

TPS7A05 1 μ Aの超低 I_Q 、200mA、小型パッケージの 低ドロップアウト・レギュレータ

1 特長

- 非常に低い I_Q : 1 μ A (標準値)、3 μ A (最大値)
 - I_{GND} : 200mAで6 μ A (標準値)
- 優れた過渡応答
- パッケージ:
 - 1.0mm \times 1.0mm X2SON (4)
 - 0.65mm \times 0.65mm DSBGA (4)
 - SOT-23 (5)
 - SOT-23 (3)
- 入力電圧範囲: 1.4V \sim 5.5V
- 出力精度: 標準値 1%、最大値 3%
- 固定出力電圧で供給
 - 0.8V \sim 3.3V
- 非常に低いドロップアウト
 - 200mAで235mV (最大値) (3.3V $_{OUT}$)
- アクティブ出力放電
- フォールドバック電流制限
- 0.47 μ F以上のコンデンサで安定

2 アプリケーション

- ウェアラブル電子機器
- ウルトラブック、タブレット、電子書籍リーダー
- 常時オンの電源
- セット・トップ・ボックス
- ゲーム・コントローラ、リモート・コントロール、玩具、ドローン
- ワイヤレス・ハンドセットおよびスマートフォン
- 携帯型およびバッテリー駆動の機器

3 概要

TPS7A05は超小型、低静止電流、低ドロップアウトのレギュレータ(LDO)で、非常に優れた過渡性能で200mAを供給できます。このデバイスは出力範囲が0.8V \sim 3.3Vで、標準精度が1%です。

TPS7A05は I_Q が非常に低く(1 μ A)、静止時消費電流も非常に低いため、バッテリー駆動のアプリケーションで動作時間を延長できます。このデバイスは充電可能なりチウムイオン電池、Li-SOCl₂やLi-MnO₂などのリチウム一次電池に加えて、2または3セルのアルカリ電池でも動作します。

TPS7A05にはアクティブ・プルダウン回路があり、ディセーブル時に出力負荷を迅速に放電します。

TPS7A05は $T_J = -40^{\circ}\text{C} \sim +125^{\circ}\text{C}$ で完全に動作が規定されており、標準のX2SON (DQN)、SOT-23 (DBV および DBZ)、DSBGA (YKA) パッケージで供給されます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
TPS7A05	X2SON (4)	1.00mm \times 1.00mm
	DSBGA (4)	0.65mm \times 0.65mm
	SOT-23 (5)	2.90mm \times 1.60mm
	SOT-23 (3)	2.90mm \times 1.60mm

(1) 提供されているすべてのパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

4 改訂履歴

Revision C (April 2019) から Revision D に変更	Page
• DBZ パッケージを APL から量産データに変更	1
• Added DBZ package to <i>Load Regulation</i> parameter in <i>Electrical Characteristics</i> table	7
• Added DBZ package to <i>Dropout voltage</i> parameter in <i>Electrical Characteristics</i> table	8
• 追加 condition statement to I_Q vs V_{IN} and <i>Temperature</i> figure	10

Revision B (August 2018) から Revision C に変更	Page
• ドキュメントに DBZ パッケージを APL リリースとして 追加	1

Revision A (May 2018) から Revision B に変更	Page
• ドキュメントのタイトルで「1mm×1mm」を「小型」に変更	1
• YKA (DSBGA)パッケージのステータスを量産データに変更	1
• Added Accuracy for 1.825 V in <i>Electrical Characteristics</i> table	7
• Changed Output current limit in <i>Electrical Characteristics</i> table	7
• Added Output current limit for +85°C in <i>Electrical Characteristics</i> table	7
• Changed Short-circuit current limit in <i>Electrical Characteristics</i> table	7
• Added Dropout voltage for 1.825 V in <i>Electrical Characteristics</i> table	8
• 変更 y-axis scaling and added conditions for I_{OUT} <i>Transient 0 mA to 100 mA</i> figure	10
• 変更 y-axis scaling and added conditions for I_{OUT} <i>Transient 0 mA to 200 mA</i> figure	11
• 追加 I_{OUT} <i>Transient 0 mA to 50 mA</i> figure to I_{OUT} <i>Transient 3 μA to 3 mA</i> figure	11
• 追加 slew rate condition to V_{IN} <i>Transient</i> figures ($I_{OUT} = 100$ mA and $I_{OUT} = 200$ mA)	12
• 追加 V_{IN} <i>Transient</i> figures ($I_{OUT} = 150$ mA and $I_{OUT} = 20$ mA)	13
• 追加 V_{IN} condition to <i>PSRR vs Frequency</i> and I_{OUT} figure ($V_{OUT} = 1.8$ V)	16

