TPA6132A2 25mW DirectPath™ステレオ・ヘッドホン・アンプ、ポップ音抑制機能搭載

1 特長

- 特許取得の DirectPath™テクノロジにより、DC ブロッキング・コンデンサが不要
  - 出力は0Vにバイアス
  - 非常に優れた低周波数の忠実性
- クリック/ポップ音のアクティブな抑制
- 標準消費電流: 2.1mA
- 完全差動またはシングル・エンド入力
  - 内蔵の抵抗により部品数を削減
  - システムのノイズ特性を改善
- 2.3V～5.5Vの電源に対して一定の最大出力電力
  - 音響的なショックを防止する設計を容易に実現
- RFノイズ耐性の向上
- Microsoft™ Windows Vista™準拠
- 高い電源ノイズ除去
  - 217Hzで100dB PSRR
  - 10kHzで90dB PSRR
- 広い電源電圧範囲: 2.3V～5.5V
- ゲイン設定: -6dB、0dB、3dB、6dB
- 短絡および熱過負荷保護
- ±8kV HBM ESD保護の出力
- 小さなパッケージで供給
  - 16ピン、3mm×3mmの薄型QFN

2 アプリケーション

- スマートフォン /携帯電話
- ノートPC
- CD/MP3プレーヤー
- 携帯ゲーム機

3 概要

TPA6132A2 (TPA6132と呼ばれることもあります)は DirectPath™ステレオ・ヘッドホン・アンプで、外部的なDCブロック出力コンデンサを必要としません。差動ステレオ入力と、内蔵の抵抗によりデバイスのゲインを設定することで、外付け部品数をさらに減らすことができます。ゲインは -6dB、0dB、3dB、6dBから選択できます。このアンプは、単一の2.3V電源から、16Ωのスピーカーへ25mWを供給できます。TPA6132A2 (TPA6132)は、電源電圧にかかわらず一定の最大出力電力を供給するため、音響的なショックを防止する設計を容易に実現できます。

TPA6132A2には完全差動入力があり、音源とヘッドホン・アンプとの間でシステム・ノイズの入り込みが低減されます。高い電源ノイズ除去性能と差動アーキテクチャから、RFノイズへの耐性が強化されています。シングル・エンドの入力信号については、INL+とINR+をグランドへ接続します。

このデバイスにはポップ音抑制回路が内蔵されており、電源オンおよび電源オフ時に耳障りなポップ音が完全に除去されます。アンプの出力は短絡および熱過負荷に対して保護されており、±8kV HBM ESD保護も搭載されているため、最終機器のIEC 61000-4-2 ESD規格への準拠を簡単に実現できます。

