TEXAS INSTRUMENTS
LMX2694-EP
JAJSIB5D – NOVEMBER 2019 – REVISED MARCH 2022

LMX2694-EP 15GHz 広帯域 PLLatinum™ RF シンセサイザ、位相同期付き

1 特長

- VID V62/19616-01XE
- 39.3MHz～15.1GHz の出力周波数
- 100kHz オフセットで位相ノイズ -110dBc/Hz (15GHz キャリア使用時)
- 8GHz 時のジッタ:54fs RMS (100Hz～100MHz)
- 出力電力をプログラム可能
- 主な PLL 仕様
  - 性能指数:-236dBc/Hz
  - 正規化 1/f ノイズ:-129dBc/Hz
  - 最高 200MHz の位相検出周波数
- 複数デバイス間の出力位相の同期
- 分解能 9ps のプログラム可能な遅延による SYSREF サポート
- 3.3V 単一電源で動作
- 動作温度範囲:-55℃～125℃

2 アプリケーション

- 防衛用無線
- 電子兵器
- レーダー
- アクティブ・アンテナ・システム (AAS) の mMIMO
- マクロ・リモート無線ユニット (RRU)
- 屋外バックホール・ユニット
- データ・アクイジション
- 無線通信試験機器

3 概要

LMX2694-EP デバイスは、高性能の広帯域フェーズ・ロック・ループ (PLL) で、電圧制御発振器 (VCO) と電圧レギュレータを内蔵しており、ダブラーなしで 39.3MHz～15.1GHz の任意の周波数を出力でき、1/2 高調波フィルタが不要です。搭載されている VCO は、1 オクターブの範囲をカバーしており、最低 39.3MHz までの周波数を出力できます。-236dBc/Hz の性能指数と高い位相検出器周波数を備えた高性能 PLL により、非常に低い帯域内ノイズと積分ジッタを実現できます。

LMX2694-EP を使えば、このデバイスの複数のインスタンスからの出力を同期することができます。このため、フラクショナル・エンジンまたは出力分周器を使用した場合を含め、あらゆるユースケースでデバイスから決定性位相が得られます。また、高速データ・コンバータの低ノイズ・クロック・ソースとしてこのデバイスを使用して、SYSREF (JESD204B 規格準拠) を生成または中継することもできます。

デバイス情報(1)

部品番号	パッケージ	本体サイズ (公称)
LMX2694-EP	VQFN (48)	7.00mm × 7.00mm

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision C (October 2021) to Revision D (March 2022)	Page
• 「*特長*」で VID V62/19616 の注文番号を「VID V62/19616-01XE」に変更	1
• 「*製品情報*」表の VID V62/19616-01XE 注文番号をデータシート末尾の「*パッケージ情報*」表へ移動	1

Changes from Revision B (May 2020) to Revision C (October 2021)	Page
• Removed equivalent division value of 72 in 表 7-8	18
• Changed the JESD_DACx values in 表 7-15	23
• Changed the R1 register bit name 3 in 図 7-11 from: 1 to: MUXOUT_CTRL	37
• Changed the OUTA_MUX register description in 表 7-65	51
• Changed the OUTB_MUX register description in 表 7-66	52

Changes from Revision A (December 2019) to Revision B (May 2020)	Page
• 最大動作温度を 125℃に変更	1
• Changed maximum T_C to 125°C in Recommended Operating Conditions	5
• Changed maximum T_C to 125°C in Electrical Characteristics	6
• Changed maximum T_C to 125°C in Timing Requirements	8

Changes from Revision * (November 2019) to Revision A (December 2019)	Page
• カスタム・データシート・リリースをカタログに変更	1

5 Pin Configuration and Functions

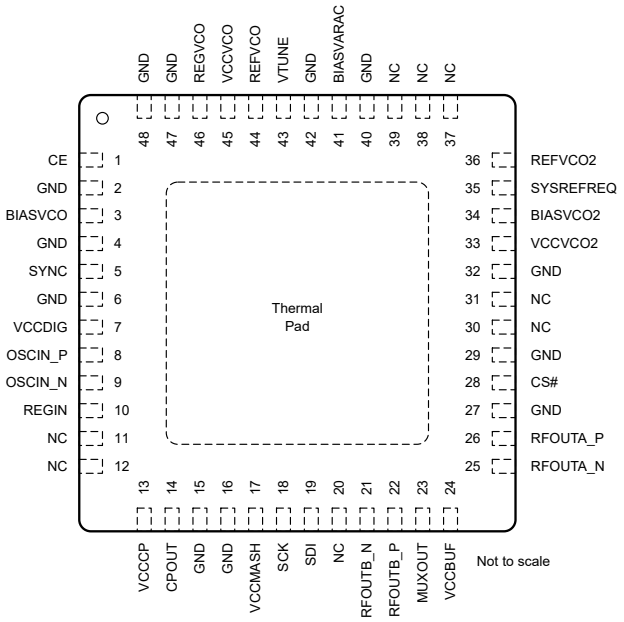

図 5-1. RTC Package 48-Pin VQFN Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
BIASVARAC	41	BP	VCO varactor bias. Connect a 10-µF decoupling capacitor to ground.
BIASVCO	3	BP	VCO bias. Connect a 10-µF decoupling capacitor to ground. Place close to pin.
BIASVCO2	34	BP	VCO bias. Connect a 1-µF decoupling capacitor to ground. Place close to pin.
CE	1	I	Chip Enable. High impedance CMOS input. 1.8-V to 3.3-V logic. Active HIGH powers on the device.
CPOUT	14	O	Charge pump output. Recommend connecting C1 of loop filter close to this pin.
CS#	28	I	SPI latch. High impedance CMOS input. 1.8-V to 3.3-V logic.
GND	2, 4, 32, 40, 42, 47	G	VCO ground.
GND	6, 16, 48	G	Digital ground.
GND	15	G	Charge pump ground.
GND	27, 29	G	Buffer ground.
MUXOUT	23	O	Multiplexed output. Can output: lock detect, SPI readback and diagnostics.
NC	11, 12, 20, 30, 31, 37, 38, 39	NC	Pins may be grounded or left unconnected.
OSCIN_N	9	I	Reference input clock (–). High impedance self-biasing pin. Requires AC-coupling capacitor. (0.1 µF recommended)
OSCIN_P	8	I	Reference input clock (+). High impedance self-biasing pin. Requires AC-coupling capacitor. (0.1 µF recommended)
REFVCO	44	BP	VCO supply reference. Connect a 10-µF decoupling capacitor to ground.
REFVCO2	36	BP	VCO supply reference. Connect a 10-µF decoupling capacitor to ground.
REGIN	10	BP	Input reference path regulator decoupling. Connect a 1-µF decoupling capacitor to ground. Place close to pin.
REGVCO	46	BP	VCO regulator node. Connect a 1-µF decoupling capacitor to ground.
RFOUTA_N	25	O	Differential output A (–). Requires connecting 50-Ω resistor pullup to V_{CC} as close as possible to pin.

表 5-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
RFOUTA_P	26	O	Differential output A (+). Requires connecting 50-Ω resistor pullup to V_{CC} as close as possible to pin.
RFOUTB_N	21	O	Differential output B (–). Requires connecting 50-Ω resistor pullup to V_{CC} as close as possible to pin.
RFOUTB_P	22	O	Differential output B (+). Requires connecting 50-Ω resistor pullup to V_{CC} as close as possible to pin.
SCK	18	I	SPI clock. High impedance CMOS input. 1.8-V to 3.3-V logic.
SDI	19	I	SPI data. High impedance CMOS input. 1.8-V to 3.3-V logic.
SYNC	5	I	Phase synchronization input. Has programmable threshold. Connect to ground if not being used.
SYSREFREQ	35	I	SYSREF request input for JESD204B support. Connect to ground if not being used.
VCCBUF	24	P	Output buffer supply. Connect to 3.3-V and a 0.1-µF decoupling capacitor to ground.
VCCCP	13	P	Charge pump supply. Connect to 3.3-V and a 0.1-µF decoupling capacitor to ground.
VCCDIG	7	P	Digital supply. Connect to 3.3-V and a 0.1-µF decoupling capacitor to ground.
VCCMASH	17	P	Digital supply. Connect to 3.3-V and a 1-µF decoupling capacitor to ground.
VCCVCO	45	P	VCO supply. Connect to 3.3-V and a 1-µF decoupling capacitor to ground.
VCCVCO2	33	P	VCO supply. Connect to 3.3-V and a 1-µF decoupling capacitor to ground.
VTUNE	43	I	VCO tuning voltage input. Connect a 1.5-nF or more capacitor to VCO ground. See *External Loop Filter* for details.
Thermal pad	—	—	Connect the GND pin to the exposed thermal pad for correct operation. Connect the thermal pad to any internal PCB ground plane using multiple vias for good thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
V_{CC}	Power supply voltage	–0.3	3.6	V
V_{IN}	IO input voltage		V_{CC} + 0.3	V
T_J	Junction temperature	–55	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±1000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1000	

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T_C	Case temperature	–55		125	°C
V_{CC}	Supply input voltage	3.2	3.3	3.45	V

6.4 Thermal Information

THERMAL METRIC(1)		LMX2694-EP RTC (VQFN) 48 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	22.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	10.0	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	6.1	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.1	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	6.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6.5 Electrical Characteristics

3.2 V ≤ V_{CC} ≤ 3.45 V, –50°C ≤ T_C ≤ 125°C. Typical values are at V_{CC} = 3.3 V, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
POWER SUPPLY							
I_{CC}	Supply current	OUTA_PD = 0; OUTB_PD = 1; OUTA_MUX = OUTB_MUX = 1; OUTA_PWR = 31; CPG = 7; f_{OSC} = f_{PD} = 100 MHz; f_{VCO} = f_{OUT} = 14.5 GHz			360		mA
	Power on reset current	RESET = 1			289		
	Power down current	POWERDOWN = 1			6

H3	VCO third harmonic	f_{VCO} = 8 GHz; divider disabled			–25		
DIGITAL INTERFACE							
V_{IH}	High-level input voltage			1.4			V
V_{IL}	Low-level input voltage					0.4	V
I_{IH}	High-level input current			–100		100	µA
I_{IL}	Low-level input current			–100		100	µA

3.2 V ≤ V_{CC} ≤ 3.45 V, –50°C ≤ T_C ≤ 125°C. Typical values are at V_{CC} = 3.3 V, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	Load current = –5 mA	MUXOUT pin	V_{CC} – 0.6			V
V_{OL}	High-level output current	Load current = 5 mA				0.6	V

(1) Single ended output power obtained after de-embedding microstrip trace losses and matching with a manual tuner. Unused port terminated to 50-Ω load.
(2) Output power, spurs, and harmonics can vary based on board layout and components.
(3) Single-ended AC coupled sine wave input with complementary side AC coupled to ground with 50-Ω resistor.
(4) For lower VCO frequencies, the N divider minimum value can limit the phase-detector frequency.
(5) The PLL noise contribution is measured using a clean reference and a wide loop bandwidth and is composed into flicker and flat components. PLL_flat = PLL_FOM + 20 x log(f_{VCO}/f_{PD}) + 10 x log(f_{PD}/1 Hz). PLL_flicker (offset) = PLL_1/f + 20 x log(f_{VCO}/1 GHz) - 10 x log(offset/10 kHz). Once these two components are found, the total PLL noise can be calculated as PLL_Noise = 10 x log($10^{PLL\_Flat/10}$ + $10^{PLL\_flicker/10}$).
(6) See セクション 7.3.7.1 for details.

