	DESCRIPTION
NAME	KTW	RGW, RGR		
BIAS	6	10	I	Bias input voltage for error amplifier, reference, and internal control circuits. A 1µF or larger bias capacitor is recommended for best performance. If IN is connected to BIAS, use a 4.7µF or larger capacitor.
EN	7	11	I	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
FB	2	16	I	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating.
GND	4	12	—	Ground
IN	5	5–8	I	Unregulated input to the device. An input capacitor of 1µF or greater is recommended for best performance.
NC	N/A	2–4, 13, 14, 17	—	No connection. This pin can be left floating or connected to GND to allow better thermal contact to the top-side plane.
OUT	3	1, 18–20	O	Regulated output voltage. No capacitor is required on this pin for stability, but is recommended for excellent performance.
PAD/TAB	—	—	—	Must be soldered to the ground plane for increased thermal performance. Internally connected to ground.
PG	N/A	9	O	Power-good (PG) is an open-drain, active-high output that indicates the status of V_{OUT}. When V_{OUT} exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When V_{OUT} is below this threshold, the pin is driven to a low-impedance state. Connect a pullup resistor from 10kΩ to 1MΩ from this pin to a supply up to 5.5V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
SS	1	15	—	Soft-start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 100µs.

5 Specifications

5.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
V_{IN}, V_{BIAS}	Input voltage	–0.3	6	V
V_{EN}	Enable voltage	–0.3	6	V
V_{PG}	Power good voltage	–0.3	6	V
I_{PG}	PG sink current	0	1.5	mA
V_{SS}	Soft-start voltage	–0.3	6	V
V_{FB}	Feedback voltage	–0.3	6	V
V_{OUT}	Output voltage	–0.3	V_{IN} + 0.3	V
I_{OUT}	Maximum output current	Internally limited		
	Output short-circuit duration	Indefinite		
P_{DISS}	Continuous total power dissipation	See Thermal Information		
T_J	Junction Temperature	–40	150	°C
T_{stg}	Storage Temperature	–55	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input supply voltage	V_{OUT} + V_{DO} (V_{IN})		5.5	V
V_{EN}	Enable supply voltage			5.5	V
V_{BIAS} [1]	BIAS supply voltage	V_{OUT} + V_{DO} (V_{BIAS})[2]		5.5	V
V_{OUT}	Output voltage	0.8		3.6	V
I_{OUT}	Output current	0		3	A
C_{OUT}	Output capacitor (legacy chip)	0			µF
	Output capacitor (new chip)	2.2			µF
C_{IN}	Input capacitor[3]	1			µF
C_{BIAS}	Bias capacitor	0.1	1		µF
T_J	Operating junction temperature	–40		125	℃

(1) BIAS supply is required when V_{IN} is below V_{OUT} + 1.62 V.
(2) V_{BIAS} has a minimum voltage of 2.7 V or V_{OUT} + V_{DO} (V_{BIAS}), whichever is higher.
(3) If V_{IN} and V_{BIAS} are connected to the same supply, the recommended minimum capacitor for the supply is 4.7 µF.

5.4 Thermal Information

THERMAL METRIC[1]		TPS744[2]				UNIT
		RGW (VQFN)	RGW (VQFN)[3]	RGR (VQFN)	KTW (TO-263)	
		20 PINS	20 PINS	20 PINS	7 PINS	
$R_{θJA}$	Junction-to-ambient thermal resistance	35.4	34.7	39.1	26.6	°C/W
$R_{θJC(top)}$	Junction-to-case (top) thermal resistance	32.4	31	29.3	41.7	°C/W
$R_{θJB}$	Junction-to-board thermal resistance	14.7	13.5	10.2	12.5	°C/W
$ψ_{JT}$	Junction-to-top characterization parameter	0.4	1.4	0.4	4.0	°C/W
$ψ_{JB}$	Junction-to-board characterization parameter	14.8	13.5	10.1	7.3	°C/W
$R_{θJC(bot)}$	Junction-to-case (bottom) thermal resistance	3.9	3.6	2.0	0.3	°C/W

(1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics* the application note.
(2) Thermal data for the RGW, RGR, and KTW packages are derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations: (a) i. RGW and RGR: The exposed pad is connected to the PCB ground layer through a 4x4 thermal via array. - ii. KTW: The exposed pad is connected to the PCB ground layer through a 6x6 thermal via array. (b) Each of top and bottom copper layers has a dedicated pattern for 20% copper coverage. (c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3in × 3in copper area. To understand the effects of the copper area on thermal performance, refer to the Thermal Considerations section.
(3) New Chip.

5.5 Electrical Characteristics

at V_{EN} = 1.1V, V_{IN} = V_{OUT} + 0.3V, C_{BIAS} = 0.1µF, C_{IN} = C_{OUT} = 10µF, I_{OUT} = 50mA, V_{BIAS} = 5.0V, and T_J = –40°C to 125°C, (unless otherwise noted); typical values are at T_J = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IN}	Input voltage range		V_{OUT} + V_{DO}		5.5	V
V_{BIAS}	BIAS pin voltage range		2.375		5.25	V
V_{REF}	Internal reference (Adjustable)	T_A = +25°C	0.796	0.8	0.804	V
V_{OUT}	Output voltage range	V_{IN} = 5V, I_{OUT} = 1.5A, V_{BIAS} = 5V	V_{REF}		3.6	V
V_{OUT}	Accuracy	2.97V ≤ V_{BIAS} ≤ 5.25V, V_{OUT} + 1.62V ≤ V_{BIAS}, 50mA ≤ I_{OUT} ≤ 3.0A[1] (legacy chip)	–1	±0.2	1	%
		V_{OUT} + V_{DO} BIAS ≤ V_{BIAS} ≤ 5.25 V, 100 mA ≤ I_{OUT} ≤ $I_{VDO\ BIAS}$, VQFN[2]	–1	±0.2	1	
		2.97V ≤ V_{BIAS} ≤ 5.25V, V_{OUT} + 1.62V ≤ V_{BIAS}, 50mA ≤ I_{OUT} ≤ 3.0A[1] (new chip)	–1	±0.3	1	
$ΔV_{OUT(ΔVIN)}$	Line regulation	$V_{OUT(nom)}$ + 0.3 ≤ V_{IN} ≤ 5.5V VQFN (legacy chip)		0.0005	0.05	%/V

		V_{OUT} decreasing (new chip)	85	90	94	$\%V_{OUT}$
V_{HYS}	PG trip hysteresis			3		$\%V_{OUT}$
$V_{PG(lo)}$	PG output low voltage	I_{PG} = 1mA (sinking), V_{OUT} < V_{IT}			0.3	V
$I_{PG(lkg)}$	PG leakage current	V_{PG} = 5.25V, V_{OUT} > V_{IT}		0.03	1	µA
T_J	Operating junction temperature		–40		125	℃
T_{SD}	Thermal shutdown temperature	Shutdown, temperature increasing (legacy chip)		155		℃
		Shutdown, temperature increasing (new chip)		165		℃
		Reset, temperature decreasing		140		℃
$R_{PULLDOWN}$	V_{BIAS} = 5V, V_{EN} = 0V	New chip only		0.83		kΩ

(1) Devices tested at 0.8V; external resistor tolerance is not taken into account.
(2) V_{OUT} is set to 1.5V to avoid minimum V_{BIAS} restrictions.
(3) Dropout is defined as the voltage from V_{IN} to V_{OUT} when V_{OUT} is 2% below nominal
(4) I_{FB} current flow is out of the device.

5.6 Typical Characteristics

At T_J = 25°C, V_{OUT} = 1.5V, V_{IN} = $V_{OUT(nom)}$ + 0.3V, V_{BIAS} = 3.3V, I_{OUT} = 50mA, C_{IN} = 1µF, C_{BIAS} = 1µF, C_{SS} = 0.01µF, and C_{OUT} = 10µF for legacy chip and T_J = 25°C, V_{IN} = $V_{OUT(nom)}$ + 0.3V, V_{BIAS} = 5V, I_{OUT} = 50mA, V_{EN} = V_{IN}, C_{IN} = 1µF, C_{BIAS} = 4.7µF, and C_{OUT} = 10µF for new chip, unless otherwise noted

6 Detailed Description

6.1 Overview

The TPS74401 family of low-dropout regulators (LDOs) incorporates many features to ensure a wide range of uses. Hysteresis and deglitch on the EN input improve the ability to sequence multiple devices without worrying about false start-up. The soft-start is fully programmable and allows the user to control the start-up time of the LDO output. Hysteresis is also available on the PG comparator to confirm no false PG signals. The TPS74401 family of LDOs is designed for FPGAs, DSPs, and any other device that requires linear supply and sequencing.

