

# TPS74901 プログラマブルソフトスタート機能付き、3A 低ドロップアウト リニアレギュレータ

## 1 特長

- $V_{OUT}$  範囲: 0.8V~3.6V
- 非常に低い  $V_{IN}$  範囲: 0.8V~5.5V
- $V_{BIAS}$  範囲: 2.7V~5.5V
- 低いドロップアウト: 3A で 120mV (標準値)
- パワーグッド (PG) 出力により、電源電圧の監視や、他の電源のためのシーケンシング信号の供給が可能
- 入力、負荷、温度に関する精度: 1% (新チップ)
- 入力、負荷、温度に関する精度: 2% (レガシーチップ)
- 可変スタートアップ突入電流
- $V_{BIAS}$  により、過渡応答性に優れた低  $V_{IN}$  動作を実現
- 2.2 $\mu$ F 以上の出力コンデンサで安定動作
- パッケージ:
  - 小型の 3mm × 3mm × 1mm VSON
  - 5mm × 5mm × 1mm VQFN および DDPAK-7
- アクティブ High イネーブル

## 2 アプリケーション

- ネットワーク接続ストレージ (NAS) - エンタープライズラックサーバー
- ネットワーク インターフェイス カード (NIC)
- 商用ネットワークとサーバーの電源

### 代表的なアプリケーション回路 (可変)

### ターンオン応答

## 3 概要

TPS74901 低ドロップアウト (LDO) リニアレギュレータは、広範なアプリケーション向けの使いやすく堅牢な電力管理ソリューションです。ソフトスタートをユーザーがプログラムできるので、スタートアップ中の容量性突入電流を低減して、入力電源のストレスを最小限に抑えることができます。ソフトスタートは単調性で、多くの種類のプロセッサおよび特定用途向け IC (ASIC) の電源供給向けに設計されています。イネーブル入力とパワーグッド出力により、外部レギュレータとの間でシーケンシングを簡単に行えます。この優れた柔軟性により、フィールドプログラマブルゲートアレイ (FPGA)、デジタル信号プロセッサ (DSP)、および特殊なスタートアップ要件を持つ他のアプリケーションのシーケンス要件を満たすソリューションを構成できます。

高精度の基準電圧およびエラーアンプは、負荷、ライン、温度、プロセスの全体にわたって 2% の精度を維持します。本デバイスは 2.2 $\mu$ F 以上の任意のタイプのコンデンサで安定して動作し、-40°C~+125°C で仕様が規定されています。TPS74901 は、小型 (3mm × 3mm) の VSON パッケージおよび小型 (5mm × 5mm) の VQFN パッケージで供給されるため、非常に小さいトータルソリューションサイズを実現できます。このデバイスは、DDPAK-7 パッケージでも供給されます。

### パッケージ情報

部品番号	パッケージ (1)	パッケージサイズ (2)
TPS74901	RGW (VQFN, 20)	5mm × 5mm
	KTW (DDPAK/TO-263, 7)	8.89mm × 10.1mm
	DRC (VSON, 10)	3mm × 3mm

- (1) 詳細については、「[メカニカル、パッケージ、および注文情報](#)」を参照してください。
- (2) パッケージサイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

図 4-3. DRC Package, 10-Pin VSON With Thermal Pad (Top View)

表 4-1. Pin Functions

NAME	PIN			TYPE	DESCRIPTION
	DDPAK/TO-263	VQFN	VSON		
BIAS	6	10	4	I	Bias input voltage for error amplifier, reference, and internal control circuits.
EN	7	11	5	I	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
FB	2	16	8	I	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating.
GND	4	12	6	—	Ground
IN	5	5, 6, 7, 8	1, 2	I	Unregulated input to the device.
NC	—	2, 3, 4, 13, 14, 17	—	—	No connection. This pin can be left floating or connected to GND to allow better thermal contact to the top-side plane.
OUT	3	1, 18, 19, 20	9, 10	O	Regulated output voltage. A small capacitor (total typical capacitance $\geq 2.2\mu\text{F}$ , ceramic) is needed from this pin to ground to assure stability.
PG	—	9	3	O	Power-good (PG) is an open-drain, active-high output that indicates the status of $V_{\text{OUT}}$ . When $V_{\text{OUT}}$ exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When $V_{\text{OUT}}$ is below this threshold the pin is driven to a low-impedance state. A pullup resistor from 10k $\Omega$ to 1M $\Omega$ must be connected from this pin to a supply up to 5.5V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
SS	1	15	7	—	Soft-start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 100 $\mu\text{s}$ .
Thermal Pad	—	—	—	—	Solder to the ground plane for increased thermal performance.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{IN}, V_{BIAS}$	Input voltage	-0.3	6	V
$V_{EN}$	Enable voltage	-0.3	6	V
$V_{PG}$	Power-good voltage	-0.3	6	V
$I_{PG}$	PG sink current	0	1.5	mA
$V_{SS}$	Soft-start voltage	-0.3	6	V
$V_{FB}$	Feedback voltage	-0.3	6	V
$V_{OUT}$	Output voltage	-0.3	$V_{IN} + 0.3$	V
$I_{OUT}$	Maximum output current	Internally limited		
	Output short-circuit duration	Indefinite		
$P_{DISS}$	Continuous total power dissipation	See Thermal Information		
$T_J$	Junction Temperature	-40	150	°C
$T_{stg}$	Storage Temperature	-55	150	