6.6 Timing Requirements

3.2 V ≤ V_{CC} ≤ 3.45 V, –50°C ≤ T_C ≤ 125°C. Typical values are at V_{CC} = 3.3 V, 25°C (unless otherwise noted)

			MIN	NOM	MAX	UNIT
SYNC AND SYSREFREQ TIMING

t_{CD}	Falling clock edge to data wait time				8	ns

6.7 Timing Diagrams

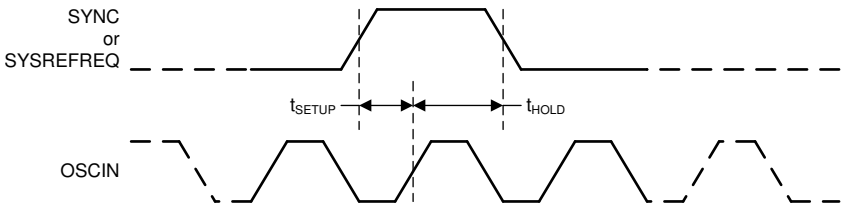

図 6-1. Trigger Signals Timing Diagram

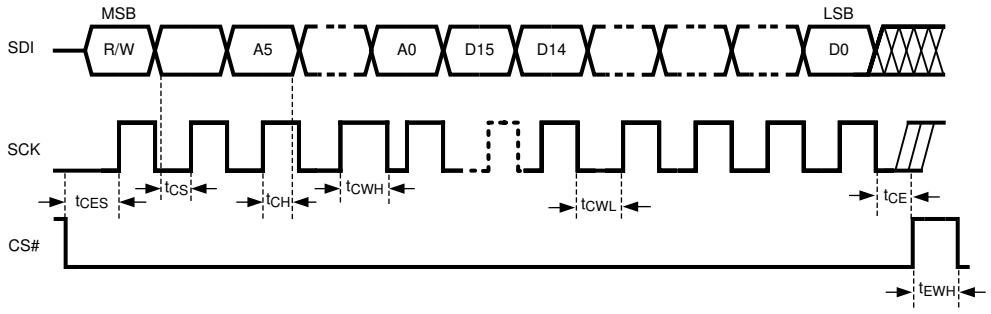

図 6-2. Serial Data Input Timing Diagram

There are several other considerations for writing on the SPI:

- The R/W bit must be set to 0.
- The data on SDI pin is clocked into a shift register on each rising edge on the SCK pin.
- The CS# must be held low for data to be clocked. Device will ignore clock pulses if CS# is held high.
- The CS# transition from high to low must occur when SCK is low.
- When SCK and SDI lines are shared between devices, TI recommends to hold the CS# line high on the device that is not to be clocked.

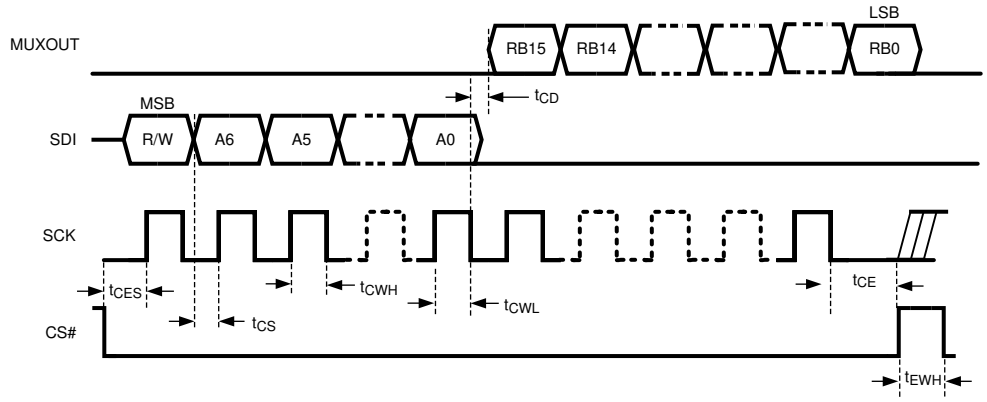

図 6-3. Serial Data Readback Timing Diagram

There are several other considerations for SPI readback:

- The R/W bit must be set to 1.
- The MUXOUT pin will always be low for the address portion of the transaction.
- The data on MUXOUT becomes available momentarily after the falling edge of SCK, and therefore, should be read back on the rising edge of SCK.
- The data portion of the transition on the SDI line is always ignored.

6.8 Typical Characteristics

7 Detailed Description

7.1 Overview

The LMX2694-EP is a high-performance, wideband frequency synthesizer with an integrated VCO and output divider. The VCO operates from 7550 to 15100 MHz, and can be combined with the output divider to produce any frequency in the range of 39.3 MHz to 15.1 GHz. There are two dividers within the input path.

The PLL is fractional-N PLL with a programmable delta-sigma modulator up to the 3rd order. The fractional denominator is a programmable 32-bit long that can provide fine frequency steps easily below 1-Hz resolution, as well as be used to do exact fractions like 1/3, 7/1000, and so on.

For applications where deterministic or adjustable phase is desired, the SYNC pin can be used to get the phase relationship between the OSCIN and RFOUTx pins deterministic. Once this is done, the phase can be adjusted in very fine steps of the VCO period divided by the fractional denominator.

The ultra-fast VCO calibration is designed for applications where the frequency must be swept or abruptly changed. The frequency can be manually programmed.

For JESD204B support, the RFOUTB output can be used as a differential SYSREF output that can be either a single pulse or a series of pulses that occur at a programmable distance away from the rising edges of the output signal.

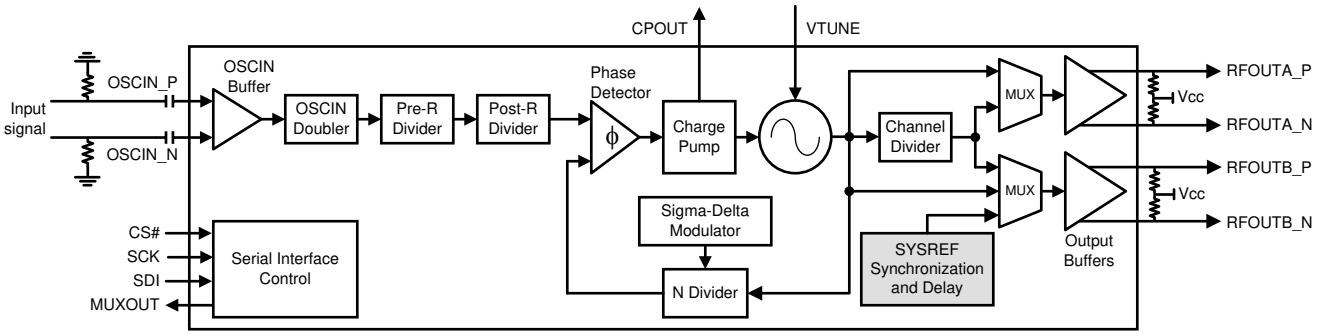
The LMX2694-EP device requires only a single 3.3-V power supply. The internal power supplies are provided by integrated LDOs, eliminating the need for high-performance external LDOs.

表 7-1 shows the range of several of the doubler, dividers, and fractional settings.

表 7-1. Range of Doubler, Divider, and Fractional Settings

PARAMETER	MIN	MAX	COMMENTS
OSCIN doubler	0 (1X)	1 (2X)	The low noise doubler can be used to increase the phase detector frequency to improve phase noise and avoid spurs. This is in reference to the OSC_2X bit.
Pre-R divider	1 (bypass)	128	Only use the Pre-R divider if the input frequency is too high for the Post-R divider.
Post-R divider	1 (bypass)	255	The maximum input frequency for the Post-R divider is 250 MHz. Use the Pre-R divider if necessary.
N divider	≥ 28	524287	The minimum divide depends on modulator order and VCO frequency. See *N Divider and Fractional Circuitry* for more details.
Fractional numerator / denominator	1 (integer mode)	$2^{32} – 1 = 4294967295$	The fractional denominator is programmable and can assume any value between 1 and $2^{32}– 1$. It is not a fixed denominator.
Fractional order	0	3	Order 0 is integer mode, and the order can be programmed.
Channel divider	1 (bypass)	192	This is the series of several dividers. Also, be aware that above 10 GHz, the maximum allowable channel divider value is 6.
Output frequency	39.3 MHz	15.1 GHz	This is implied by the minimum VCO frequency divided by the maximum channel divider value.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Reference Oscillator Input

The OSCIN pins are used as a frequency reference input to the device. The input is high impedance and requires AC-coupling caps at the pin. The OSCIN pins can be driven single-ended with a CMOS clock or XO. Differential clock input is also supported, making it easier to interface with high-performance system clock devices such as TI's LMK series clock devices. As the OSCIN signal is used as a clock for the VCO calibration, a proper reference signal must be applied at the OSCIN pin at the time of programming FCAL_EN.

7.3.2 Reference Path

The reference path consists of an OSCIN doubler (OSC_2X), Pre-R divider, and a Post-R divider.

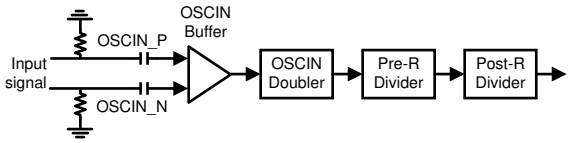


図 7-1. Reference Path Diagram

The OSCIN doubler (OSC_2X) can double up low OSCIN frequencies. Pre-R (PLL_R_PRE) and Post-R (PLL_R) dividers both divide frequency down. Use 式 1 to calculate the phase detector frequency, f_{PD}:

$$f_{PD} = f_{OSC} \times OSC\_2X / (PLL\_R\_PRE \times PLL\_R) \quad (1)$$

- If the OSCIN doubler is used, the OSCIN signal should have a 50% duty cycle as both the rising and falling edges are used.
- If the OSCIN doubler is not used, only rising edges of the OSCIN signal are used and duty cycle is not critical.

7.3.2.1 OSCIN Doubler (OSC_2X)

The OSCIN doubler allows the user to double the input reference frequency at up to 400 MHz, while adding minimal noise. It may be advantageous to use the doubler to go higher than the maximum phase detector frequency in some situations, because the Pre-R divider may be able to divide down this frequency to a phase detector frequency that is advantageous for fractional spurs.

7.3.2.2 Pre-R Divider (PLL_R_PRE)

The Pre-R divider is useful for reducing the input frequency to help meet the maximum 250-MHz input frequency limitation to the PLL-R divider. Otherwise, it does not have to be used.

7.3.2.3 Post-R Divider (PLL_R)

The Post-R divider can be used to further divide down the frequency to the phase detector frequency. When PLL_R > 1, the input frequency to this divider is limited to 250 MHz.

7.3.3 State Machine Clock

The state machine clock is a divided-down version of the OSCIN signal that is used internally in the device. This divide value 1, 2, 4, 8, 16, or 32 and is determined by CAL_CLK_DIV programming word (described in the *Programming* section). This state machine clock impacts various features like the VCO calibration. The state machine clock is calculated as $f_{SM} = f_{OSC} / 2^{CAL\_CLK\_DIV}$.

7.3.4 PLL Phase Detector and Charge Pump

The phase detector compares the outputs of the Post-R divider and N divider, and will generate a correction current corresponding to the phase error until the two signals are aligned in-phase. This charge-pump current is software-programmable to many different levels, which allows the user to modify the closed-loop bandwidth of the PLL.

7.3.5 N Divider and Fractional Circuitry

The N divider includes fractional compensation that can achieve any fractional denominator from 1 to ($2^{32} – 1$). The integer portion of N is the whole part of the N divider value, while the fractional portion (N_{frac} = NUM / DEN) is the remaining fraction. In general, the total N divider value is determined by N + NUM / DEN. The N, NUM and DEN are software-programmable. The higher the denominator, the finer the resolution step of the output. For example, even when using f_{PD} = 200 MHz, the output can increment in steps of 200 MHz / ($2^{32} – 1$) = 0.047 Hz. 式 2 shows the relationship between the phase detector and VCO frequencies. Note that in SYNC mode, there is an extra divider that is not shown in 式 2.

$$f_{VCO} = f_{PD} \times [N + NUM/DEN] \quad (2)$$

The sigma-delta modulator that controls this fractional division is also programmable from integer mode to the third order. To make the fractional spurs consistent, the modulator is reset any time that the R0 register is programmed.

The N divider has minimum value restrictions based on the modulator order (MASH_ORDER) and VCO frequency. Furthermore, the PFD_DLY_SEL bit must be programmed in accordance to 表 7-2. IncludedDivide may be larger than one in SYNC mode. In all other modes, IncludedDivide is just one.

