

# TPS793 Low-Noise, High PSRR, RF, 200mA Low-Dropout Linear Regulators in NanoStar™ Wafer Chip Scale and SOT-23

## 1 Features

- Low-dropout regulator with enable
- Available in fixed-voltage versions:
  - 1.8V to 4.75V (Legacy chip)
  - 1.8V to 3.3V (New chip)
- Adjustable output voltage range: 1.22V to 5.5V
- Low noise:
  - 55 $\mu$ V<sub>RMS</sub> (Legacy chip)
  - 69 $\mu$ V<sub>RMS</sub> (New chip)
- Fast start-up time:
  - 50 $\mu$ s (Legacy chip)
  - 500 $\mu$ s (New chip)
- Very-low dropout voltage: 112mV (typ)
- For a more updated portfolio device, see the [TPS7A20](#)

## 2 Applications

- [TV applications](#)
- [Building automation](#)
- [Smartphones and tablets](#)
- [Connected peripherals and printers](#)
- [Home theater and entertainment applications](#)

## 3 Description

The TPS793 is a low-dropout (LDO) voltage regulators that features high power-supply rejection ratio (PSRR), and offers excellent line and load transient responses. This device is stable with a small 2.2 $\mu$ F ceramic capacitor on the output. The TPS793 offers low dropout voltages for example, 112mV (typical) at 200mA. The low output noise and great PSRR makes this device suitable to power sensitive analog loads. The TPS793 offers a flexible option for post regulation with the adjustable capability.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TPS793	DBV (SOT-23, 6)	2.9mm × 2.8mm
	DBV (SOT-23, 5)	2.9mm × 2.8mm
	YZQ (DSBGA, 5) <sup>(3)</sup>	1.35mm × 1mm

- (1) For more information, see the [Mechanical, Packaging, and Orderable Information](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.
- (3) Legacy chip only

**Typical Application Circuit**

## 4 Pin Configuration and Functions

**Figure 4-1. DBV Package, 5-Pin SOT-23 Fixed Voltage Version (Top View)**

**Figure 4-2. DBV Package, 6-Pin SOT-23 Adjustable Voltage Version (Top View)**

**Figure 4-3. YZQ Package, 5-Pin DSBGA (Top View) (Legacy chip only)**

**Table 4-1. Pin Functions**

NAME	PIN		I/O	DESCRIPTION
	DBV	YZQ		
EN	3	A3	I	Enable pin. Driving the enable pin (EN) high turns on the regulator. Driving this pin low puts the regulator into shutdown mode. EN can be connected to IN if not used.
FB	5	—	I	Feedback pin. This terminal is the feedback input pin for the adjustable device. Fixed voltage versions in the DBV package do not have this pin.
GND	2	A1	—	Regulator ground.
IN	1	C3	I	Input to the device.
NR/NC	4	B2	—	Noise Reduction pin (legacy chip only). Connecting an external capacitor to this pin filters noise generated by the internal bandgap. This configuration improves power-supply rejection and reduces output noise for the legacy chip and YZQ package only. No Connect pin (new chip only). This pin is not internally connected. Connect to GND for improved thermal performance or leave floating. For lower noise performance on a fixed device, consider looking at <a href="#">TPS7A20</a> .
OUT	6	C1	O	Output of the regulator.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	V <sub>IN</sub> , V <sub>EN</sub> , V <sub>OUT</sub> (Legacy Chip)	-0.3	6	V
	V <sub>IN</sub> , V <sub>EN</sub> (New Chip)	-0.3	6.5	V
	V <sub>OUT</sub> (New Chip)	-0.3	V <sub>IN</sub> + 0.3 <sup>(2)</sup>	
Current	Output, I <sub>OUT</sub>	Internally limited		
Temperature	Operating junction, T <sub>J</sub>	-40	150	°C
	Storage, T <sub>stg</sub>	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The absolute maximum rating is V<sub>IN</sub> + 0.3 V or 6.5 V, whichever is smaller.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, V all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input voltage	2.7		5.5	V
V <sub>EN</sub>	Enable voltage	0		5.5	V
V <sub>OUT</sub>	Output voltage	V <sub>FB</sub>		5	V
I <sub>OUT</sub>	Output current	0		200	mA
T <sub>J</sub>	Operating junction temperature	–40		125	°C
C <sub>IN</sub>	Input capacitor (Legacy Chip)	0.1	1		μF
	Input capacitor (New Chip)	1			
C <sub>OUT</sub>	Output capacitor	2.2 <sup>(1) (2)</sup>	10		μF
C <sub>NR</sub>	Noise reduction capacitor <sup>(3)</sup>	0	10		nF
C <sub>FF</sub>	Feed-forward capacitor (Legacy Chip)		15		pF
	Feed-forward capacitor (New Chip) <sup>(4)</sup>	0	10	100	nF
R <sub>2</sub>	Lower feedback resistor (Legacy Chip)		30.1		kΩ
F <sub>EN</sub>	Enable toggle frequency (New Chip)			10	kHz

- (1) If C<sub>FF</sub> is not used or V<sub>OUT</sub>(nom) < 1.8V, the minimum recommended C<sub>OUT</sub> = 4.7μF.
- (2) The minimum effective capacitance is 0.47 μF for the new chip only.
- (3) Legacy Chip only. The New Chip does not have a Noise Reduction pin. For more information please refer to Pin Functions table.
- (4) Feed-forward capacitor is optional and not required for stability.