TPA6132A2は単一の2.3V～5.5V電源で動作し、標準消費電流は2.1mAです。シャットダウン・モードでは消費電流が1μA未満に低減されます。

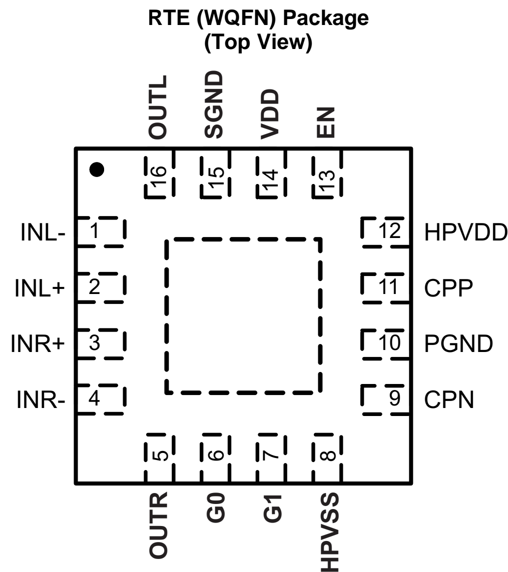
5 Pin Configuration and Functions



Pin Functions

PIN		I/O/P	DESCRIPTION
NAME	NO.		
INL-	1	I	Inverting left input for differential signals; left input for single-ended signals
INL+	2	I	Non-inverting left input for differential signals. Connect to ground for single-ended input applications
INR+	3	I	Non-inverting right input for differential signals. Connect to ground for single-ended input applications
INR-	4	I	Inverting right input for differential signals; right input for single-ended signals
OUTR	5	O	Right headphone amplifier output. Connect to right terminal of headphone jack
G0	6	I	Gain select
GAIN0		I	
G1	7	I	Gain select
GAIN1		I	
HPVSS	8	P	Charge pump output and negative power supply for output amplifiers; connect 1μF capacitor to GND
CPN	9	P	Charge pump negative flying cap. Connect to negative side of 1μF capacitor between CPP and CPN
PGND	10	P	Ground
CPP	11	P	Charge pump positive flying cap. Connect to positive side of 1μF capacitor between CPP and CPN
HPVDD	12	P	Positive power supply for headphone amplifiers. Connect to a 2.2μF capacitor. Do not connect to VDD
EN	13	I	Amplifier enable. Connect to logic low to shutdown; connect to logic high to activate
VDD	14	P	Positive power supply for TPA6132A2
SGND	15	P	Amplifier reference voltage. Connect to ground terminal of headphone jack
OUTL	16	O	Left headphone amplifier output. Connect to left terminal of headphone jack
Thermal Pad	–		Solder the exposed metal pad on the TPA6132A2RTE QFN package to the landing pad on the PCB. Connect the landing pad to ground or leave it electrically unconnected (floating).

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range, T_A = 25°C (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage	VDD	–0.3	6	V
Headphone amplifier supply voltage	HPVDD (do not connect to external supply)	–0.3	1.9	V
Input voltage, V_I	INR+, INR-, INL+, INL-	HPVSS –0.3	HPVDD + 0.3	V
	EN, G0, G1	–0.3	VDD + 0.3	V
Output continuous total power dissipation		See *Thermal Information*		
Operating free-air temperature range, T_A		–40	85	°C
Operating junction temperature range, T_J		–40	150	°C
Storage temperature range, T_{stg}		–65	85	°C

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	OUTL, OUTR	±8000	V
			All Other Pins	±2000	
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]		±1500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Condtions

		MIN	MAX	UNIT
	Supply voltage, VDD	2.3	5.5	V
V_{IH}	High-level input voltage; EN, G0, G1	1.3		V
V_{IL}	Low-level input voltage; EN, G0, G1		0.6	V
V_I	Input voltage; INR+, INR-, INL+, INL-	0	HPVDD + 0.3	V
	Voltage applied to Output; OUTR, OUTL (when EN = 0 V)	–0.3	3.6	V
T_A	Operating free-air temperature	–40	85	°C

6.4 Thermal Information

THERMAL METRIC[1]		RTE	UNIT
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	51.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	24.3	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.9	°C/W
ψ_{JB}	Junction-to-board characterization parameter	24.3	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	9.0	°C/W

