

SN65DSI83-Q1 車載用、シングル・チャンネル、MIPI® DSIからシングルリンクLVDSへのブリッジ

1 特長

- 車載アプリケーションに対応
- 下記内容でAEC-Q100認定済み：
 - デバイス温度グレード2: 動作時周囲温度-40°C～+105°C
 - デバイスHBM ESD分類レベル3A
 - デバイスCDM ESD分類レベルC6
- MIPI® D-PHYバージョン1.00.00物理レイヤ・フロントエンドおよびDisplay Serial Interface (DSI)バージョン1.02.00を実装
- シングル・チャンネルDSIレシーバは、チャンネルごとに1、2、3、4本のD-PHYデータ・レーンとして構成でき、レーンごとに最高1Gbpsで動作
- 18bppおよび24bppのDSIビデオ・パケットをRGB666およびRGB888フォーマットでサポート
- 最大解像度: 60fps WUXGA 1920×1200、18bppおよび24bppカラー(低ブランキング)。60fps、1366×768/1280×800 (18bppおよび24bpp)のディスプレイにも適切
- シングル・リンクLVDS用出力
- シングル・チャンネルDSIからシングル・リンクLVDSへの動作モードをサポート
- LVDS出力クロック範囲: 25MHz～154MHz
- LVDSピクセル・クロックはフリーランニングの連続D-PHYクロックまたは外部リファレンス・クロック(REFCLK)により供給
- 1.8VのメインV_{CC}電源
- 低消費電力機能として、SHUTDOWNモード、低減LVDS出力電圧スイング、同相、MIPI超低消費電力状態(ULPS)をサポート
- PCB配線を簡素化するため、LVDSチャンネルSWAPおよびLVDS PIN順序の反転機能を搭載
- 64ピンの10mm×10mm HTQFP (PAP) PowerPAD™ ICパッケージで供給

2 アプリケーション

- インフォテインメント用のディスプレイ内蔵ヘッド・ユニット
- インフォテインメント用のリモート・ディスプレイ付きヘッド・ユニット
- インフォテインメント用のリアシート・エンターテインメント
- ハイブリッド車載クラスター
- 携帯用ナビゲーション・デバイス
- ナビゲーション
- 産業用ヒューマン・マシン・インターフェイス(HMI)およびディスプレイ

3 概要

SN65DSI83-Q1 DSI-to-LVDSブリッジは、シングル・チャンネルのMIPI D-PHYレシーバ・フロントエンド構成で、チャンネルごとに4つのレーンがあり、それぞれ1Gbpsで動作し、最大入力帯域幅は4Gbpsです。このブリッジはMIPI DSI 18bpp RGB666および24bpp RGB888パケットをデコードし、フォーマットされたビデオ・データストリームを、25MHz～154MHzのピクセル・クロックで動作するLVDS出力に変換して、リンクごとに4つのデータ・レーンを持つシングル・リンクLVDSを提供します。

SN65DSI83-Q1デバイスは、最高でWUXGA 1920×1200、毎秒60フレーム、24bppを、低ブランキングでサポートします。SN65DSI83-Q1デバイスは、毎秒60フレームの1366×768/1280×800、18bppおよび24bppのアプリケーションにも適しています。DSIとLVDSのインターフェイス間のデータ・ストリーム・ミスマッチに適應するため、部分的なライン・バッファが実装されています。

SN65DSI83-Q1デバイスは、小型の外形の10mm×10mm、0.5mmピッチのHTQFPパッケージに搭載され、-40°C～+105°Cの温度範囲で動作します。

4 改訂履歴

2016年12月発行のものから更新

	Page
• Deleted figure <i>RESET and Initialization Timing Definition While V_{CC} is High</i>	12
• Changed the paragraph following Figure 8	15
• Changed <i>Recommended Initialization Sequence</i> To: <i>Initialization Sequence</i>	16
• Changed Table 2	16
• Changed item 3 in <i>Video Stop and Restart Sequence</i> From: Drive all DSI input lanes including DSI CLK lane to LP11. To: Drive all DSI data lanes to LP11, but keep the DSI CLK lanes in HS.	37

5 Pin Configuration and Functions

See the [Layout](#) section for layout information.

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
ADDR	64	I/O	Local I ² C interface target address select. See Table 3 . In normal operation this pin is an input. When the ADDR pin is programmed high, it must be tied to the same 1.8-V power rails where the SN65DSI83-Q1 VCC 1.8-V power rail is connected
A_CLKP	38	O	LVDS channel A, LVDS clock output
A_CLKN	39		
A_Y0P	46	O	LVDS channel A, LVDS data output 0
A_Y0N	47		
A_Y1P	44	O	LVDS channel A, LVDS data output 1
A_Y1N	45		
A_Y2P	41	O	LVDS channel A, LVDS data output 2
A_Y2N	42		
A_Y3P	36	O	LVDS channel A, LVDS data output 3. A_Y3P and A_Y3N must be left not connected (NC) for 18-bpp panels
A_Y3N	37		
DA0P	19	I	MIPI D-PHY channel A, data lane 0; data rate up to 1 Gbps
DA0N	20		
DA1P	21	I	MIPI D-PHY channel A, data lane 1; data rate up to 1 Gbps
DA1N	22		
DA2P	27	I	MIPI D-PHY channel A, data lane 2; data rate up to 1 Gbps
DA2N	28		
DA3P	29	I	MIPI D-PHY channel A, data lane 3; data rate up to 1 Gbps
DA3N	30		
DACP	24	I	MIPI D-PHY channel A, clock lane; data rate up to 1 Gbps
DACN	25		
EN	2	I	Chip enable and reset. The device is reset (shutdown) when the EN pin is low
GND	23, 26, 52	G	Reference ground
IRQ	33	O	Interrupt signal
REFCLK	17	I	This pin is an optional external reference clock for the LVDS pixel clock. If an external reference clock is not used, this pin must be pulled to ground with an external resistor. The source of the reference clock must be placed as close as possible with a series resistor near the source to reduce EMI

Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
RSVD	4	RSVD	Reserved and leave them unconnected

VCORE	31	P	1.1-V output from the voltage regulator. This pin must have a 1-μF external capacitor to ground
PowerPAD	—	—	Reference ground

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT	
V _{CC}	Supply voltage	-0.3	2.175	V	
	Input voltage	CMOS input pins	-0.5	2.175	V
		DSI input pins (DAxP, DAxN)	-0.4	1.4	V
T _A	Operating free-air temperature	-40	105	°C	
T _J	Junction temperature	-40	115	°C	
T _{stg}	Storage temperature	-65	150	°C	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±4000
		Charged-device model (CDM), per AEC Q100-011	±1000

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	V _{CC} power supply	1.65	1.8	1.95	V
V _{PSN}	Supply noise on any V _{CC} pin	$f_{(noise)} > 1 \text{ MHz}$		0.05	V
V _(DSI)	DSI input pin voltage	-50		1350	mV
f _(I2C)	Local I ² C input frequency			400	kHz
f _{HS(CLK)}	DSI high-speed (HS) clock input frequency	40		500	MHz
t _{su}	DSI HS data to clock setup time; see Figure 1	0.15			UI ⁽¹⁾
t _h	DSI HS data to clock hold time; see Figure 1	0.15			UI ⁽¹⁾
Z _{OD(LVDS)}	LVDS output differential impedance	90		132	Ω
T _C	Case temperature			92.2	°C

- (1) The unit interval (UI) is one half of the period of the HS clock; at 500 MHz the minimum setup and hold time is 150 ps.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65DSI83-Q1	UNIT
		PAP (HTQFP)	
		64 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	36.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	18.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	20.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.8	°C/W
ψ _{JB}	Junction-to-board characterization parameter	20.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	2.2	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
V _{IL}	Low-level control signal input voltage				0.3 × V _{CC}	V
V _{IH}	High-level control signal input voltage		0.7 × V _{CC}			V
V _{OH}	High-level output voltage	I _{OH} = -4 mA	1.25			V
V _{OL}	Low-level output voltage	I _{OL} = 4 mA			0.4	V
I _{LKG}	Input failsafe leakage current	V _{CC} = 0; V _{CC(PIN)} = 1.8 V			±30	μA
I _{IH}	High level input current	Any input terminal			±30	μA
I _{IL}	Low level input current	Any input terminal			±30	μA
I _{OZ}	High-impedance output current	CMOS output terminals			±10	μA
I _{OS}	Short-circuit output current	Any output driving GND short			±50	mA
I _{CC}	Device active current	See ⁽²⁾		77	124	mA
I _{ULPS}	Device standby current	All data and clock lanes are in ultra-low power state (ULPS)		7.7	14	mA
I _{RST}	Shutdown current	EN = 0			130	μA
R _{EN}	EN control input resistor			200		kΩ

- (1) All typical values are at V_{CC} = 1.8 V and T_A = 25°C
(2) SN65DSI83-Q1: SINGLE Channel DSI to SINGLE Channel DSI, 1280 × 800
(a) Number of LVDS lanes = 3 data lanes + 1 CLK lane
(b) Number of DSI lanes = 4 data lanes + 1 CLK lane
(c) LVDS CLK OUT = 83 M
(d) DSI CLK = 500 M
(e) RGB888, LVDS 18 bpp
Maximum values are at V_{CC} = 1.95 V and T_A = 85°C

Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT	
MIPI DSI INTERFACE						
V _{IH-LP}	LP receiver input high threshold	See Figure 2	880		mV

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
DSI						
t_{GS}	DSI LP glitch suppression pulse width				300	ps
LVDS						
t_c	Output clock period		6.49		40	ns
t_w	High-level output clock (CLK) pulse duration		4/7 t_c			ns
t_0	Delay time, CLK \uparrow to 1st serial bit position	$t_c = 6.49$ ns; Input clock jitter < 25 ps (REFCLK) See Figure 4	-0.15		0.15	ns
t_1	Delay time, CLK \uparrow to 2nd serial bit position		1/7 $t_c - 0.15$		1/7 $t_c + 0.15$	ns
t_2	Delay time, CLK \uparrow to 3rd serial bit position		2/7 $t_c - 0.15$		2/7 $t_c + 0.15$	ns
t_3	Delay time, CLK \uparrow to 4th serial bit position		3/7 $t_c - 0.15$		3/7 $t_c + 0.15$	ns
t_4	Delay time, CLK \uparrow to 5th serial bit position		4/7 $t_c - 0.15$		4/7 $t_c + 0.15$	ns
t_5	Delay time, CLK \uparrow to 6th serial bit position		5/7 $t_c - 0.15$		5/7 $t_c + 0.15$	ns
t_6	Delay time, CLK \uparrow to 7th serial bit position		6/7 $t_c - 0.15$		6/7 $t_c + 0.15$	ns
t_r	Differential output rise time		See Figure 4	180		500
t_f	Differential output fall time					
EN, ULPS, RESET						
t_{en}	Enable time from EN or ULPS	$t_{c(o)} = 12.9$ ns			1	ms
t_{dis}	Disable time to standby; see	$t_{c(o)} = 12.9$ ns			0.1	ms
t_{reset}	Reset yime		10			ms
REFCLK						
F_{REFCLK}	REFCLK frequency. Supported frequencies: 25 MHz - 154 MHz		25		154	MHz
t_r, t_f	REFCLK rise and fall time		100 × 10 ⁻¹²		1 × 10 ⁻⁹	s
t_{pj}	REFCLK peak-to-peak phase jitter				50	ps
Duty	REFCLK duty cycle		40%	50%	60%	
REFCLK or DSI CLK (DACP/N)						
SSC_CLKIN	SSC enabled Input CLK center spread depth ⁽²⁾		0.5%	1%	2%	
	Modulation frequency		30		60	kHz