Pin Functions

NAME	PIN				I/O	DESCRIPTION
	DQN	DBV	DBZ	YKA		
IN	4	1	3	A1	Input	Input pin. For best transient response and to minimize input impedance, use the recommended value or larger ceramic capacitor from IN to ground as listed in the Recommended Operating Conditions table. Place the input capacitor as close to input of the device as possible.
EN	3	3	—	B1	Input	Enable pin. Driving this pin to logic high enables the device; driving this pin to logic low disables the device. If enable functionality is not required, this pin must be connected to IN. V_{EN} must not exceed V_{IN} .
GND	2	2	1	B2	—	Ground pin. This pin must be connected to ground on the board.
OUT	1	5	2	A2	Output	Regulated output pin. A capacitor is required from OUT to ground for stability. For best transient response, use the nominal recommended value or larger ceramic capacitor from OUT to ground. Follow the recommended capacitor value as listed in the Recommended Operating Conditions table. Place the output capacitor as close to output of the device as possible.
NC	—	4	—	—	—	No connect pin. This pin is not internally connected. Connect to ground or leave floating.
Thermal pad	Pad	—	—	—	—	Connect the thermal pad to a large-area ground plane. This pad is not an electrical connection to the device ground.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage ⁽²⁾	IN	-0.3	6.0	V
	EN	-0.3	V _{IN} + 0.3	
	OUT	-0.3	V _{IN} + 0.3 or 3.6 ⁽³⁾	
Current	Maximum output current	Internally limited		A
Temperature	Operating junction temperature, T _J	-40	125	°C
	Storage temperature, T _{stg}	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages with respect to GND.
- (3) V_{IN} + 0.3 V or 3.6 V (whichever is smaller)

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{IN}	Input supply voltage	1.4		5.5	V
V _{EN}	Enable supply voltage	0		V _{IN}	V
V _{OUT}	Nominal output voltage range	0.8		3.3	V
I _{OUT}	Output current ⁽¹⁾	0		200	mA
C _{IN}	Input capacitor		1		µF
C _{OUT}	Output capacitor	0.47	1	22	µF
T _J	Operating junction temperature	-40		125	°C

- (1) Output current of 10 µA minimum required to meet output voltage accuracy specification.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS7A05				UNIT
		DBZ (SOT-23)	DBV (SOT-23)	DQN (X2SON)	YKA (DSBGA)	
		3 PINS	5 PINS	4 PINS	4 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	267.3	185.6	144.1	198.0	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	103.5	104.3	137.9	2.1	°C/W
R _{θJB}	Junction-to-board thermal resistance	98.0	54.5	83.5	66.9	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	9.2	31.0	5.3	0.9	°C/W
Y _{JB}	Junction-to-board characterization parameter	97.4	54.5	83.8	76.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	n/a	71.8	n/a	°C/W