表 7-2. Minimum N Divider Restrictions

MASH_ORDER	f_{VCO} / IncludedDivide (MHz)	MINIMUM N	PFD_DLY_SEL
0	≤ 12500	29	1
	> 12500	33	2
1	≤ 10000	30	1
	10000 - 12500	34	2
	> 12500	38	3
2	≤ 4000 (SYNC mode)	31	1
	4000 - 7500 (SYNC mode)	31	2
	7500 - 10000	32	2
	> 10000	36	3
3	≤ 4000 (SYNC mode)	33	1
	4000 - 7500 (SYNC mode)	37	2
	7500 - 10000	41	3
	> 10000	45	4

7.3.6 MUXOUT Pin

The MUXOUT pin can be configured as either a lock detect indicator for the PLL or as a serial data output for the SPI interface to read back registers. Field MUXOUT_LD_SEL (register R0[2]) configures this output.

表 7-3. MUXOUT Pin Configurations

MUXOUT_LD_SEL	FUNCTION
0	Serial data output for readback
1	Lock detect indicator

When the lock detect indicator is selected, there are two types of indicators that can be selected with the field LD_TYPE (register R59[0]). The first indicator is called “VCOCal” (LD_TYPE = 0), and the second indicator is called “Vtune and VCOCal” (LD_TYPE = 1).

7.3.6.1 Serial Data Output for Readback

In this mode, the MUXOUT pin can be used as a the serial data output of the SPI interface. This output cannot be in a tri-state condition, therefore no line sharing is possible. Details of this pin operation are described in *Timing Requirements*. Readback is very useful when a device is used in full-assist mode, because the VCO calibration data are retrieved and saved for future use. It can also be used to read back the lock detect status using the field rb_LD_VTUNE(register R110[10:9]).

7.3.6.2 Lock Detect Indicator Set as Type “VCOCal”

In this mode, the MUXOUT pin will be low when the VCO is calibrating or when the lock detect delay timer is running. Otherwise, the MUXOUT will be high. The programmable timer (LD_DLY, register R60[15:0]) adds an additional delay after the VCO calibration finishes and before the lock detect indicator is asserted high. LD_DLY is a 16-bit unsigned quantity that corresponds to the 4 times the number of phase detector cycles in absolute delay. For example, a phase detector frequency of 100 MHz and the LD_DLY = 10000 will add a delay of 400 µs before the indicator is asserted. This indicator will remain in its current state (high or low) until register R0 is programmed with FCAL_EN = 1 with a valid input reference. In other words, if the PLL goes out of lock or the input reference goes away when the current state is high, then the current state will remain high.

7.3.6.3 Lock Detect Indicator Set as Type “Vtune and VCOCal”

In this mode the MUXOUT pin will be high when the VCO calibration has finished, the lock detect delay timer is finished running, and the PLL is locked. This indicator may remain in its current state (high or low) if the OSCin signal is lost. The true status of the indicator will be updated and resume its operation only when a valid input reference to the OSCin pin is returned. An alternative method to monitor the OSCin of the PLL is recommended. This indicator is reliable as long as the reference to OSCin is present.

The output of the device can be automatically muted when lock detect indicator “Vtune and VCOCal” is low. This feature is enabled with the field OUT_MUTE (register R0[9]) asserted.

7.3.7 VCO (Voltage-Controlled Oscillator)

The LMX2694-EP includes a fully integrated VCO. The VCO takes the voltage from the loop filter and converts this into a frequency. The VCO frequency is related to the other frequencies and as follows:

$$f_{VCO} = f_{PD} \times \text{N divider} \times \text{IncludedDivide} \quad (3)$$

7.3.7.1 VCO Calibration

To reduce the VCO tuning gain, and therefore improve the VCO phase-noise performance, the VCO frequency range is divided into several different frequency bands. The entire range (7550 to 15100 MHz) covers an octave that allows the divider to take care of frequencies below the lower bound. This creates the need for frequency calibration to determine the correct frequency band given a desired output frequency. The frequency calibration routine is activated any time that the R0 register is programmed with the FCAL_EN = 1. It is important that a valid OSCIN signal must present before VCO calibration begins.

The VCO also has an internal amplitude calibration algorithm to optimize the phase noise, which is also activated any time the R0 register is programmed.

The optimum internal settings for this are temperature-dependent. If the temperature is allowed to drift too much without being recalibrated, some minor phase noise degradation could result. The maximum allowable drift for

continuous lock, ΔT_{CL}, is stated in the electrical specifications. For this device, a number of 125°C means the device never loses lock if the device is operated under recommended operating conditions.

The LMX2694-EP allows the user to assist the VCO calibration. In general, there are three kinds of assistance, as shown in 表 7-4.

表 7-4. Assisting the VCO Calibration Speed

ASSISTANCE LEVEL	DESCRIPTION	VCO_SEL	VCO_SEL_FORCE VCO_CAPCTRL_FORCE VCO_DACISET_FORCE	VCO_CAPCTRL VCO_DACISET
No assist	User does nothing to improve VCO calibration speed.	7	0	Don't care
Partial assist	Upon every frequency change, before the FCAL_EN bit is checked, the user provides the initial starting VCO_SEL.	Choose by table	0	Don't care
Full assist	The user forces the VCO core (VCO_SEL), amplitude settings (VCO_DACISET), and frequency band (VCO_CAPCTRL) and manually sets the value.	Choose by readback	1	Choose by readback

For the no-assist method, just set VCO_SEL = 7 and this is done. For partial-assist, the VCO calibration speed can be improved by changing the VCO_SEL bit according to frequency. Note that the frequency is not the actual VCO core range, but actually favors choosing the VCO. This is not only optimal for VCO calibration speed, but required for reliable locking.

表 7-5. Minimum VCO_SEL for Partial Assist

f_{VCO}	VCO CORE (MIN)
7550 - 8740 MHz	VCO1
8740 - 10000 MHz	VCO2
10000 - 10980 MHz	VCO3
10980 - 12100 MHz	VCO4
12100 - 13080 MHz	VCO5
13080 - 14180 MHz	VCO6
14180 - 15100 MHz	VCO7

For fastest calibration time, it is ideal to use the minimum VCO core as recommended in 表 7-5. The 表 7-6 shows typical VCO calibration times (in µs) for this choice in bold as well as showing how long the calibration time is increased if a higher than necessary VCO core is chosen. Realize that these calibration times are specific to these f_{OSC} and f_{PD} conditions specified and at the boundary of two cores, sometimes the calibration time can be increased.

表 7-6. Typical Calibration Times for f_{OSC} = f_{PD} = 100 MHz Based on VCO_SEL

f_{VCO} (GHz)	VCO_SEL						
	VCO7	VCO6	VCO5	VCO4	VCO3	VCO2	VCO1
8.1	650	540	550	440	360	230	110
9.3	610	530	540	430	320	**220**	Invalid
10.4	590	520	530	430	**240**	Invalid	
11.4	340	290	280	**180**	Invalid		
12.5	270	170	**120**	Invalid			
13.6	240	**130**	Invalid				
14.7	**160**	Invalid					

7.3.7.2 Determining the VCO Gain

The VCO gain varies between the seven cores, and is the lowest at the lowest end of the band and highest at the highest end of each band. For a more accurate estimation, use 表 7-7.

表 7-7. VCO Gain

f1	f2	$K_{VCO}1$	$K_{VCO}2$
7550	8740	78	114
8740	10000	91	125
10000	10980	112	136
10980	12100	136	168
12100	13080	171	206
13080	14180	188	218
14180	15100	218	248

Based ion 表 7-7, 式 4 can estimate the VCO gain for an arbitrary VCO frequency of f_{VCO}:

$$K_{VCO} = K_{VCO}1 + (K_{VCO}2 – K_{VCO}1) × (f_{VCO} – f1) / (f2 – f1) \quad (4)$$

7.3.8 Channel Divider

To go below the VCO lower bound of 7550 MHz, the channel divider can be used. The channel divider consists of four segments, and the total division value is equal to the multiplication of them. Therefore, not all values are valid.

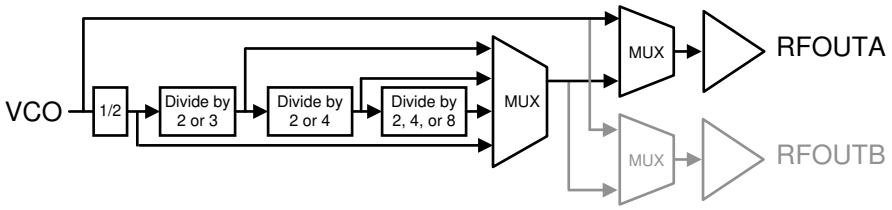

図 7-2. Channel Divider

When the channel divider is used, there are limitations on the values. 表 7-8 shows how these values are implemented and which segments are used.

表 7-8. Channel Divider Segments

EQUIVALENT DIVISION VALUE	FREQUENCY LIMITATION	OUTPUT FREQUENCY (MHz)		CHDIV[4:0]	SEG0	SEG1	SEG2	SEG3
		MIN	MAX					
2	None	3775	7550	0	2	1	1	1
4		1887.5	3775	1	2	2	1	1
6		1258.333	2516.667	2	2	3	1	1
8	f_{VCO} ≤ 11.5 GHz	943.75	1437.5	3	2	2	2	1
12		629.167	958.333	4	2	3	2	1
16		471.875	718.75	5	2	2	4	1
24		314.583	469.167	6	2	3	4	1
32		235.938	359.375	7	2	2	8	1
48		157.292	239.583	8	2	3	8	1
64		117.969	179.688	9	2	2	8	2
96		78.646	119.792	10	2	3	8	2
128		58.984	89.844	11	2	2	8	4
192		39.323	59.896	12	2	3	8	4
Invalid	n/a	n/a	n/a	13 - 31	n/a	n/a	n/a	n/a

The channel divider is powered up whenever an output (OUTx_MUX) is selected to the channel divider or SYSREF, regardless of whether it is powered down or not. When an output is not used, TI recommends selecting the VCO output to ensure that the channel divider is not unnecessarily powered up.

表 7-9. Channel Divider

OUTA MUX	OUTB MUX	CHANNEL DIVIDER
Channel Divider	X	Powered up
X	Channel Divider or SYSREF	Powered up
All other cases		Powered down

7.3.9 Output Buffer

The RF output buffer type is open-collector that requires an external pullup to V_{CC}. This component may be a 50-Ω resistor or an inductor. The inductor has less controlled impedance, but higher power. For the inductor case, it is often helpful to follow this with a resistive pad. The output power can be programmed to various levels or disabled while still keeping the PLL in lock.

表 7-10. OUTx_PWR Recommendations

f_{OUT}	RESTRICTIONS	COMMENTS
10 MHz ≤ f_{OUT} ≤ 5 GHz	None	At lower frequencies, the output buffer impedance is high, so the 50-Ω pullup will make the output impedance look somewhat like 50 Ω.
5 GHz ≤ f_{OUT} ≤ 10 GHz	OUTx_PWR ≤ 31	In this range, parasitic inductances have some impact, so the output setting is restricted.
10 GHz < f_{OUT}	OUTx_PWR ≤ 20	At these higher frequency ranges, it is best to keep below 20 for highest power and optimal noise floor.

7.3.10 Powerdown Modes

The LMX2694-EP can be powered up and down using the CE pin or the POWERDOWN bit. When the device comes out of the powered-down state, either by resuming the POWERDOWN bit to zero or by pulling back CE pin HIGH (if it was powered down by CE pin), register R0 must be programmed with FCAL_EN high again to recalibrate the device.

7.3.11 Treatment of Unused Pins

This device has several pins for many features and there is a preferred way to treat these pins if not needed. For the input pins, a series resistor is recommend, but they can be directly shorted.