6.2 Functional Block Diagram

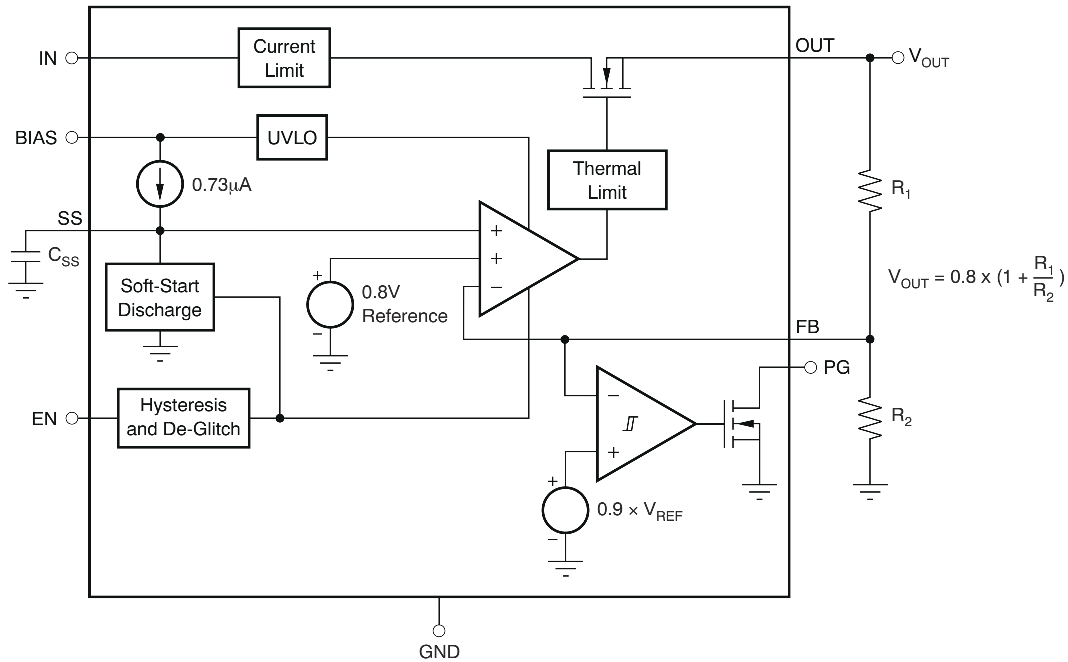

図 6-1. Legacy Chip Functional Block Diagram

図 6-2. New Chip Functional Block Diagram

6.3 Feature Description

6.3.1 Enable, Shutdown

The enable (EN) pin is active high and compatible with standard digital signaling levels. V_{EN} lower than 0.4V turns the regulator off, whereas V_{EN} above 1.1V turns the regulator on. Unlike many regulators, the enable circuitry has hysteresis and deglitching for use with relatively slow-ramping analog signals. This configuration allows the TPS74401 to be enabled by connecting the output of another supply to the EN pin. The enable circuitry typically has 50mV of hysteresis and a deglitch circuit to help avoid on-off cycling resulting from small glitches in the V_{EN} signal.

The enable threshold is typically 0.8V and varies with temperature and process variations. Temperature variation is approximately –1mV/°C; therefore, process variation accounts for most of the variation in the enable threshold. If precise turn-on timing is required, use a fast rise-time signal to enable the TPS74401.

If not used, EN can be connected to either IN or BIAS. If EN is connected to IN, connect EN as close as possible to the largest capacitance on the input to prevent voltage droops on that line from triggering the enable circuit.

6.3.2 Power-Good (VQFN Package Only)

The power-good (PG) pin is an open-drain output and can be connected to any 5.5V or lower rail through an external pullup resistor. This pin requires at least 1.1V on V_{BIAS} to have a valid output. The PG output is high-impedance when V_{OUT} is greater than (V_{IT} + V_{HYS}). If V_{OUT} drops below V_{IT} or if V_{BIAS} drops below 1.9V, the open-drain output turns on and pulls the PG output low. The PG pin also asserts when the device is disabled. The recommended operating condition of the PG pin sink current is up to 1mA, thus the pullup resistor for PG must be in the range of 10kΩ to 1MΩ. PG is only provided on the VQFN package. If output voltage monitoring is not needed, the PG pin can be left floating.

6.3.3 Internal Current Limit

The TPS74401 features a factory-trimmed, accurate current limit that is flat over temperature and supply voltage. The current limit allows the device to supply surges of up to 3.5A and maintain regulation. The current limit responds in approximately 10μs to reduce the current during a short-circuit fault. Recovery from a short-circuit condition is well-controlled and results in very little output overshoot when the load is removed. See 図 5-43 in the *Typical Characteristics* section for short-circuit recovery performance.

The internal current limit protection circuitry of the TPS74401 is designed to protect against overload conditions. This circuitry is not intended to allow operation above the rated current of the device. Continuously running the TPS74401 above the rated current degrades device reliability.

6.3.4 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 155°C for the legacy chip and 165°C for the new chip, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the regulator, protecting the regulator from damage as a result of overheating.

Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heatsinking. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, trigger thermal protection at least 30°C above the maximum expected ambient condition of the application. This condition produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS74401 is designed to protect against overload conditions. This circuitry is not intended to replace proper heatsinking. Continuously running the TPS74401 into thermal shutdown degrades device reliability.

6.4 Device Functional Modes

6.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage and bias voltage are both at least at the respective minimum specifications.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.
- The device is not operating in dropout.

6.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

Copyright © 2024 Texas Instruments Incorporated

6.4.3 Disabled

The device is disabled under the following conditions:

- The input or bias voltages are below the respective minimum specifications.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

表 6-1 shows the conditions that lead to the different modes of operation.

表 6-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER				
	V_{IN}	V_{EN}	V_{BIAS}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ (V_{IN})	$V_{EN} > V_{EN(high)}$	$V_{BIAS} \geq V_{OUT}$ + 1.62V	$I_{OUT} < I_{CL}$	T_J < 125°C
Dropout mode	$V_{IN} < V_{OUT(nom)} + V_{DO}$ (V_{IN})	$V_{EN} > V_{EN(high)}$	$V_{BIAS} < V_{OUT}$ + 1.62V	—	T_J < 125°C
Disabled mode (any true condition disables the device)	$V_{IN} < V_{IN(min)}$	$V_{EN} < V_{EN(low)}$	$V_{BIAS} < V_{BIAS(min)}$	—	T_J > 155°C

6.5 Programming

6.5.1 Programmable Soft-Start

The TPS74401 features a programmable, monotonic, voltage-controlled soft-start that is set with an external capacitor (C_{SS}). This feature is important for many applications to eliminate power-up initialization problems when powering FPGAs, DSPs, or other processors. The controlled voltage ramp of the output also reduces peak inrush current during start-up, minimizing start-up transients to the input power bus.

To achieve a linear and monotonic soft-start, the TPS74401 error amplifier tracks the voltage ramp of the external soft-start capacitor until the voltage exceeds the internal reference. The soft-start ramp time depends on the soft-start charging current (I_{SS}), the soft-start capacitance (C_{SS}), and the internal reference voltage (V_{REF}), and can be calculated using 式 1:

$$t_{SS} = \frac{(V_{REF} \times C_{SS})}{I_{SS}} \quad (1)$$

If large output capacitors are used, the device current limit (I_{CL}) and the output capacitor can set the start-up time. In this case, the start-up time is given by 式 2:

$$t_{SSCL} = \frac{\left[V_{OUT(nom)} \times C_{OUT}\right]}{I_{CL(min)}} \quad (2)$$

where

- $V_{OUT(nom)}$ is the nominal set output voltage as set by the user,
- C_{OUT} is the output capacitance,
- and $I_{CL(min)}$ is the minimum current limit for the device.

In applications where monotonic start-up is required, the soft-start time given by 式 1 must be set to be greater than 式 2.

Copyright © 2024 Texas Instruments Incorporated

The maximum recommended soft-start capacitor is 0.015µF. Larger soft-start capacitors can be used and do not damage the device; however, the soft-start capacitor discharge circuit can not be able to fully discharge the soft-start capacitor when re-enabled. Soft-start capacitors larger than 0.015µF can be a problem in applications where the user must rapidly pulse the enable pin and also require the device to soft-start from ground. C_{SS} must be low-leakage; X7R, X5R, or C0G dielectric materials are preferred. 表 6-2 lists suggested soft-start capacitor values.

表 6-2. Standard Capacitor Values for Programming the Soft-Start Time

C_{SS}	SOFT-START TIME (LEGACY CHIP)[(1)]	SOFT-START TIME (NEW CHIP)[(1)]
Open	0.1ms	0.25ms
470pF	0.5ms	0.7ms
1000pF	1ms	1.5ms
4700pF	5ms	7ms
0.01µF	10ms	15ms
0.015µF	16ms	22.6ms

(1) $t_{SS}(s) = 0.8 \times C_{SS}(F) \div I_{SS}$

6.5.2 Sequencing Requirements

The device can have V_{IN}, V_{BIAS}, and V_{EN} sequenced in any order without causing damage to the device. However, for the soft-start function to work as intended, certain sequencing rules must be applied. Enabling the device after V_{IN} and V_{BIAS} are present is preferred, and can be accomplished using a digital output from a processor or supply supervisor. An analog signal from an external RC circuit, as shown in 図 6-3, can also be used as long as the delay time is long enough for V_{IN} and V_{BIAS} to be present.