6.5 Electrical Characteristics

specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 1.4 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, $C_{IN} = 1\text{ }\mu\text{F}$, and $C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted); typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
Nominal accuracy ⁽¹⁾	$V_{OUT} \geq 1.0\text{ V}$, $T_J = 25^\circ\text{C}$	-1%		1%	mV	
	$V_{OUT} < 1.0\text{ V}$, $T_J = 25^\circ\text{C}$	-10		10		
Accuracy over temperature ⁽¹⁾	$V_{OUT} \geq 1.0\text{ V}$, $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$	-2%		2%	mV	
	$V_{OUT} \geq 1.0\text{ V}$	-3%		3%		
	$V_{OUT} < 1.0\text{ V}$, $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$	-20		20		
	$V_{OUT} < 1.0\text{ V}$	-30		30		
	$V_{OUT} = 1.825\text{ V}$, $T_J = +10^\circ\text{C}$ to $+45^\circ\text{C}$, $I_{OUT} = 100\text{ }\mu\text{A}$	-0.9%		0.9%		
$\Delta V_{OUT(\Delta V_{IN})}$	$V_{OUT(nom)} + 0.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}^{(2)}$, $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		5	16.5	mV	
	$V_{OUT(nom)} + 0.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}^{(2)}$			18		
$\Delta V_{OUT(\Delta I_{OUT})}$	$100\text{ }\mu\text{A} \leq I_{OUT} \leq 200\text{ mA}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 0.1\text{ V}$, $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$	DBV, DQN, YKA	20	43	mV	
		DBZ	27	50		
	$100\text{ }\mu\text{A} \leq I_{OUT} \leq 200\text{ mA}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 0.1\text{ V}$	DBV, DQN, YKA		55		
		DBZ		62		
I_{GND}	Ground current	$T_J = 25^\circ\text{C}$, $I_{OUT} = 1\text{ }\mu\text{A}$	0.6	1	1.3	μA
		$I_{OUT} = 1\text{ }\mu\text{A}$, $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$			2	
		$I_{OUT} = 1\text{ }\mu\text{A}$			3	
I_{SHDN}	Shutdown current	$V_{EN} = 0.4\text{ V}$, $1.4\text{ V} \leq V_{IN} \leq 5.5\text{ V}$, $T_J = 25^\circ\text{C}$			nA	
I_{CL}	Output current limit	$V_{OUT} = 90\% \times V_{OUT(nom)}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 0.5\text{ V}$			mA	
I_{CL}	Output current limit	$V_{OUT} = 90\% \times V_{OUT(nom)}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 0.5\text{ V}$, $T_J = 0^\circ\text{C}$ to $+85^\circ\text{C}$			mA	
I_{SC}	Short-circuit current limit	$V_{OUT} = 0\text{ V}$			mA	

(1) $I_{OUT} \geq 10\text{ }\mu\text{A}$ required to meet accuracy specifications.

(2) $V_{IN} = 1.4\text{ V}$ for $V_{OUT} \leq 0.9\text{ V}$.

(3) Load Regulation is normalized to the output voltage at $I_{OUT} = 1\text{ mA}$.

Electrical Characteristics (continued)

specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 1.4 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, $C_{IN} = 1\text{ }\mu\text{F}$, and $C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted); typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT

7 Detailed Description

7.1 Overview

The TPS7A05 is a ultra-low I_Q linear voltage regulator that is optimized for excellent transient performance. These characteristics make the TPS7A05 ideal for most battery-powered applications.

This low-dropout regulator (LDO) offers foldback current limit, shutdown, thermal protection, and optional active discharge.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Excellent Transient Response

The device includes several innovative circuits to ensure excellent transient response. Dynamic biasing increases the I_Q for a short duration during transients to extend the closed-loop bandwidth and improve the device response time during transients.

Adaptive biasing increases the I_Q as the dc load current increases, extending the bandwidth of the control loop. The device response time across the output voltage range is constant because of the use of a buffered reference topology, which keeps the control loop in unity gain at any output voltage.

These features give the device a wide loop bandwidth during transients that ensure excellent transient response while maintaining the device low I_Q in steady-state conditions; see the [Application and Implementation](#) section for more details.

7.3.2 Active Discharge

Devices with this option have an internal pulldown MOSFET that connects a 120- Ω resistor to ground when the device is disabled to actively discharge the output voltage. The active discharge circuit is activated when the device is disabled, in undervoltage lockout (UVLO), or in thermal shutdown.

The discharge time after disabling depends on the output capacitance (C_{OUT}) and the load resistance (R_L) in parallel with the 120- Ω pulldown resistor. 式 1 calculates the time constant:

$$\tau = \frac{120 \cdot R_L}{120 + R_L} \cdot C_{OUT} \quad (1)$$

Do not rely on the active discharge circuit for discharging a large amount of output capacitance after the input supply has collapsed because reverse current can flow from the output to the input. This reverse current flow can cause damage to the device. Limit reverse current to no more than 5% of the device-rated current.

7.3.3 Low I_Q in Dropout

In most LDOs the I_Q significantly increases when the device is placed into dropout, which is especially true for low I_Q LDOs with adaptive biasing. The TPS7A05 detects when operating in dropout and disables the adaptive biasing, minimizing the I_Q increase.