表 7-11. Recommended Treatment of Pins

PINS	RECOMMENDED TREATMENT IF NOT USED
CE	V_{CC} with 1 kΩ.
SYNC, SYSREFREQ	Ground with 1 kΩ.
OSCIN_P, OSCIN_N	Ground with 50 Ω after AC-coupling capacitors. If one of the complimentary sides is used and other side is not, impedance looking out should be similar for both of these pins.
SCK, SDI	Ground with 1 kΩ.
CS#	V_{CC} with 1 kΩ.
RFOUTx	V_{CC} with 50 Ω. If one of the complimentary sides is used and the other side is not, impedance looking out should be similar for both of these pins.
MUXOUT	Ground with 10 kΩ.

7.3.12 Phase Synchronization

7.3.12.1 General Concept

The SYNC pin allows the user to synchronize the LMX2694-EP such that the delay from the rising edge of the OSCIN signal to the output signal is deterministic. Initially, the devices are locked to the input, but are not synchronized. The user sends a synchronization pulse that is reclocked to the next rising edge of the OSCIN pulse. After a given time, t_1, the phase relationship from OSCIN to f_{OUT} will be deterministic. This time is

dominated by the sum of the VCO calibration time, the analog setting time of the PLL loop, and the MASH_RST_CNT if used in fractional mode.

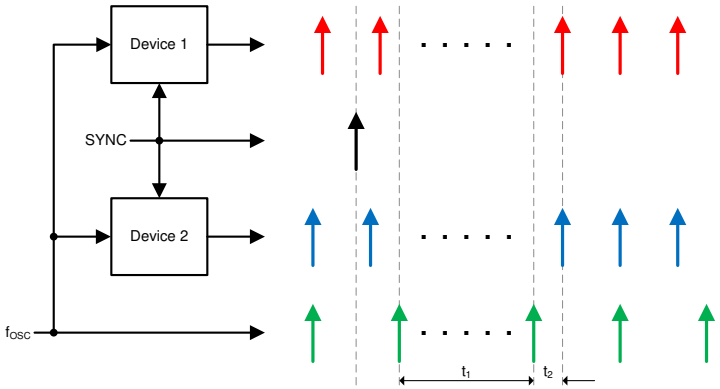

図 7-3. Phase SYNC Mechanism

When the SYNC feature is enabled, part of the channel divide may be included in the feedback path.

表 7-12. IncludedDivide With VCO_PHASE_SYNC = 1

OUTx_MUX	CHANNEL DIVIDER	IncludedDivide
OUTA_MUX = OUTB_MUX = 1 ("VCO")	Don't care	1
All other valid conditions	Divisible by 3 but NOT 24 or 192	SEG0 x SEG1 = 6
	All other values	SEG0 x SEG1 = 4

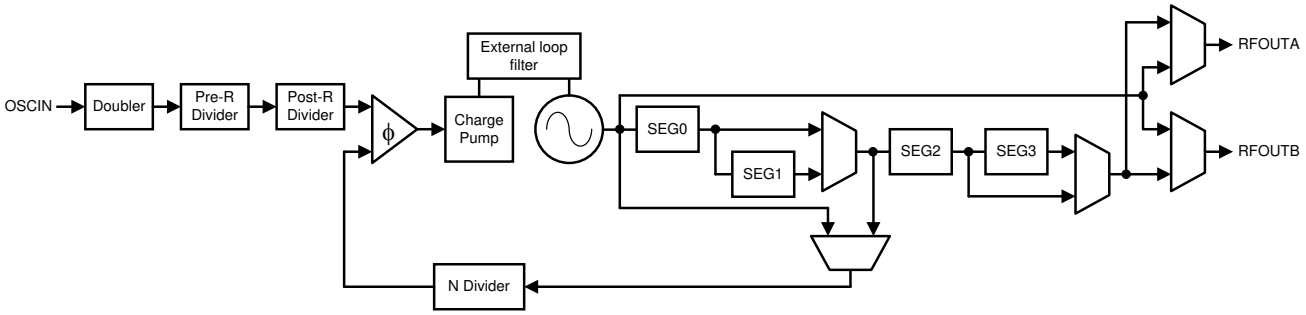

図 7-4. Phase SYNC Diagram

7.3.12.2 Categories of Applications for SYNC

The requirements for SYNC depend on certain setup conditions. In cases that the SYNC is not timing critical, it can be done through software by toggling the VCO_PHASE_SYNC bit from 0 to 1. 図 7-5 gives the different categories. When it is timing critical, then it must be done through the pin and the setup and hold times for the OSCIN pin are critical. For timing critical SYNC (Category 3 only), adhere to the following guidelines.

表 7-13. SYNC Pin Timing Characteristics for Category 3 SYNC

PARAMETER		MIN	MAX	UNIT
f_{OSC}	Input reference frequency		40	MHz
t_{SETUP}	Setup time between SYNC and OSCIN rising edges	9		ns
t_{HOLD}	Hold time between SYNC and OSCIN rising edges	4		ns

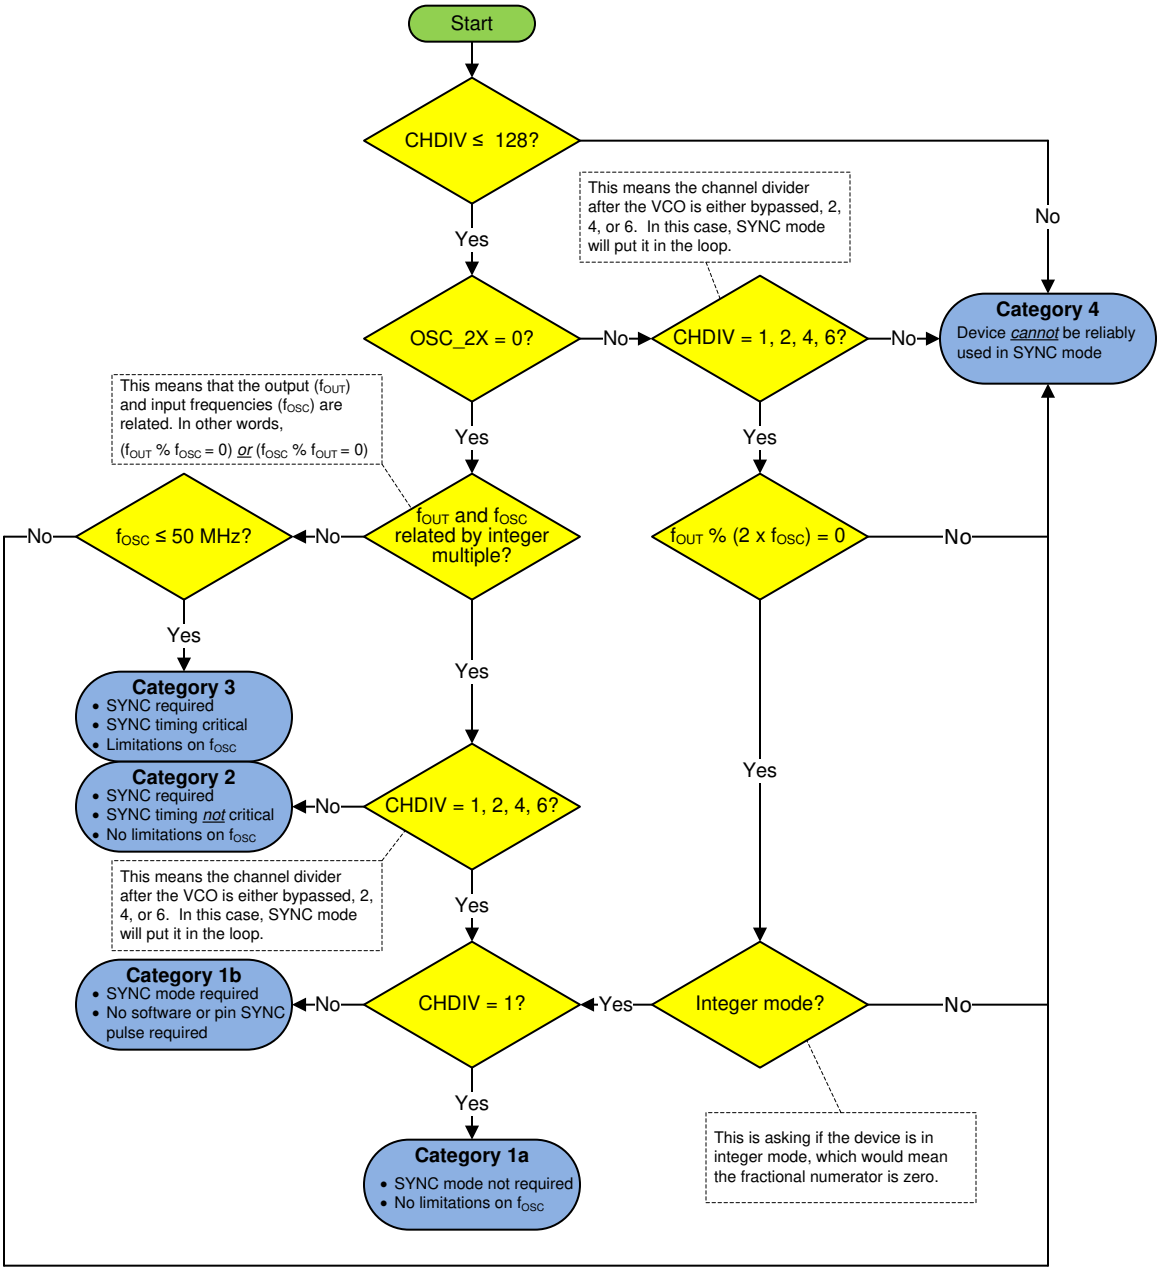

図 7-5. Determining the SYNC Category

7.3.12.3 Procedure for Using SYNC

This procedure must be used to put the device in SYNC mode.

1. Use the flowchart to determine the SYNC category.
2. Make determinations for OSCIN and using SYNC based on the category.
   a. If category 4, SYNC cannot be performed in this setup.
   b. If category 3, ensure that the maximum f_{OSC} frequency for SYNC is not violated and there are hardware accommodations to use the SYNC pin.
3. If the channel divide is used, determine the included channel divide value which will be 2 × SEG1 of the channel divide.
   a. If OUTA_MUX is not channel divider and OUTB_MUX is not channel divider or SYSREF, then IncludedDivide = 1.

b. Otherwise, IncludedDivide = 2 × SEG1. In the case that the channel divider is 2, then IncludedDivide = 4.

4. If not done already, divide the N divider and fractional values by the included channel divide to account for the included channel divide.
5. Program the device with the VCO_PHASE_SYNC = 1. Note that this does not count as applying a SYNC to device (for category 2).
6. Apply the SYNC, if required.
   a. If category 2, VCO_PHASE_SYNC can be toggled from 0 to 1. Alternatively, a rising edge can be sent to the SYNC pin and the timing of this is not critical.
   b. If category 3, the SYNC pin must be used, and the timing must be away from the rising edge of the OSCIN signal.

7.3.12.4 SYNC Input Pin

If not using SYNC mode (VCO_PHASE_SYNC = 0), the INPIN_IGNORE bit must be set to one, otherwise it causes issues with lock detect. If the pin is desired for to be used and VCO_PHASE_SYNC = 1, then set INPIN_IGNORE = 0.

7.3.13 Phase Adjust

The MASH_SEED word can use the sigma-delta modulator to shift output signal phase with respect to the input reference. If a SYNC pulse is sent (software or pin) or the MASH is reset with MASH_RST_N, then this phase shift is from the initial phase of zero. If the MASH_SEED word is written to, then this phase is added. The phase shift is calculated as below.

$$\text{Phase shift in degrees} = 360 \times (\text{MASH\_SEED} / \text{PLL\_DEN}) \times (\text{IncludedDivide} / \text{CHDIV}) \quad (5)$$

For example:

MASH_SEED = 1; PLL_DEN = 12; CHDIV = 16

If VCO_PHASE_SYNC = 0, Phase shift = 360 × (1 / 12) × (1 / 16) = 1.875 degrees.

If VCO_PHASE_SYNC = 1, Phase shift = 360 × (1 / 12) × (4 / 16) = 7.5 degrees.

There are several considerations when using MASH_SEED.

- Phase shift can be done with a PLL_NUM = 0, but MASH_ORDER must be greater than zero. For MASH_ORDER = 1, the phase shifting only occurs when MASH_SEED is a multiple of PLL_DEN.
- For the 2nd order modulator, PLL_N ≥ 45. For the 3rd order modulator, PLL_N ≥ 49.