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS793				UNIT
		DBV (SOT23-6)	YZQ (DSBGA)	DBV (SOT23-6) <sup>(2)</sup>	DBV (SOT23-5) <sup>(2)</sup>	
		6 PINS	5 PINS	6 PINS	5 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	225.1	178.5	171.7	182.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	78.4	1.4	110.8	114.8	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	54.7	62.1	85.4	79.1	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	3.3	0.9	54.4	56.8	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	53.8	62.1	85.2	78.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	N/A	N/A	N/A	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Packaging](#) application note.

(2) New Chip.

## 5.5 Electrical Characteristics

over recommended operating temperature range, T<sub>J</sub> = –40°C to +125°C V<sub>EN</sub> = V<sub>IN</sub>, V<sub>IN</sub> = V<sub>O(typ)</sub> + 1V<sup>(1)</sup> I<sub>OUT</sub> = 1 mA, C<sub>OUT</sub> = 10 μF, C<sub>NR</sub> = 0.01 μF (Legacy Chip) (unless otherwise noted). All typical values at T<sub>J</sub> = 25°C.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V <sub>IN</sub>	Input voltage range			2.7		5.5	V
I <sub>OUT</sub>	Continuous output current			0		200	mA
V <sub>OUT</sub>	Output voltage range	TPS79301		V <sub>FB</sub>		5.5 – V <sub>DROPOUT</sub>	V
		TPS79318	0μA < I <sub>OUT</sub> < 200mA, 2.8V < V <sub>IN</sub> < 5.5V	1.764	1.8	1.836	
		TPS79325	0μA < I <sub>OUT</sub> < 200mA, 3.5V < V <sub>IN</sub> < 5.5V	2.45	2.5	2.55	
		TPS79328	0μA < I <sub>OUT</sub> < 200mA, 3.8V < V <sub>IN</sub> < 5.5V	2.744	2.8	2.856	
		TPS793285 (Legacy chip only)	0μA < I <sub>OUT</sub> < 200mA, 3.85V < V <sub>IN</sub> < 5.5V	2.793	2.85	2.907	
		TPS79330	0μA < I <sub>OUT</sub> < 200mA, 4V < V <sub>IN</sub> < 5.5V	2.94	3	3.06	
		TPS79333	0μA < I <sub>OUT</sub> < 200mA, 4.3V < V <sub>IN</sub> < 5.5V	3.234	3.3	3.366	
		TPS793475 (Legacy chip only)	0μA < I <sub>OUT</sub> < 200mA, 5.25V < V <sub>IN</sub> < 5.5V	4.655	4.75	4.845	
I <sub>GND</sub>	Quiescent current (GND current)	0μA ≤ I <sub>O</sub> ≤ 200mA (Legacy Chip)			170	220	μA
		0μA ≤ I <sub>O</sub> ≤ 200mA (New Chip)			250	1000	
ΔV <sub>OUT</sub> /ΔI <sub>OUT</sub>	Load regulation	0μA ≤ I <sub>OUT</sub> ≤ 200mA			5		mV
ΔV <sub>OUT</sub> /ΔV <sub>IN</sub>	Line regulation	V <sub>OUT</sub> + 1V ≤ V <sub>IN</sub> ≤ 5.5V			0.05	0.12	%/V

## 5.5 Electrical Characteristics (continued)

over recommended operating temperature range,  $T_J = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$   $V_{EN} = V_{IN}$ ,  $V_{IN} = V_{O(typ)} + 1\text{V}^{(1)}$   $I_{OUT} = 1\text{ mA}$ ,  $C_{OUT} = 10\ \mu\text{F}$ ,  $C_{NR} = 0.01\ \mu\text{F}$  (Legacy Chip) (unless otherwise noted). All typical values at  $T_J = 25^{\circ}\text{C}$ .