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{IN}$	Input supply voltage	$V_{OUT} + V_{DO}$ ( $V_{IN}$ )		5.5	V
$V_{EN}$	Enable supply voltage			5.5	V
$V_{BIAS}$ <sup>(1)</sup>	BIAS supply voltage	$V_{OUT} + V_{DO}$ ( $V_{BIAS}$ ) <sup>(2)</sup>		5.5	V
$V_{OUT}$	Output voltage	0.8		3.6	V
$I_{OUT}$	Output current	0		3	A
$C_{OUT}$	Output capacitor	2.2			μF
$C_{IN}$	Input capacitor <sup>(3)</sup>	1			μF
$C_{BIAS}$	Bias capacitor	0.1	1		μF
$T_J$	Operating junction temperature	-40		125	°C

- (1) BIAS supply is required when  $V_{IN}$  is below  $V_{OUT} + 1.62$  V.  
(2)  $V_{BIAS}$  has a minimum voltage of 2.7 V or  $V_{OUT} + V_{DO}$  ( $V_{BIAS}$ ), whichever is higher.  
(3) If  $V_{IN}$  and  $V_{BIAS}$  are connected to the same supply, the recommended minimum capacitor for the supply is 4.7 μF.

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS749					UNIT
		RGW (VQFN)	RGW (VQFN) <sup>(2)</sup>	KTW (TO-263)	DRC (VSON)	DRC (VSON) <sup>(2)</sup>	
		20 PINS	20 PINS	7 PINS	10 PINS	10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	38.1	34.7	33.8	48.1	47.2	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	36.3	31	35.9	60.3	63.7	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	17.5	13.5	25	22.4	19.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.7	1.4	6	1.0	4.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	17.6	13.5	23.6	22.6	19.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	6.2	3.6	N/A	4.3	3.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

### 5.7 Typical Characteristics: $I_{OUT} = 1\text{ A}$ (continued)

at  $T_J = 25^\circ\text{C}$ ,  $V_{IN} = V_{OUT(NOM)} + 0.3\text{V}$ ,  $V_{BIAS} = 5\text{V}$ ,  $I_{OUT} = 1\text{A}$ ,  $V_{EN} = V_{IN} = 1.8\text{V}$ ,  $V_{OUT} = 1.5\text{V}$ ,  $C_{IN} = 1\mu\text{F}$ ,  $C_{BIAS} = 4.7\mu\text{F}$ , and  $C_{OUT} = 10\mu\text{F}$  (unless otherwise noted)

## 6 Detailed Description

### 6.1 Overview

The TPS74901 is a low-dropout (LDO) regulator that features soft-start capabilities. This regulator uses a low-current bias input to power all internal control circuitry, allowing the NMOS pass transistor to regulate very-low input and output voltages.

Using an NMOS pass transistor offers several critical advantages for many applications. Unlike a p-channel metal-oxide-semiconductor field effect transistor (PMOS) topology device, the output capacitor has little effect on loop stability. This architecture allows the TPS74901 to be stable with any capacitor with a value of  $2.2\mu\text{F}$  or greater. Transient response is also superior to PMOS topologies, particularly for low  $V_{\text{IN}}$  applications.

The TPS74901 features a programmable voltage-controlled soft-start circuit that provides a smooth, monotonic start-up and limits start-up inrush currents that can be caused by large capacitive loads. A power-good (PG) output is available to allow supply monitoring and sequencing of other supplies. An enable (EN) pin with hysteresis and deglitch allows slow-ramping signals to be used for sequencing the device. The low  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often present in processor-intensive systems.