7 Detailed Description

7.1 Overview

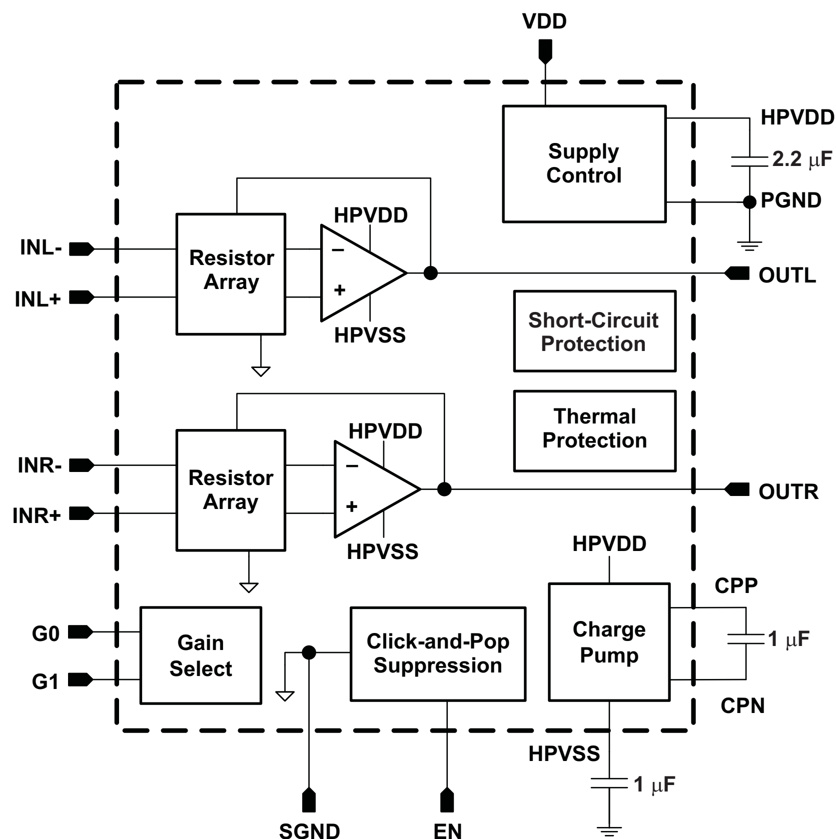
The TPA6132A2 is a DirectPath™ stereo headphone amplifier that requires no output DC blocking capacitors and is capable of delivering 25m-W/Ch into16-Ω speakers. The device has built-in pop suppression circuitry to completely eliminate pop noise during turn- on and turn-off. The amplifier outputs have short- circuit and thermal-overload protection.

The TPA6132A2 features fully differential inputs to reduce system noise pickup between the audio source and the headphone amplifier. The high power supply noise rejection performance and differential architecture provides increased RF noise immunity.

Differential stereo inputs and built-in resistors set the device gain, reducing external component count. The TPA6132A2 has four gain settings which are controlled with pins G0 and G1. The combination of these pins set the device to –6-dB, 0-dB, 3-dB or 6-dB gain.

The TPA6132A2 operates from a single 2.3-V to 5.5-V supply with 2.1 mA of typical supply current, as it uses a built-in charge pump to generate a negative voltage supply for the headphone amplifiers. Shutdown mode reduces supply current to less than 1 μA

7.2 Functional Block Diagram



Copyright © 2008–2017, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Headphone Amplifiers

Single-supply headphone amplifiers typically require dc-blocking capacitors to remove dc bias from their output voltage. The top drawing in Figure 23 illustrates this connection. If dc bias is not removed, large dc current will flow through the headphones which wastes power, clip the output signal, and potentially damage the headphones.

These dc-blocking capacitors are often large in value and size. Headphone speakers have a typical resistance between 16 Ω and 32 Ω. This combination creates a high-pass filter with a cutoff frequency as shown in Equation 1, where R_L is the load impedance, C_O is the dc-block capacitor, and f_C is the cutoff frequency.

$$f_c = \frac{1}{2\pi R_L C_O} \quad (1)$$

For a given high-pass cutoff frequency and load impedance, the required dc-blocking capacitor is found as:

$$C_O = \frac{1}{2\pi f_C R_L} \quad (2)$$

Reducing f_C improves low frequency fidelity and requires a larger dc-blocking capacitor. To achieve a 20 Hz cutoff with 16 Ω headphones, C_O must be at least 500 μF. Large capacitor values require large packages, consuming PCB area, increasing height, and increasing cost of assembly. During start-up or shutdown the dc-blocking capacitor has to be charged or discharged. This causes an audible pop on start-up and power-down. Large dc-blocking capacitors also reduce audio output signal fidelity.