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT

## 5.5 Electrical Characteristics (continued)

over recommended operating temperature range,  $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$   $V_{EN} = V_{IN}$ ,  $V_{IN} = V_{O(typ)} + 1\text{V}^{(1)}$   $I_{OUT} = 1\text{ mA}$ ,  $C_{OUT} = 10\ \mu\text{F}$ ,  $C_{NR} = 0.01\ \mu\text{F}$  (Legacy Chip) (unless otherwise noted). All typical values at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
PSRR	Power-supply rejection ratio (TPS79328)	f = 100Hz	$I_{OUT} = 10\text{mA}$ (Legacy Chip)		70		dB
			$I_{OUT} = 10\text{mA}$ (New Chip)		64		
			$I_{OUT} = 200\text{mA}$ (Legacy Chip)		68		
			$I_{OUT} = 200\text{mA}$ (New Chip)		65		
		f = 10kHz	$I_{OUT} = 200\text{mA}$ (Legacy Chip)		70		
			$I_{OUT} = 200\text{mA}$ (New Chip)		49		
		f = 100kHz	$I_{OUT} = 200\text{mA}$ (Legacy Chip)		43		
			$I_{OUT} = 200\text{mA}$ (New Chip)		39		
$V_{DO}$	Dropout voltage (TPS79328)	$V_{IN} = V_{OUT} - 0.1\text{V}$ , $I_{OUT} = 200\text{mA}^{(3)}$			120	200	mV
	Dropout voltage (TPS793285) (Legacy chip only)	$V_{IN} = V_{OUT} - 0.1\text{V}$ , $I_{OUT} = 200\text{mA}^{(3)}$			120	200	
	Dropout voltage (TPS79330)	$V_{IN} = V_{OUT} - 0.1\text{V}$ , $I_{OUT} = 200\text{mA}^{(3)}$			112	200	
	Dropout voltage (TPS79333)	$V_{IN} = V_{OUT} - 0.1\text{V}$ , $I_{OUT} = 200\text{mA}^{(3)}$			112	180	
	Dropout voltage (TPS793475) (legacy chip only)	$V_{IN} = V_{OUT} - 0.1\text{V}$ , $I_{OUT} = 200\text{mA}^{(3)}$			77	125	
$V_{UVLO}$	UVLO threshold	$V_{IN}$ rising (Legacy Chip)		2.25		2.65	V
		$V_{IN}$ rising (New Chip)		1.32		1.6	
$V_{UVLO(HYST)}$	UVLO hysteresis	$T_J = 25^\circ\text{C}$ , $V_{CC}$ rising (Legacy Chip)			100		mV
		$T_J = 25^\circ\text{C}$ , $V_{CC}$ rising (New Chip)			130		

- (1) Resistor tolerance is not included in overall accuracy in the adjustable version.
- (2) For adjustable versions, this parameters applies only after  $V_{IN}$  is applied; then  $V_{EN}$  transitions high to low.
- (3) Dropout is not measured for the TPS79318 and TPS79325 because minimum  $V_{IN} = 2.7\text{V}$ .

## 5.6 Typical Characteristics

over recommended operating temperature range,  $T_J = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$   $V_{EN} = V_{IN}$ ,  $V_{IN} = V_{O(typ)} + 1\text{V}$   $I_{OUT} = 1\text{ mA}$ ,  $C_{OUT} = 10\ \mu\text{F}$ ,  $C_{NR} = 0.01\ \mu\text{F}$  (Legacy Chip) (unless otherwise noted). All typical values at  $T_J = 25^{\circ}\text{C}$ .

## 6 Detailed Description

### 6.1 Overview

The TPS793 family of LDO regulators has been optimized for use in noise-sensitive battery-operated equipment. The device features extremely low dropout voltages, high PSRR, ultralow output noise, low quiescent current, and enable-input to reduce supply currents to less than 1  $\mu$ A when the regulator is turned off.

### 6.2 Functional Block Diagrams

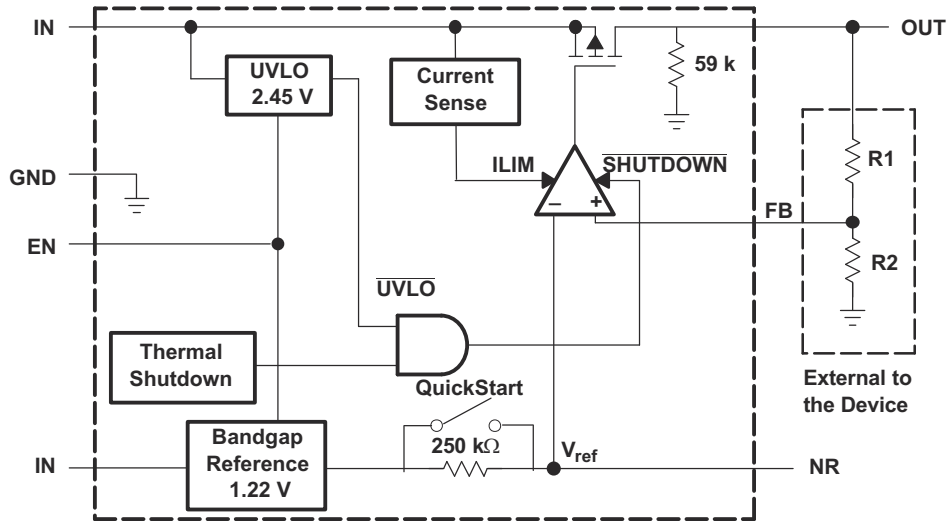

Figure 6-1. TPS79301 Block Diagram (Adjustable Version Legacy Chip)