図 6-1. Legacy Chip Functional Block Diagram

6-2. New Chip Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Enable and Shutdown

The enable (EN) pin is active high and is compatible with standard digital-signaling levels.  $V_{EN}$  below 0.4V turns the regulator off and  $V_{EN}$  above 1.1V turns the regulator on. Unlike many regulators, the enable circuitry has hysteresis and deglitching for use with relatively slowly ramping analog signals. This configuration allows the TPS74901 to be enabled by connecting the output of another supply to the EN pin. The enable circuitry typically has 50mV of hysteresis and a deglitch circuit to help avoid ON-OFF cycling because of small glitches in the  $V_{EN}$  signal.

The enable threshold is typically 0.8V and varies with temperature and process variations. Temperature variation is approximately  $-1\text{mV}/^\circ\text{C}$ ; process variation accounts for most of the rest of the variation to the 0.4V and 1.1V limits. If precise turn-on timing is required, a fast rise-time signal must be used to enable the TPS74901.

If not used, EN can be connected to either IN or BIAS. If EN is connected to IN, then connect EN as close as possible to the largest capacitance on the input to prevent voltage droops on that line from triggering the enable circuit.

The TPS749 has an internal active pulldown circuit that connects the output to GND through an 833Ω resistor when the device is disabled. This resistor discharges the output with a time constant of:

$$\tau = \left( \frac{833 \times R_L}{833 + R_L} \right) \times C_{OUT}$$

### 6.3.2 Power-Good

The power-good (PG) pin is an open-drain output and can be connected to any 5.5V or lower rail through an external pullup resistor. This pin requires at least 1.1V on  $V_{BIAS}$  to have a valid output. The PG output is high-impedance when  $V_{OUT}$  is greater than  $V_{IT} + V_{HYS}$ . If  $V_{OUT}$  drops below  $V_{IT}$  or if  $V_{BIAS}$  drops below 1.9V, the open-drain output turns on and pulls the PG output low. The PG pin also asserts when the device is disabled. The recommended operating condition of PG pin sink current is up to 1mA, so the pullup resistor for PG must be in the range of 10k $\Omega$  to 1M $\Omega$ . PG is only provided on the VQFN package. If output voltage monitoring is not needed, the PG pin can be left floating.

### 6.3.3 Internal Current Limit

The TPS74901 features a factory-trimmed, accurate current limit that is flat over temperature and supply voltage. The current limit allows the device to supply surges of up to 4A and maintain regulation. The current limit responds in approximately 10 $\mu$ s to reduce the current during a short-circuit fault.

The internal current-limit protection circuitry of the TPS74901 is designed to protect against overload conditions. This circuitry is not intended to allow operation above the rated current of the device. Continuously running the TPS74901 above the rated current degrades device reliability.

### 6.3.4 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the regulator, protecting the regulator from damage as a result of overheating.

Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heat sinking. For reliable operation, junction temperature must be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heat sink), increase the ambient temperature until thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection must trigger at least 40°C above the maximum expected ambient condition of the application. This condition produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS74901 is designed to protect against overload conditions. This circuitry is not intended to replace proper heat sinking. Continuously running the TPS74901 into thermal shutdown degrades device reliability.

## 6.4 Device Functional Modes

表 6-1 lists the conditions that lead to the different modes of operation.

**表 6-1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER				
	$V_{IN}$	$V_{EN}$	$V_{BIAS}$	$I_{OUT}$	$T_J$
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}(V_{IN})$	$V_{EN} > V_{EN(high)}$	$V_{BIAS} \geq V_{OUT} + V_{DO}(V_{BIAS})$	$I_{OUT} < I_{CL}$	$T_J < 125^{\circ}\text{C}$
Dropout mode	$V_{IN} < V_{OUT(nom)} + V_{DO}(V_{IN})$	$V_{EN} > V_{EN(high)}$	$V_{BIAS} < V_{OUT} + V_{DO}(V_{BIAS})$	—	$T_J < 125^{\circ}\text{C}$
Disabled mode (any true condition disables the device)		$V_{EN} < V_{EN(low)}$	$V_{BIAS} < V_{BIAS(UVLO)}$	—	$T_J > 165^{\circ}\text{C}$

### 6.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage and bias voltage are both at least at the respective minimum specifications
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold
- The output current is less than the current limit
- The device junction temperature is less than the maximum specified junction temperature

### 6.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass transistor is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

### 6.4.3 Disabled

The device is disabled under the following conditions:

- The input or bias voltages are below the respective minimum specifications
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold
- The device junction temperature is greater than the thermal shutdown temperature

## 7 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 7.1 Application Information

#### 7.1.1 Input, Output, and BIAS Capacitor Requirements

The device is designed to be stable for all available types of and values of output capacitors  $\geq 2.2\mu\text{F}$ . The device is also stable with multiple capacitors in parallel, which can be of any type or value.