When using MASH_SEED in the case where IncludedDivide > 1, there are several additional considerations in order to get the phase shift to be monotonically increasing with MASH_SEED.

- TI recommends to use MASH_ORDER ≤ 2.
- When using the 2nd order modulator for VCO frequencies below 10 GHz (when IncludedDivide = 6) or 9 GHz (when IncludedDivide = 4), it may be necessary to increase the PLL_N value much higher or change to the 1st order modulator. When this is necessary depends on the VCO frequency, IncludedDivide, and PLL_N value.

7.3.14 Fine Adjustments for Phase Adjust and Phase SYNC

Phase SYNC refers to the process of getting the same phase relationship for every power up cycle and each time assuming that a given programming procedure is followed. However, there are some adjustments that can be made to get the most accurate results. As for the consistency of the phase SYNC, the only source of variation could be if the VCO calibration chooses a different VCO core and capacitor, which can introduce a bimodal distribution with about 10 ps of variation. If this 10 ps is not desirable, then it can be eliminated by reading back the VCO core, capcode, and DACISET values and forcing these values to ensure the same calibration settings every time. The delay through the device varies from part to part and can be on the order of 60 ps. This part to part variation can be calibrated out with the MASH_SEED. The variation in delay through the device also changes on the order of +2.5 ps/°C, but devices on the same board likely have similar temperatures, so this will somewhat track. In summary, the device can be made to have consistent delay through the part and there are

means to adjust out any remaining errors with the MASH_SEED. This tends only to be an issue at higher output frequencies when the period is shorter.

7.3.15 SYSREF

The LMX2694-EP can generate a SYSREF output signal that is synchronized to f_{OUT} with a programmable delay. This output can be a single pulse, series of pulses, or a continuous stream of pulses. To use the SYSREF capability, the PLL must first be placed in SYNC mode with VCO_PHASE_SYNC = 1.

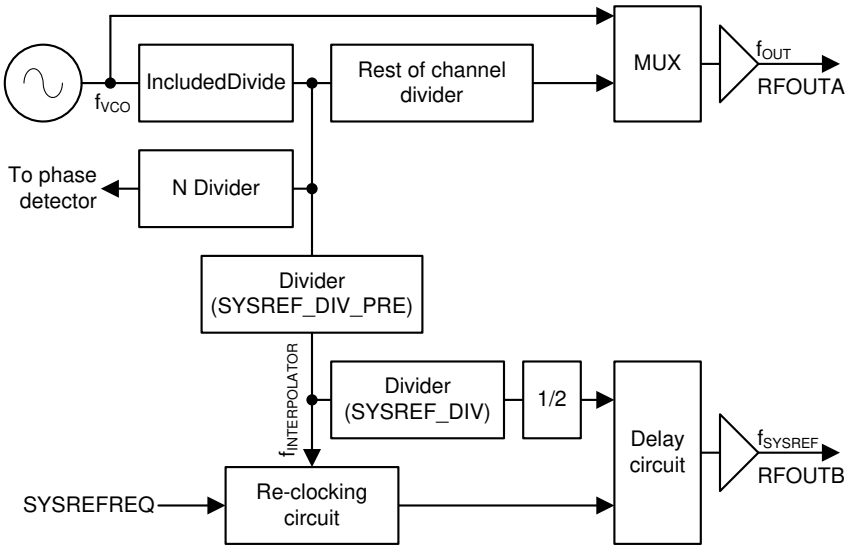

図 7-6. SYSREF Setup

As 図 7-6 shows, the SYSREF feature uses IncludedDivide and SYSREF_DIV_PRE divider to generate $f_{INTERPOLATOR}$. This frequency is used for re-clocking of the rising and falling edges at the SYSREFREQ pin. In master mode, the $f_{INTERPOLATOR}$ is further divided by 2 × SYSREF_DIV to generate finite series or continuous stream of pulses.

表 7-14. SYSREF Setup

PARAMETER	MIN	TYP	MAX	UNIT
f_{VCO}	7550		15100	MHz
$f_{INTERPOLATOR}$	0.8		1.5	GHz
IncludedDivide		4 or 6		
SYSREF_DIV_PRE	1, 2, or 4			
SYSREF_DIV	4, 6, 8, ..., 4098			
$f_{INTERPOLATOR}$	$f_{INTERPOLATOR} = f_{VCO}$ / (IncludedDivide × SYSREF_DIV_PRE)			
f_{SYSREF}	$f_{SYSREF} = f_{INTERPOLATOR}$ / (2 × SYSREF_DIV)			
Delay step size		9		ps
Pulses for pulsed mode (SYSREF_PULSE_CNT)	0		15	

The delay can be programmed using the JESD_DAC1_CTRL, JESD_DAC2_CTRL, JESD_DAC3_CTRL, and JESD_DAC4_CTRL words. By concatenating these words into a larger word called "SYSREFPHASESHIFT", the relative delay can be found. The sum of these words must always be 63.

表 7-15. SYSREF Delay

SYSREFPHASESHIFT	DELAY	JESD_DAC1	JESD_DAC2	JESD_DAC3	JESD_DAC4
0	Minimum	36	27	0	0
...				0	0

表 7-15. SYSREF Delay (continued)

SYSREFPHASESHIFT	DELAY	JESD_DAC1	JESD_DAC2	JESD_DAC3	JESD_DAC4
36		0	63	0	0
37		0	62	1	0
...					
99		0	0	63	0
100		0	0	62	1
...					
161		0	0	1	62
162		0	0	0	63
163		1	0	0	62
225		63	0	0	0
226		62	1	0	0
247	Maximum	41	22	0	0
> 247	Invalid	Invalid	Invalid	Invalid	Invalid

7.3.15.1 Programmable Fields

表 7-16 has the programmable fields for the SYSREF functionality.

表 7-16. SYSREF Programming Fields

FIELD	PROGRAMMING	DEFAULT	DESCRIPTION
SYSREF_EN	0 = Disabled 1 = Enabled	0	Enables the SYSREF mode. SYSREF_EN must be 1 if and only if OUTB_MUX = 2 (SYSREF).
SYSREF_DIV_PRE	1 = DIV1 2 = DIV2 4 = DIV4 Other states = Invalid		The output of this divider is the $f_{INTERPOLATOR}$.
SYSREF_REPEAT	0 = Master mode 1 = Repeater mode	0	In master mode, the device creates a series of SYSREF pulses. In repeater mode, SYSREF pulses are generated with the SYSREFREQ pin.
SYSREF_PULSE	0 = Continuous mode 1 = Pulsed mode	0	Continuous mode continuously makes SYSREF pulses, where pulsed mode makes a series of SYSREF_PULSE_CNT pulses
SYSREF_PULSE_CNT	0 to 15	4	In the case of using pulsed mode, this is the number of pulses. Setting this to zero is an allowable, but not practical state.
SYSREF_DIV	0 = Divide by 4 1 = Divide by 6 2 = Divide by 8 ... 2047 = Divide by 4098	0	The SYSREF frequency is at the VCO frequency divided by this value.

7.3.15.2 Input and Output Pin Formats

7.3.15.2.1 SYSREF Output Format

The SYSREF output comes in differential format through RFOUTB. This will have a minimum voltage of about 2.3 V and a maximum of 3.3 V. If DC coupling cannot be used, there are two strategies for AC coupling.

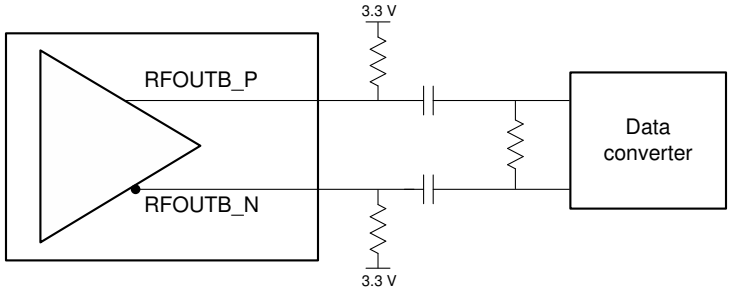

図 7-7. SYSREF Output

1. Send a series of pulses to establish a DC-bias level across the AC-coupling capacitor.
2. Establish a bias voltage at the data converter that is below the threshold voltage by using a resistive divider.

7.3.15.3 SYSREF Examples

The SYSREF can be used in a repeater mode, which just echos the input, after the SYSREF is reclocked to the $f_{INTERPOLATOR}$ frequency and then RFOUT—or it can be used in a repeater. In repeater mode, it can repeat 1, 2, 4, 8, or infinite (continuous) pulses. The frequency for repeater mode is equal to the RFOUT frequency divided by the SYSREF divider.

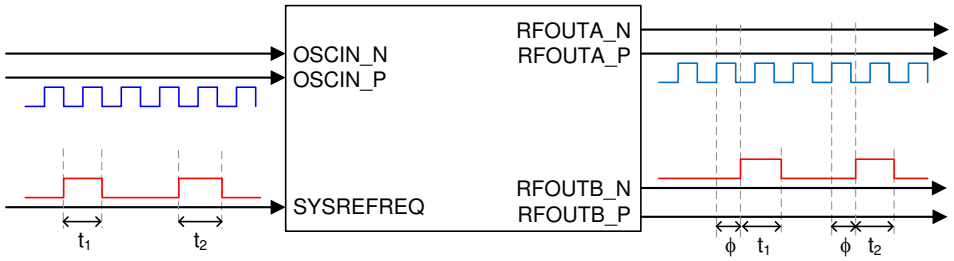

図 7-8. SYSREF Out in Repeater Mode

In master mode, the SYSREFREQ pin is pulled high to allow the SYSREF output.

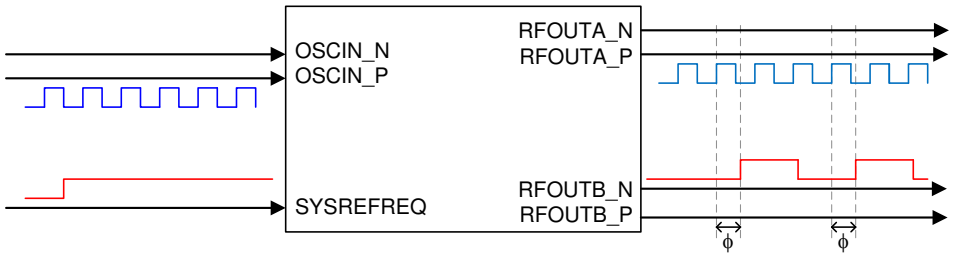

図 7-9. SYSREF Out in Pulsed / Continuous Mode

7.3.15.4 SYSREF Procedure

To use SYSREF, do the these steps:

1. Put the device in SYNC mode using the procedure already outlined.
2. Figure out IncludedDivide the same way it is done for SYNC mode.
3. Calculate the SYSREF_DIV_PRE value such that the interpolator frequency ($f_{INTERPOLATOR}$) is in the range of 800 to 1500 MHz. $f_{INTERPOLATOR} = f_{VCO}$ / IncludedDivide / SYSREF_DIV_PRE. Make this frequency a multiple of f_{OSC} if possible.
4. If using master mode (SYSREF_REPEAT = 0), ensure SYSREFREQ pin is high.
5. If using repeater mode (SYSREF_REPEAT = 1), set up the pulse count if desired. Pulses are created by toggling the SYSREFREQ pin.
6. Adjust the delay between the RFOUTA and RFOUTB signal using the JESD_DACx_CTRL fields.

7.4 Device Functional Modes

表 7-17 shows the function modes of the LMX2694-EP.