Two different headphone amplifier architectures are available to eliminate the need for dc-blocking capacitors. The Capless amplifier architecture is similar provides a reference voltage to the headphone connector shield pin as shown in the middle drawing of Figure 23. The audio output signals are centered around this reference voltage, which is typically half of the supply voltage to allow symmetrical output voltage swing.

When using a Capless amplifier do not connect the headphone jack shield to any ground reference or large currents will result. This makes Capless amplifiers ineffective for plugging non-headphone accessories into the headphone connector. Capless amplifiers are useful only with floating GND headphones.

Copyright © 2008–2017, Texas Instruments Incorporated

Feature Description (continued)

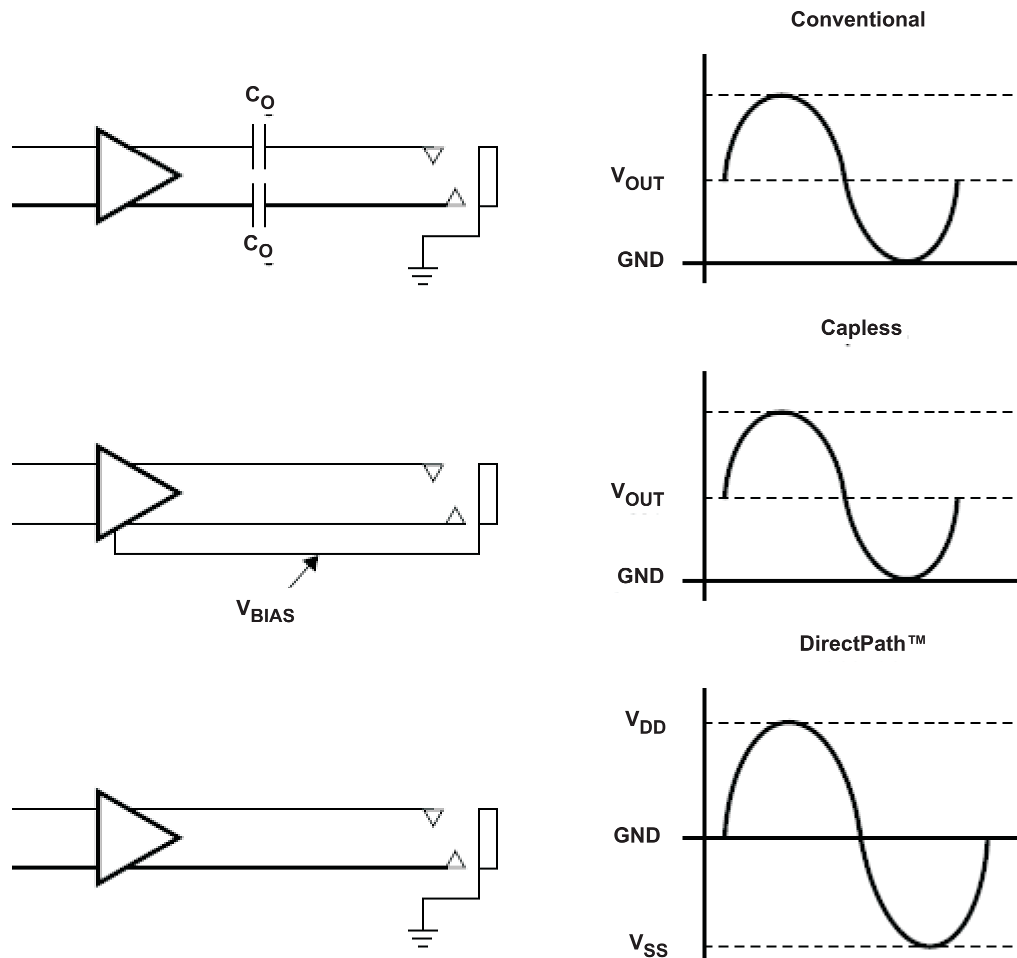


Figure 23. Amplifier Applications

The DirectPath™ amplifier architecture operates from a single supply voltage and uses an internal charge pump to generate a negative supply rail for the headphone amplifier. The output voltages are centered around 0 V and are capable of positive and negative voltage swings as shown in the bottom drawing of Figure 23. DirectPath amplifiers require no output dc-blocking capacitors. The headphone connector shield pin connects to ground and will interface will headphones and non-headphone accessories. The TPA6132A2 is a DirectPath amplifier.