The capacitance required on the IN and BIAS pin strongly depends on the input supply source impedance. To counteract any inductance in the input, the minimum recommended capacitor for  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$  is  $1\mu\text{F}$ . If  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$  are connected to the same supply, the recommended minimum capacitor for  $V_{\text{BIAS}}$  is  $4.7\mu\text{F}$ . Good quality, low-ESR capacitors must be used on the input; ceramic X5R and X7R capacitors are preferred. These capacitors must be placed as close as possible to the pins for optimum performance.

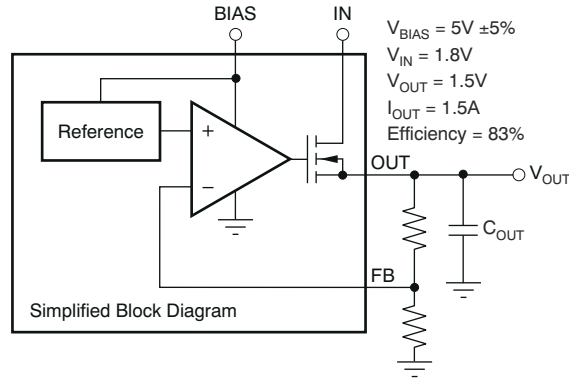

#### 7.1.2 Transient Response

The TPS74901 is designed to have excellent transient response for most applications with a small amount of output capacitance. In some cases, the transient response can be limited by the transient response of the input supply. This limitation is especially true in applications where the difference between the input and output is less than 300mV. In this case, adding additional input capacitance improves the transient response much more than just adding additional output capacitance otherwise does. With a solid input supply, adding additional output capacitance reduces undershoot and overshoot during a transient event; see [Figure 5-36](#) in the *Typical Characteristics* section. Because the TPS74901 is stable with output capacitors as low as  $2.2\mu\text{F}$ , many applications can need very little capacitance at the LDO output. For these applications, local bypass capacitance for the powered device can be sufficient to meet the transient requirements of the application. This design reduces the total solution cost by avoiding the need to use expensive high-value capacitors at the LDO output.

#### 7.1.3 Dropout Voltage

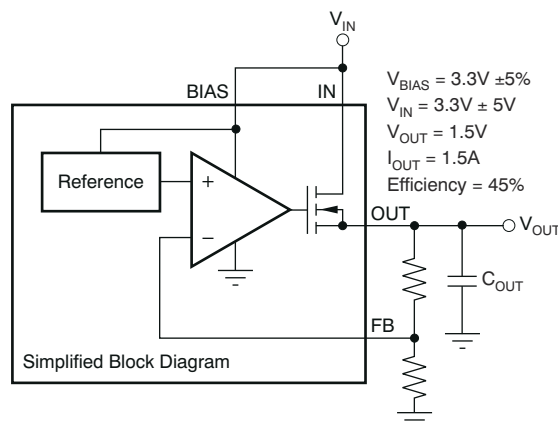

The TPS74901 offers very low dropout performance, making the device designed for high-current low  $V_{\text{IN}}$  and low  $V_{\text{OUT}}$  applications. The low dropout of the TPS74901 allows the device to be used in place of a DC/DC converter and still achieve good efficiencies. This capability provides designers with the power architecture for applications to achieve the smallest, simplest, and lowest-cost solution.

There are two different specifications for dropout voltage with the TPS74901. The first specification (see [Figure 7-1](#)) is referred to as  $V_{\text{IN}}$  dropout and is used when an external bias voltage is applied to achieve low dropout. This specification assumes that  $V_{\text{BIAS}}$  is at least 3.25V above  $V_{\text{OUT}}$ , which is the case for  $V_{\text{BIAS}}$  when powered by a 5V rail with 5% tolerance and with  $V_{\text{OUT}} = 1.5\text{V}$  (3.25V is a test condition of this device and can be adjusted by referring to [Figure 5-11](#)). If  $V_{\text{BIAS}}$  is higher than  $V_{\text{OUT}} + 3.25\text{V}$ ,  $V_{\text{IN}}$  dropout is less than specified.