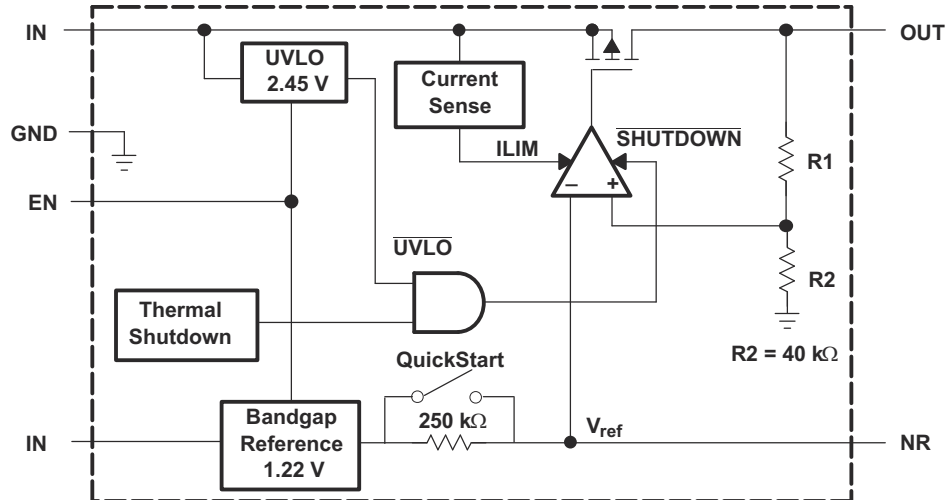

Figure 6-2. TPS793 Block Diagram (Fixed Version Legacy Chip)

**Figure 6-3. TPS79301 Block Diagram (Adjustable Version Legacy Chip)**

**Figure 6-4. TPS793 Block Diagram (Fixed Version New Chip)**

## 6.3 Feature Description

### 6.3.1 Undervoltage Lockout (UVLO)

The TPS793 uses an undervoltage lockout (UVLO) circuit that disables the output until the input voltage is greater than the rising UVLO voltage. This circuit verifies that the device does not exhibit any unpredictable behavior when the supply voltage is lower than the operational range of the internal circuitry,  $V_{IN(min)}$ .

### 6.3.2 Shutdown

The enable pin (EN) is active high. Enable the device by forcing the EN pin to exceed  $V_{EN(high)}$ . Turn off the device by forcing the EN pin to drop below the maximum EN pin low-level input voltage (see *Electrical Characteristics* table). If shutdown capability is not required, connect EN to IN.

### 6.3.3 Active Discharge (new chip)

The device has an internal pulldown MOSFET that connects an  $R_{PULLDOWN}$  resistor to ground when the device is disabled to actively discharge the output voltage. The active discharge circuit is activated by the enable pin.

Do not rely on the active discharge circuit to discharge the output voltage after the input supply has collapsed because reverse current can possibly flow from the output to the input. This reverse current flow can cause damage to the device especially when a large output capacitor is used. Limit reverse current to no more than 5% of the device rated current for a short period of time.

### 6.3.4 Foldback Current Limit

The legacy chip of TPS793 features internal current limiting and thermal protection. During normal operation, the TPS793 limits output current to approximately 400 mA. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care must be taken not to exceed the power dissipation ratings of the package or the absolute maximum voltage ratings of the device.

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a hybrid brickwall-foldback scheme. The current limit transitions from a brickwall scheme to a foldback scheme at the foldback voltage ( $V_{FOLDBACK}$ ). In a high-load current fault with the output voltage above  $V_{FOLDBACK}$ , the brickwall scheme limits the output current to the current limit ( $I_{CL}$ ). When the voltage drops below  $V_{FOLDBACK}$ , a foldback current limit activates that scales back the current as the output voltage approaches GND. When the output is shorted, the device supplies a typical current called the short-circuit current limit ( $I_{SC}$ ).  $I_{CL}$  and  $I_{SC}$  are listed in the *Electrical Characteristics* table.

For this device,  $V_{FOLDBACK} = 0.4 \times V_{OUT(NOM)}$ .

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brickwall current limit, the pass transistor dissipates power  $[(V_{IN} - V_{OUT}) \times I_{CL}]$ . When the device output is shorted and the output is below  $V_{FOLDBACK}$ , the pass transistor dissipates power  $[(V_{IN} - V_{OUT}) \times I_{SC}]$ . If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application report](#).

Figure 6-5 shows a diagram of the foldback current limit.

**Figure 6-5. Foldback Current Limit**

### 6.3.5 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 165°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit can cycle on and off. This cycling limits regulator dissipation, protecting the device from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature must be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The TPS793 internal protection circuitry is designed to protect against overload conditions. This circuitry is not intended to replace proper heatsinking. Continuously running the TPS793 into thermal shutdown degrades device reliability.

### 6.3.6 Reverse Current

The legacy chip of TPS793 PMOS-pass transistor has a built-in back diode that conducts reverse current when the input voltage drops below the output voltage (for example, during power down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage operation is anticipated, external limiting to 5% of the rated output current is recommended.

The new chip of TPS793, as with most modern LDOs, excessive reverse current can damage this device.

Reverse current flows through the body diode on the pass element instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device as a result of one of the following conditions:

- Degradation caused by electromigration
- Excessive heat dissipation
- Potential for a latch-up condition

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of  $V_{OUT} > V_{IN} + 0.3\text{ V}$ :

- If the device has a large  $C_{OUT}$  and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

If reverse current flow is expected in the application, external protection must be used to protect the device. Figure 6-6 shows one approach of protecting the device.

**Figure 6-6. Example Circuit for Reverse Current Protection Using a Schottky Diode**

## 6.4 Device Functional Modes

### 6.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage is at least as high as  $V_{IN(min)}$ .
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage is greater than  $V_{EN(min)}$ .
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.

### 6.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode of operation, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in the linear region and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

### 6.4.3 Disabled

The device is disabled under the following conditions:

- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.
- The input voltage is less than  $UVLO_{falling}$ .