(1) All typical values are at $V_{CC} = 1.8$ V and $T_A = 25^\circ\text{C}$

(2) For EMI reduction purpose, the SN65DSI83-Q1 supports the center spreading of the LVDS CLK output through the REFCLK or DSI CLK input. The center spread CLK input to the REFCLK or DSI CLK is passed through to the LVDS CLK output A_CLKP/N.

Figure 4. SN65DSI83-Q1 LVDS Timing Definitions

Parameter Measurement Information (continued)

- (1) See the [ULPS](#) section of the data sheet for the ULPS entry and exit sequence.
- (2) ULPS entry and exit protocol and timing requirements must be met according to the MIPI DPHY specification.

Figure 5. ULPS Timing Definition

8 Detailed Description

8.1 Overview

The SN65DSI83-Q1 DSI to LVDS bridge device features a single-channel MIPI® D-PHY receiver front-end configuration with four lanes per channel operating at 1 Gbps per lane; a maximum input bandwidth of 4 Gbps. The bridge decodes MIPI DSI 18-bpp RGB666 and 24-bpp RGB888 packets and converts the formatted video data stream to an LVDS output operating at pixel clocks operating from 25 MHz to 154 MHz, offering a Single-Link LVDS with four data lanes per link.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Clock Configurations and Multipliers

The LVDS clock may be derived from the DSI channel A clock, or from an external reference clock source. When the MIPI D-PHY channel A HS clock is used as the LVDS clock source, the D-PHY clock lane must operate in HS free-running (continuous) mode. This feature eliminates the need for an external reference clock reducing system costs.

Feature Description (continued)

The reference clock source is selected by HS_CLK_SRC (CSR 0x0A.0) programmed through the local I²C interface. If an external reference clock is selected, it is multiplied by the factor in REFCLK_MULTIPLIER (CSR 0x0B.1:0) to generate the LVDS output clock. When an external reference clock is selected, it must be between 25 MHz and 154 MHz. If the DSI channel A clock is selected, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE (CSR 0x12) must be set to the frequency range of the LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

8.3.2 ULPS

The SN65DSI83-Q1 device supports the MIPI defined ULPS. While the device is in the ULPS, the CSR registers are accessible via I²C interface. ULPS sequence must be issued to all active DSI CLK and, or DSI data lanes of the enabled DSI channels for the SN65DSI83-Q1 device to enter the ULPS. The following sequence must be followed to enter and exit the ULPS.

1. The host issues a ULPS entry sequence to all DSI CLK and data lanes enabled.
2. When the host is ready to exit the ULPS mode, the host issues a ULPS exit sequence to all DSI CLK and data lanes that need to be active in normal operation.
3. Wait for the PLL_LOCK bit (CSR 0x0A.7) to be set.
4. Set the SOFT_RESET bit (CSR 0x09.0).
5. Device resumes normal operation (that is, video streaming resumes on the panel).

8.3.3 LVDS Pattern Generation

The SN65DSI83-Q1 device supports a pattern generation feature on LVDS channels. This feature can be used to test the LVDS output path and LVDS panels in a system platform. The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C. No DSI data is received while the pattern generation feature is enabled.

There are three modes available for LVDS test pattern generation. The mode of test pattern generation is determined by register configuration, as shown in [Table 1](#).

Table 1. Video Registers

ADDRESS BIT	REGISTER NAME
0x20.7:0	CHA_ACTIVE_LINE_LENGTH_LOW
0x21.3:0	CHA_ACTIVE_LINE_LENGTH_HIGH
0x24.7:0	CHA_VERTICAL_DISPLAY_SIZE_LOW
0x25.3:0	CHA_VERTICAL_DISPLAY_SIZE_HIGH
0x2C.7:0	CHA_HSYNC_PULSE_WIDTH_LOW
0x2D.1:0	CHA_HSYNC_PULSE_WIDTH_HIGH
0x30.7:0	CHA_VSYNC_PULSE_WIDTH_LOW
0x31.1:0	CHA_VSYNC_PULSE_WIDTH_HIGH
0x34.7:0	CHA_HORIZONTAL_BACK_PORCH
0x36.7:0	CHA_VERTICAL_BACK_PORCH
0x38.7:0	CHA_HORIZONTAL_FRONT_PORCH
0x3A.7:0	CHA_VERTICAL_FRONT_PORCH

8.3.4 Reset Implementation

When the EN pin is deasserted (low), the SN65DSI83-Q1 device is in SHUTDOWN or RESET state. In this state, CMOS inputs are ignored, the MIPI D-PHY inputs are disabled and outputs are high impedance. Transitioning the EN input from a low to a high level after the V_{CC} supply has reached the minimum operating voltage as shown in [Figure 6](#) is critical. This transition is achieved by a control signal to the EN input, or by an external capacitor connected between EN and GND.

Figure 6. Cold-Start V_{CC} Ramp Up to EN

When implementing the external capacitor, the size of the external capacitor depends on the power up ramp of the V_{CC} supply, where a slower ramp-up results in a larger value external capacitor. Consider an approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor.

Figure 7 and Figure 8 show both EN implementations.