**図 7-1. Typical Application of the TPS74901 Using an Auxiliary Bias Rail**

The second specification (shown in 図 7-2) is referred to as  $V_{BIAS}$  dropout and is applied to applications where IN and BIAS are tied together. This option allows the device to be used in applications where an auxiliary bias voltage is not available or low dropout is not required. Dropout is limited by BIAS in these applications because  $V_{BIAS}$  provides the gate drive to the pass transistor; therefore,  $V_{BIAS}$  must be 1.75V above  $V_{OUT}$ . Because of this usage, IN and BIAS tied together easily consume a huge amount of power. Pay attention not to exceed the power rating of the device package.

**図 7-2. Typical Application of the TPS74901 Without an Auxiliary Bias**

### 7.1.4 Output Noise

The TPS74901 provides low-output noise when a soft-start capacitor is used. When the device reaches the end of the soft-start cycle, the soft-start capacitor serves as a filter for the internal reference. By using a 0.001 $\mu$ F soft-start capacitor, the output noise is reduced by half and is typically 30 $\mu$ V<sub>RMS</sub> for a 1.2V output (10Hz to 100kHz). Further increasing  $C_{SS}$  has little effect on noise. Because most of the output noise is generated by the internal reference, the noise is a function of the set output voltage. The RMS noise with a 0.001 $\mu$ F soft-start capacitor is given in 式 1.

$$V_N(\mu V_{RMS}) = 25 \left( \frac{\mu V_{RMS}}{V} \right) \times V_{OUT}(V) \quad (1)$$

The low-output noise of the TPS74901 makes the device a good choice for powering transceivers, PLLs, or other noise-sensitive circuitry.

### 7.1.5 Programmable Soft-Start

The TPS74901 features a programmable, monotonic, voltage-controlled soft-start that is set with an external capacitor ( $C_{SS}$ ). This feature is important for many applications because power-up initialization problems are eliminated when powering FPGAs, DSPs, or other processors. The controlled voltage ramp of the output also reduces peak inrush current during start-up, minimizing start-up transient events to the input power bus.

To achieve a linear and monotonic soft-start, the TPS74901 error amplifier tracks the voltage ramp of the external soft-start capacitor until the voltage exceeds the internal reference. The soft-start ramp time is dependent on the soft-start charging current ( $I_{SS}$ ), soft-start capacitance ( $C_{SS}$ ), and the internal reference voltage ( $V_{REF}$ ), and can be calculated using 式 2.

$$t_{SS} = \frac{(V_{REF} \times C_{SS})}{I_{SS}} \quad (2)$$

If large output capacitors are used, the device current limit ( $I_{CL}$ ) and the output capacitor can set the start-up time. In this case, the start-up time is given by 式 3:

$$t_{SSCL} = \frac{(V_{OUT(NOM)} \times C_{OUT})}{I_{CL(MIN)}} \quad (3)$$

where:

- $V_{OUT(NOM)}$  is the nominal set output voltage
- $C_{OUT}$  is the output capacitance
- $I_{CL(MIN)}$  is the minimum current limit for the device

In applications where monotonic start-up is required, the soft-start time given by 式 2 must be set to be greater than 式 3.

The maximum recommended soft-start capacitor is 0.015 $\mu$ F. Larger soft-start capacitors can be used and do not damage the device; however, the soft-start capacitor discharge circuit can possibly be unable to fully discharge the soft-start capacitor when enabled. Soft-start capacitors larger than 0.015 $\mu$ F can be a problem in applications where the enable pin must be rapidly pulsed while still requiring the device to soft-start from ground.  $C_{SS}$  must be low-leakage; X7R, X5R, or C0G dielectric materials are preferred. See 表 7-1 for suggested soft-start capacitor values.

**表 7-1. Standard Capacitor Values for Programming the Soft-Start Time**

$C_{SS}^{(1)}$	SOFT-START TIME (Legacy Chip)	SOFT-START TIME (New Chip)
Open	0.1ms	0.25ms
270pF	0.5ms	0.4ms
560pF	1ms	0.8ms
2.7nF	5ms	4.1ms
5.6nF	10ms	8.5ms
0.01 $\mu$ F	18ms	15ms

(1)  $t_{SS}(s) = 0.8 \times C_{SS}(F) / I_{SS}$ , where  $t_{SS}(s)$  = soft-start time in seconds.