表 7-17. Functional Modes

MODE	DESCRIPTION	SOFTWARE SETTINGS
RESET	Registers are held in their reset state. This device does have a power-on reset, but it is good practice to also do a software reset if there is any possibility of noise on the programming lines, especially if there is sharing with other devices. Also realize that there are registers not disclosed in the data sheet that are reset as well.	RESET = 1 POWERDOWN = 0
POWERDOWN	Device is powered down.	POWERDOWN = 1
Normal operating mode	This is used with at least one output on as a frequency synthesizer and the device can be controlled through the SPI interface.	
SYNC mode	This is used where part of the channel divider is in the feedback path to ensure deterministic phase.	VCO_PHASE_SYNC = 1
SYSREF mode	In this mode, RFOUTB is used to generate pulses for SYSREF.	VCO_PHASE_SYNC =1 SYSREF_EN = 1

7.5 Programming

The LMX2694-EP is programmed using 24-bit shift registers. The shift register consists of a R/W bit (MSB), followed by a 7-bit address field and a 16-bit data field. For the R/W bit, 0 is for write, and 1 is for read. The address field ADDRESS[6:0] is used to decode the internal register address. The remaining 16 bits form the data field DATA[15:0]. While CS# is low, serial data is clocked into the shift register upon the rising edge of clock (data is programmed MSB first). When CS# goes high, data is transferred from the data field into the selected register bank. See 図 6-2 for timing details.

7.5.1 Recommended Initial Power-Up Sequence

For the most reliable programming, TI recommends this procedure:

1. Apply power to device.
2. Program RESET = 1 to reset registers.
3. Program RESET = 0 to remove reset.
4. Program registers as shown in the register map in REVERSE order from highest to lowest.
5. Programming of registers R113 down to R79 is not required, but if they are programmed, they should be done so as the register map shows. Programming of registers R79 down to R0 is required. Registers in this range that only 1's and 0's should also be programmed in accordance to the register map. Do NOT assume that the power-on reset state and the recommended value are the same.
6. Wait 10 ms.
7. Program register R0 one additional time with FCAL_EN = 1 to ensure that the VCO calibration runs from a stable state.

7.5.2 Recommended Sequence for Changing Frequencies

The recommended sequence for changing frequencies is as follows:

1. Change the N-divider value.
2. Program the PLL numerator and denominator.
3. Program FCAL_EN (R0[3]) = 1.

R/W-0x0	R/W-0x0			R/W-0x1	R/W-0x1	R/W-0x0	R/W-0x0

表 7-20. R0 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R/W	0x0	Program 0x0 to this field.
14	VCO_PHASE_SYNC	R/W	0x0	Enables phase SYNC. In this state, part of the channel divider is put in the feedback path to ensure deterministic phase. The action of toggling this bit from 0 to 1 also sends an asynchronous SYNC pulse. 0x0 = Normal operation 0x1 = Phase SYNC enabled
13-10	RESERVED	R/W	0x8	Program 0x8 to this field.
9	OUT_MUTE	R/W	0x0	Mute the outputs (RFOUTA / RFOUTB) when the VCO is calibrating. 0x0 = Disabled 0x1 = Muted
8-7	FCAL_HPFD_ADJ	R/W	0x0	Set this field in accordance to the phase detector frequency for optimal VCO calibration. 0x0 = $f_{PD} \leq 100$ MHz 0x1 = 100 MHz < $f_{PD} \leq 150$ MHz 0x2 = 150 MHz < $f_{PD} \leq 200$ MHz 0x3 = $f_{PD} > 200$ MHz
6-4	RESERVED	R/W	0x0	Program 0x1 to this field.
3	FCAL_EN	R/W	0x1	Writing register R0 with this bit set to a '1' enables and triggers the VCO frequency calibration. 0x0 = No VCO frequency calibration 0x1 = Enabled
2	MUXOUT_LD_SEL	R/W	0x1	Selects the functionality of the MUXOUT pin. 0x0 = Register readback 0x1 = Lock detect
1	RESET	R/W	0x0	Register reset. This resets all registers and state machines. After writing a '1', you must write a '0' to remove the reset. It is recommended to toggle the RESET bit before programming the part to ensure consistent performance. 0x0 = Normal operation 0x1 = Reset
0	POWERDOWN	R/W	0x0	Powers down device. 0x0 = Normal operation 0x1 = Powered down

7.6.2 R1 Register (Offset = 0x1) [reset = 0x80C]

R1 is shown in 図 7-11 and described in 表 7-21.

Return to 表 7-18.

図 7-11. R1 Register

7-5	SYSREF_DIV_PRE	R/W	0x4	This divider is used to get the frequency input to the SYSREF interpolater within acceptable limits. 0x2 = Divided by 2 0x4 = Divided by 4
4	SYSREF_PULSE	R/W	0x0	When in master mode (SYSREF_REPEAT = 0), this allows multiple pulses (as determined by SYSREF_PULSE_CNT) to be sent out whenever the SYSREFREQ pin goes high. 0x0 = Disabled 0x1 = Enable
3	SYSREF_EN	R/W	0x0	Enables SYSREF mode. 0x0 = Disabled 0x1 = Enabled

表 7-91. R71 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SYSREF_REPEAT	R/W	0x0	Defines SYSREF mode. In Master mode, SYSREF pulses are generated continuously at the output. In Repeater mode, SYSREF pulses are generated in response to the SYSREFREQ pin. 0x0 = Master mode 0x1 = Repeater Mode
1-0	RESERVED	R/W	0x0	Program 0x0 to this field.

8 Application and Implementation

Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

8.1.1 OSCIN Configuration

OSCIN supports single or differential-ended clock. There must be a AC-coupling capacitor in series before the device pin. The OSCIN inputs are high-impedance CMOS with internal bias voltage. TI recommends putting termination shunt resistors to terminate the differential traces (if there are 50-Ω characteristic traces, place 50-Ω resistors). The OSCIN_P and OSCIN_N side must be matched in layout. A series AC-coupling capacitors must immediately follow OSCIN pins in the board layout, then the shunt termination resistors to ground must be placed after.

Input clock definitions are shown in 図 8-1.

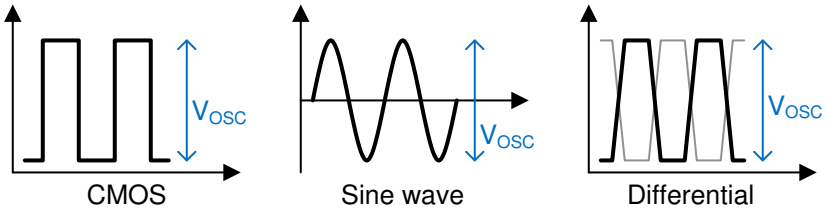

図 8-1. Input Clock Definitions

8.1.2 OSCIN Slew Rate

The slew rate of the OSCIN signal can have an impact on the spurs and phase noise of the LMX2694-EP if it is too low. In general, the best performance is for a high slew rate, but lower amplitude signal, such as LVDS.

8.1.3 RF Output Buffer Power Control

The OUTA_PWR and OUTB_PWR registers control the amount of drive current for the output. This current creates a voltage across the pullup component and load. TI generally recommends to keep the OUTx_PWR setting at 31 or less, as higher settings consume more current consumption and can also lead to higher output power. Optimal noise floor is typically obtained by setting OUTx_PWR in the range of 15 to 25.

8.1.4 RF Output Buffer Pullup

The choice of output buffer components is very important and can have a profound impact on the output power. The pullup component can be a resistor or inductor or combination thereof. The signal swing is created by a current flowing this pullup, so a higher impedance implies a higher signal swing. However, as this pullup component can be treated as if it is in parallel with the load impedance, there are diminishing returns as the impedance gets much larger than the load impedance. The output impedance of the device varies as a function of frequency and is a complex number, but typically has a magnitude on the order of 100 Ω, but this decreases with frequency.

The output can be used differentially or single-ended. If using single-ended, the pullup is still needed, and user needs to terminate the unused complimentary side such that the impedance as seen from the pin looking out is similar to the pin that is being used. Following are some typical components that might be useful.

表 8-1. Output Pullup Configuration

COMPONENT	VALUE	PART NUMBER
Inductor	1 nH, 13.6 GHz SRF	Toko LL1005-FH1N0S
	3.3 nH, 6.8 GHz SRF	Toko LL1005-FH3N3S
	10 nH, 3.8 GHz SRF	Toko LL1005-FH10NU
Resistor	50 Ω	Vishay FC0402E50R0BST1
Capacitor	Varies with frequency	ATC 520L103KT16T ATC 504L50R0FTNCFT

8.1.4.1 Resistor Pullup

One strategy for the choice of the pullup component is to use a resistor (R). This is typically chosen to be 50-Ω and under the assumption that the part output impedance is high, then the output impedance will theoretically be 50 Ω, regardless of output frequency. As the output impedance of the device is not infinite, the output impedance when the pullup resistor is used will be less than 50 Ω, but will be reasonably close. There will be some drop across the resistor, but this does not seem to have a large impact on signal swing for a 50-Ω resistor provided that OUTx_PWR ≤ 31.

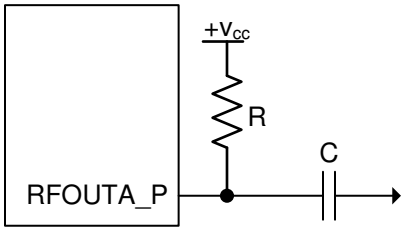

図 8-2. Resistor Pullup

8.1.4.2 Inductor Pullup

Another strategy is to choose an inductor pullup (L). This allows a higher impedance without any concern of creating any DC drop across the component. Ideally, the inductor should be chosen large enough so that the impedance is high relative to the load impedance and also be operating away from its self-resonant frequency. For instance, consider a 3.3-nH pullup inductor with a self-resonant frequency of 7 GHz driving a 25-Ω spectrum analyzer input. This inductor theoretically has j50-Ω input impedance around 2.4 GHz. At this frequency, this in parallel with load is about j35-Ω, which is a 3-dB power reduction. At 1.4 GHz, this inductor has impedance of about 29 Ω. This in parallel with the 50-Ω load has a magnitude of 25 Ω, which is the same result seen with the 50-Ω pullup. The main issue with the inductor pullup is that the impedance does not look nicely matched to the load.

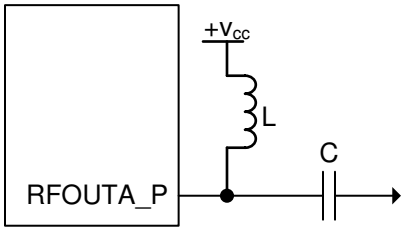

図 8-3. Inductor Pullup

As the output impedance is not so nicely matched, but there is higher output power, it makes sense to use a resistive pad to get the best impedance control. A 6-dB pad (R1 = 18 Ω, R2 = 68 Ω) is likely more attenuation than necessary. A 3-dB or even 1-dB pad might suffice. Two AC-coupling capacitors are required before the pad. In 図 8-4, one of them is placed by the resistor to ground to minimize the number of components in the high frequency path for lower loss.

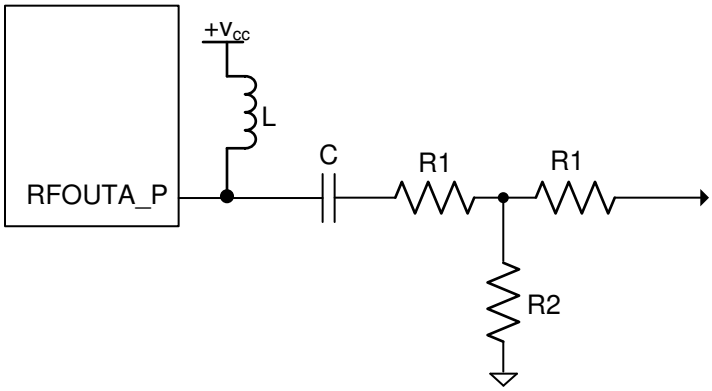

図 8-4. Inductor Pullup With Pad

For the resistive pad, 表 8-2 shows some common values:

表 8-2. Resistive T-Pad Values

ATTENUATION	R1	R2
1 dB	2.7 Ω	420 Ω
2 dB	5.6 Ω	220 Ω
3 dB	6.8 Ω	150 Ω
4 dB	12 Ω	100 Ω
5 dB	15 Ω	82 Ω
6 dB	18 Ω	68 Ω

8.1.4.3 Combination Pullup

The resistor gives a good low frequency response, while the inductor gives a good high frequency response with worse matching. It is desirable to have the impedance of the pullup to be high, but if a resistor is used, then there could be too much DC drop. If an inductor is used, it is hard to find one good at low frequencies and around its self-resonant frequency. One approach to address this is to use a series resistor and inductor followed by resistive pad.