Figure 7. External Capacitor Controlled EN

Figure 8. EN Input from Active Controller

When the SN65DSI83-Q1 is reset while V_{CC} is high, the EN pin must be held low for at least 10 ms before being asserted high as described in Table 2 to be sure that the device is properly reset. The DSI CLK lane MUST be in HS and the DSI data lanes MUST be driven to LP11 while the device is in reset before the EN pin is asserted per the timing described in Table 2.

8.3.5 Initialization Sequence

Use the following initialization sequence to setup the SN65DSI83-Q1. This sequence is required for proper operation of the device. Steps 9 through 11 in the sequence are optional. Also see [Figure 6](#).

Table 2. Initialization Sequence

INITIALIZATION SEQUENCE NUMBER	INITIALIZATION SEQUENCE DESCRIPTION
Init seq 1	Power on
Init seq 2	After power is applied and stable, the DSI CLK lanes MUST be in HS state and the DSI data lanes MUST be driven to LP11 state
Init seq 3	Set EN pin to Low
Wait 10 ms ⁽¹⁾	
Init seq 4	Tie EN pin to High
Wait 10 ms ⁽¹⁾	
Init seq 5	Initialize all CSR registers to their appropriate values based on the implementation (The SN65DSI8x is not functional until the CSR registers are initialized)
Init seq 6	Set the PLL_EN bit (CSR 0x0D.0)
Wait 10 ms ⁽¹⁾	
Init seq 7	Set the SOFT_RESET bit (CSR 0x09.0)
Wait 10 ms ⁽¹⁾	
Init seq 8	Change DSI data lanes to HS state and start DSI video stream
Wait 5 ms ⁽¹⁾	
Init seq 9	Read back all registers and confirm they were correctly written
Init seq 10	Write 0xFF to CSR 0xE5 to clear the error registers
Wait 1 ms ⁽¹⁾	
Init seq 11	Read CSR 0xE5. If CSR 0xE5 != 0x00, then go back to step #2 and re-initialize

(1) Minimum recommended delay. It is fine to exceed these.

8.3.6 LVDS Output Formats

The SN65DSI83-Q1 device processes DSI packets and produces video data driven to the LVDS interface in an industry standard format. Single-Link LVDS is supported by the SN65DSI83-Q1 device. During conditions such as the default condition, and some video synchronization periods, where no video stream data is passing from the DSI input to the LVDS output, the SN65DSI83-Q1 device transmits zero value pixel data on the LVDS outputs while maintaining transmission of the vertical sync and horizontal sync status.

[Figure 9](#) illustrates a Single-Link LVDS 18-bpp application.

[Figure 10](#) illustrates a Single-Link 24-bpp application using Format 2, controlled by CHA_24BPP_FORMAT1 (CSR 0x18.1). In data Format 2, the two MSB per color are transferred on the Y3P/N LVDS lane.

[Figure 11](#) illustrates a 24-bpp Single-Link application using Format 1. In data Format 1, the two LSB per color are transferred on the Y3P/N LVDS lane.

[Figure 12](#) illustrates a Single-Link LVDS application where 24-bpp data is received from DSI and converted to 18 bpp data for transmission to an 18-bpp panel. This application is configured by setting CHA_24BPP_FORMAT1 (CSR 0x18.1) to 1 and CHA_24BPP_MODE (CSR 0x18.3) to 0. In this configuration, the SN65DSI83-Q1 device does not transmit the 2 LSB per color since the Y3P and Y3N LVDS lane is disabled.

NOTE

[Figure 9](#), [Figure 10](#), [Figure 11](#), and [Figure 12](#) only illustrate a few example applications for the SN65DSI83-Q1 device. Other applications are also supported.

DE = Data Enable; A_Y3P/N are Output Low

Figure 9. LVDS Output Data; Single-Link 18 bpp

DE = Data Enable

Figure 11. LVDS Output Data (Format 1); Single-Link 24 bpp

DE = Data Enable; A_Y3P and A_Y3N are output low; A_Y3P and A_Y3N are output low

Figure 12. LVDS Output Data (Format 1); 24 bpp to Single-Link 18 bpp Conversion

8.3.7 DSI Lane Merging

The SN65DSI83-Q1 supports four DSI data lanes per input channel, and may be configured to support one, two, or three DSI data lanes per channel. Unused DSI input pins on the SN65DSI83-Q1 must be left unconnected or driven to LP11 state. The bytes received from the data lanes are merged in HS mode to form packets that carry the video stream. DSI data lanes are bit and byte aligned.

Figure 13 shows the lane merging function for each channel; 4-Lane, 3-Lane, and 2-Lane modes are illustrated.

Figure 13. SN65DSI83-Q1 DSI Lane Merging Illustration

8.3.8 DSI Pixel Stream Packets

The SN65DSI83-Q1 processes 18-bpp (RGB666) and 24-bpp (RGB888) DSI packets as shown in Figure 14, Figure 15, and Figure 16.

Figure 14. 18-bpp (Loosely Packed) DSI Packet Structure

Figure 15. 18-bpp (Tightly Packed) DSI Packet Structure

Figure 16. 24-bpp DSI Packet Structure

8.3.9 DSI Video Transmission Specifications

The SN65DSI83-Q1 supports burst video mode and non-burst video mode with sync events or with sync pulses packet transmission as described in the DSI specification. The burst mode supports time-compressed pixel stream packets that leave added time per scan line for power savings LP mode. The SN65DSI83-Q1 requires a transition to LP mode once per frame to enable PHY synchronization with the DSI host processor; however, for a robust and low-power implementation, the transition to LP mode is recommended on every video line.