Another option for setting the start-up rate is to use a feedforward capacitor. See the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator application note](#) for more information.

### 7.1.6 Sequencing Requirements

$V_{IN}$ ,  $V_{BIAS}$ , and  $V_{EN}$  can be sequenced in any order without causing damage to the device. However, for the soft-start function to work as intended, certain sequencing rules must be applied. Connecting EN to IN is acceptable for most applications as long as  $V_{IN}$  is greater than 1.1V, and the ramp rate of  $V_{IN}$  and  $V_{BIAS}$  is faster than the set soft-start ramp rate. If the ramp rate of the input sources is slower than the set soft-start time, the output tracks the slower supply minus the dropout voltage until the set output voltage is reached. If EN is connected to BIAS, the device soft-starts as programmed, provided that  $V_{IN}$  is present before  $V_{BIAS}$ . If  $V_{BIAS}$  and  $V_{EN}$  are present before  $V_{IN}$  is applied and the set soft-start time has expired, then  $V_{OUT}$  tracks  $V_{IN}$ . If the soft-start time has not expired, the output tracks  $V_{IN}$  until  $V_{OUT}$  reaches the value set by the charging soft-start capacitor. [Figure 7-3](#) shows the use of an RC delay circuit to hold off  $V_{EN}$  until  $V_{BIAS}$  has ramped. This technique can also be used to drive EN from  $V_{IN}$ . An external control signal can also be used to enable the device after  $V_{IN}$  and  $V_{BIAS}$  are present.

#### 注

When  $V_{BIAS}$  and  $V_{EN}$  are present and  $V_{IN}$  is not supplied, this device outputs approximately 50 $\mu$ A of current from OUT. Although this condition does not cause any damage to the device, the output current can charge up the OUT node if total resistance between OUT and GND (including external feedback resistors) is greater than 10k $\Omega$ .

**Figure 7-3. Soft-Start Delay Using an RC Circuit on Enable**

## 7.2 Typical Application

図 7-4 shows the typical application circuit for the TPS74901 adjustable output device.

$R_1$  and  $R_2$  can be calculated for any output voltage using the formula shown in 図 7-4. 表 7-2 lists sample resistor values of common output voltages. To achieve the maximum accuracy specifications,  $R_2$  must be  $\leq 4.99\text{k}\Omega$ .

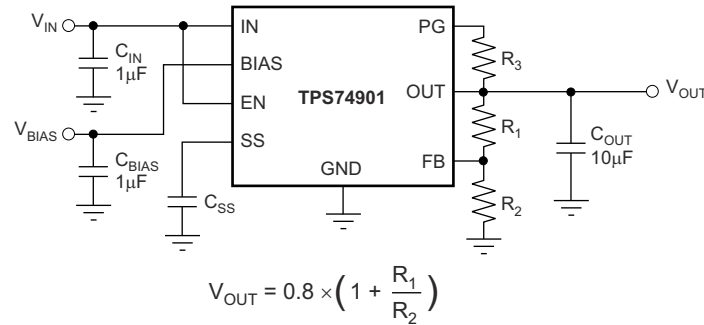

図 7-4. Typical Application Circuit for the TPS74901 (Adjustable)

表 7-2. Standard 1% Resistor Values for Programming the Output Voltage<sup>(1)</sup>

$R_1$ (k $\Omega$ )	$R_2$ (k $\Omega$ )	$V_{OUT}$ (V)
Short	Open	0.8
0.619	4.99	0.9
1.13	4.53	1
1.37	4.42	1.05
1.87	4.99	1.1
2.49	4.99	1.2
4.12	4.75	1.5
3.57	2.87	1.8
3.57	1.69	2.5
3.57	1.15	3.3

(1)  $V_{OUT} = 0.8 \times (1 + R_1 / R_2)$ .

### 7.2.1 Design Requirements

The goal of this design is to create a 1.2V rail at 3A with minimal external components from a 1.5V rail.

### 7.2.2 Detailed Design Procedure

First choose the bias, which must be at least 1.75V above the output voltage. A 3.3V rail is used to achieve this minimum voltage. For a minimal external component count and size, select the minimum capacitor sizes.  $C_{IN} = 1\mu\text{F}$ ,  $C_{BIAS} = 1\mu\text{F}$ , and a  $C_{OUT} = 10\mu\text{F}$ . The  $C_{OUT}$  value was chosen to improve transient response. Using 表 7-2,  $R_1$  is set to 2.49k $\Omega$  and  $R_2$  is set to 4.99k $\Omega$  to create a 1.2V rail. The pullup resistor for PG is set to 10k $\Omega$ .