Table 6-1 shows the conditions that lead to the different modes of operation.

**Table 6-1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER			
	$V_{IN}$	$V_{EN}$	$I_{OUT}$	$T_J$
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN(high)}$	$I_{OUT} < I_{LIM}$	$T_J < 125^{\circ}C$
Dropout mode	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(high)}$	—	$T_J < 125^{\circ}C$
Disabled mode (any true condition disables the device)	$V_{IN} < UVLO_{falling}$	$V_{EN} < V_{EN(low)}$	—	$T_J > 165^{\circ}C^{(1)}$

(1) Approximate value for thermal shutdown.

## 7 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 7.1 Application Information

The TPS793 family of LDO regulators has been optimized for use in noise-sensitive battery-operated equipment. The device features extremely low dropout voltages, high PSRR, low output noise, low quiescent current, and enable-input to reduce supply currents to less than 1µA when the regulator is turned off.

#### 7.1.1 Adjustable Operation

The output voltage of the TPS79301 adjustable regulator is programmed using an external resistor divider as shown in [Figure 7-1](#). The output voltage is calculated using [Equation 1](#):

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right) \quad (1)$$

where:

- $V_{REF} = 1.2246 \text{ V typ}$  (the internal reference voltage)

Resistors  $R_1$  and  $R_2$  must be selected for approximately 50-µA divider current. Lower value resistors can be used for improved noise performance, but the solution consumes more power. Higher resistors values can cause accuracy issues and other problems. The recommended design procedure is to choose  $R_2 = 30.1 \text{ k}\Omega$  to set the divider current at 50 µA,  $C_{FF} = 15 \text{ pF}$  for stability, and then calculate  $R_1$  using [Equation 2](#):

$$R_1 = \left( \frac{V_{OUT}}{V_{REF}} - 1 \right) \times R_2 \quad (2)$$

To improve the stability of the adjustable version, place a small compensation capacitor between OUT and FB. For output voltages less than 1.8 V, the value of this capacitor must be 100 pF. For output voltages greater than 1.8 V, the approximate value of this capacitor can be calculated as shown in [Equation 3](#):

$$C_{FF} = \frac{(3 \times 10^{-7}) \times (R_1 + R_2)}{(R_1 \times R_2)} \quad (3)$$

The suggested value of this capacitor for several resistor ratios is shown in the table in [Figure 7-1](#). If this capacitor is not used (such as in a unity-gain configuration) or if an output voltage less than 1.8 V is chosen, then the minimum recommended output capacitor is 4.7 µF instead of 2.2 µF.