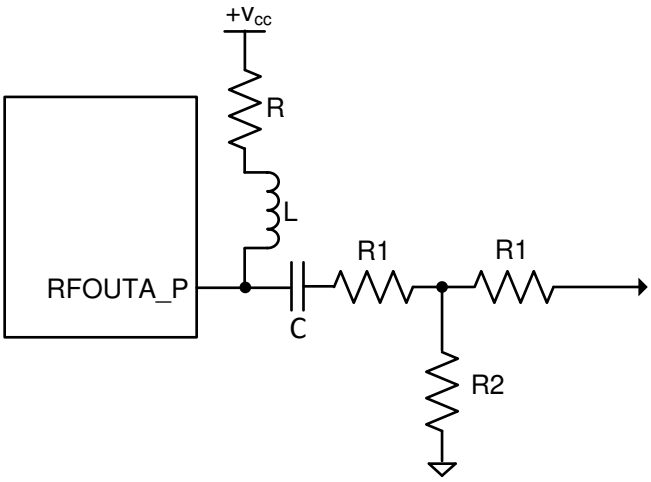

図 8-5. Inductor and Resistor Pullup

8.1.5 RF Output Treatment for the Complimentary Side

Regardless of whether both sides of the differential outputs are used, both sides should see a similar load.

8.1.5.1 Single-Ended Termination of Unused Output

The unused output should see a roughly the same impedance as looking out of the pin to minimize harmonics and get the best output power. As placement of the pull-up components is critical for the best output power, the routing does not need to be perfectly symmetrical. It makes sense to give highest priority routing to the used output (RFOUTA_P in this case).

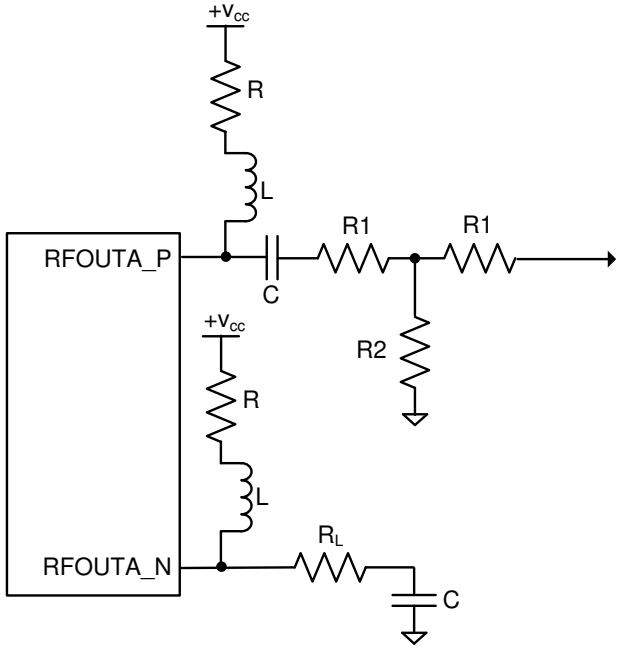

図 8-6. Termination of Unused Output - Single-Ended

8.1.5.2 Differential Termination

For differential termination this can be done by doing the same termination to both sides, or it is also possible to connect the grounds together. This approach can also be accompanied by a differential to single-ended balun for the highest possible output power.

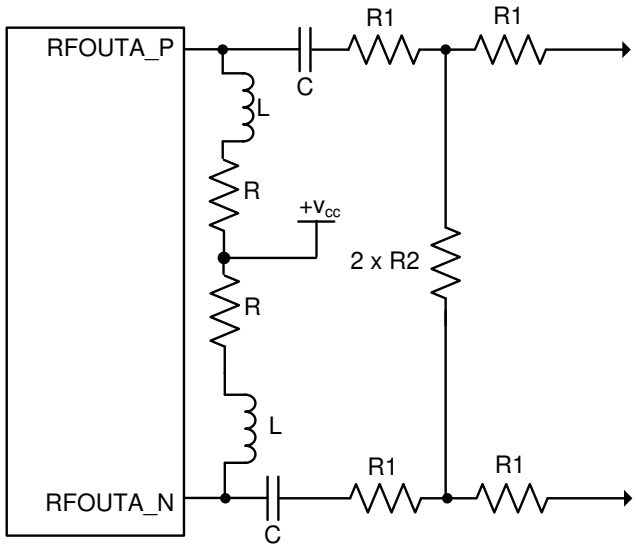

図 8-7. Termination of Unused Output - Differential

8.1.6 External Loop Filter

The LMX2694-EP requires an external loop filter that is application-specific and can be configured by PLLatinum Sim. For the LMX2694-EP, it matters what impedance is seen from the VTUNE pin looking outwards. This impedance is dominated by the component C3 for a third order filter or C1 for a second order filter. If there is at least 1.5 nF for the capacitance that is shunt with this pin, the VCO phase noise will be close to the best it can be. If there is less, the VCO phase noise in the 100-kHz to 1-MHz region will degrade. This capacitor should be placed close to the VTUNE pin.

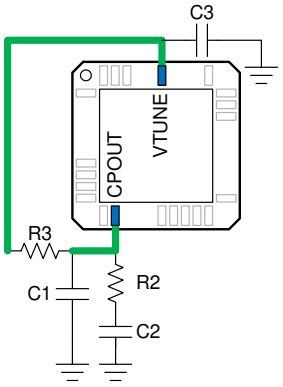

図 8-8. External Loop Filter

8.2 Typical Application

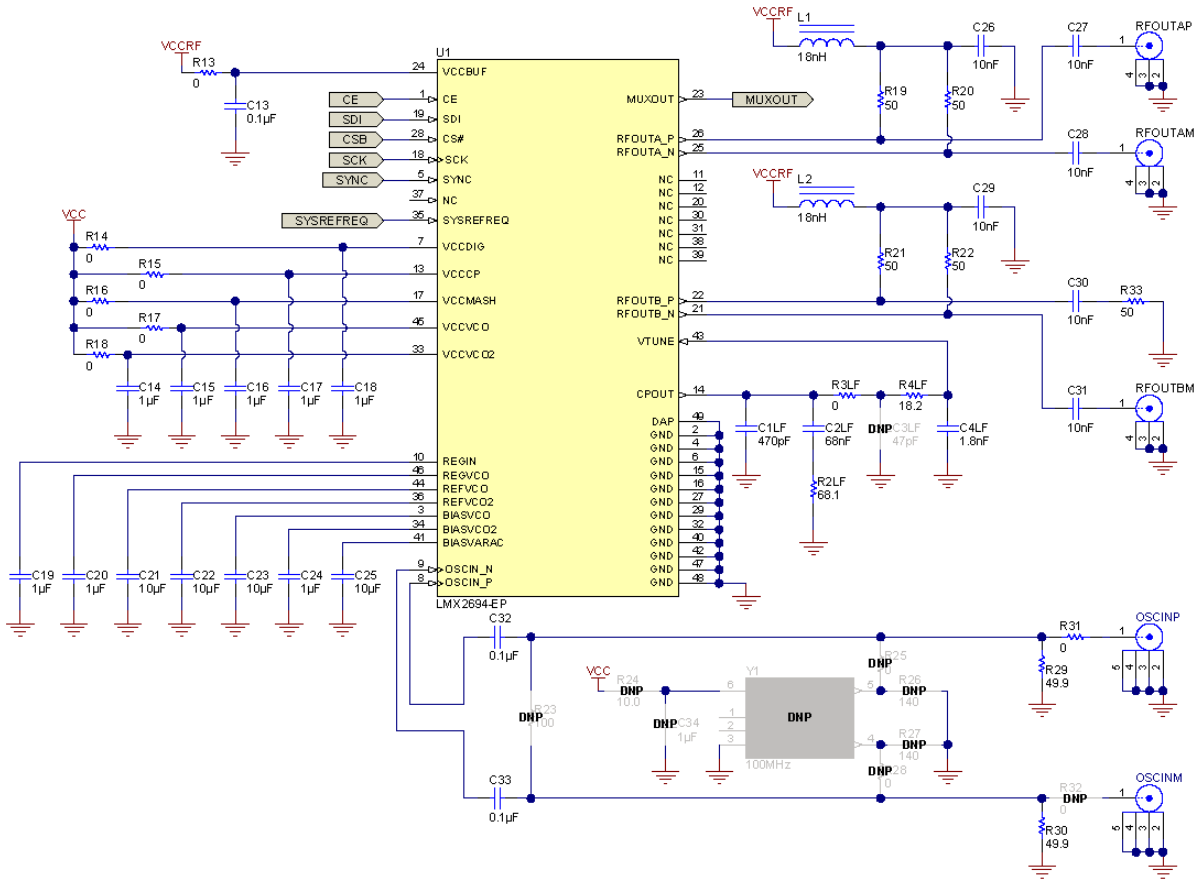

図 8-9. Typical Application Schematic

8.2.1 Design Requirements

The design of the loop filter is complex and is typically done with software. The PLLatinum Sim software is an excellent resource for doing this and the design is shown in 図 8-10.

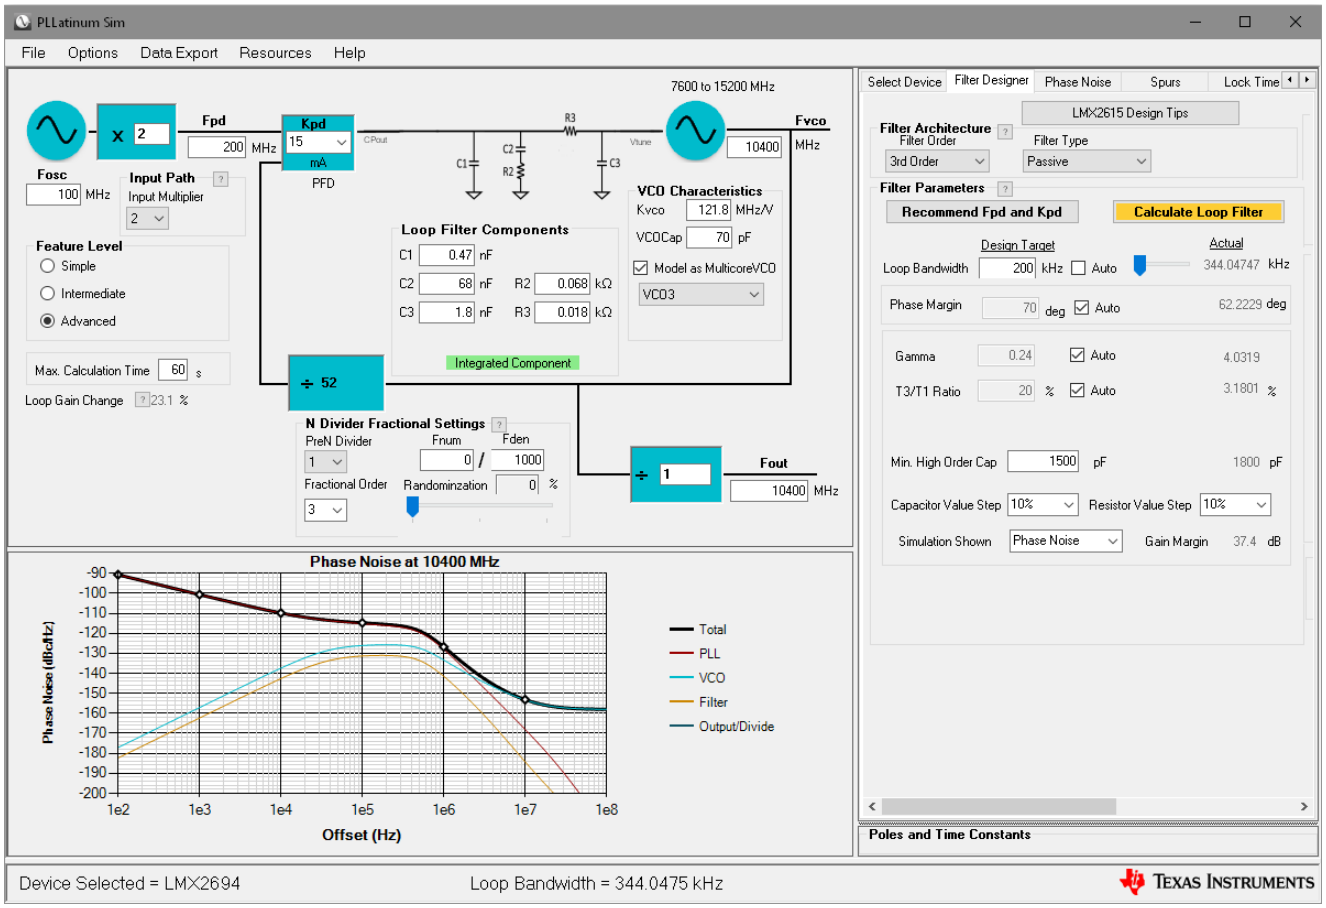

図 8-10. PLLatinum Sim Tool

8.2.2 Detailed Design Procedure

The integration of phase noise over a certain bandwidth (jitter) is an performance specification that translates to signal-to-noise ratio. Phase noise inside the loop bandwidth is dominated by the PLL, while the phase noise outside the loop bandwidth is dominated by the VCO. Generally, jitter is lowest if loop bandwidth is designed to the point where the two intersect. A higher phase margin loop filter design has less peaking at the loop bandwidth and thus lower jitter. The tradeoff with this is that longer lock times and spurs must be considered in design as well.