Figure 17 shows the DSI video transmission applied to SN65DSI83-Q1 applications. In all applications, the LVDS output rate must be less than or equal to the DSI input rate. The first line of a video frame shall start with a VSS packet, and all other lines start with VSE or HSS. The position of the synchronization packets in time is of utmost importance since this has a direct impact on the visual performance of the display panel; that is, these packets generate the HS and VS (horizontal and vertical sync) signals on the LVDS interface after the delay programmed into CHA_SYNC_DELAY_LOW/HIGH (CSR 0x28.7:0 and 0x29.3:0).

As required in the DSI specification, the SN65DSI83-Q1 requires that pixel stream packets contain an integer number of pixels (i.e. end on a pixel boundary); it is recommended to transmit an entire scan line on one pixel stream packet. When a scan line is broken in to multiple packets, inter-packet latency shall be considered such that the video pipeline (ie. pixel queue or partial line buffer) does not run empty (i.e. under-run); during scan line processing, if the pixel queue runs empty, the SNDSI83-Q1 transmits zero data (18'b0 or 24'b0) on the LVDS interface.

NOTE

When the HS clock is used as a source for the LVDS pixel clock, the LP mode transitions apply only to the data lanes, and the DSI clock lane remains in the HS mode during the entire video transmission.

The SN65DSI83-Q1 does not support the DSI Virtual Channel capability or reverse direction (peripheral to processor) transmissions.

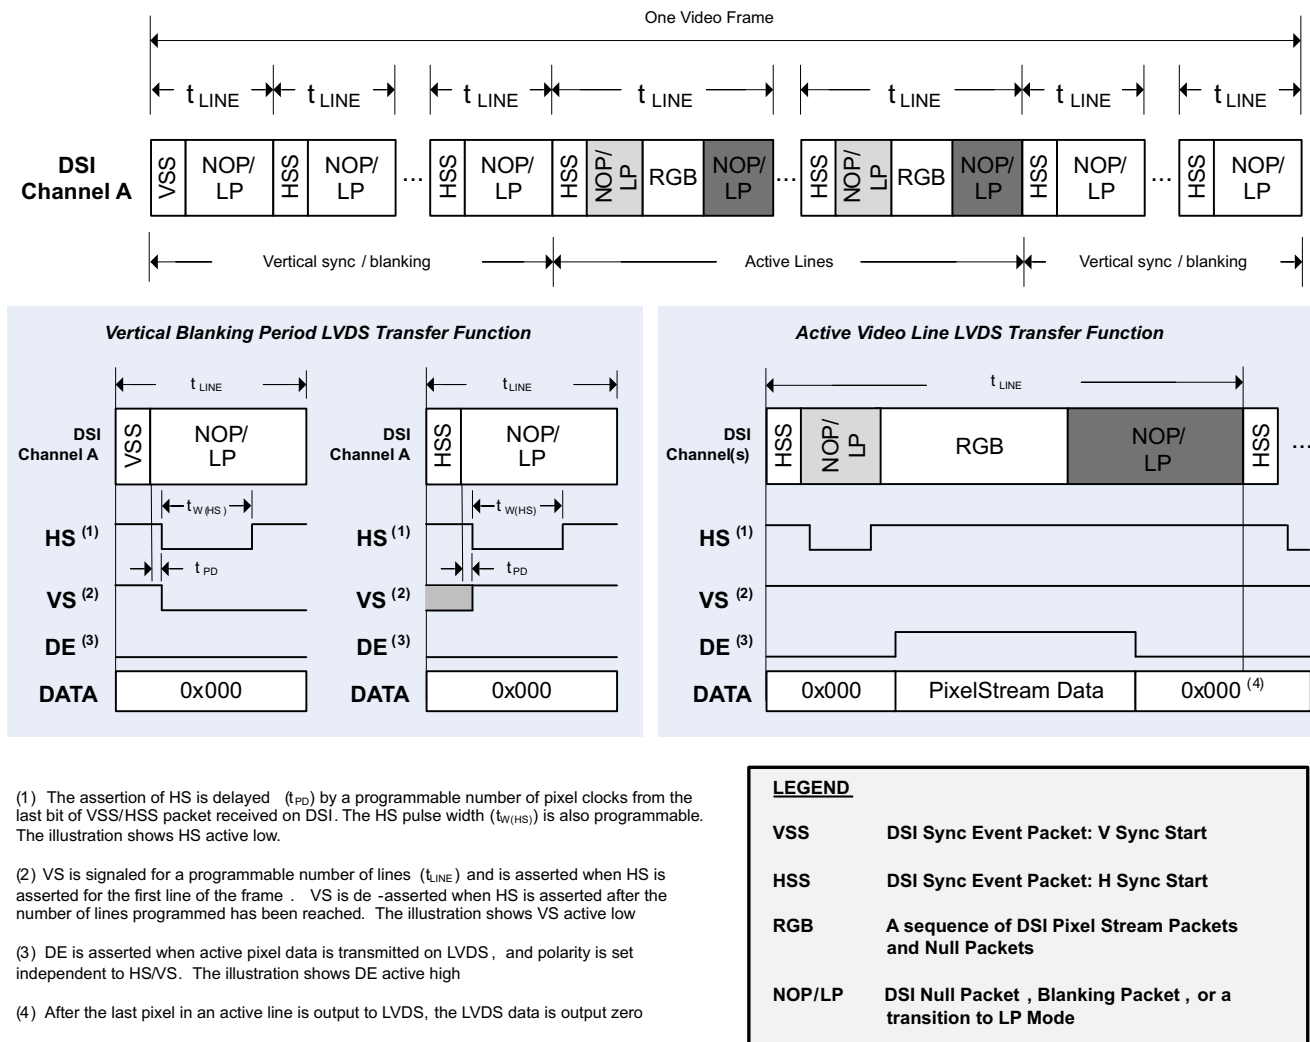

Figure 17. DSI Channel Transmission and Transfer Function

8.4 Programming

8.4.1 Local I²C Interface Overview

The SN65DSI83-Q1 device local I²C interface is enabled when EN is input high, access to the CSR registers is supported during ULPS. The SCL and SDA pins are used for I²C clock and I²C data respectively. The SN65DSI83-Q1 device I²C interface conforms to the 2-wire serial interface defined by the I²C Bus Specification, Version 2.1 (January 2000) and supports fast mode transfers up to 400 kbps.