**Figure 7-1. TPS79301 Adjustable LDO Regulator Programming**

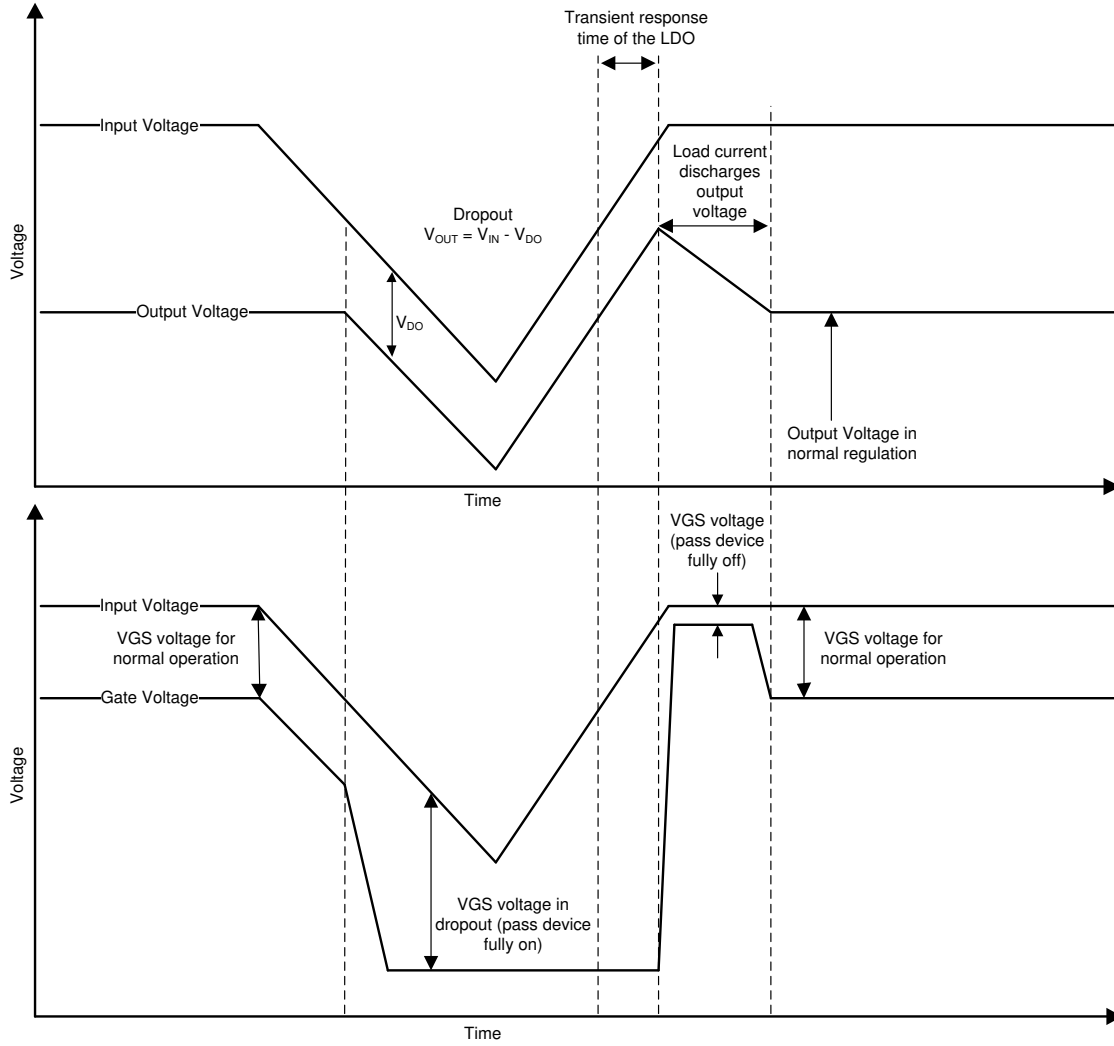

### 7.1.2 Exiting Dropout

Some applications have transients that place the LDO into dropout, such as slower ramps on  $V_{IN}$  during start-up. As with other LDOs, the output can overshoot on recovery from these conditions. A ramping input supply causes an LDO to overshoot on start-up, as shown in Figure 7-2, when the slew rate and voltage levels are in the correct range. Use an enable signal to avoid this condition.

**Figure 7-2. Start-Up Into Dropout**

Line transients out of dropout can also cause overshoot on the output of the regulator. These overshoots are caused by the error amplifier having to drive the gate capacitance of the pass element and bring the gate back to the correct voltage for proper regulation. Figure 7-3 illustrates what is happening internally with the gate voltage and how overshoot can be caused during operation. When the LDO is placed in dropout, the gate voltage ( $V_{GS}$ ) is pulled all the way down to ground to give the pass device the lowest on-resistance as possible. However, if a line transient occurs when the device is in dropout, the loop is not in regulation and can cause the output to overshoot until the loop responds and the output current pulls the output voltage back down into regulation. If these transients are not acceptable, then continue to add input capacitance in the system until the transient is slow enough to reduce the overshoot.

**Figure 7-3. Line Transients From Dropout**

## 7.2 Typical Application

A typical application circuit is shown in [Figure 7-4](#).

**Figure 7-4. Typical Application Circuit**

### 7.2.1 Design Requirements

[Table 7-1](#) lists the design requirements.

**Table 7-1. Design Parameters**

PARAMETER	DESIGN REQUIREMENT
Input voltage	4.2 V to 3 V (Lithium Ion battery)
Output voltage	1.8 V, $\pm 1\%$
DC output current	10 mA
Peak output current	75 mA
Maximum ambient temperature	65°C

### 7.2.2 Detailed Design Procedure

Pick the desired output voltage option. An input capacitor of 1 $\mu$ F is used as the battery is connected to the input through a via and a short 10-mil (0.01-in) trace. An output capacitor of 10  $\mu$ F is used to provide optimal response time for the load transient. Verify that the maximum junction temperature is not exceeded by referring to [Figure 7-8](#).

#### 7.2.2.1 Capacitor Recommendations

Low equivalent series resistance (ESR) capacitors must be used for the input, output, noise reduction, and bypass capacitors. Ceramic capacitors with X7R and X5R dielectrics are preferred. These dielectrics offer more stable characteristics. Ceramic X7R capacitors offer improved over-temperature performance, while ceramic X5R capacitors are more cost-effective and are available in higher values.

#### 7.2.2.2 Input and Output Capacitor Requirements

A 0.1 $\mu$ F or larger ceramic input bypass capacitor, connected between IN and GND and located close to the legacy chip of TPS793, is required for stability and improves transient response, noise rejection, and ripple rejection. A 1 $\mu$ F or larger ceramic input bypass capacitor, connected between IN and GND and located close to the new chip of TPS793, is required for stability and improves transient response, noise rejection, and ripple rejection. A higher-value input capacitor can be necessary if large, fast-rise-time load transients are anticipated or the device is located several inches from the power source.

Like most low-dropout regulators, the TPS793 requires an output capacitor connected between OUT and GND to stabilize the internal control loop. The minimum recommended capacitance is 2.2 $\mu$ F. Any 2.2 $\mu$ F or larger ceramic capacitor is suitable, provided the capacitance does not vary significantly over temperature. If load current is not expected to exceed 100 mA, a 1.0- $\mu$ F ceramic capacitor can be used. If a feed-forward capacitor is not used (such as in a unity-gain configuration) or if an output voltage less than 1.8 V is chosen, then the

minimum recommended output capacitor is 4.7µF instead of 2.2µF. [Table 7-2](#) lists the recommended output capacitor sizes for several common configurations.