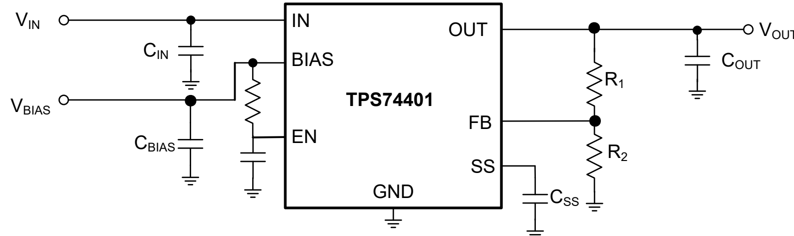

図 6-3. Soft-Start Delay Using an RC Circuit on Enable

If a signal is not available to enable the device after IN and BIAS, simply connecting EN to IN is acceptable for most applications as long as V_{IN} is greater than 1.1V and the ramp rate of V_{IN} and V_{BIAS} is faster the set soft-start ramp rate. If the ramp rate of the input sources is slower than the set soft-start time, the output tracks the slower supply less the dropout voltage until the set output voltage is reached. If EN is connected to BIAS, the device soft-starts as programmed, provided that V_{IN} is present before V_{BIAS}. If V_{BIAS} and V_{EN} are present before V_{IN} is applied and the set soft-start time has expired, then V_{OUT} tracks V_{IN}.

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

The TPS74401 belongs to a family of ultra-low dropout regulators that feature soft-start. These regulators use a low current bias input to power all internal control circuitry, allowing the NMOS pass transistor to regulate very low output voltages with low V_{IN} to V_{OUT} headroom.

The use of an NMOS-pass FET offers several critical advantages for many applications. Unlike a PMOS topology device, the output capacitor has little affect on loop stability. This architecture allows the TPS74401 to be stable with any capacitor ≥ 2.2µF. Transient response is better than PMOS topologies, particularly for low V_{IN} applications.

The TPS74401 features a programmable, voltage-controlled soft-start circuit that provides a smooth, monotonic start-up and limits startup inrush currents that can be caused by large capacitive loads. A power-good (PG) output is available to allow supply monitoring and sequencing of other supplies. An enable (EN) pin with hysteresis and de-glitch allows slow-ramping signals to be used for sequencing the device. The low V_{IN} and V_{OUT} capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often present in processor intensive systems.

7.1.1 Input, Output, and Bias Capacitor Requirements

The legacy chip of TPS74401 does not require any output capacitor for stability, however, the new chip of TPS74401 is designed to be stable for all available types and values of output capacitors ≥ 2.2µF. If an output capacitor is needed, the device is designed to be stable for all available types and values of output capacitance. The device is also stable with multiple capacitors in parallel, of any type or value. This flexibility is a result of a remarkable control loop that confirms that the device is stable independent of the output capacitance.

The capacitance required on the IN and BIAS pins strongly depends on the input supply source impedance. To counteract any inductance in the input, the minimum recommended capacitor for V_{IN} and V_{BIAS} is 1µF. If V_{IN} and V_{BIAS} are connected to the same supply, the recommended minimum capacitor for V_{BIAS} is 4.7µF. Use good quality, low-ESR capacitors on the input; ceramic X5R and X7R capacitors are preferred. Place these capacitors as close to the pins as possible for optimum performance and to help confirm stability.

7.1.2 Transient Response

The TPS74401 is designed to have transient response within 5% for most applications. In some cases, the transient response can be limited by the transient response of the input supply. This limitation is especially true in applications where the difference between the input and output is less than 300mV. In this case, adding additional input capacitance improves the transient response much more than just adding additional output capacitance. With a solid input supply, adding additional output capacitance reduces undershoot and overshoot during a transient at the expense of a slightly longer V_{OUT} recovery time; see 図 5-33 in the *Typical Characteristics* section. Because the legacy chip is stable without an output capacitor and the new chip is stable with output capacitors ≥ 2.2µF, many applications can allow for little or no capacitance at the LDO output. For these applications, local bypass capacitance for the device under power can be sufficient to meet the transient requirements of the application. This design reduces the total cost by avoiding the need to use expensive, high-value capacitors at the LDO output.

7.1.3 Dropout Voltage

The TPS74401 offers industry-leading dropout performance, making the device excellent for high-current, low V_{IN} and low V_{OUT} applications. The extremely low dropout of the TPS74401 also allows the device to be used in place of a dc/dc converter and also achieve good efficiencies. 式 3 provides a quick estimate of the efficiencies.

$$\text{Efficiency} \approx \frac{V_{OUT} \times I_{OUT}}{\left[V_{IN} \times \left(I_{IN} + I_{Q}\right)\right]} \approx \frac{V_{OUT}}{V_{IN}} \text{ at } I_{OUT} >> I_{Q} \tag{3}$$

This efficiency allows users to redesign the power architecture to achieve a small, simple, and low-cost option.

There are two different specifications for dropout voltage with the TPS74401. The first specification (see 図 7-12) is referred to as *V_{IN} Dropout* and is for users who wish to apply an external bias voltage to achieve low dropout. This specification assumes that V_{BIAS} is at least 1.62V above V_{OUT}; for example, when V_{BIAS} is powered by a 3.3V rail with 5% tolerance and with V_{OUT} = 1.5V. If V_{BIAS} is higher than (3.3V × 0.95) or V_{OUT} is less than 1.5V, V_{IN} dropout is less than specified.

The second specification (see 図 7-13) is referred to as *V_{BIAS} Dropout* and is for users who wish to have V_{BIAS} < V_{IN} + 1.62V. This option allows the device to be used in applications where an auxiliary bias voltage is not available or low dropout is not required. Dropout is limited by BIAS in these applications because V_{BIAS} provides the gate drive to the pass transistor and therefore must be greater than V_{OUT} + V_{DO} (V_{BIAS}). Because of this usage, IN and BIAS tied together easily consume excessive power. Pay attention and do not exceed the power rating of the IC package.

7.1.4 Output Noise

The TPS74401 provides low output noise when a soft-start capacitor is used. When the device reaches the end of the soft-start cycle, the soft-start capacitor serves as a filter for the internal reference. By using a 0.001µF soft-start capacitor, the output noise is reduced by half and is typically 19µV_{RMS} for a 1.2V output (100Hz to 100kHz). Noise is a function of the set output voltage because most of the output noise is generated by the internal reference.

The RMS noise with a 0.001µF soft-start capacitor is given in 式 4 for the legacy chip and 式 5 for the new chip.

$$V_N(\mu V_{RMS}) = 16\left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V) \tag{4}$$

$$V_N(\mu V_{RMS}) = 20\left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V) \tag{5}$$

The low output noise of the TPS74401 makes the device a good choice for powering transceivers, PLLs, or other noise-sensitive circuitry.

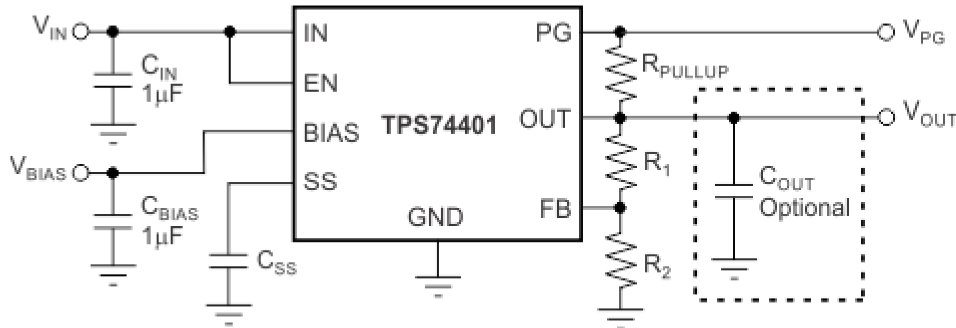
Copyright © 2024 Texas Instruments Incorporated

7.2 Typical Applications

7.2.1 Setting the TPS74401

図 7-1 shows a typical application circuit for the TPS74401.

R_1 and R_2 can be calculated for any output voltage using the formula shown in 図 7-1. 表 7-1 lists sample resistor values of common output voltages. To achieve the maximum accuracy specifications, R_2 must be ≤ 4.99kΩ.



$$R_1 = \left(\frac{V_{OUT}}{V_{REF}} - 1\right) \times R_2$$

図 7-1. Typical Application Circuit for the TPS74401

表 7-1. Standard 1% Resistor Values for Programming the Output Voltage

R_1 (kΩ)	R_2 (kΩ)	V_{OUT} (V)[1]
Short	Open	0.8
0.619	4.99	0.9
1.13	4.53	1.0
1.37	4.42	1.05
1.87	4.99	1.1
2.49	4.99	1.2
4.12	4.75	1.5
3.57	2.87	1.8
3.57	1.69	2.5
3.57	1.15	3.3

(1) $V_{OUT} = 0.8 \times (1 + R_1 \div R_2)$

注

When V_{BIAS} and V_{EN} are present and V_{IN} is not supplied, this device outputs approximately 50µA of current from OUT. Although this condition does not cause any damage to the device, the output current can charge up the OUT node if total resistance between OUT and GND (including external feedback resistors) is greater than 10kΩ.