8.2.3 Application Curve

Using the settings described, the performance measured using a clean 100-MHz input reference is shown. Note the loop bandwidth is about 350 kHz, as simulations predict.

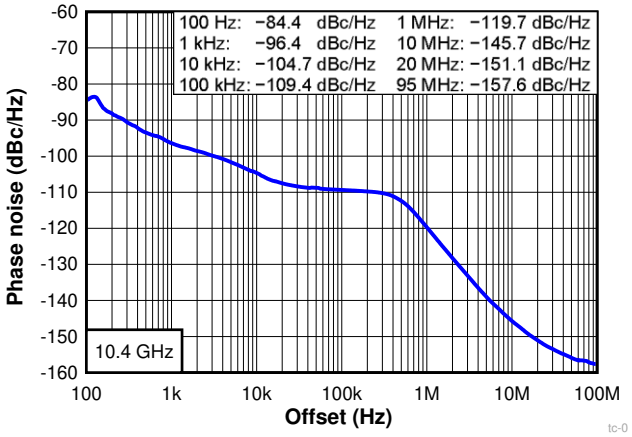

図 8-11. Results for Loop Filter Design

9 Power Supply Recommendations

TI recommends placement of bypass capacitors close to the pins. Consult the EVM instructions for layout examples. If fractional spurs are a large concern, using a ferrite bead to each of these power supply pins can reduce spurs to a small degree. This device has integrated LDOs, which improves the resistance to power supply noise. However, the pullup components on the RFOUTA and RFOUTB pins on the outputs have a direct connection to the power supply, so take extra care to ensure that the voltage is clean for these pins.

10 Layout

10.1 Layout Guidelines

In general, the layout guidelines are similar to most other PLL devices. Here are some specific guidelines.

- GND pins may be routed on the package back to the DAP.
- The OSCIN pins, these are internally biased and must be AC coupled.
- If not used, the SYSREFREQ may be grounded to the DAP.
- For optimal VCO phase noise in the 200 kHz to 1 MHz range, it is ideal that the capacitor closest to the VTUNE pin be at least 3.3 nF. As requiring this larger capacitor may restrict the loop bandwidth, this value can be reduced (to say 1.5 nF) at the expense of VCO phase noise.
- For the outputs, keep the pullup component as close as possible to the pin and use the same component on each side of the differential pair.
- If a single-ended output is needed, the other side must have the same loading and pullup. However, the routing for the used side can be optimized by routing the complementary side through a via to the other side of the board. On this side, use the same pullup and make the load look equivalent to the side that is used.
- Ensure DAP on device is well-grounded with many vias, preferably copper filled.
- Have a thermal pad that is as large as the LMX2694-EP exposed pad. Add vias to the thermal pad to maximize thermal performance.
- Use a low loss dielectric material, such as Rogers 4350B, for optimal output power.

10.2 Layout Example

In addition to the layout guidelines already given, here are some additional comments for this specific layout example.

- The most critical part of the layout that the placement of the pull-up components (R19, R20, R21, and R22) is close to the pin for optimal output power.
- For this layout, all of the loop filter (C1LF, C2LF, C3LF, C4LF, R2LF, R3LF, and R4LF) are on the back side of the board. C4LF is located right underneath to the VTUNE pin. In the event that this C4LF capacitor would be open, it is recommended to move one of loop capacitors in this spot. For instance, if a 3rd order loop filter was used, technically C3LF would be non-zero and C4LF would be open. However, for this layout example that is designed for a 4th order loop filter, it would be optimal to make R3LF = 0 Ω, C3LF = open, and C4LF to be whatever C3LF would have been.

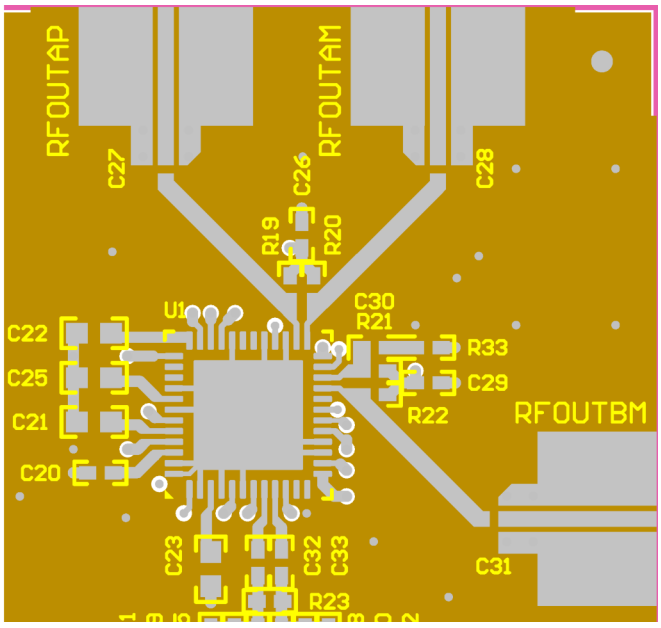

図 10-1. Layout Example

11 Device and Documentation Support

11.1 Device Support

11.1.1 Development Support

Texas Instruments has several software tools to aid in the development at www.ti.com. Among these tools are:

- PLLatinum Sim program for designing loop filters, simulating phase noise and spurs.
- TICS Pro software to understand how to program the device and for programming the EVM board.

11.2 Documentation Support

11.2.1 Related Documentation

For related documentation see the following:

- AN-1879 Fractional N Frequency Synthesis (SNAA062)

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の使用条件を参照してください。

11.5 Trademarks

PLLatinum™ is a trademark of Texas Instruments.
TI E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

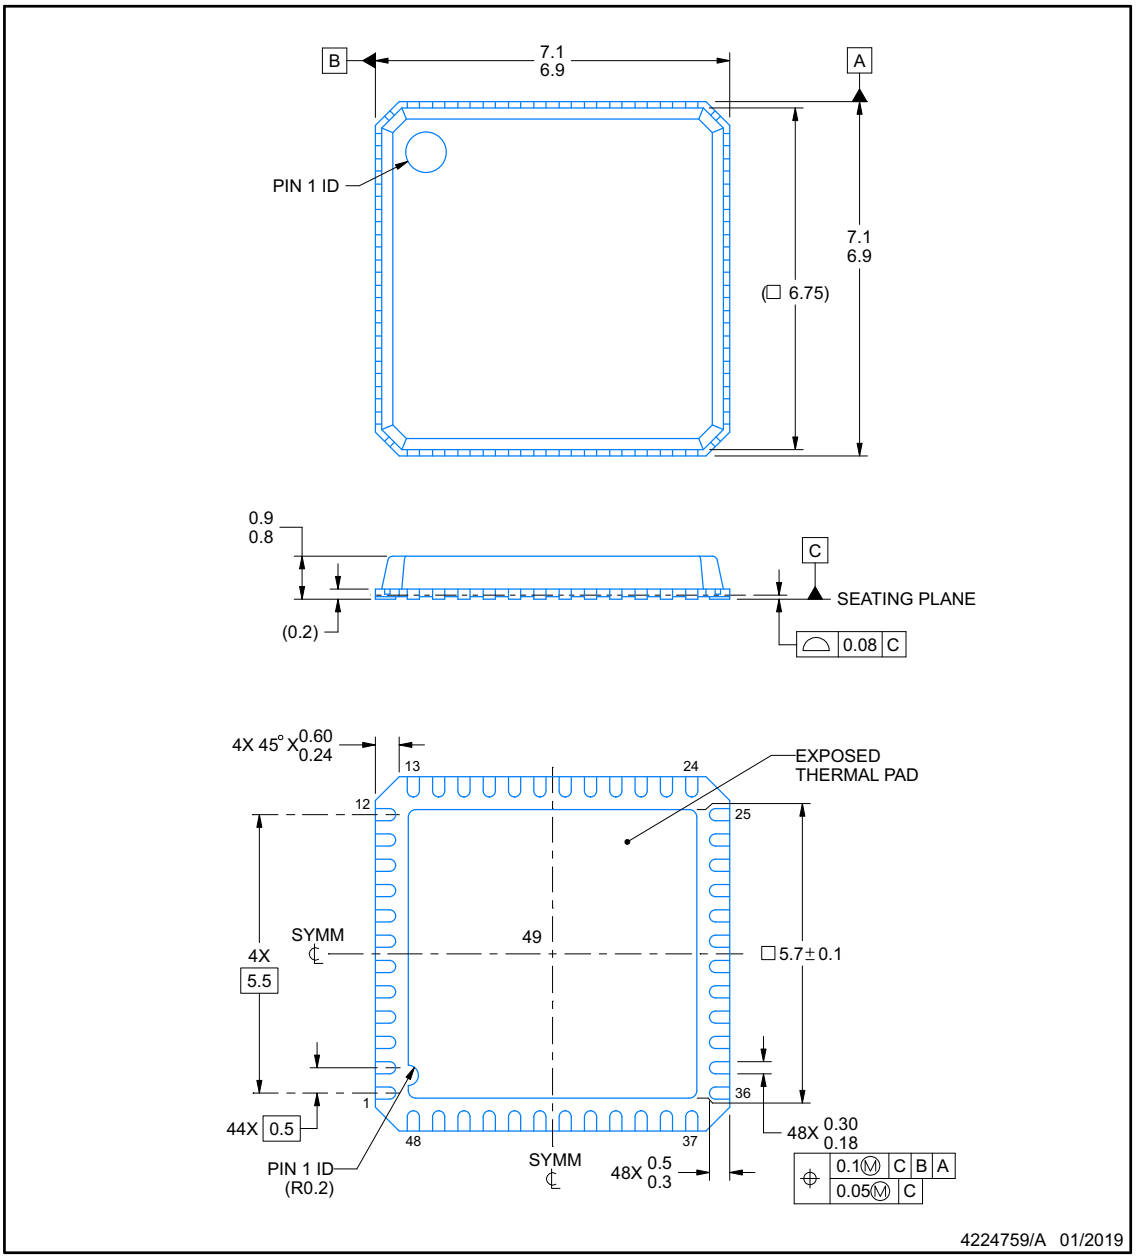
The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OUTLINE

RTC0048G

VQFNP - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMX2694SRTCTEP	ACTIVE	VQFN	RTC	48	50	RoHS & Green	NIPDAUAG	Level-3-260C-168 HR	-55 to 125	LMX2694 EP	Samples
V62/19616-01XE	ACTIVE	VQFN	RTC	48	50	RoHS & Green	NIPDAUAG	Level-3-260C-168 HR		LMX2694 EP	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