**Table 7-2. Output Capacitor Sizing**

Condition	C <sub>OUT</sub> (µF)
V <sub>OUT</sub> < 1.8 V or C <sub>FF</sub> = 0 nF	4.7
V <sub>OUT</sub> > 1.8 V, I <sub>OUT</sub> > 100 mA	2.2
V <sub>OUT</sub> > 1.8 V, I <sub>OUT</sub> < 100 mA	1

### 7.2.2.3 Noise Reduction and Feed-Forward Capacitor Requirements

The internal voltage reference is a key source of noise in an LDO regulator. The legacy chip of TPS793 has an NR pin which is connected to the voltage reference through a 250-kΩ internal resistor. The 250-kΩ internal resistor, in conjunction with an external bypass capacitor connected to the NR pin, creates a low-pass filter to reduce the voltage reference noise and, therefore, the noise at the regulator output. In order for the regulator to operate properly, the current flow out of the NR pin must be at a minimum, because any leakage current creates an IR drop across the internal resistor, thus creating an output error. Therefore, the bypass capacitor must have minimal leakage current. The bypass capacitor must be no more than 0.1 µF to verify that the capacitor is fully charged during the quickstart time provided by the internal switch shown in the [Functional Block Diagrams](#).

A feed-forward capacitor is recommended when using the adjustable version, to improve the stability of the device. If R<sub>2</sub> = 30.1 kΩ, set C<sub>1</sub> to 15 pF for optimal performance. For voltages less than 1.8 V, the value of this capacitor must be 100 pF. For voltages greater than 1.8 V, the approximate value of this capacitor can be calculated as shown in [Equation 3](#).

### 7.2.3 Application Curves

### 7.3 Best Design Practices

Do place at least one, low ESR, 2.2 $\mu$ F capacitor as close as possible between the OUT pin of the regulator and the GND pin.

Do place at least one, low ESR, 0.1 $\mu$ F capacitor as close as possible between the IN pin of the regulator and the GND pin.

Do provide adequate thermal paths away from the device.

Do not place the input or output capacitor more than 10mm away from the regulator.

Do not exceed the absolute maximum ratings.

Do not float the Enable (EN) pin.

Do not resistively or inductively load the NR pin.

Do not let the output voltage get more than 0.3V above the input voltage.

### 7.4 Power Supply Recommendations

These devices are designed to operate from an input voltage supply range from 2.7V to 5.5V. The input voltage range must provide adequate headroom for the device to have a regulated output. This input supply must be well-regulated and stable. A 0.1 $\mu$ F input capacitor is required for stability (legacy chip) or a 1 $\mu$ F (new chip); if the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

### 7.5 Layout

#### 7.5.1 Layout Guidelines

Layout is a critical part of good power-supply design. There are several signal paths that conduct fast-changing currents or voltages that can interact with stray inductance or parasitic capacitance to generate noise or degrade the power-supply performance. To help eliminate these problems, the IN pin must be bypassed to ground with a low ESR ceramic bypass capacitor with an X5R or X7R dielectric.

Equivalent series inductance (ESL) and equivalent series resistance (ESR) must be minimized to maximize performance and provide stability. Every capacitor ( $C_{IN}$ ,  $C_{OUT}$ ,  $C_{NR/SS}$ ,  $C_{FF}$ ) must be placed as close as possible to the device and on the same side of the PCB as the regulator.

Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. The use of vias and long traces is strongly discouraged because these circuits can impact system performance negatively, and even cause instability.

##### 7.5.1.1 Board Layout Recommendations to Improve PSRR and Noise Performance

To improve ac measurements like PSRR, output noise, and transient response, it is recommended that the board be designed with separate ground planes for  $V_{IN}$  and  $V_{OUT}$ , with each ground plane connected only at the GND

pin of the device. In addition, the ground connection for the bypass capacitor must connect directly to the GND pin of the device.

### 7.5.1.2 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low- and high-K boards are given in the *Thermal Information* table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves the heatsink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation ( $P_D$ ) can be approximated by the product of the output current times the voltage drop across the output pass element ( $V_{IN}$  to  $V_{OUT}$ ), as shown in [Equation 4](#).

Where:

- $T_{Jmax}$  is the maximum allowable junction temperature.
- $R_{\theta JA}$  is the thermal resistance junction-to-ambient for the package.
- $T_A$  is the ambient temperature.

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \tag{4}$$

Power dissipation resulting from quiescent current is negligible. Excessive power dissipation triggers the thermal protection circuit.

[Figure 7-8](#) shows the maximum ambient temperature versus the power dissipation of the TPS730. This figure assumes the device is soldered on a JEDEC standard, high-K layout with no airflow over the board. Actual board thermal impedances vary widely. If the application requires high power dissipation, having a thorough understanding of the board temperature and thermal impedances is helpful to verify the TPS730 does not operate above a junction temperature of 125°C.

**Figure 7-8. Maximum Ambient Temperature vs Power Dissipation**

Estimating the junction temperature can be done by using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , shown in the *Thermal Information* table. These metrics are a more accurate representation of the heat transfer characteristics of the die and the package than  $R_{\theta JA}$ . The junction temperature can be estimated with [Equation 5](#).

$$\begin{aligned} \Psi_{JT}: T_J &= T_T + \Psi_{JT} \cdot P_D \\ \Psi_{JB}: T_J &= T_B + \Psi_{JB} \cdot P_D \end{aligned} \tag{5}$$

where

- $P_D$  is the power dissipation shown by [Equation 4](#).
- $T_T$  is the temperature at the center-top of the IC package.
- $T_B$  is the PCB temperature measured 1 mm away from the IC package *on the PCB surface*.