The device address byte is the first byte received following the start condition from the master device. The 7-bit device address for SN65DSI83-Q1 device is factory preset to 010110X with the least significant bit being determined by the ADDR control input. Table 3 clarifies the SN65DSI83-Q1 device target address.

Table 3. SN65DSI83-Q1 I²C Target Address Description (1)(2)

BIT 7 (MSB)	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0 (W/R)
0	1	0	1	1	0	ADDR	0/1

(1) When ADDR = 1, Address cycle is 0x5A (write) and 0x5B (read)

(2) When ADDR = 0, Address cycle is 0x58 (write) and 0x59 (read)

The following procedure is followed to write to the SN65DSI83-Q1 device I²C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI83-Q1 device 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SN65DSI83-Q1 device acknowledges the address cycle.
3. The master presents the subaddress (I²C register within SN65DSI83-Q1 device) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI83-Q1 device acknowledges the subaddress cycle.
5. The master presents the first byte of data to be written to the I²C register.
6. The SN65DSI83-Q1 device acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the SN65DSI83-Q1 device.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure is followed to read the SN65DSI83-Q1 I²C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the SN65DSI83-Q1 device 7-bit address and a one-value W/R bit to indicate a read cycle.
2. The SN65DSI83-Q1 device acknowledges the address cycle.
3. The SN65DSI83-Q1 device transmits the contents of the memory registers MSB-first starting at register 00h. If a write to the SN65DSI83-Q1 I²C register occurred prior to the read, then the SN65DSI83-Q1 device starts at the subaddress specified in the write.
4. The SN65DSI83-Q1 device waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the SN65DSI83-Q1 device transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure is followed for setting a starting subaddress for I²C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI83-Q1 device 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SN65DSI83-Q1 device acknowledges the address cycle.
3. The master presents the subaddress (I²C register within the SN65DSI83-Q1 device) to be written, consisting of one byte of data, MSB first.
4. The SN65DSI83-Q1 device acknowledges the subaddress cycle.
5. The master terminates the write operation by generating a stop condition (P).

8.5 Register Maps

8.5.1 Control and Status Registers Overview

Many of the SN65DSI83-Q1 functions are controlled by the Control and Status Registers (CSR). All CSR registers are accessible through the local I²C interface.

See the following tables for the SN65DSI83-Q1 CSR descriptions. Reserved or undefined bit fields should not be modified. Otherwise, the device may operate incorrectly.

8.5.1.1 CSR Bit Field Definitions – ID Registers

8.5.1.1.1 Registers 0x00 – 0x08

Figure 18. Registers 0x00 – 0x08

0	PLL_UNLOCK	R/W	1	This bit is set whenever the PLL Lock status transitions from LOCK to UNLOCK.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The SN65DSI83-Q1 device is primarily targeted for portable applications such as tablets and smart phones that utilize the MIPI DSI video format. The SN65DSI83-Q1 device can be used between a GPU with DSI output and a video panel with LVDS inputs.

9.1.1 Video STOP and Restart Sequence

When the system requires to stop outputting video to the display, TI recommends to use the following sequence for the SN65DSI83-Q1 device:

1. Clear the PLL_EN bit to 0 (CSR 0x0D.0).
2. Stop video streaming on DSI inputs.
3. Drive all DSI data lanes to LP11, but keep the DSI CLK lanes in HS.

When the system is ready to restart the video streaming.

1. Start video streaming on DSI inputs.
2. Set the PLL_EN bit to 1 (CSR 0x0D.0).
3. Wait for minimum of 3 ms.
4. Set the SOFT_RESET bit (0x09.0).

9.1.2 Reverse LVDS Pin Order Option

For ease of PCB routing, the SN65DSI83-Q1 device supports reversing the pin order via configuration register programming. The order of the LVDS pin for LVDS channel A can be reversed by setting the address 0x1A bit 5 CHA_REVERSE_LVDS. See the corresponding register bit definition for details.

9.1.3 IRQ Usage

The SN65DSI83-Q1 device provides an IRQ pin that can be used to indicate when certain errors occur on DSI. The IRQ output is enabled through the IRQ_EN bit (CSR 0xE0.0). The IRQ pin is asserted when an error occurs on DSI, the corresponding error enable bit is set, and the IRQ_EN bit is set. An error is cleared by writing a 1 to the corresponding error status bit.

NOTE

If the SOFT_RESET bit is set while the DSI video stream is active, some of the error status bits may be set.

NOTE

If the DSI video stream is stopped, some of the error status bits may be set. These error status bits must be cleared before restarting the video stream.

NOTE

If the DSI video stream starts before the device is configured, some of the error status bits may be set. TI recommends to start streaming after the device is correctly configured as recommended in the initialization sequence in the [Initialization Sequence](#) section.

9.2 Typical Application

Figure 48 shows a typical application using the SN65DSI83-Q1 device for a single channel DSI receiver to interface a single-channel DSI application processor to an LVDS single-link 18 bit-per-pixel panel supporting 1280 × 800 WXGA resolutions at 60 frames per second.

Figure 48. Typical WXGA 18-bpp Panel Application

9.2.1 Design Requirements

Table 34 shows the SN65DSI83-Q1 design parameters.