7.3.4 Undervoltage Lockout (UVLO)

The undervoltage lockout (UVLO) circuit monitors the input voltage (V_{IN}) to prevent the device from turning on before V_{IN} rises above the lockout voltage. The UVLO circuit also disables the output of the device when V_{IN} falls below the lockout voltage. If the device includes the optional active discharge, the output is connected to ground with a 120- Ω pulldown resistor when V_{IN} is below the lockout voltage; see the [Application and Implementation](#) section for more details.

7.3.5 Enable

The enable pin for the device is active high. The output of the device is turned on when the enable pin voltage is greater than the EN pin logic high voltage, and the output of the device is turned off when the enable pin voltage is less than the EN pin logic low voltage. A voltage less than the EN pin logic low voltage on the enable pin disables all internal circuits.

At the next turn-on, any voltage on the EN pin below the logic low voltage ensures a normal start-up waveform with start-up ramp rate control, provided there is enough time to discharge the output capacitance. If shutdown capability is not required, connect EN to IN. V_{EN} must not exceed V_{IN} .

7.3.6 Internal Foldback Current Limit

The internal foldback current-limit circuit is used to protect the LDO against high-load current faults or shorting events. The foldback mechanism lowers the current limit as the output voltage decreases, and limits power dissipation during short-circuit events while still allowing for the device to operate at its rated output current; see [Figure 29](#).

Feature Description (continued)

A foldback example for this device is that when V_{OUT} is 90% of $V_{OUT(nom)}$ the current limit is $I_{CL}(\text{typical})$; however, if V_{OUT} is forced to 0 V the current limit is $I_{SC}(\text{typical})$.

In many LDOs the foldback current limit can prevent start-up into a constant-current load or a negatively-biased output. The foldback mechanism for this device goes into a brick-wall current limit when $V_{OUT} > 500$ mV (typ), thus limiting current to $I_{CL}(\text{typical})$ and, when V_{OUT} is approximately 0 V, current is limited to $I_{SC}(\text{typical})$ to ensure normal start-up into a variety of loads.

The foldback current limit is disengaged when $I_{OUT} < 1$ mA (typical) to reduce I_Q . As such, the current-limit loop takes longer to respond to a current-limit event when $I_{OUT} < 1$ mA (typ).

Thermal shutdown can activate during a current-limit event because of the high power dissipation typically found in these conditions. To ensure proper operation of the current limit, minimize the inductances to the input and load. Continuous operation in current limit is not recommended.

7.3.7 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when thermal junction temperature (T_J) of the main pass-FET rises to $T_{sd(\text{Shutdown})}$ (typical). Thermal shutdown hysteresis assures that the LDO resets again (turns on) when the temperature falls to $T_{sd(\text{Reset})}$ (typical).

The thermal time-constant of the semiconductor die is fairly short, and thus the device may cycle on and off when thermal shutdown is reached until power dissipation is reduced.

For reliable operation, limit the junction temperature to a maximum of 125°C. Operation above 125°C causes the device to exceed its operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overload conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above a junction temperature of 125°C reduces long-term reliability.

A fast start-up when $T_J > T_{sd(\text{Reset})}$ (typical, outside of the specified operating range) causes the device thermal shutdown to assert at $T_{sd(\text{Reset})}$ and prevents the device from turning on until the junction temperature is reduced below $T_{sd(\text{Shutdown})}$.

7.4 Device Functional Modes

The device has several modes of operation,:

- Normal operation: The device regulates to the nominal output voltage
- Dropout operation: The pass element operates as a resistor and the output voltage is set as $V_{IN} - V_{DO}$
- Shutdown: The output of the device is disabled and the discharge circuit is activated

表 1 shows the conditions that lead to the different modes of operation. See the [Electrical Characteristics](#) table for parameter values.

表 1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{sd(Shutdown)}$
Dropout mode	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{sd(Shutdown)}$
Disabled mode (any true condition disables the device)	$V_{IN} < V_{UVLO}$	$V_{EN} < V_{EN(LO)}$	—	$T_J > T_{sd(Shutdown)}$

7.4.1 Normal Mode

The device regulates the output to the nominal output voltage when all normal mode conditions in 表 1 are met.