7.3.2 Eliminating Turn-on Pop and Power Supply Sequencing

The TPA6132A2 has excellent noise and turn-on / turn-off pop performance. It uses an integrated click-and-pop suppression circuit to allow fast start-up and shutdown without generating any voltage transients at the output pins. Typical start-up time from shutdown is 5 ms.

DirectPath technology keeps the output dc voltage at 0 V even when the amplifier is powered up. The DirectPath technology together with the active pop-and-click suppression circuit eliminates audible transients during start up and shutdown.

Use input coupling capacitors to ensure inaudible turn-on pop. Activate the TPA6132A2 after all audio sources have been activated and their output voltages have settled. On power-down, deactivate the TPA6132A2 before deactivating the audio input source. The EN pin controls device shutdown: Set to 0.6 V or lower to deactivate the TPA6132A2; set to 1.3 V or higher to activate.

Copyright © 2008–2017, Texas Instruments Incorporated

Feature Description (continued)

7.3.3 RF and Power Supply Noise Immunity

The TPA6132A2 employs a new differential amplifier architecture to achieve high power supply noise rejection and RF noise rejection. RF and power supply noise are common in modern electronics. Although RF frequencies are much higher than the 20 kHz audio band, signal modulation often falls in-band. This, in turn, modulates the supply voltage, allowing a coupling path into the audio amplifier. A common example is the 217 Hz GSM frame-rate buzz often heard from an active speaker when a cell phone is placed nearby during a phone call.

The TPA6132A2 has excellent rejection of power supply and RF noise, preventing audio signal degradation.

7.3.4 Constant Maximum Output Power and Acoustic Shock Prevention

Typically the output power increases with increasing supply voltage on an unregulated headphone amplifier. The TPA6132A2 maintains a constant output power independent of the supply voltage. Thus the design for prevention of acoustic shock (hearing damage due to exposure to a loud sound) is simplified since the output power will remain constant, independent of the supply voltage. This feature allows maximizing the audio signal at the lowest supply voltage.

7.4 Device Functional Modes

7.4.1 Gain Control

The TPA6132A2 has four gain settings which are controlled with pins G0 and G1. Table 1 gives an overview of the gain function.

G0 VOLTAGE	G1 VOLTAGE	AMPLIFIER GAIN
≤ 0.5 V	≤ 0.5 V	–6 dB
≥ 1.3 V	≤ 0.5 V	0 dB
≤ 0.5 V	≥ 1.3 V	3 dB
≥ 1.3 V	≥ 1.3 V	6 dB

Table 1. Windows Vista™ Premium Mobile Mode Specifications

Device Type	Requirement	Windows Premium Mobile Vista Specifications	TPA6132A2 Typical Performance
Analog Speaker Line Jack (R_L = 10 kΩ, FS = 0.707 Vrms)	THD+N	≤ –65 dB FS [20 Hz, 20 kHz]	–75 dB FS[20 Hz, 20 kHz]
	Dynamic Range with Signal Present	≤ –80 dB FS A-Weight	–100 dB FS A-Weight

8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPA6132A2 starts its operation by asserting the EN pin to logic 1. The device enters in shutdown mode when pulling low EN pin. The charge pump generates a negative supply voltage. The charge pump flying capacitor connected between CPP and CPN transfers charge to generate the negative supply voltage. The output voltages are capable of positive and negative voltage swings and are centered close to 0 V, eliminating the need for output capacitors. Input coupling capacitors block any dc bias from the audio source and ensure maximum dynamic range. The device has built-in pop suppression circuitry to completely eliminate pop noise during turn- on, turn-off and enter or exit shutdown mode.