7.2.1.1 Design Requirements

The design goals are V_{IN} = 1.8V, V_{OUT} = 1.5V, and I_{OUT} = 2A maximum. The design optimizes transient response while meeting a 1ms start-up time with a start-up dominated by the soft-start feature. The input supply comes from a supply on the same circuit board. The available system rails for V_{BIAS} are 2.7V, 3.3V, and 5V.

The design space consists of C_{IN}, C_{OUT}, C_{BIAS}, C_{SS}, V_{BIAS}, R_1, R_2, and R_3, and the circuit is from 図 7-1.

This example uses a V_{IN} of 1.8V, with a V_{BIAS} of 2.5V.

7.2.1.2 Detailed Design Procedure

The first step for this design is to examine the maximum load current along with the input and output voltage requirements, to determine if the device thermal and dropout voltage requirements can be met. At 3A, the input dropout voltage of the TPS74401 family is a maximum of 240mV over temperature. As a result, the dropout headroom is sufficient for operation over both input and output voltage accuracy.

The maximum power dissipated in the linear regulator is the maximum voltage dropped across the pass element from the input to the output multiplied by the maximum load current. In this example, the maximum voltage drop across in the pass element is (1.8V – 1.5V), giving a V_{DROP} = 300mV. The power dissipated can than be estimated by the equation $P_{DISS} = I_{L(max)} \times V_{DROP}$ = approximately 600mW. This calculation gives an efficiency of nearly 83.3% by using 式 3.

When the power dissipated in the linear regulator is known, the corresponding junction temperature increase can be calculated. To estimate the junction temperature increase above ambient, the power dissipated must be multiplied by the junction-to-ambient thermal resistance. For thermal resistance information, see the *Thermal Information* table. For this example, using the KTW package, the junction temperature rise is calculated to be 21.2°C. The maximum junction temperature increase is calculated by adding the junction temperature rise to the maximum ambient temperature. In this example, the maximum junction temperature is 46.2°C. Keep in mind that the junction temperature must be less than 125°C for reliable operation. Additional ground planes, added thermal vias, and air flow all help to improve the thermal transfer characteristics of the system.

The next step is to determine the bias voltage or if a separate source is needed for the bias voltage. Because V_{IN} is less than V_{OUT} plus the V_{BIAS} dropout, V_{BIAS} must be an independent supply. $V_{BIAS} = V_{OUT}$ + 1.62V = 3.12V; the system has a 3.3V rail to use for this supply and also to provide some limited headroom for V_{BIAS}. The 5V rail is a better choice to improve the performance of the LDO, so the 5V rail is used.

図 7-11. V_{BIAS} Dropout Voltage vs I_{OUT} and Temperature (T_J)

7.2.2 Using an Auxiliary Bias Rail

図 7-12 shows a typical application of the TPS74401 using an auxiliary bias rail. The auxiliary bias rail allows for the designer to specify the system to have a low V_{DO}. The bias rail supplies the error amplifier with a higher supply voltage, increasing the voltage that can be applied to the gate of the pass device.

V_{BIAS} must be at least V_{OUT} + 1.62V.

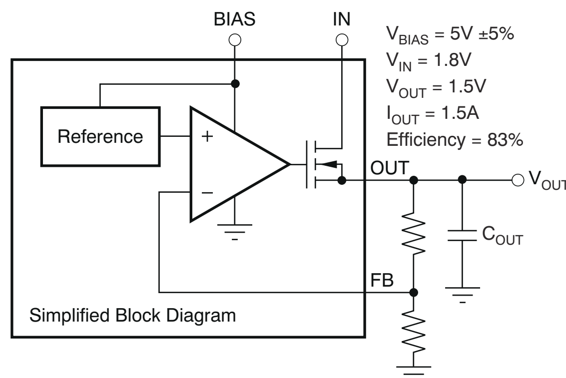

図 7-12. Typical Application of the TPS74401 Using an Auxiliary Bias Rail

Copyright © 2024 Texas Instruments Incorporated

7.2.3 Without an Auxiliary Bias

The TPS74401 is capable of operating without a bias rail if $V_{IN} \geq V_{OUT} + V_{DO}$ (V_{BIAS}). Additional capacitance is advised for this scenario, with at least 4.7μF of capacitance near the input pin. 図 7-13 shows a typical application of the TPS74401 without an auxiliary bias.

If using the TPS74401 in this situation and under high load conditions, check that the printed circuit board (PCB) provides adequate thermal handling capabilities to keep the device in the recommended operating range. See the *Power Supply Recommendations* section for more information.

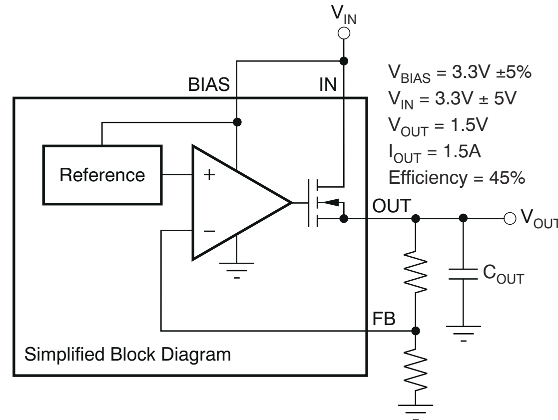

図 7-13. Typical Application of the TPS74401 Without an Auxiliary Bias

7.3 Power Supply Recommendations

The TPS74401 is designed to operate from an input voltage between 1.1V to 5.5V, provided the bias rail is at least 1.62V higher than the input supply. The bias rail and the input supply must both provide adequate headroom and current for the device to operate normally.

Connect a low output impedance power supply directly to the IN pin of the TPS74401. This supply must have at least 1μF of capacitance near the IN pin for stability. A supply with similar requirements must also be connected directly to the bias rail with a separate 1μF or larger capacitor.

If the IN pin is tied to the bias pin, a minimum 4.7μF of capacitance is needed for stability.

To increase the overall PSRR of the solution at higher frequencies, use a pi-filter or ferrite bead before the input capacitor.

7.4 Layout

7.4.1 Layout Guidelines

An excellent layout greatly improves transient performance, PSRR, and noise. To minimize the voltage droop on the input of the device during load transients, connect the capacitance on IN and BIAS as close as possible to the device. This capacitance also minimizes the effects of parasitic inductance and resistance of the input source and can therefore improve stability. To achieve peak transient performance and accuracy, connect the top side of R_1 in 図 7-1 as close as possible to the load. This connection minimizes the voltage droop on BIAS during transient conditions and can improve the turn-on response.

7.4.1.1 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and verifying reliable operation.

Power dissipation of the device depends on input voltage and load conditions, and can be calculated using 式 6:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \tag{6}$$

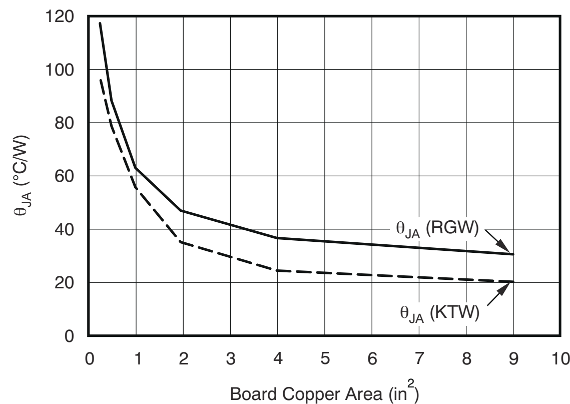
Copyright © 2024 Texas Instruments Incorporated

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On the VQFN (RGW, RGR) packages, the primary conduction path for heat is through the exposed pad to the PCB. The pad can be connected to ground or left floating; however, the pad must attach to an appropriate amount of copper PCB area to verify that the device does not overheat. On the DDPAK (KTW) package, the primary conduction path for heat is through the tab to the PCB. Connect that tab to ground. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be estimated using 式 7:

$$R_{\theta JA} = \frac{(+125°C - T_A)}{P_D} \quad (7)$$

Knowing the maximum $R_{\theta JA}$, the minimum amount of PCB copper area needed for appropriate heat sinking is estimated using 図 7-14.



θ_{JA} value at board size of 9 in^2 (that is, 3 in × 3 in) is a JEDEC standard.

図 7-14. θ_{JA} versus Board Size

図 7-14 shows the variation of θ_{JA} as a function of ground plane copper area in the board. 図 7-14 is intended only as a guideline to demonstrate the affects of heat spreading in the ground plane; do not use 図 7-14 to estimate actual thermal performance in real application environments.

注

When the device is mounted on an application PCB, TI strongly recommends using Ψ_{JT} and Ψ_{JB}, as explained in the *Thermal Information* table.