### 7.2.3 Application Curves

7-5.  $V_{IN}$  PSRR vs  $(V_{IN} - V_{OUT})$

7-6. Noise Spectral Density

### 7.3 Power Supply Recommendations

The TPS74901 is designed to operate from an input voltage from 1.1V to 5.5V, provided the bias rail is at least 1.75V higher than the input supply. The bias rail and the input supply must both provide adequate headroom and current for the device to operate normally.

Connect a low-output impedance power supply directly to the IN pin of the TPS74901. This supply must have at least 1 $\mu$ F of capacitance near the IN pin for stability. A supply with similar requirements must also be connected directly to the bias rail with a separate 1 $\mu$ F or larger capacitor.

If the IN pin is tied to the bias pin, a minimum 4.7 $\mu$ F of capacitance is needed for stability.

To increase the overall PSRR of the solution at higher frequencies, use a PI-filter or ferrite bead before the input capacitor.

### 7.4 Layout

#### 7.4.1 Layout Guidelines

An optimal layout can greatly improve transient performance, PSRR, and noise. To minimize the voltage droop on the input of the device during load transients, connect the capacitance on IN and BIAS as close as possible to the device. This capacitance also minimizes the effects of parasitic inductance and resistance of the input source and can therefore improve stability. To achieve optimal transient performance and accuracy, connect the top side of  $R_1$  in 7-4 as close as possible to the load. If BIAS is connected to IN, connect BIAS as close to the sense point of the input supply as possible. This connection minimizes the voltage droop on BIAS during transient conditions and can improve the turn-on response.

##### 7.4.1.1 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation.

Power dissipation of the device depends on input voltage and load conditions, and can be calculated using 4:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On the VQFN (RGW) package, the primary conduction path for heat is through the exposed pad to the PCB. The pad can be connected to ground or left floating; however, the pad must be attached to an appropriate amount of

copper PCB area to ensure the device does not overheat. On the DDPAK (KTW) package, the primary conduction path for heat is through the tab to the PCB. Connect that tab to ground. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be estimated using 式 5:

$$R_{\theta JA} = \frac{(+125^{\circ}\text{C} - T_A)}{P_D} \quad (5)$$

Knowing the maximum  $R_{\theta JA}$ , the minimum amount of PCB copper area needed for appropriate heat sinking can be estimated using 図 7-7.

$R_{\theta JA}$  value at board size of 9 in<sup>2</sup> (that is, 3 inches × 3 inches) is a JEDEC standard.

#### 図 7-7. $R_{\theta JA}$ versus Board Size

図 7-7 shows the variation of  $R_{\theta JA}$  as a function of ground plane copper area in the board. 図 7-7 is intended only as a guideline to demonstrate the affects of heat spreading in the ground plane; do not use 図 7-7 to estimate actual thermal performance in real application environments.

#### 注

When the device is mounted on an application PCB, TI strongly recommends using  $\Psi_{JT}$  and  $\Psi_{JB}$ , as explained in the *Thermal Considerations* section.

#### 7.4.1.2 Thermal Considerations

A better method of estimating the thermal measure comes from using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , as shown in 式 6. These metrics are a more accurate representation of the heat transfer characteristics of the die and the package than  $R_{\theta JA}$ . The junction temperature can be estimated with the corresponding formulas given in 式 6.

$$\begin{aligned} \Psi_{JT}: T_J &= T_T + \Psi_{JT} \cdot P_D \\ \Psi_{JB}: T_J &= T_B + \Psi_{JB} \cdot P_D \end{aligned} \quad (6)$$

where:

- $P_D$  is the power dissipation shown by 式 4
- $T_T$  is the temperature at the center-top of the device package
- $T_B$  is the PCB temperature measured 1mm away from the device package *on the PCB surface* (see 図 7-8)

注

Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring  $T_T$  and  $T_B$ , see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com).

- A.  $T_T$  is measured at the center of both the X- and Y-dimensional axes.
- B.  $T_B$  is measured below the package lead on the PCB surface.

☒ 7-8. Measuring Points for  $T_T$  and  $T_B$

Compared with  $R_{\theta JA}$ , the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$  are less independent of board size but do have a small dependency on board size and layout. [Figure 7-9](#) shows characteristic performance of  $\Psi_{JT}$  and  $\Psi_{JB}$  versus board size.