7.4.2 Dropout Mode

The device is not in regulation, and the output voltage tracks the input voltage minus the voltage drop across the pass transistor of the device. In this mode, the PSRR, noise, and transient performance of the device are significantly degraded.

7.4.3 Disable Mode

In this mode, the pass element is turned off, the internal circuits are shut down, and the output voltage is actively discharged to ground by an internal resistor.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Recommended Capacitor Types

The device is designed to be stable using low equivalent series resistance (ESR) ceramic capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and COG-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. As a rule of thumb, assume effective capacitance to decrease by as much as 50%. The input and output capacitors recommended in the *Recommended Operating Conditions* table account for an effective capacitance of approximately 50% of the nominal value.

8.1.2 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. An input capacitor is recommended if the source impedance is more than 0.5 Ω. A higher value capacitor may be necessary if large, fast rise-time load or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic performance of the device is improved with the use of an output capacitor. Use an output capacitor within the range specified in the *Recommended Operating Conditions* table for stability.

8.1.3 Special Considerations When Ramping Down V_{IN} and Enable

Care must be taken when ramping down voltage on the IN and EN pins to power-down the device when the operating free-air temperature is less than 15°C. The minimum ramp-down time for the IN pin is 10 ms. The minimum ramp-down time for the EN pin is 100 μs. Ramping at faster rates can cause the regulator to exhibit undesired startup behavior on the next power-on.

If V_{IN} is ramped down faster than 10 ms, the next startup may exhibit a partial startup, shutoff, followed by a normal soft-start startup.  48 shows this response.

 48. Partial Startup, Shutdown, Normal Startup With $V_{EN} = V_{IN}$

Application Information (continued)

If the EN pin is ramped down faster than 100 μ s, the next startup may exhibit a delay time of up to 130 ms before the output ramps up with a normal soft-start startup. [Figure 49](#) shows this delay.

Figure 49. Long Delay to Startup With $V_{EN} = V_{IN}$

Fast ramp downs of V_{IN} and the EN pin charge internal high-impedance nodes in the device, which take extended time to discharge below 15°C. To avoid these startup behaviors, follow the recommended minimum ramp down times for V_{IN} and the EN pin.

8.1.4 Load Transient Response

The load-step transient response is the output voltage response by the LDO to a step in load current, whereby output voltage regulation is maintained. See [Figure 6](#) for typical load transient response. There are two key transitions during a load transient response: the transition from a light to a heavy load and the transition from a heavy to a light load. The regions in [Figure 50](#) are broken down as described in this section. Regions A, E, and H are where the output voltage is in steady-state.

During transitions from a light load to a heavy load, the:

- Initial voltage dip is a result of the depletion of the output capacitor charge and parasitic impedance to the output capacitor (region B)
- Recovery from the dip results from the LDO increasing its sourcing current, and leads to output voltage regulation (region C)

During transitions from a heavy load to a light load, the:

- Initial voltage rise results from the LDO sourcing a large current, and leads to the output capacitor charge to increase (region F)
- Recovery from the rise results from the LDO decreasing its sourcing current in combination with the load discharging the output capacitor (region G)

A larger output capacitance reduces the peaks during a load transient but slows down the response time of the device. A larger dc load also reduces the peaks because the amplitude of the transition is lowered and a higher current discharge path is provided for the output capacitor.

Figure 50. Load Transient Waveform

Application Information (continued)

8.1.5 Dropout Voltage

The device uses a PMOS pass transistor to achieve low dropout. When $(V_{IN} - V_{OUT})$ is less than the dropout voltage (V_{DO}), the PMOS pass transistor is in the linear region of operation, and the input-to-output resistance of the device is the drain-to-source resistance of the PMOS pass transistor. V_{DO} scales with the output current and changes with temperature because the PMOS pass transistor functions like a resistor in dropout mode. For a graph of dropout voltage, see [Figure 22](#). As with any linear regulator, PSRR and the transient response degrade as $(V_{IN} - V_{OUT})$ approaches dropout operation. See [Figure 23](#) for dropout performance.