8.2 Typical Applications

8.2.1 Configuration with Differential Input Signals

Figure 24 shows a typical application circuit for the TPA6132A2 with a stereo headphone jack output and differential input signals. Also supports charge pump flying capacitor and power supply decoupling capacitors.

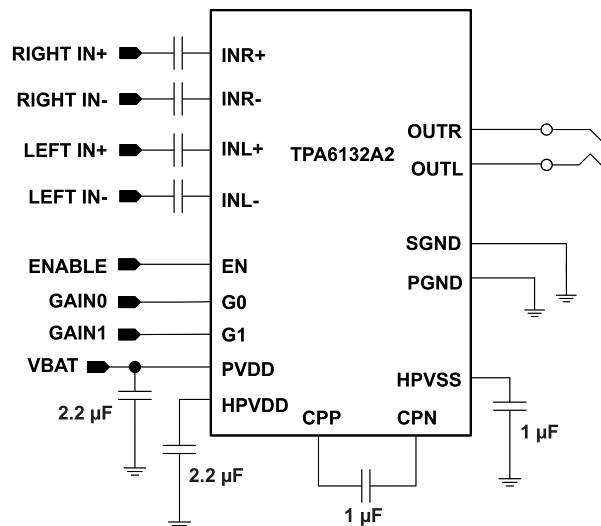

Figure 24. Typical Application Configuration with Differential Input Signals

8.2.1.1 Design Requirements

For this design example, use the parameters shown in Table 2.

Table 2. Design Parameters

PARAMETERS	VALUES
Input voltage range	2.2 V to 5.3 V
Output voltage	1.1-V_{RMS}
Current	2 mA to 3.2 mA

Copyright © 2008–2017, Texas Instruments Incorporated

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Input Coupling Capacitors

Input coupling capacitors block any dc bias from the audio source and ensure maximum dynamic range. Input coupling capacitors also minimize TPA6132A2 turn-on pop to an inaudible level.

The input capacitors are in series with TPA6132A2 internal input resistors, creating a high-pass filter. Equation 3 calculates the high-pass filter corner frequency. The input impedance, RIN, is dependent on device gain. Larger input capacitors decrease the corner frequency. See the Operating Characteristics table for input impedance values.

$$f_C = \frac{1}{2\pi R_{IN} C_{IN}} \quad (3)$$

For a given high-pass cutoff frequency, the minimum input coupling capacitor is found as:

$$C_{IN} = \frac{1}{2\pi f_C R_{IN}} \quad (4)$$

Example: Design for a 20 Hz corner frequency with a TPA6132A2 gain of +6 dB. The Operating Characteristics table gives RIN as 13.2 kΩ. Equation 4 shows the input coupling capacitors must be at least 0.6 µF to achieve a 20 Hz high-pass corner frequency. Choose a 0.68 µF standard value capacitor for each TPA6132A2 input (X5R material or better is required for best performance).

Input capacitors can be removed provided the TPA6132A2 inputs are driven differentially with less than ±1 V and the common-mode voltage is within the input common-mode range of the amplifier. Without input capacitors turn-on pop performance may be degraded and should be evaluated in the system.

8.2.1.2.2 Charge Pump Flying Capacitor and HPVSS Capacitor

The TPA6132A2 uses a built-in charge pump to generate a negative voltage supply for the headphone amplifiers. The charge pump flying capacitor connects between CPP and CPN. It transfers charge to generate the negative supply voltage. The HPVSS capacitor must be at least equal in value to the flying capacitor to allow maximum charge transfer. Use low equivalent-series-resistance (ESR) ceramic capacitors (X5R material or better is required for best performance) to maximize charge pump efficiency. Typical values are 1 µF to 2.2 µF for the HPVSS and flying capacitors. Although values down to 0.47 µF can be used, total harmonic distortion (THD) will increase.