Referring to [Figure 7-9](#), the RGW package thermal performance has negligible dependency on board size. The KTW package, however, does have a measurable dependency on board size. This dependency exists because the package shape is not point symmetric to the center of a device. In the KTW package, for example (see [Figure 7-8](#)), silicon is not beneath the measuring point of  $T_T$  that is the center of the X and Y dimension, so that  $\Psi_{JT}$  has a dependency. Also, because of that non-point symmetry, device heat distribution on the PCB is not point symmetric either, so that  $\Psi_{JB}$  has a greater dependency on board size and layout.

**Figure 7-9.  $\Psi_{JT}$  and  $\Psi_{JB}$  versus Board Size**

For a more detailed discussion of why TI does not recommend using  $R_{\theta JC(top)}$  to determine thermal characteristics, see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com). Also, see the [IC Package Thermal Metrics application note](#) (also available on the TI website) for further information.

## 8 Device and Documentation Support

### 8.1 Device Support

#### 8.1.1 Device Nomenclature

表 8-1. Device Nomenclature

PRODUCT <sup>(1)</sup>	V <sub>OUT</sub>
TPS74901yyyzM3	<p>yyy is the package designator. z is the package quantity. M3 is a suffix designator for devices that only use the latest manufacturing flow (CSO: RFB). Devices without this suffix ship with the legacy chip (CSO: DLN) or the new chip (CSO: RFB). The reel packaging label provides CSO information to distinguish which chip is used. The device performance for new and legacy chips is denoted throughout the document.</p>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on [www.ti.com](http://www.ti.com).

#### 8.1.2 Development Support

##### 8.1.2.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS74901. The [TPS74901EVM-210 evaluation module](#) and related user's guide ([SLVU190](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

##### 8.1.2.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS74901 is available through the product folders under *Tools & Software*.

[テキサス・インスツルメンツ E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

### 8.5 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

## 8.6 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

## 8.7 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

## 9 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision J (April 2023) to Revision K (June 2024)	Page
• M3 への参照を新しいチップに変更「概要」セクションに「入力、負荷、温度に関する精度: 1% (新チップ)」を追加 ..	1
• Added (Legacy Chip) to KTW package.....	3
• Changed <i>Typical Characteristics: I<sub>OUT</sub> = 50mA</i> section and added new chip curves.....	8
• Changed <i>Typical Characteristics: I<sub>OUT</sub> = 1 A</i> section, added new chip curves side by side to legacy curves..	14
• Changed <i>Legacy Chip Functional Block Diagram</i> to include pulldown resistor for legacy chip and added <i>New Chip Functional Block Diagram</i> .....	16
• Added active pulldown circuit discussion and equation to <i>Enable and Shutdown</i> section.....	17
• Added <i>SOFT-START TIME (New Chip)</i> column and changed footnote in <i>Standard Capacitor Values for Programming the Soft-Start Time</i> table.....	22
• Added feed-forward capacitor discussion to <i>Programmable Soft-Start</i> section.....	22
• Changed <i>Application Curves</i> section to only show new chip curves.....	25
• Changed last sentence of <i>Layout Recommendations and Power Dissipation</i> section; added  7-7 .....	25
• Deleted (previously numbered) Figure 35 through Figure 39.....	26
• Added <i>Device Nomenclature</i> section.....	30

Changes from Revision I (May 2016) to Revision J (April 2023)	Page
• ドキュメント全体にわたって表、図、相互参照の採番方法を更新 .....	1
• ドキュメントに M3 サフィックス デバイスを追加.....	1
• 「アプリケーション」セクションにリンクを追加 .....	1

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、[テキサス・インスツルメンツの販売条件](#)、または [ti.com](https://www.ti.com) やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## KTW (R-PSFM-G7)

## PLASTIC FLANGE-MOUNT

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 $\triangle C$ . Lead width and height dimensions apply to the plated lead.  
 D. Leads are not allowed above the Datum B.  
 E. Stand-off height is measured from lead tip with reference to Datum B.  
 $\triangle F$ . Lead width dimension does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum dimension by more than 0.003".  
 G. Cross-hatch indicates exposed metal surface.  
 $\triangle H$ . Falls within JEDEC MO-169 with the exception of the dimensions indicated.

## GENERIC PACKAGE VIEW

**RGW 20**

**VQFN - 1 mm max height**

5 x 5, 0.65 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4227157/A

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

4219039/A 06/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

VQFN - 1 mm max height