8.1.5.1 Behavior When Transitioning From Dropout Into Regulation

Some applications may have transients that place the device into dropout, especially as this device can be powered from a battery with high ESR. A typical application with these conditions is using a stack of two 1.55-V coin-cell batteries with an ESR of $30\ \Omega$ to create a 2.5-V rail and experiencing a load transient from $1\ \mu\text{A}$ to 25 mA. This load transient causes the input supply to drop 750 mV, placing the device into dropout.

The load transient saturates the output stage of the error amplifier when the pass element is driven fully on, making the pass element function like a resistor from V_{IN} to V_{OUT} . The error amplifier response time to this load transient is limited because the error amplifier must first recover from saturation and then place the pass element back into active mode. During this time V_{OUT} overshoots because the pass element is functioning as a resistor from V_{IN} to V_{OUT} . This device uses a loop pulldown circuit to help mitigate the overshoot.

If operating under these conditions, applying a higher dc load or increasing the output capacitance reduces the overshoot because these solutions provide a path to dissipate the excess charge.

8.1.5.2 Behavior of Output Resulting From Line Transient When in Dropout

The output deviation resulting from a line transient can be significantly higher when the device is operating in dropout. As explained in the [Dropout Voltage](#) section, the response time of the error amplifier is limited when in dropout, so the output deviation is larger and can exceed twice the regulated output voltage. Care must be taken in applications where line transients are expected when the device is operating in dropout.

8.1.6 Undervoltage Lockout (UVLO) Operation

The UVLO circuit ensures that the device stays disabled before its input supply reaches the minimum operational voltage range, and ensures that the device shuts down when the input supply collapses. See [Figure 46](#) for rising and falling thresholds. [Figure 51](#) depicts the UVLO circuit response to various input voltage events. The diagram can be separated into the following parts:

- Region A: The device does not start until the input reaches the UVLO rising threshold
- Region B: Normal operation, regulating device
- Region C: Brownout event above the UVLO falling threshold (UVLO rising threshold – UVLO hysteresis). The output may fall out of regulation but the device is still enabled.
- Region D: Normal operation, regulating device
- Region E: Brownout event below the UVLO falling threshold. The device is disabled in most cases and the output falls as a result of the load and active discharge circuit. The device is re-enabled when the UVLO rising threshold is reached by the input voltage and a normal start-up follows.
- Region F: Normal operation followed by the input falling to the UVLO falling threshold
- Region G: The device is disabled as the input voltage falls below the UVLO falling threshold to 0 V. The output falls as a result of the load and active discharge circuit.

Application Information (continued)

图 51. Typical UVLO Operation

8.1.7 Power Dissipation (P_D)

Circuit reliability demands that proper consideration be given to device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must be as free as possible of other heat-generating devices that cause added thermal stresses.

式 2 calculates the maximum allowable power dissipation for the device in a given package:

$$P_{D-MAX} = ((T_J - T_A) / R_{\theta JA}) \quad (2)$$

式 3 represents the actual power being dissipated in the device:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (3)$$

An important note is that power dissipation can be minimized, and thus greater efficiency achieved, by proper selection of the system voltage rails. Proper selection allows the minimum input-to-output voltage differential to be obtained. The low dropout of the TPS7A05 allows for maximum efficiency across a wide range of output voltages.

The main heat conduction path for the device depends on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum power dissipation determines the maximum allowable junction temperature (T_J) for the device. According to 式 4, maximum power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A). The equation is rearranged in 式 5 for output current.

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (4)$$

$$I_{OUT} = (T_J - T_A) / [R_{\theta JA} \times (V_{IN} - V_{OUT})] \quad (5)$$

Unfortunately, this thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The $R_{\theta JA}$ recorded in the [Thermal Information](#) table is determined by the JEDEC standard, PCB, and copper-spreading area, and is only used as a relative measure of package thermal performance. For a well-designed thermal layout, $R_{\theta JA}$ is actually the sum of the DQN package junction-to-case (bottom) thermal resistance ($R_{\theta JC(bot)}$) plus the thermal resistance contribution by the PCB copper.