7.4.1.2 Thermal Considerations

A better method of estimating the thermal measure comes from using the thermal metrics Ψ_{JT} and Ψ_{JB}, as shown in the *Thermal Information* table. These metrics are a more accurate representation of the heat transfer characteristics of the die and the package than $R_{\theta JA}$. The junction temperature can be estimated with the corresponding formulas given in 式 8.

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \times P_D \\ \Psi_{JB}: T_J = T_B + \Psi_{JB} \times P_D \quad (8)$$

where

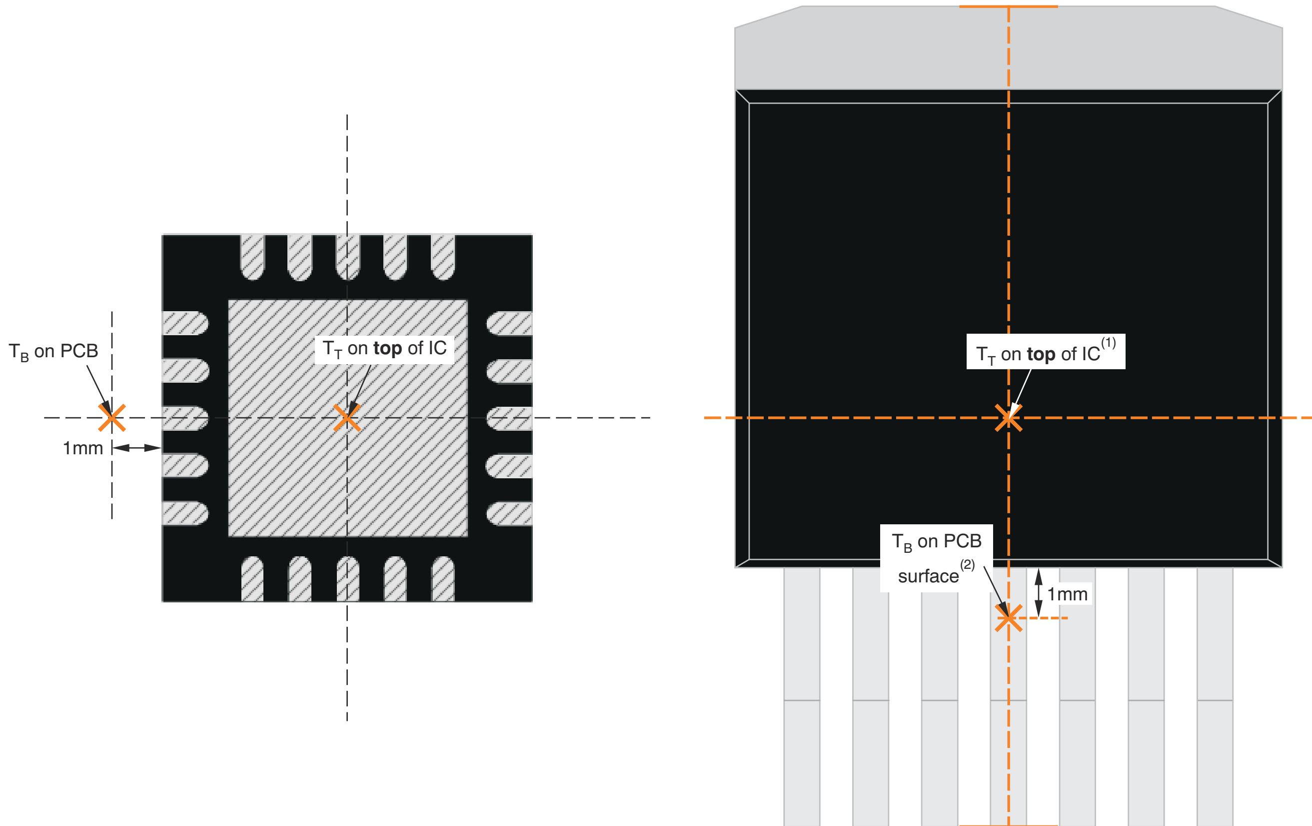
- P_D is the power dissipation shown by 式 8,
- T_T is the temperature at the center-top of the IC package, and
- T_B is the PCB temperature measured 1mm away from the IC package *on the PCB surface* (see 図 7-15).

Copyright © 2024 Texas Instruments Incorporated

注

Both T_T and T_B can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring T_T and T_B, see the *Using New Thermal Metrics* application note.



(a) Example RGW (QFN) Package Measurement

(b) Example KTW (DDPAK) Package Measurement

A. T_T is measured at the center of both the X- and Y-dimensional axes.

B. T_B is measured ***below*** the package lead **on the PCB surface**.

図 7-15. Measuring Points for T_T and T_B

Compared with θ_{JA}, the thermal metrics Ψ_{JT} and Ψ_{JB} are less independent of board size, but do have a small dependency on board size and layout. 図 7-16 shows characteristic performance of Ψ_{JT} and Ψ_{JB} versus board size.

Referring to 図 7-16, the RGW package thermal performance has negligible dependency on board size. The KTW package, however, does have a measurable dependency on board size. This dependency exists because the package shape is not point symmetric to an IC center. In the KTW package, for example (see 図 7-15), silicon is not beneath the measuring point of T_T which is the center of the X and Y dimension, so that Ψ_{JT} has a dependency. Also, because of that non-point symmetry, device heat distribution on the PCB is not point symmetric either, so that Ψ_{JB} has a greater dependency on board size and layout.

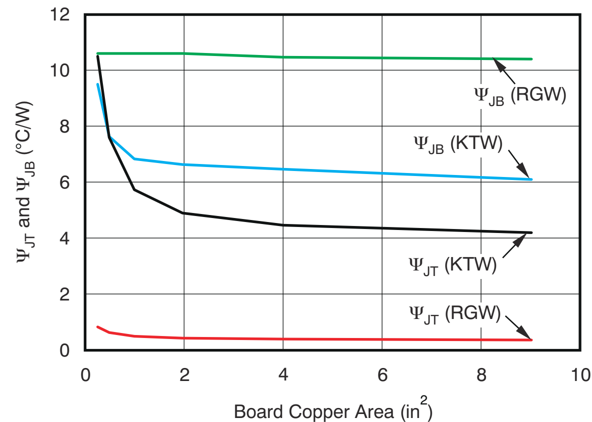


図 7-16. Ψ_{JT} and Ψ_{JB} versus Board Size

For a more detailed description of why TI does not recommend using $\theta_{JC(top)}$ to determine thermal characteristics, see the *Using New Thermal Metrics* application note. Also, see the *IC Package Thermal Metrics* application note for further information.

8 Device and Documentation Support

8.1 Documentation Support

8.1.1 Related Documentation

For related documentation see the following:

- Texas Instruments, *6A Current-Sharing Dual LDO* design guide
- Texas Instruments, *Using New Thermal Metrics* application note
- Texas Instruments, *IC Package Thermal Metrics* application note
- Texas Instruments, *TPS74401EVM-118 Evaluation Module* user's guide

8.1.2 Device Nomenclature

表 8-1. Device Nomenclature

PRODUCT(1)	V_{OUT}
TPS74401**yyyzM3**	**yyy** is the package designator. **z** is the package quantity. **M3** is a suffix designator for devices that only use the latest manufacturing flow (CSO: RFB). Devices without this suffix can ship with the legacy chip (CSO: DLN) or the new chip (CSO: RFB). The reel packaging label provides CSO information to distinguish which chip is being used. Device performance for new and legacy chips is denoted throughout the document.

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on www.ti.com.

8.2 Device Support

8.2.1 Development Support

8.2.1.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS74401. The TPS74401EVM-118 evaluation module (and related user guide) can be requested at the Texas Instruments website through the product folders or purchased directly from the TI eStore.

8.2.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS74401 is available through the product folders under *Tools & Software*.