Table 34. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
VCC	1.8 V (±5%)
Clock source (REFCLK or DSIA_CLK)	DSIA_CLK
REFCKL frequency	N/A
DSIA clock frequency	500 MHz
PANEL INFORMATION	
Pixel clock (MHz)	83 MHz
Horizontal active (pixels)	1280
Horizontal blanking (pixels)	384
Vertical active (lines)	800
Vertical blanking (lines)	30
Horizontal sync offset (pixels)	64
Horizontal sync pulse width (pixels)	128
Vertical sync offset (lines)	3
Vertical sync pulse width (lines)	7

Table 34. Design Parameters (continued)

DESIGN PARAMETERS	EXAMPLE VALUE
PANEL INFORMATION (continued)	
Horizontal sync pulse polarity	Negative
Vertical sync pulse polarity	Negative
Color bit depth (6 bpc or 8 bpc)	6-bit
Number of LVDS lanes	1 × [3 Data Lanes + 1 Clock Lane]
DSI INFORMATION	
Number of DSI lanes	1 × [4 Data Lanes + 1 Clock Lane]
DSI clock frequency(MHz)	500 MHz
Dual DSI configuration(odd/even or left/right)	N/A

9.2.2 Detailed Design Procedure

The video resolution parameters required by the panel need to be programmed into the SN65DSI83-Q1 device. For this example, the parameters programmed are the following:

Horizontal Active = 1280 or 0x500

CHA_ACTIVE_LINE_LENGTH_LOW = 0x00

CHA_ACTIVE_LINE_LENGTH_HIGH = 0x05

Vertical Active = 800 or 0x320

CHA_VERTICAL_DISPLAY_SIZE_LOW = 0x20

CHA_VERTICAL_DISPLAY_SIZE_HIGH = 0x03

Horizontal Pulse Width = 128 or 0x80

CHA_HSYNC_PULSE_WIDTH_LOW = 0x80

CHA_HSYNC_PULSE_WIDTH_HIGH = 0x00

Vertical Pulse Width = 7

CHA_VSYNC_PULSE_WIDTH_LOW = 0x07

CHA_VSYNC_PULSE_WIDTH_HIGH = 0x00

Horizontal Backporch = HorizontalBlanking – (HorizontalSyncOffset + HorizontalSyncPulseWidth)

Horizontal Backporch = 384 – (64 + 128)

Horizontal Backporch = 192 or 0xC0

CHA_HORIZONTAL_BACK_PORCH = 0xC0

Vertical Backporch = VerticalBlanking – (VerticalSyncOffset + VerticalSyncPulseWidth)

Vertical Backporch = 30 – (3 + 7)

Vertical Backporch = 20 or 0x14

CHA_VERTICAL_BACK_PORCH = 0x14

SN65DSI83-Q1

JAJSCQ6A – DECEMBER 2016 – REVISED JUNE 2018

www.ti.com

Horizontal Frontporch = HorizontalSyncOffset

Horizontal Frontporch = 64 or 0x40

CHA_HORIZONTAL_FRONT_PORCH = 0x40

Vertical Frontporch = VerticalSyncOffset

Vertical Frontporch = 3

CHA_VERTICAL_FRONT_PORCH = 0x03

The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C and configuring the TEST PATTERN GENERATION PURPOSE ONLY register as shown in [Table 30](#).

LVDS clock is derived from the DSI channel A clock. When the MIPI D-PHY channel A HS clock is used as the LVDS clock source, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE (CSR 0x12) must be set to the frequency range of the LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

LVDS_CLK_RANGE = 2 – 62.5 MHz ≤ LVDS_CLK < 87.5 MHz

HS_CLK_SRC = 1 – LVDS pixel clock derived from MIPI D-PHY channel A

DSI_CLK_DIVIDER = 00101 – Divide by 6

CHA_DSI_LANES = 00 – Four lanes are enabled

CHA_DSI_CLK_RANGE = 0x64 – 500 MHz

9.2.2.1 Example Script

Figure 49. Power Consumption

10 Power Supply Recommendations

10.1 V_{CC} Power Supply

Each VCC power supply pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83-Q1 device. It is recommended to have one bulk capacitor (1 μ F to 10 μ F) on it. It is also recommended to have the pins connected to a solid power plane.

10.2 V_{CORE} Power Supply

This pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83-Q1 device. It is recommended to have one bulk capacitor (1 μ F to 10 μ F) on it. It is also recommended to have the pins connected to a solid power plane.

11 Layout

11.1 Layout Guidelines

11.1.1 Package Specific

For the PAP package, to minimize the power supply noise floor, provide good decoupling near the SN65DSI83-Q1 device power pins. The use of four ceramic capacitors (2 \times 0.1 μ F and 2 \times 0.01 μ F) provides good performance. At the least, TI recommends to install one 0.1- μ F and one 0.01- μ F capacitor near the SN65DSI83-Q1 device. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI83-Q1 device on the bottom of the PCB is often a good choice.