Application Information (continued)

8.1.7.1 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the LDO when in-circuit on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of the copper-spreading area. The key thermal metrics (Ψ_{JT} and Ψ_{JB}) are used in accordance with 式 6 and are given in the *Thermal Information* table.

$$\Psi_{JT} : T_J = T_T + \Psi_{JT} \times P_D \text{ and } \Psi_{JB} : T_J = T_B + \Psi_{JB} \times P_D$$

where:

- P_D is the power dissipated as explained in 式 3
- T_T is the temperature at the center-top of the device package, and
- T_B is the PCB surface temperature measured 1 mm from the device package and centered on the package edge (6)

8.1.7.2 Recommended Area for Continuous Operation

The operational area of an LDO is limited by the dropout voltage, output current, junction temperature, and input voltage. The recommended area for continuous operation for a linear regulator is shown in 图 52 and can be separated into the following regions:

- Dropout voltage limits the minimum differential voltage between the input and the output ($V_{IN} - V_{OUT}$) at a given output current level; see the *Dropout Voltage* section for more details.
- The rated output currents limits the maximum recommended output current level. Exceeding this rating causes the device to fall out of specification.
- The rated junction temperature limits the maximum junction temperature of the device. Exceeding this rating causes the device to fall out of specification and reduces long-term reliability.
 - 式 5 provides the shape of the slope. The slope is nonlinear because the maximum rated junction temperature of the LDO is controlled by the power dissipation across the LDO, thus when $V_{IN} - V_{OUT}$ increases the output current must decrease.
- The rated input voltage range governs both the minimum and maximum of $V_{IN} - V_{OUT}$.

图 52. Region Description for Continuous Operation

8.2 Typical Application

图 53. Operation From the Battery Input Supply

8.2.1 Design Requirements

表 2 summarizes the design requirements for 图 53.

表 2. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	3.0 V to 2.0 V (CR2032 battery)
Output voltage	1.0 V, $\pm 2\%$ (T_J from -40 to $+85^\circ\text{C}$)
Output load	10 mA

8.2.2 Design Considerations

For this design example, the 1.0-V, fixed-version TPS7A0510 device is selected. A single CR2032 coin-cell battery was used, thus a 1.0- μF input capacitor is recommended to minimize transient currents drawn from the battery. A 1.0- μF output capacitor is also recommended for excellent load transient response. The dropout voltage (V_{DO}) is kept within the TPS7A05 dropout voltage specification for the 1.0-V output voltage option to keep the device in regulation under all load and temperature conditions for this design. The very small ground current consumed by the regulator shown in 图 54 allows for long battery life.

8.2.3 Application Curve

图 54. I_{GND} vs I_{OUT} at 25°C

9 Power Supply Recommendations

This device is designed to operate from an input supply voltage range of 1.4 V to 5.5 V. The input supply must be well regulated and free of spurious noise. To ensure that the output voltage is well regulated and dynamic performance is optimum, the input supply must be at least $V_{OUT(nom)} + 0.5$ V. A 1 μF or greater input capacitor is recommended to be used to reduce the impedance of the input supply, especially during transients.

10 Layout

10.1 Layout Guidelines

- Place input and output capacitors as close to the device as possible
- Use copper planes for device connections to optimize thermal performance
- Place thermal vias around the device to distribute heat
- Do not place a thermal via directly beneath the thermal pad of the DQN package. A via can wick solder or solder paste away from the thermal pad joint during the soldering process, leading to a compromised solder joint on the thermal pad.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

GENERIC PACKAGE VIEW

DQN 4

X2SON - 0.4 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4210367/F

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.
4. Features may not exist. Recommend use of pin 1 marking on top of package for orientation purposes.
5. Shape of exposed side leads may differ.
6. Number and location of exposed tie bars may vary.

LAND PATTERN EXAMPLE
SCALE: 40X

SOLDER MASK DETAIL

4215302/E 12/2016

NOTES: (continued)

7. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
8. If any vias are implemented, it is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE
 BASED ON 0.075 - 0.1mm THICK STENCIL
 EXPOSED PAD
 88% PRINTED SOLDER COVERAGE BY AREA
 SCALE: 60X

4215302/E 12/2016

NOTES: (continued)

9. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DBZ0003A

PACKAGE OUTLINE

SOT-23 - 1.12 mm max height

SMALL OUTLINE TRANSISTOR

4214838/F 08/2024

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
4. Support pin may differ or may not be present.
5. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25mm per side

EXAMPLE BOARD LAYOUT