8.2.1.3 Application Curves

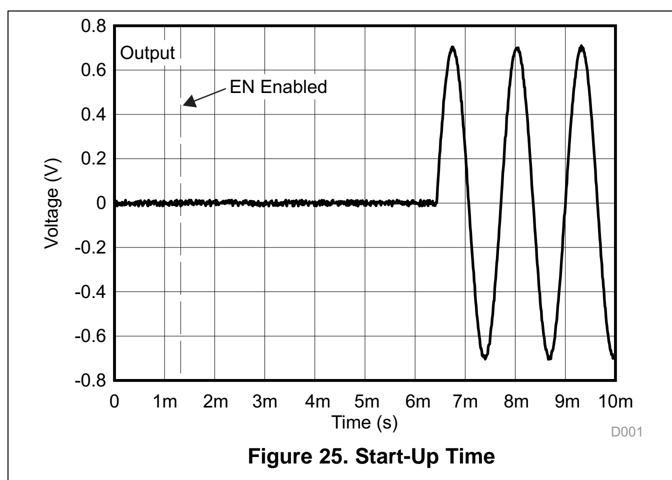

Figure 25. Start-Up Time

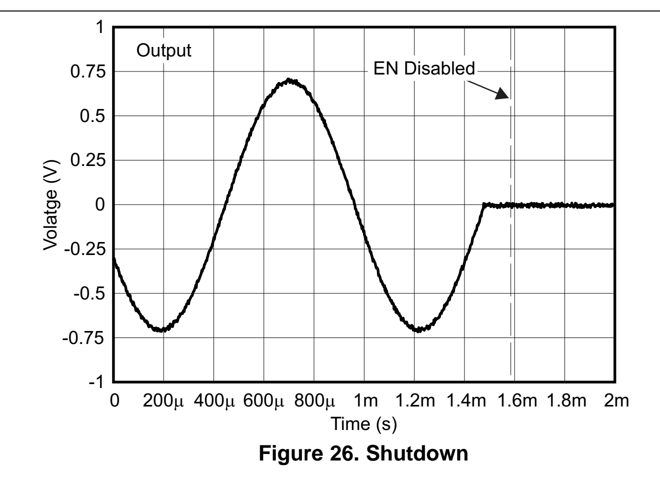

Figure 26. Shutdown

8.2.2 Configuration with Single-Ended Input Signals

Figure 27 shows a typical application circuit for the TPA6132A2 with a stereo headphone jack output and single-ended input signals. Also supports charge pump flying capacitor and power supply decoupling capacitors.

9 Power Supply Recommendations

Connect the supply voltage to the VDD pin and decouple it with an X5R or better capacitor. Connect the HPVDD pin only to a 2.2 μF, X5R or better, capacitor. Do not connect HPVDD to an external voltage supply. Place both capacitors within 5 mm of their associated pins on the TPA6132A2. Ensure that the ground connection of each of the capacitors has a minimum length return path to the device. Failure to properly decouple the TPA6132A2 may degrade audio or EMC performance.

9.1 Power Supply and HPVDD Decoupling Capacitors

The TPA6132A2 DirectPath headphone amplifier requires adequate power supply decoupling to ensure that output noise and total harmonic distortion (THD) remain low. Use good low equivalent-series-resistance (ESR) ceramic capacitors (X5R material or better is required for best performance). Place a 2.2 μF capacitor within 5 mm of the VDD pin. Reducing the distance between the decoupling capacitor and VDD minimizes parasitic inductance and resistance, improving TPA6132A2 supply rejection performance. Use 0402 or smaller size capacitors if possible.

For additional supply rejection, connect an additional 10 μF or higher value capacitor between VDD and ground. This will help filter lower frequency power supply noise. The high power supply rejection ratio (PSRR) of the TPA6132A2 makes the 10 μF capacitor unnecessary in most applications.

Connect a 2.2 μF capacitor between HPVDD and ground. This ensures the amplifier internal bias supply remains stable and maximizes headphone amplifier performance.