8.3 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。 変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

8.4 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

8.6 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

8.7 用語集

テキサス・インスツルメンツ用語集　　この用語集には、用語や略語の一覧および定義が記載されています。

9 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision R (April 2017) to Revision S (November 2024) **Page**

- ドキュメント全体にわたって表、図、相互参照の採番方法を更新 ... 1
- ドキュメント全体を通して従来チップと新チップの表記を追加 ... 1
- 「特長」および「概要」セクションを変更 ... 1
- 「製品情報」表を「パッケージ情報」に変更 ... 1
- Changed *Typical Characteristics* section: Identified legacy chip plots and added new chip plots ... 8
- Changed *Output Noise* section ... 22

Changes from Revision Q (April 2015) to Revision R (April 2017) **Page**

- ドキュメントに RGR パッケージを追加 ... 1
- ドキュメント全体を通して TPS744xx を TPS74401 に変更 ... 1
- 「パッケージ」の「特長」箇条書き項目を変更 ... 1
- 「概要」セクションの 2 番目の段落を変更：RGR パッケージを追加し、2 番目から最後までの文を変更 ... 1
- 「代表的なアプリケーション回路」図の固定電圧バージョンを削除 ... 1
- Added RGR package to *Pin Configuration and Functions* section ... 3
- Changed FB/SNS to FB in both pin out drawings, deleted TPS744xx from VQFN package ... 3
- Changed *Surface Mount* to *Top View* in KTW pin out drawing ... 3
- Changed *input capacitor* to *bias capacitor* in BIAS pin description ... 3
- Deleted *(adjustable version only)* from description of FB pin in *Pin Functions* table ... 3
- Changed I/O column value to — from O for NC pins of *Pin Functions* table ... 3
- Deleted SNS pin from *Pin Functions* table ... 3
- Added RGR package to *Thermal Information table* ... 5
- Deleted "adjustable" from footnote 1 and deleted "I_{SNS}" from footnote 4 of Electrical Characteristics table ... 5
- Deleted (adjustable version) from V_{REF} parameter name in *Electrical Characteristics table* ... 5
- Deleted SNS pin reference from I_{FB},I_{SNS} parameter: Changed symbol from I_{FB}, I_{SNS} to I_{FB}, deleted *sense* from parameter name ... 5
- Changed conditions of R_1, R_2 in *Noise Spectral Density* figure ... 8
- Deleted *Fixed Voltage Versions* figure from *Functional Block Diagram* section ... 16
- Changed first paragraph of *Application Information* section: deleted *and tracking capabilities* from first sentence and changed *very low input and output voltages* to *very low output voltages with low V_{IN} to V_{OUT} headroom* in last sentence ... 21
- Changed title of first typical application from *Adjustable Voltage Part and Setting* to *Setting the TPS74401* . 23
- Deleted reference to adjustable version in first sentence and *Typical Application Circuit for the TPS74401* figure in first typical application section ... 23
- Changed *Because $V_{IN} \geq V_{OUT}$ + 1.62V* to *Because V_{IN} is less than V_{OUT} plus the V_{BIAS} dropout* and V_{BIAS} = V_{IN} to V_{BIAS} = V_{OUT} in last paragraph of *Detailed Design Procedure* in first typical application section ... 24
- Deleted *Fixed Voltage and Sense Pin* section ... 26

Copyright © 2024 Texas Instruments Incorporated

- Deleted BIAS recommendation from *Layout Guidelines* section..27
- Added RGR package to VQFN description in *Power Dissipation* section..27
- Added RGR package to *Thermal Considerations* section 28
- Changed *RGW Package* to *VQFN Packages* in caption of *Layout Schematic* figure..................................... 31

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. [1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

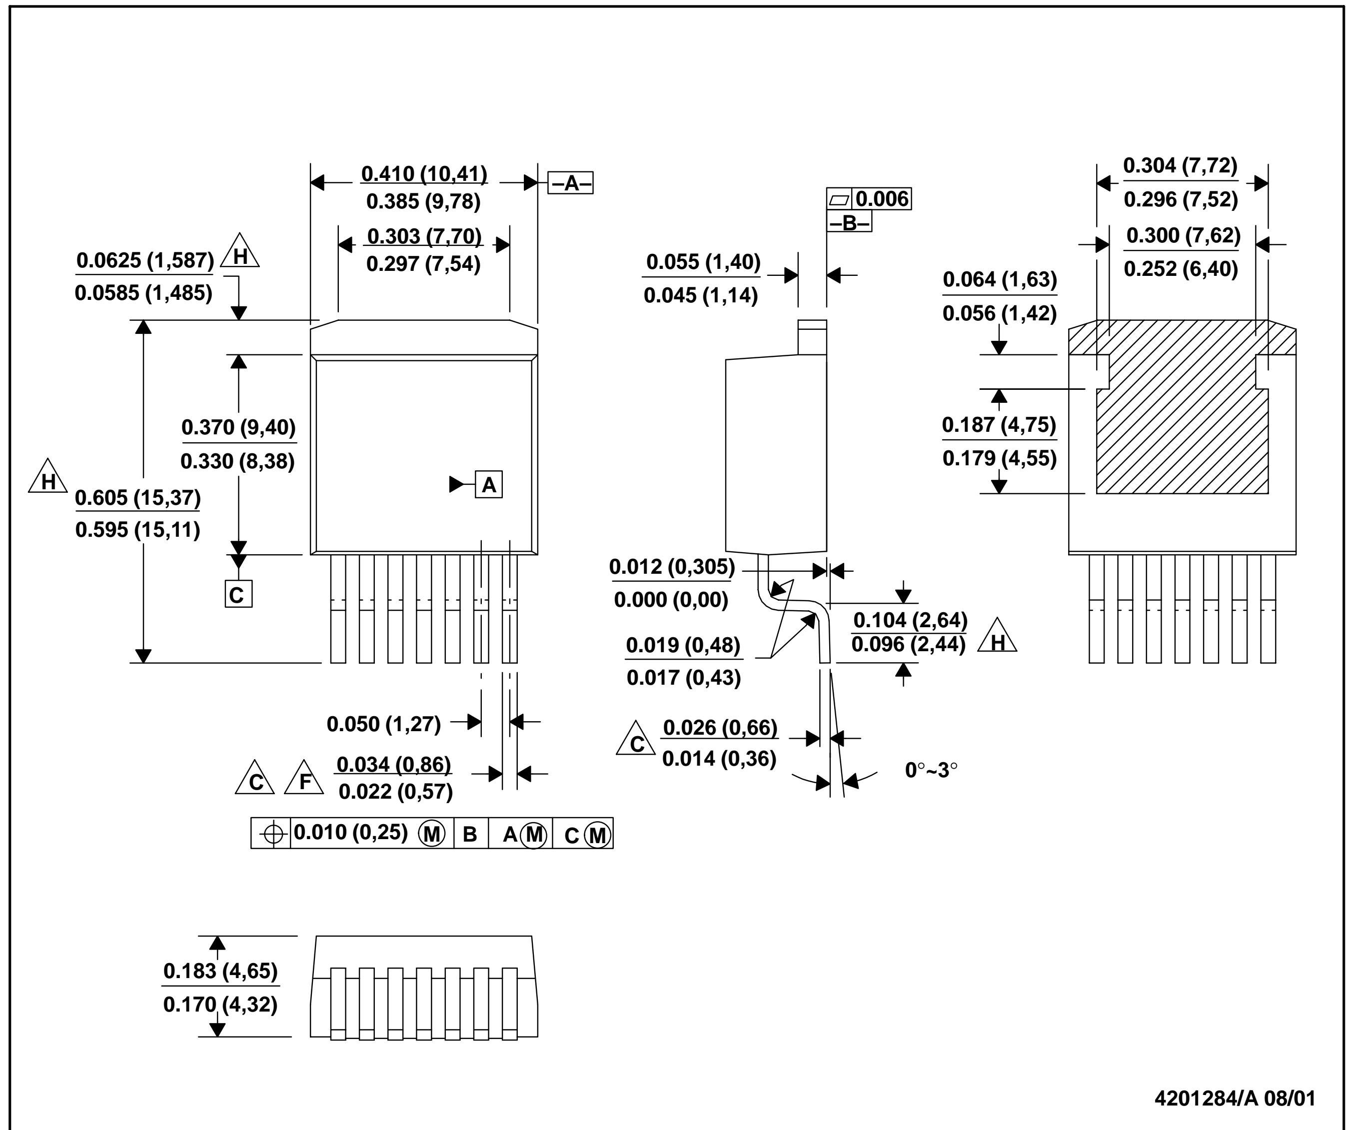
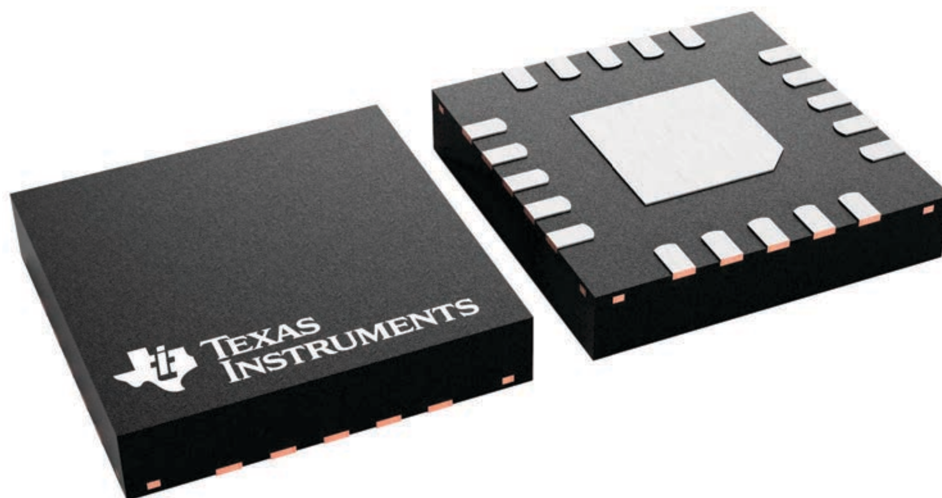
KTW (R-PSFM-G7) **PLASTIC FLANGE-MOUNT**