---

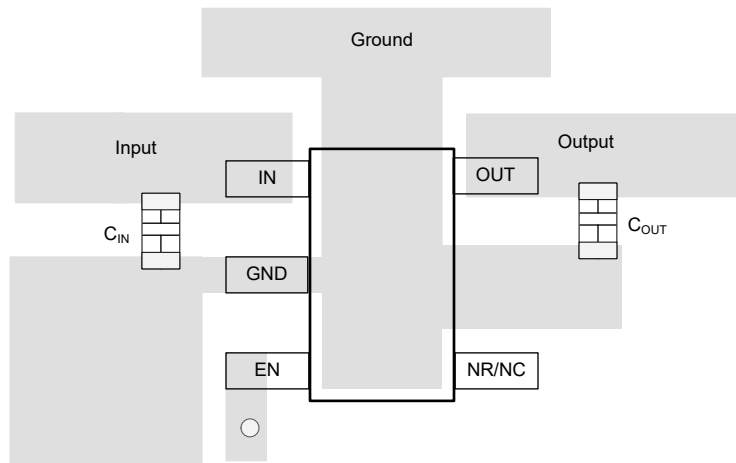

#### Note

Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

---

For more information about measuring  $T_T$  and  $T_B$ , see the application note *Using New Thermal Metrics (SBVA025)*, available for download at [www.ti.com](http://www.ti.com).

## 8 Device and Documentation Support

### 8.1 Device Support

#### 8.1.1 Development Support

##### 8.1.1.1 Evaluation Modules

Seven evaluation modules (EVMs) are available to assist in the initial circuit performance evaluation using the TPS793:

- [TPS79301EVM](#)
- [TPS79318YEQEVM](#)
- [TPS79325YEQEVM](#)
- [TPS793285YEQEVM](#)
- [TPS79328EVM](#)
- [TPS79328YEQEVM](#)
- [TPS79330YEQEVM](#)

These EVMs can be requested at the Texas Instruments website through the device product folders or purchased directly from [the TI eStore](#).

##### 8.1.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS793 is available through the product folders under *Tools & Software*.

#### 8.1.2 Device Nomenclature

**Table 8-1. Ordering Information** <sup>(1) (2)</sup>

PRODUCT	V <sub>OUT</sub>
TPS793xx yyyM3 z	<p><b>XX(X)</b> is the nominal output voltage (for example, 28 = 2.8 V; 285 = 2.85 V; 01 = adjustable version).  <b>YYY</b> is the package designator.  <b>M3</b> is a suffix designator for the devices that only use the latest manufacturing flow (CSO:RFB). Devices without this suffix can ship with the legacy chip (CSO:DLN) or the new chip (CSO:RFB). The reel packaging label provides CSO information to distinguish which chip is being used.  <b>Z</b> is the package quantity. R is for reel (3000 pieces), T is for tape (250 pieces).</p>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on [www.ti.com](#).

(2) Output voltages from 1.2 V to 4.8 V in 50-mV increments are available. Contact the factory for details and availability.

### 8.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 8.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

## 8.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

## 8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 8.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision L (March 2015) to Revision M (December 2024)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document .....	1
• Changed entire document to align with current family format .....	1
• Added M3 devices to document .....	1
• Added NC/NR pin.....	3
• Updated Pin Description table to include new chip and legacy chip descriptions.....	3
• Added suggestion to look at TPS7A20 for lower noise performance.....	3
• Updated <i>Layout</i> section image.....	26

Changes from Revision K (October 2007) to Revision L (March 2015)	Page
• Added <i>Pin Configurations and Functions</i> section, ESD Ratings table, <i>Feature Description</i> section, <i>Device Functional Modes, Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1
• Changed title of data sheet .....	1
• Deleted references to YEQ package throughout document (package is obsolete) .....	1
• Changed fourth bullet of <i>Features</i> list to <i>low noise</i> .....	1
• Changed front-page figure .....	1
• Changed <i>Absolute Maximum Ratings</i> condition statement .....	4
• Deleted <i>Dissipation Ratings</i> table; added <i>Thermal Information</i> table .....	4
• Deleted $T_J = 25^\circ\text{C}$ test condition from PSRR specification measurements in <i>Electrical Characteristics</i> because of redundancy .....	4
• Added condition statement to <a href="#">Section 5.6</a> .....	9
• Changed <a href="#">Figure 7-1</a> ; changed capacitor notation to $C_{FF}$ in figure and related table .....	21
• Changed <a href="#">Figure 7-4</a> ; changed capacitor notation to $C_{FF}$ in figure, changed 2.2 $\mu\text{F}$ capacitor value to 10 $\mu\text{F}$ , and changed device name.....	24

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

#### **OTHER QUALIFIED VERSIONS OF TPS793 :**

- Automotive : [TPS793-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

# EXAMPLE BOARD LAYOUT

DBV0006A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214840/G 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0006A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214840/G 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