WARNING

DO NOT connect HPVDD directly to VDD or an external supply voltage. The voltage at HPVDD is generated internally. Connecting HPVDD to an external voltage can damage the device.

10 Layout

10.1 Layout Guidelines

- Solder the exposed metal pad on the TPA6132A2RTE QFN package to the landing pad on the PCB.
- Connect the landing pad to ground or leave it electrically unconnected (floating). *Do not connect the landing pad to VDD or to any other power supply voltage*.
- If the pad is grounded, it must be connected to the same ground as the PGND pin (10).
- See the layout and mechanical drawings at the end of the data sheet for proper sizing.
- Soldering the thermal pad is required for mechanical reliability and enhances thermal conductivity of the package.

WARNING

DO NOT connect the TPA6132A2RTE exposed metal pad to VDD or any other power supply voltage.

10.2 Layout Example

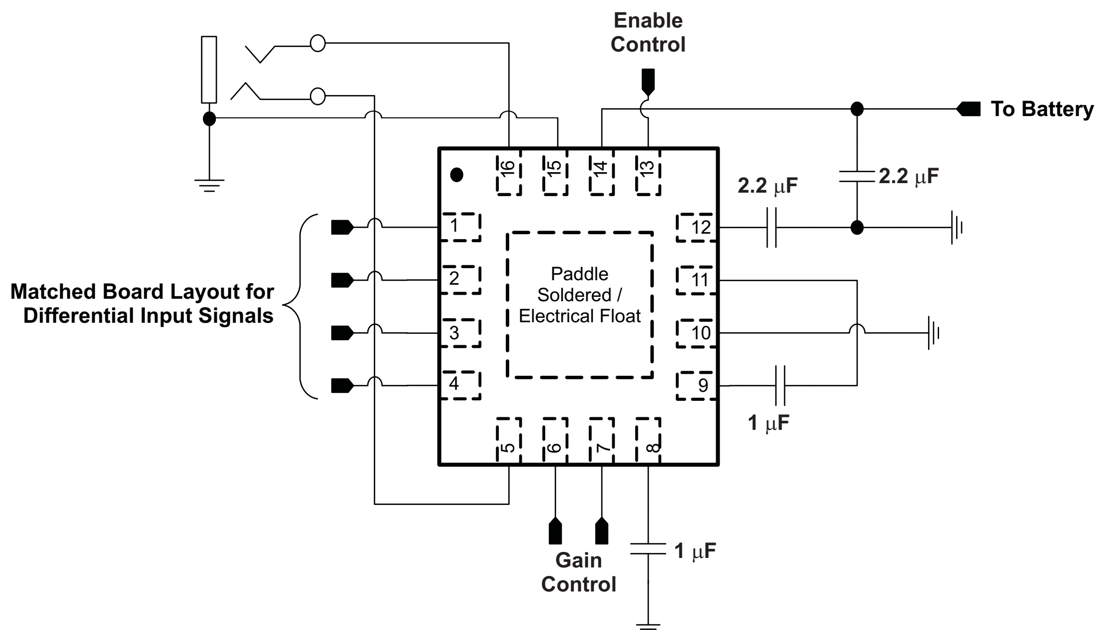

Figure 30. Board Layout Concept

10.3 GND Connections

The SGND pin is an input reference and must be connected to the headphone ground connector pin. This ensures no turn-on pop and minimizes output offset voltage. Do not connect more than ±0.3 V to SGND.

PGND is a power ground. Connect supply decoupling capacitors for VDD, HPVDD, and HPVSS to PGND.

12 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPA6132A2RTER	ACTIVE	WQFN	RTE	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	AIWI	Samples
TPA6132A2RTET	ACTIVE	WQFN	RTE	16	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	AIWI	Samples

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

C. Quad Flatpack, No-leads (QFN) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MO-220.

RTE (S-PWQFN-N16) PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