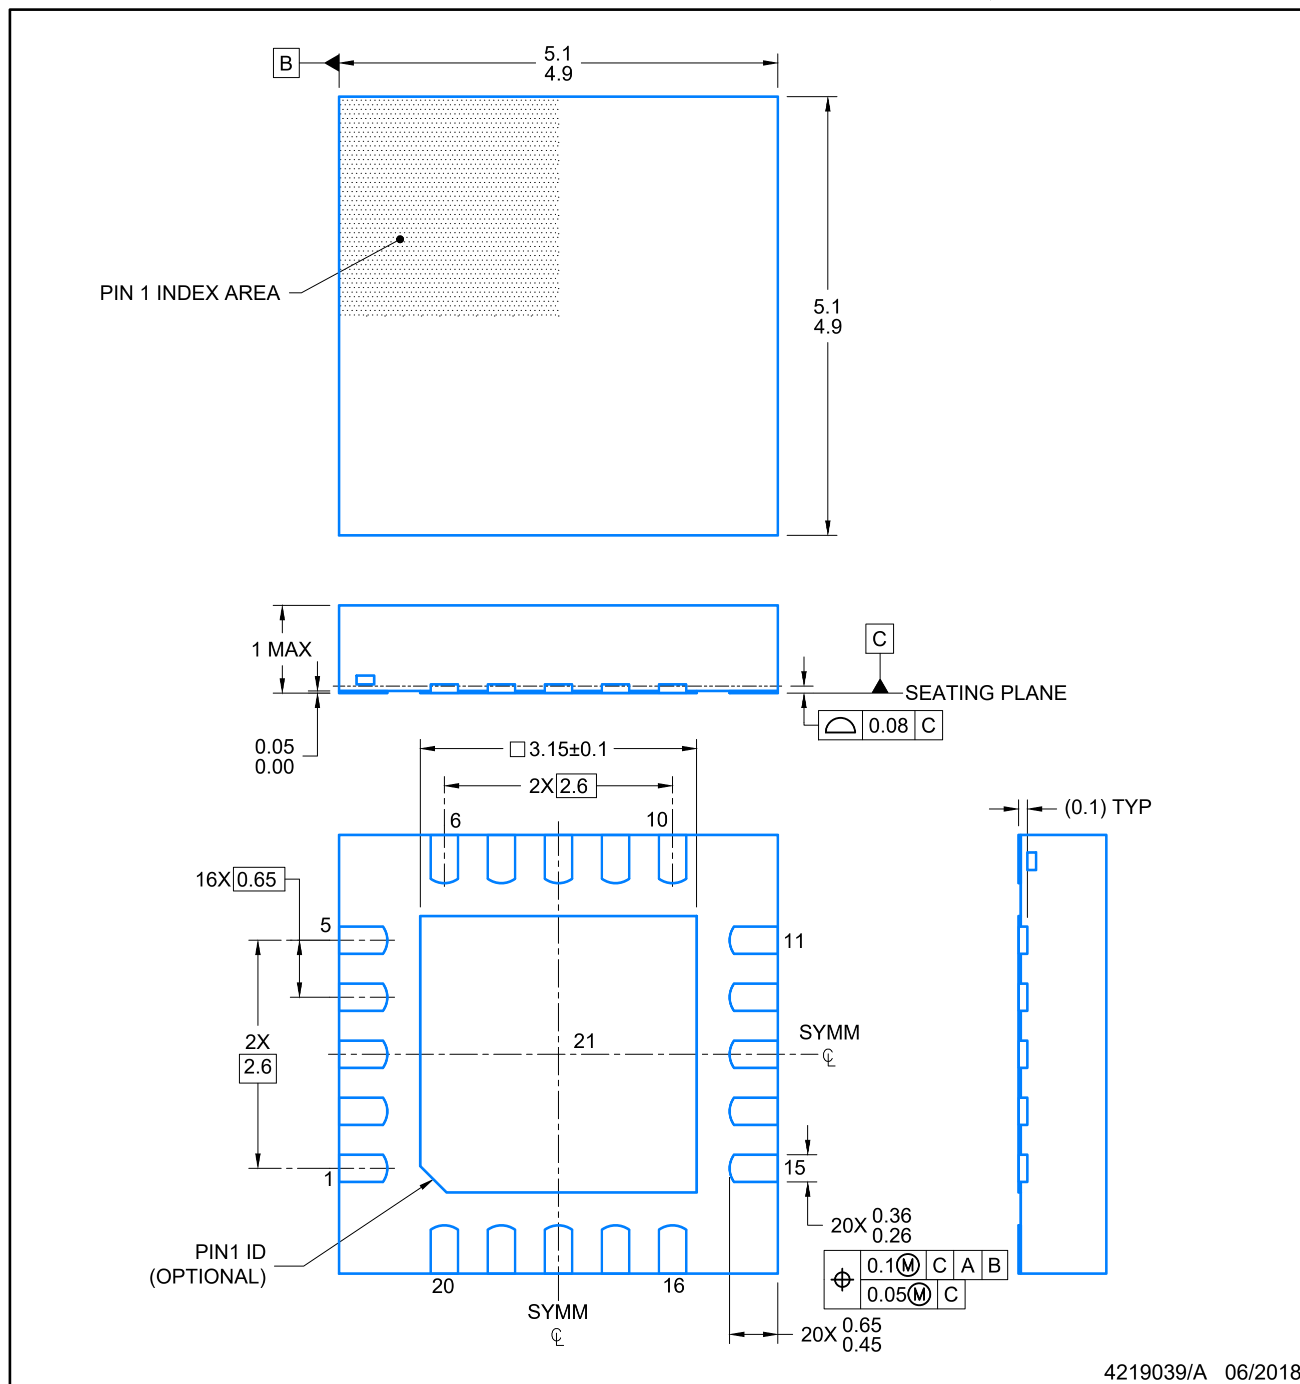


NOTES:
- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- C. Lead width and height dimensions apply to the plated lead.
- D. Leads are not allowed above the Datum B.
- E. Stand–off height is measured from lead tip with reference to Datum B.
- F. Lead width dimension does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum dimension by more than 0.003”.
- G. Cross–hatch indicates exposed metal surface.
- H. Falls within JEDEC MO–169 with the exception of the dimensions indicated.