11.1.2 Differential Pairs

- Differential pairs must be routed with controlled 100- Ω differential impedance (\pm 20%) or 50- Ω single-ended impedance (\pm 15%).
- Keep away from other high speed signals
- Keep lengths to within 5 mils of each other.
- Length matching must be near the location of mismatch.
- Each pair must be separated at least by 3 times the signal trace width.
- The use of bends in differential traces must be kept to a minimum. When bends are used, the number of left and right bends must be as equal as possible and the angle of the bend must be \geq 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
- Route all differential pairs on the same of layer.
- The number of vias must be kept to a minimum. It is recommended to keep the via count to 2 or less.
- Keep traces on layers adjacent to ground plane.
- Do NOT route differential pairs over any plane split.
- Adding Test points cause impedance discontinuity and therefore negatively impacts signal performance. If test points are used, they must be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

11.1.3 Ground

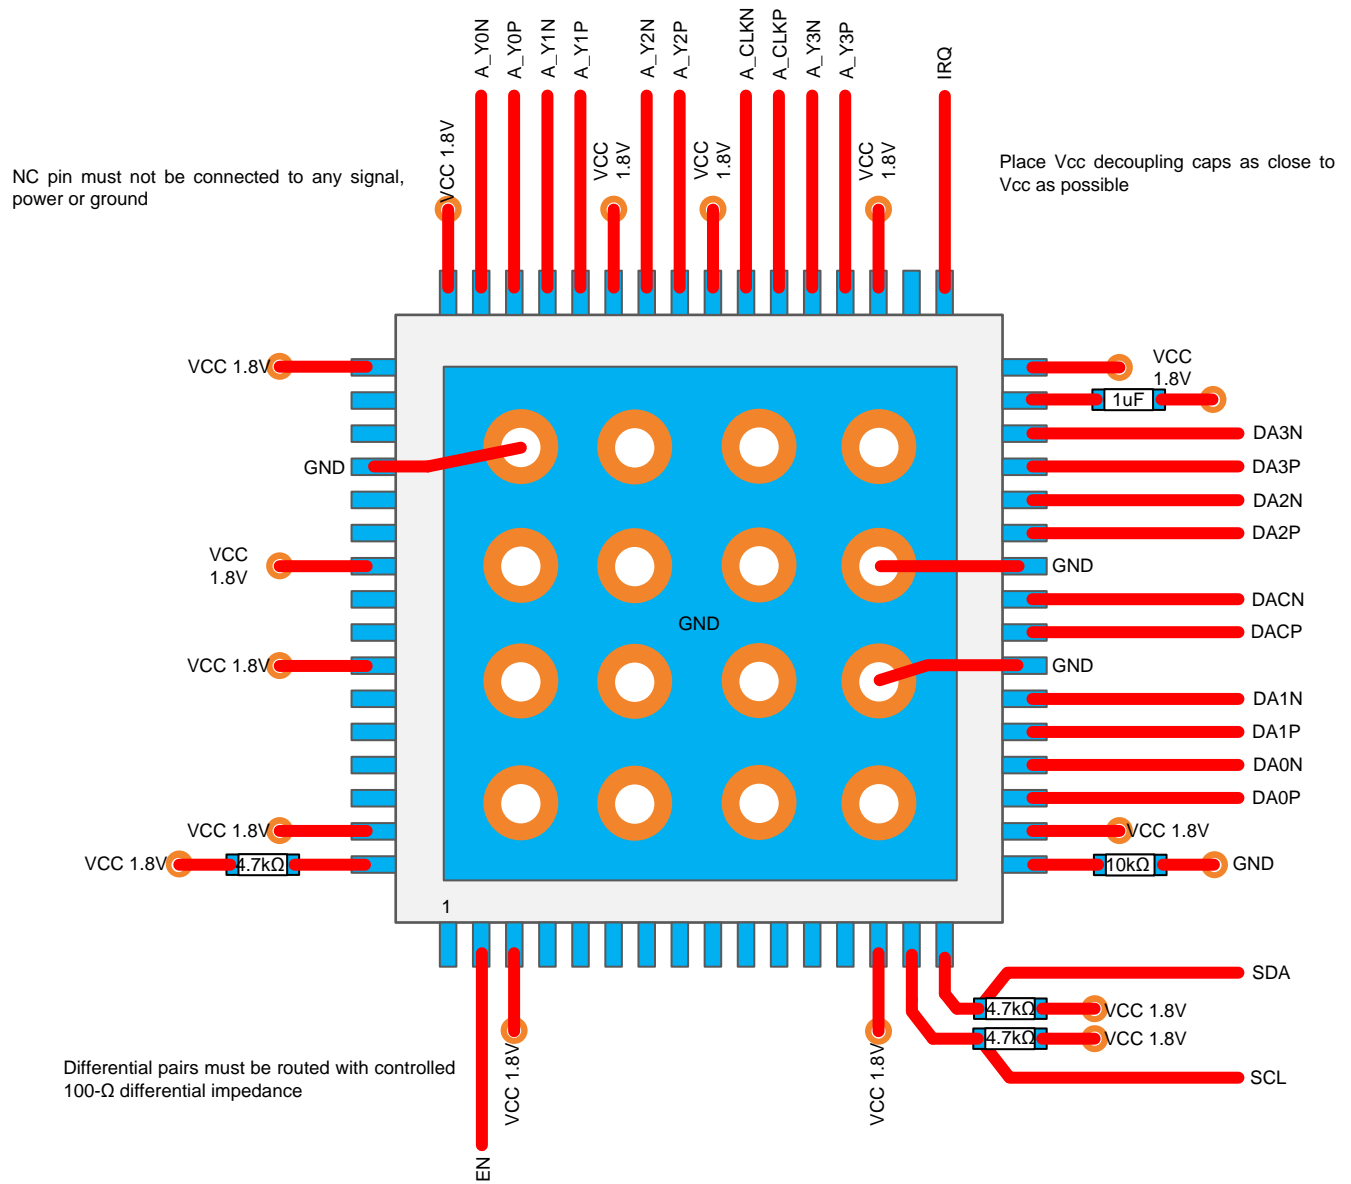

TI recommends that only one board ground plane be used in the design. This provides the best image plane for signal traces running above the plane. The thermal pad of the SN65DSI83-Q1 must be connected to this plane with vias.

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65DSI83TPAPRQ1	ACTIVE	HTQFP	PAP	64	1000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	DSI83TQ1	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