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

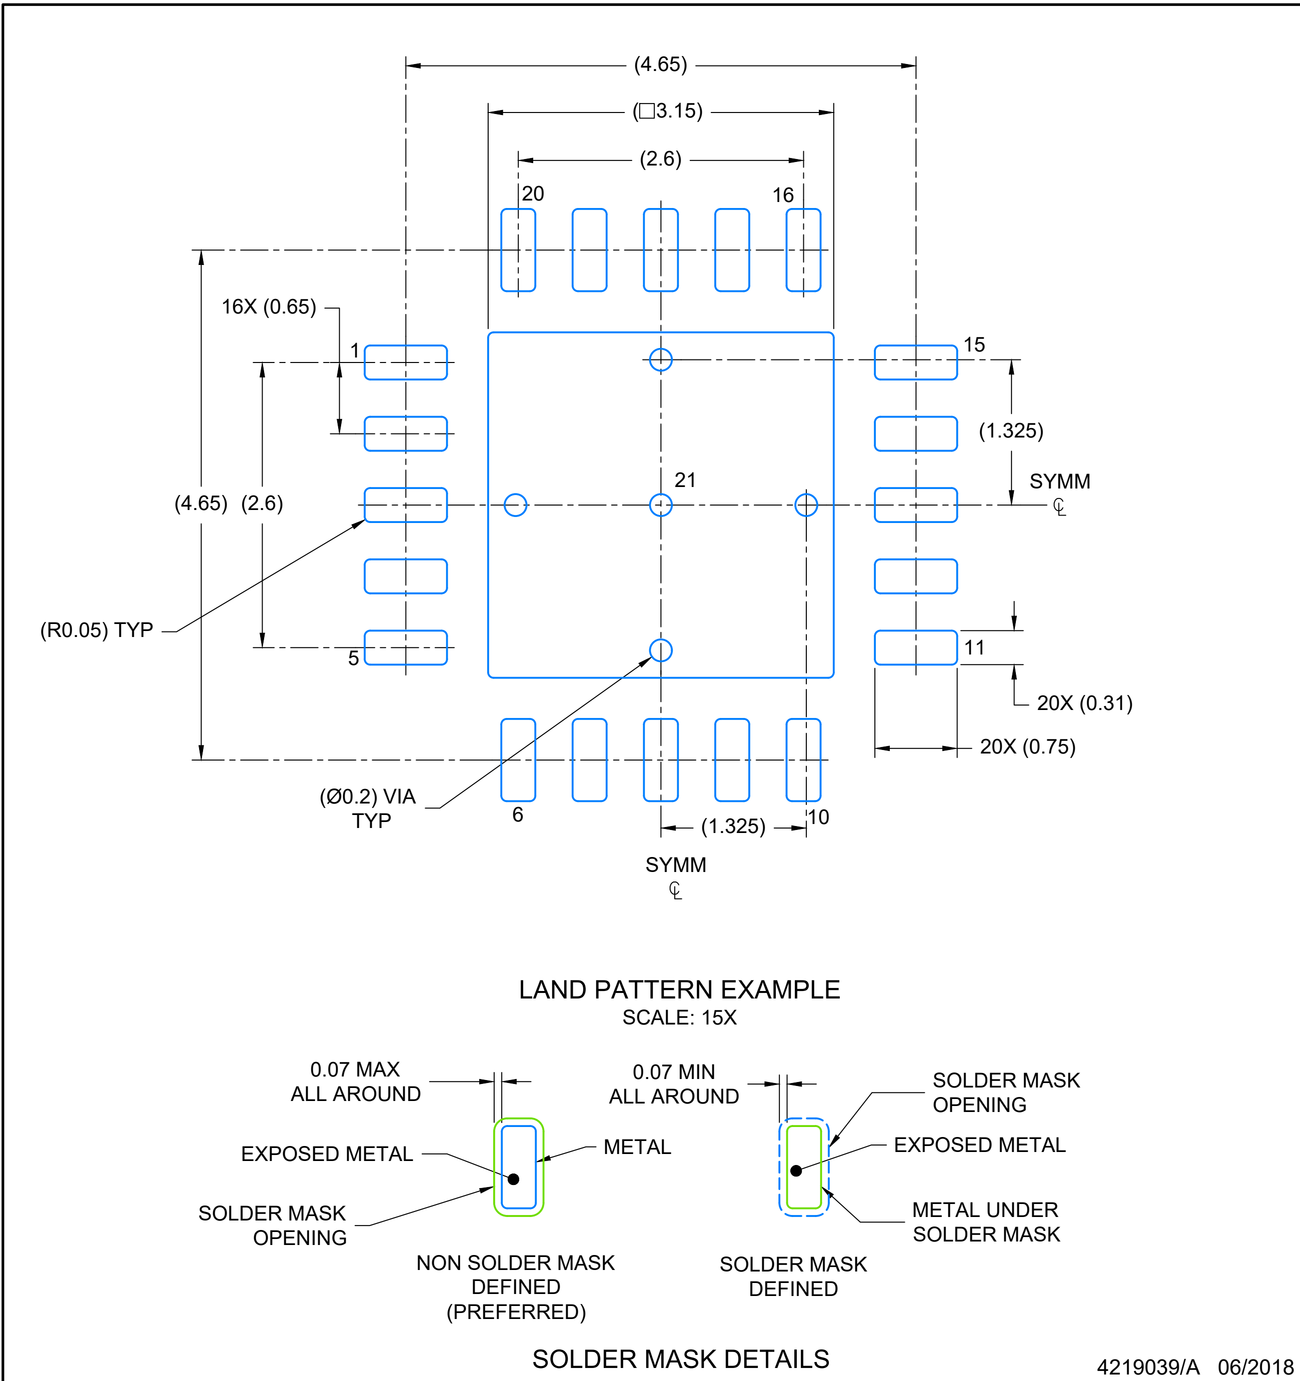


4227157/A



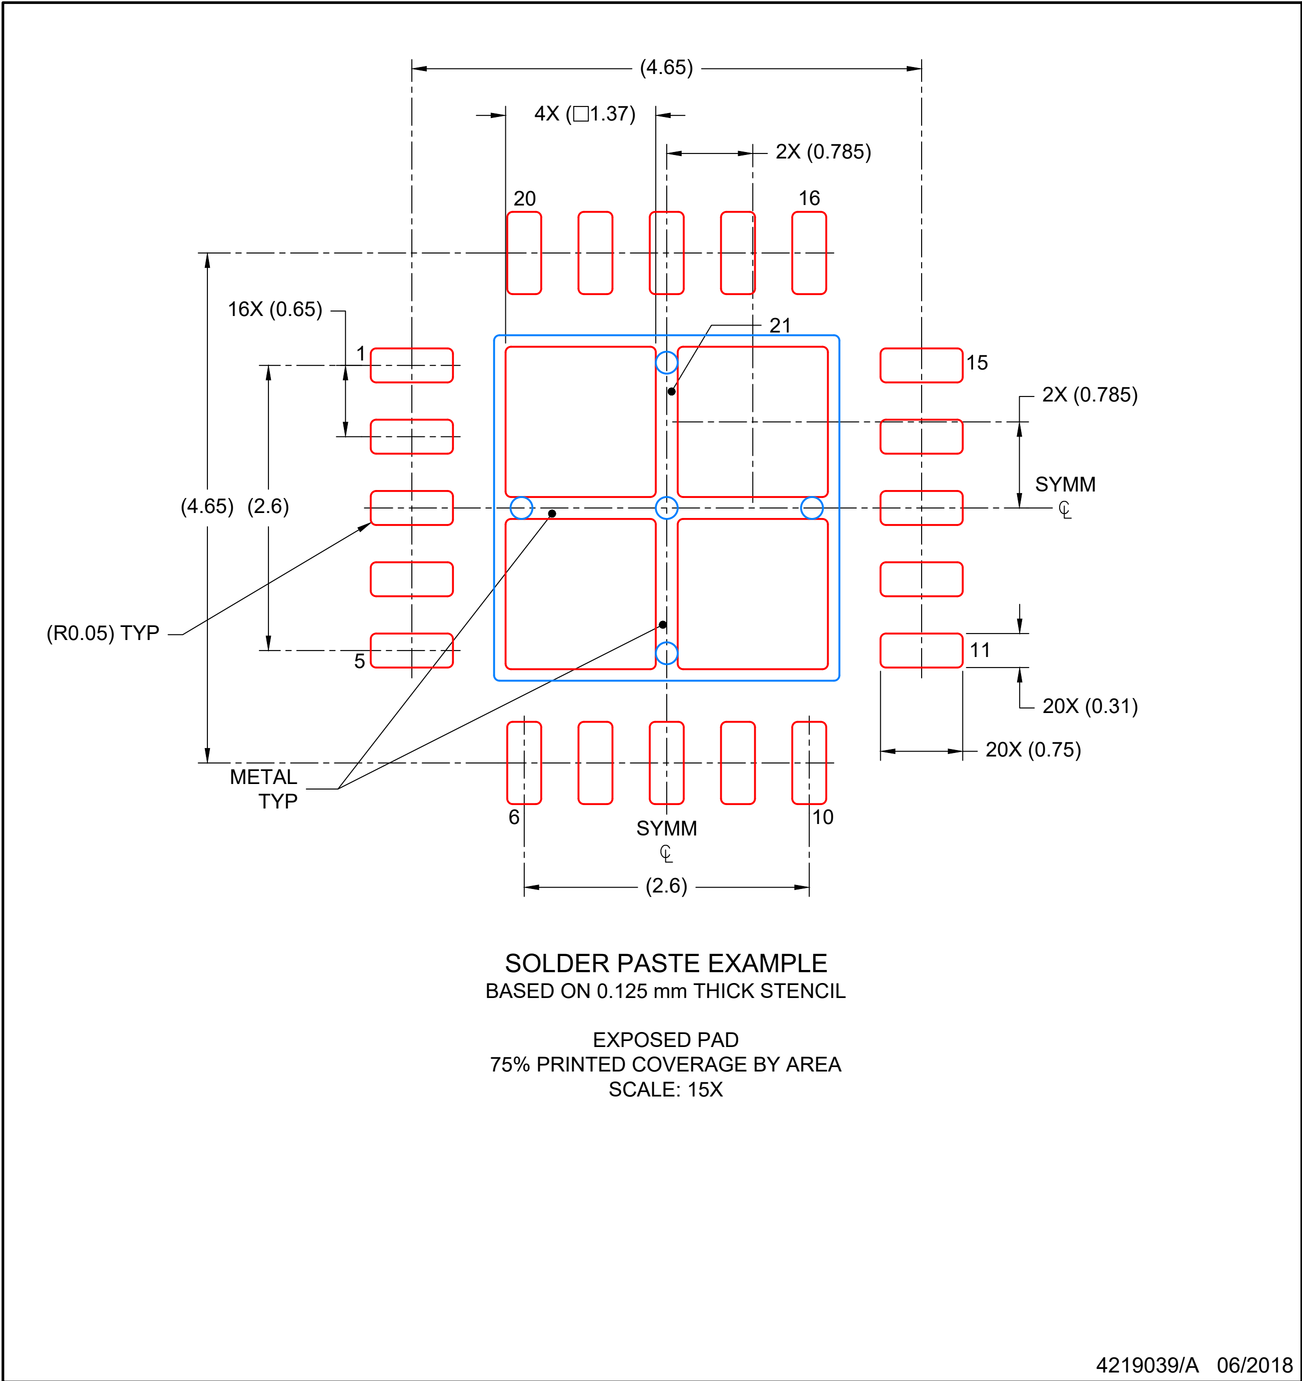
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.



NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.



NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
